President Xi Jinping first announced the initiative during official visits to Kazakhstan and Indonesia in 2013 as a two-pronged plan: a land-based Silk Road Economic Belt and a Maritime Silk Road. McBride, J., Berman, N., & Chatzky, A. (2023). *China’s Massive Belt and Road Initiative*. Council on Foreign Relations. <https://www.cfr.org/background/chinas-massive-belt-and-road-initiative> (accessed on July 5, 2023). The two plans were collectively known as the One Belt, One Road Initiative and eventually became the Belt and Road Initiative. *Ibid*.

certain regions, including Southeast Asia and East Africa, to China directly or via maritime ports²⁹⁹³.

BRI also promotes improvements to railway networks connecting China with Europe²⁹⁹⁴. With the implementation of BRI, China has built inter-regional and inter-continental railway networks in cooperation with multiple countries²⁹⁹⁵, including Laos, Thailand, Hungary, Serbia, Indonesia, Pakistan, Kyrgyzstan and Uzbekistan²⁹⁹⁶. China also cooperates with multiple countries on international railway operations²⁹⁹⁷. For instance, railway companies in China, Belarus, Germany, Kazakhstan, Mongolia, Poland and Russia have signed an agreement on deeper cooperation on China-Europe rail service²⁹⁹⁸.

Railways built by Chinese companies in Africa, including in Nigeria, Kenya and Zambia, have constituted a major part of Chinese lending to African countries – a practice that has drawn criticism for creating ‘*debt traps*’ while alleviating overcapacity concerns in China’s domestic market (see also Section 20.4.5)²⁹⁹⁹. To support these efforts, the Ministry of Transport encourages local actors to improve service functions and transportation capabilities and establish logistics companies and cross-border e-commerce platforms³⁰⁰⁰.

Furthermore, China has conditioned loans for infrastructure projects under the BRI on the adoption of Chinese technical standards, fostering dependence on Chinese companies for further construction and maintenance³⁰⁰¹. NDRC has set benchmarks to promote the adoption of Chinese standards abroad, and by September 2019, China entered 90 bilateral agreements with 52 countries and regions regarding technical standardisation³⁰⁰². Generally, technical standards are national or regional in nature³⁰⁰³. If one country adopts another’s technical standards, the former will become locked into the latter’s technology and must rely on suppliers

based in the latter for railway construction and maintenance³⁰⁰⁴. As such, railway projects in Ethiopia, Djibouti, Indonesia and Laos constructed through the BRI and financed by China's state banks have facilitated reliance on Chinese companies in these countries³⁰⁰⁵.

A 2023 analysis found that paying back these loans drains host countries' tax revenues and foreign currency reserves³⁰⁰⁶. For example, Indonesia was forced to bail out a railway financed by Chinese bank loans twice, and a USD 3,5 billion (~EUR 3,3 billion) loan provided for a railway system in Laos requires approximately 25% of the country's annual output to repay³⁰⁰⁷.

20.3.7. OTHER POLICIES

Various other policies relate to railway component localisation and railway construction investment. In 1999, the State Council released the *Implementation Opinions on the Localisation of Urban Rail Transit Equipment* to local governments³⁰⁰⁸. This policy – still in force at the time of writing this Report – requires urban railway projects to use domestically-manufactured railway vehicles and equipment³⁰⁰⁹. Specifically, the average localisation rate of all rail vehicles and equipment must be no less than 70%, regardless of the types of construction funds involved³⁰¹⁰. The policy also notes that the state may provide financial support (including, for instance, loans with favourable interest rates and financial subsidies) for those urban rail projects that meet the above standard³⁰¹¹. China's localisation requirements have reached 75% for metro rolling stock, 50% for metro traction and 60% for metro signalling³⁰¹². For example, the procurement announcement for the Xuzhou Urban Rail Transit No. 6 Line Phase I Project-Electric Vehicle Traction System requires that the localisation rate shall be no less than 50%³⁰¹³.

In 2016, NDRC released the Medium and Long-term Railway Network Plan³⁰¹⁴. This policy provides central guidance on railway construction from 2016 to 2025 and long-term planning through 2030³⁰¹⁵. It promotes innovation in investment methods for railway construction³⁰¹⁶. Specifically, it indicates the Government is to support local governments in establishing railway

development funds, issuing government-backed railway construction bonds and raising long-term, low-cost construction funds³⁰¹⁷. This policy also provides for the state to implement policies to increase investment in the construction of railways in China's emerging Middle and West regions while researching and developing subsidy policies for their operation³⁰¹⁸.

20.4. MARKET INTERVENTIONS

This section examines how the Chinese government intervenes in its internal railway industry through imposing technology transfer policies on foreign companies, providing financial incentives and support to domestic companies – such as grants, preferential tax treatment and preferential loan policies – and creating barriers to foreign company access to public procurement of railway contracts through standardisation and other requirements. Overcapacity issues partly driven by such policies, in turn, help drive China's expansion into the overseas railway market.

20.4.1. STATE SUPPORT MEASURES

20.4.1.1. FOREIGN TECHNOLOGY TRANSFERS

China's intellectual property system favours domestic companies over foreign investors³⁰¹⁹. From 2018 through 2019, the EU lodged and revised a WTO consultation request regarding China's practice of conditioning foreign investment on transferring technology into China through, for example, requiring foreign companies to share certain technology with domestic partners in joint ventures³⁰²⁰. Such practices helped lay the groundwork of China's high-speed railway industry (see also Section 8.2.3.1.3 for a more general context of technology transfers).

After nearly a decade of failed attempts to develop high-speed rail technology, a '*technology transfer for market access*' strategy was promulgated in 2003, permitting foreign firms to sell high-speed rail technology only if they formed joint ventures and shared technology with Chinese companies³⁰²¹. After agreeing to train engineers, provide access to blueprints, and instruct companies on manufacturing processes, Alstom, Kawasaki, and Bombardier were awarded some of the contracts of the initial USD 1,4 billion (~EUR 1,1 billion) procurement package launched in 2004³⁰²². Once Chinese companies absorbed and were able to replicate this technology³⁰²³, companies like Alstom were effectively shut out of the high-speed rail

market³⁰²⁴, and Japanese firms continue to bring IP claims based on allegedly stolen high-speed rail technology³⁰²⁵.

20.4.1.2. FINANCIAL SUPPORT AND INCENTIVES

Strong internal demand, often driven by public investment, spurred China's railway industry to grow exponentially from 2007 to 2017³⁰²⁶ (see also Section 20.2.5). China provides its railway industry with a comprehensive suite of financial incentives that includes grants, equity investments, preferential tax treatment, and loans with favourable terms (see also Chapter 6).

20.4.1.3. GRANTS

China's central and subnational governments provide grants to enterprises in a wide range of advanced manufacturing, strategic emerging, and high-tech industries critical to the country's economic development, including the railway industry. These grants are issued for a variety of purposes, including the transformation and upgrading of industrial enterprises³⁰²⁷, R&D³⁰²⁸, transformative science and technology achievements³⁰²⁹ and intellectual property development³⁰³⁰.

The National Key R&D Plan focuses on industries that are key to China's national economy³⁰³¹ and includes a key special program on advanced rail³⁰³². According to one study, the Government subsidised advanced rail transit through the National Key R&D Plan with RMB

1.2 billion³⁰³³ (~EUR 163,2 million) in 2016, RMB 480,9 million³⁰³⁴ (~EUR 63 million) in 2017 and RMB 183,8 million³⁰³⁵ (~EUR 23,5 million) in 2018. The National Key R&D Plan for the 14th FYP period continues to subsidise the railway industry through the key special program of ‘*transportation equipment and intelligent transportation technology*’³⁰³⁶.

The annual reports of the key publicly listed companies in the railway industry discussed in Section 20.2.1 show substantial subsidisation through grants. For example:

- The annual reports of CRRC show that, ever since 2007, it has received substantial government subsidies for ‘*science and technology programs*’, with such subsidies totalling RMB 478,4 billion (~EUR 57,7 billion) in 2022³⁰³⁷. CRRC’s annual report disclosed RMB 410 million (~EUR 57,9 million) in government subsidies in 2022³⁰³⁸. These consisted of subsidies provided through the government’s science and technology fund, compensation for demolition projects and returning land, discounted interest on imported products and subsidies for infrastructure development and environmental protection³⁰³⁹.
- CRSC’s 2022 annual report disclosed RMB 361 million (~EUR 51 million) in government subsidies for scientific research and as compensation for demolition projects³⁰⁴⁰.
- That same year, CRCC received RMB 136,5 million (~EUR 19,3 million) in annual government subsidies for scientific research, tax, and corporate development and support purposes³⁰⁴¹.
- CREC’s 2022 annual report reveals government subsidies of RMB 87,5 million (~EUR 12,4 million)³⁰⁴². The subsidies were used for several specific projects, the Yichun Luming infrastructure investment project and demolition costs for the Hada high-speed

railway³⁰⁴³. CREC also received subsidies for science and research and company support³⁰⁴⁴.

- While China Railway receives targeted subsidies for a variety of public welfare activities, including transporting students, disabled soldiers, agricultural materials and emergency rescue personnel, as well as funds to supplement operating losses from such public welfare activities³⁰⁴⁵, the amount of subsidies is not disclosed.

20.4.1.4. EQUITY INVESTMENT

China Railway Development Fund Co., Ltd. (*‘the Rail Fund’*) is a railway investment and financing fund supported by the Government³⁰⁴⁶. The Rail Fund claims to follow market economy rules and attracts private capital investment to expand the sources of capital for railway construction, but mainly invests in railway projects approved by the government³⁰⁴⁷. The Rail Fund is a public-private enterprise in which China Railway acts as the Government’s representative, alongside other private shareholders³⁰⁴⁸. China Railway is the largest shareholder with 48.1% of the Rail Fund’s shares, and CDB (see Section 6.3.1.3) is the second largest, owning 33.8% of shares³⁰⁴⁹. A mix of state-owned and private insurance companies hold the remaining 18% of shares³⁰⁵⁰. While private investors, as the preferred shareholders of the Rail Fund, have priority in obtaining stable and reasonable investment returns and enjoy voting rights and other rights³⁰⁵¹, the Rail Fund is mainly operated by China Railway as the investment manager for railway construction projects targeted by the Rail Fund³⁰⁵².

When the distributable income of the Rail Fund is insufficient to pay the agreed returns to its private investors, China Railway must make up the difference and cannot withdraw its capital, while private investors can withdraw after one year³⁰⁵³. Since it was established in September 2014 with registered capital of RMB 367,1 billion (~EUR 44,8 billion), the Rail Fund has participated in or controlled 103 large- and medium-sized railway construction projects representing a total investment of RMB 3,3 trillion (~EUR 435 billion), with China Railway contributing RMB 385.7 billion (~EUR 50,8 billion) of this amount³⁰⁵⁴.

20.4.1.5. LAND SUPPLY

China Railway currently owns abundant land resources, with a large number of stations and marshalling yards concentrated in city centres³⁰⁵⁵. Government policy encourages China Railway to develop the land it owns around the railways and use the income generated by that land to fund railway construction and operation³⁰⁵⁶. Through this policy, China Railway engages in real estate development while offsetting its railway operating losses³⁰⁵⁷.

20.4.1.6. PREFERENTIAL TAXATION

EIT (see Section 15.5.2) is the most significant tax imposed on Chinese companies. China has been providing a preferential EIT rate of 15% to HNTEs since 1991³⁰⁵⁸, but this preferential treatment was not uniformly provided for by legislation until the promulgation of the Law of the People's Republic of China on Enterprise Income Tax in 2007³⁰⁵⁹. The 15% rate is a substantial reduction of 10% points from China's standard 25% EIT rate for resident enterprises³⁰⁶⁰.

HNTEs are resident companies that: (1) are engaged in continuous R&D and application of technological achievements in the fields prescribed in the list of *High- and New-Tech Fields with Key Support of the State*; and (2) have developed core independent intellectual property rights and conducted their business operations on the basis of these intellectual property rights³⁰⁶¹. Local authorities in China share responsibility for awarding companies HNTE status³⁰⁶². For an HNTE to qualify for the preferential EIT rate³⁰⁶³:

- (1) the enterprise must obtain ownership of intellectual property rights, which play a core supportive role technologically for the enterprise's main products or services through, for example, independent R&D, transfer, donation, or merger or acquisition;

- (2)the technologies playing a core supportive role for the enterprise’s main products or services are included in the list of *High-and-New-Tech Fields with Key Support of the State*;
- (3)the proportion of scientific and technological personnel engaged in R&D and related technological innovation activities at the enterprise must account for no less than 10% of the total number of employees of the enterprise;
- (4)total R&D expenses must account for no less than 3 to 5% of the total business income, depending upon the amount of the company’s annual business income;
- (5)R&D expenses accrued within the territory of China must account for no less than 60% of total R&D expenses; and
- (6)business income generated from high- and new-tech products or services must account for no less than 60% of the total income of the enterprise.

The list of High- and New-Tech Fields with Key Support of the State includes the field of ‘*advanced manufacturing and automation*’ and the sub-field of ‘*automobile- and rail-vehicle-related technology*’³⁰⁶⁴. Several subsidiaries of CRRC are HNTes and qualify for the 15% EIT rate³⁰⁶⁵. While the requirements to qualify for the preferential EIT rate for HNTes do not distinguish between domestic companies and FIEs in China, FIEs may face difficulties in complying with the requirement that at least 60% of R&D expenses be accrued within China³⁰⁶⁶.

In addition, R&D expenses incurred by companies in the development of new technologies, products or techniques are subject to a deduction on taxable income³⁰⁶⁷.

20.4.1.7. PREFERENTIAL LOANS

Chinese policy banks – including CDB and EXIM (see Section 6.3.1.3.) – have issued several loans to support the development of China’s railway industry. From 2011 to 2020, CDB lent RMB 1,2 trillion (~EUR 152,2 billion) to China Railway and its predecessors³⁰⁶⁸. CDB provided loans to the railway sector totalling RMB 236,7 billion (~EUR 28,9 billion) in

³⁰⁶⁸ China Development Bank. (2021). *China Development Bank has lent more than 2.6 trillion yuan to support the construction of more than 70,000 kilometres of railways*. https://www.cdb.com.cn/xwzx/khdt/202104/t20210412_8373.html (accessed on 8 June 2023).

2014³⁰⁶⁹, RMB 121,6 billion (~EUR 17,4 billion) in 2015³⁰⁷⁰, RMB 172,5 billion (~EUR 23,5 billion) in 2016³⁰⁷¹ and RMB 147,2 billion (~EUR 19,3 billion) in 2017³⁰⁷². It continued to support the development of the railway industry from 2018 through 2022³⁰⁷³.

For example, in 2020, CDB issued the Work Plan of China Development Bank on Supporting the High-quality Development of the Manufacturing Industry, which established a special loan of RMB 250 billion (~EUR 31,7 billion) to support key areas defined by national industry policies, which include high-speed rail and rail transit equipment³⁰⁷⁴. In a study of 22 global firms with combined revenues of more than 70% of the global rolling stock market in 2020, the OECD found that these companies received approximately USD 5 billion (~EUR 4,4 billion) from grants, tax concessions, and below-market borrowings from 2016 to 2020³⁰⁷⁵. CRRC alone obtained nearly 60% of all below-market borrowings identified by the OECD³⁰⁷⁶.

20.4.1.8. EFFECTS OF STATE SUPPORT MEASURES

While China relied on imports for the initial development of its high-speed rail capabilities, by 2020, the majority of equipment for China's high-speed railways were made by Chinese companies³⁰⁷⁷. A study found that the introduction of high-speed rail technology to China via technology transfers '*leads to a significant growth in patenting activities among firms close to the direct receivers of foreign technologies*' and is '*associated with real economic gains, such as significant growth in total factor productivity and revenue*'³⁰⁷⁸.

The government has provided financial support to Chinese firms to not only build and operate its high-speed rail network but manufacture the equipment supporting these projects³⁰⁷⁹. The Commission estimated in 2019 that CRRC was receiving EUR 450 million per year in subsidies³⁰⁸⁰, and according to an analysis by the Information Technology and Innovation Foundation (‘ITIF’), from 2015 to 2021, CRRC received almost USD 800 million (~EUR 702,5 million) in direct government subsidies³⁰⁸¹. The ITIF also estimates that CRRC’s state-supported debt increased from USD 70 billion (~EUR 56,3 billion) in 2005 to over USD 558 billion (~EUR 493,9 billion) in 2017³⁰⁸².

These and other measures create economies of scale for China’s SOEs that further reduce the ability of other companies to compete. According to the ITIF, ‘CRRC is not only larger than its competitors, but also has the broadest capabilities in the rail market’³⁰⁸³. While CRRC enjoys 70% of the global rolling stock market, the ITIF analysis estimates that CRRC’s market share would be 15 to 40% of this market in the absence of these measures³⁰⁸⁴.

Through direct subsidies, government grants, tax benefits and export credits, China continues to subsidise its industries of strategic importance, including its SOEs³⁰⁸⁵. Firms involved in advanced rail technology receive subsidies and tax incentives to support R&D, enjoy income tax rate reductions and qualify for more tax deductions³⁰⁸⁶.

20.4.2. PUBLIC PROCUREMENT PRACTICES

Opaque and discriminatory procurement procedures hinder foreign firms’ access to China’s massive domestic rail market³⁰⁸⁷ (see also Section 7.1.2).

20.4.3. RESTRICTIONS ON FOREIGN COMPANY ACCESS TO PUBLIC PROCUREMENT

China’s WTO membership imposes certain obligations with respect to non-discrimination despite China’s attestations that the procurement activities of its SOEs are commercial in nature and thus fall outside of this requirement³⁰⁸⁸. Nevertheless, China controls a heavily restricted procurement market that, along with its control of SOEs, funnels work to Chinese companies³⁰⁸⁹.

³⁰⁸⁹ ITIF Heading off track 2021, pp. 24–25.

China's railway industry reflects the discriminatory nature and distortionary effects of the country's public procurement practices. According to the ITIF, to compete for public procurement contracts, foreign firms must get licenses by setting up joint ventures with Chinese companies, yet some tenders prohibit such joint ventures from bidding³⁰⁹⁰. Similarly, firms with local IP are granted more points under procurement criteria³⁰⁹¹.

In 2022, China Railway launched four tenders for the supply of 87 high-speed trains³⁰⁹². None of these bids were won by foreign companies, and only one of these bids was won by an FIE: Alstom Sifang (Qingdao) Transportation Ltd., a joint venture between Alstom and a subsidiary of CRRC³⁰⁹³. In some cases, CRRC started production before the tender was issued and had trains ready for delivery by the time the contract was signed³⁰⁹⁴. In a survey across industries, companies cited myriad licensing requirements and challenges as creating barriers to access to the Chinese market, including IP disclosures, inconsistent interpretation of regulations between central and local regulators, lengthy and indeterminate approval timelines, and de facto licensing restrictions on the number of players permitted in a particular industry³⁰⁹⁵.

The implementation of Made in China 2025 and related policy initiatives may further reduce market access for foreign firms operating in China, as such firms receive unequal treatment relative to the treatment of Chinese companies by other governments³⁰⁹⁶. According to the Commission's Joint Research Centre ('JRC'), from 2015 to 2018, about 30% of all European deals in China related to sectors covered by Made in China 2025, and one of them was related to advanced rail equipment³⁰⁹⁷. While China operated at a trade deficit in rail vehicles from 2008 to 2010, from 2014 to 2016 it operated at a significant trade surplus³⁰⁹⁸. Around the same time, European investors began favouring joint ventures and investing in minority stakes of Chinese companies because of the discriminatory policy and regulatory environment's favouring of Chinese firms³⁰⁹⁹. UNIFE assesses that the 'accessibility rate' of foreign investors to the Chinese rail market fell from an already-low rate of 20% in 2013-2015³¹⁰⁰ to 17% in 2020³¹⁰¹.

While CRRC enjoys the largest share of the global high-speed rail market mainly due to its outsized presence in the Chinese market, other major companies like Alstom, Hitachi, Kawasaki, and Siemens have seen their relative and absolute market shares decrease due to their inability to access the Chinese market³¹⁰². According to ITIF, as EU imports of rail products from China more than doubled from EUR 101 million in 2011 to EUR 212 million in 2017, EU exports of locomotives to China fell from EUR 865 million to EUR 505 million over this same time period³¹⁰³.

20.4.4. STANDARDISATION

Technical standards consist of common product specifications that include basic safety and interoperability requirements for common use³¹⁰⁴. In contrast to Europe and the US, China's standardization approach is state-driven, as even ostensibly private standards-developing organisations rely on state funding and state-support³¹⁰⁵. The economies of scale resulting from the Chinese governmental interventions in its domestic rail market allow for greater standardisation of the production process³¹⁰⁶. This not only helps increase production, but also gives Chinese companies a leg up in winning contracts with China Railway, which tends to include similar requirements in each contract³¹⁰⁷.

China's activities in international standards-setting bodies also impact its domestic market. The 14th Five Years Development Plan for Railway Standardisation's goal of translating more than 95% of international railway standards into Chinese standards by 2025³¹⁰⁸ exceeds the general national target of 85% alignment³¹⁰⁹. This is of concern, as China has been accused of pushing its own domestic standards through international bodies, and then requiring that all companies in its domestic market use international standards as a means to 'cover up unfair domestic protectionism'³¹¹⁰.

20.4.5. OVERCAPACITY

Overseas expansion of the high-speed railway segment has helped reduce domestic overcapacity³¹¹¹. During their rapid expansion, both CRRC and CRCC have faced overcapacity

China Railway

issues³¹¹². Even when the high-speed railway segment itself is not experiencing overcapacity issues³¹¹³, China uses this industry to resolve overcapacity in other industries such as iron and cement manufacturing³¹¹⁴.

China has identified the need to curb overcapacity and has taken steps in recent years to attempt to mitigate this issue. In 2018, NDRC released a circular providing guidance on strengthening the regulation of investments in urban railway transportation and preventing overcapacity³¹¹⁵. Specifically, the circular requires local governments to report their local industries' manufacturing capacities for urban railway locomotives, traction systems, braking systems, and signalling systems to NDRC in order to establish monitoring mechanisms and strengthen guidance to prevent overcapacity³¹¹⁶. Furthermore, the circular directs provincial-level NDRCs to strictly regulate investment in urban railway locomotives, prohibiting regions that utilise less than 80% of such products manufactured from increasing manufacturing, and requiring companies that apply for expansion projects to demonstrate an 80% utilisation rate during the prior two years³¹¹⁷.

A 2018 State Council opinion concluded that several cities had too many urban rail construction projects, thereby imposing financial burdens on local governments³¹¹⁸.

In 2022, Beijing's Fengtai District released a circular regarding the development of rail transportation for the 14th FYP period that mentions overcapacity in the manufacture of urban railway transportation cars and associated raw materials³¹¹⁹.

The Government also ordered CRRC to halt development of maglev production plants “as part of broader orders to stop local governments from building excessive local transit projects that drive up debt and create overcapacity in industrial production”³¹²⁰. One such factory was expected to produce 60 maglev trains a year, far more than the global market could support³¹²¹.

According to a special report published by the National Bureau of Asian Research, the BRI not only serves geopolitical interests but “other contingent, commercial goals, particularly in offshoring surplus investment at home to other geographies [...] to resolve latent issues of overcapacity and debt issues through the export of capital and capacity”³¹²². After China injected “huge sums of capital at home” in the wake of the 2008 global financial crisis, SOEs facing a saturated domestic market were encouraged to search for other markets with the help and support of state-owned banks, leading to increased railway construction abroad, especially in developing countries³¹²³. From 2013 to 2019, CRCC signed 21 rail construction contracts abroad worth USD 19,3 billion (~EUR 15,3 billion), while CREC signed 19 contracts worth USD 12,9 billion (~EUR 10,9 billion)³¹²⁴.

20.5. CHAPTER SUMMARY

China has supported the development of its railway industry, and especially high-speed rail and its components, through a variety of plans, policies and strategies issued by the country's central and local governments. Government policy facilitated the transfer of high-speed rail technology from foreign to Chinese companies while this industry was still nascent in China. In the nearly 20 years since then, China has provided financial support via grants, equity investments, and preferential tax and loan treatment to its essentially state-owned railway industry while shielding domestic companies from international competitors.

Reforming how the industry is structured and regulated has been instrumental in China's development of the sector. The 2015 forced merger of CNR and CSR to form CRRC created a national and, increasingly, global champion in rolling stock manufacturing. In 2013, and again in 2017, China reorganised the supervision of its railway industry to separate regulatory and

inspection duties from operations and to allow China Railway to operate as a modern enterprise. Since then, China Railway has invested in railway infrastructure development, including through its role as government representative of the China Railway Development Fund Co., Ltd.

China Railway also plays a role in government procurement, launching tenders for railway component purchases for the country's rail projects that are inaccessible to foreign companies, and even foreign-Chinese joint ventures have seen their access to public tenders diminish.

The totality of China's interventions in its domestic market have sheltered China's railway SOEs from foreign competition at home and enabled them to significantly undercut their European, Japanese, and US competitors abroad. At the same time, China's projects through the BRI and other initiatives helped push Chinese overcapacity overseas, sometimes through financing arrangements that contributed further indirect distortions on the Chinese domestic market.

21.5.	Chapter summary	654

21.1. INTRODUCTION

Environmental goods and services are those that aim “to prevent, measure, control, limit, minimise or correct environmental damage and resources depletion”³¹²⁵. Environmental goods can be defined as the outputs of environmental activities, i.e. activities that either directly serve an environmental purpose or produce specifically designed products whose use serve an environmental purpose. Thus environmental goods are all goods that directly serve environmental protection (all activities and actions which have as their main purpose the prevention, reduction and elimination of pollution and of any other degradation of the environment) or resource management (activities that include the preservation, maintenance and enhancement of the stock of natural resources and therefore the safeguarding of those resources against depletion) or are specifically designed goods whose use serves for environmental protection or resource management³¹²⁶. As such, they encompass a wide array of components, products, sectors and industries, and developing an internationally agreed upon definition of what falls within or outside the definition of ‘environmental goods’ has proven difficult³¹²⁷. Nevertheless, goods that undisputedly fall within the definition are products and components principally focused on the clean energy transition, such as goods used in the renewable energy sector. Accordingly, this chapter will focus on the environmental goods used in the renewable energy generation sector, specifically goods used to produce solar energy, wind energy and geothermal energy – in particular, solar cells, wind turbines and geothermal (or ‘ground source’) heat pumps (‘GHP’), respectively.

China has explicitly identified the production of environmental goods as important to its economic development objectives. In 2010, the State Council adopted the *Decision of the State Council on Accelerating the Cultivation and Development of Strategic Emerging Industries*, designating certain industries as SEIs that warranted special policy and fiscal attention³¹²⁸. One such industry was the ‘new energy industry’, which includes both the PV and wind power industries³¹²⁹. Accordingly, manufacturers of products in the new energy industry have been eligible to receive various kinds of state support.

³¹²⁵ Eurostat 2009, *The environmental goods and services sector*, p. 19; available at: <https://ec.europa.eu/eurostat/documents/3859598/5910217/KS-RA-09-012-EN.PDF.pdf/01d1733e-46b6-4da8-92e6-766a65d7fd60?t=1414781549000> (accessed on 11 October 2023).

³¹²⁹ *Ibid.*

Now China is responsible for 60% of global wind turbine manufacturing capacity³¹³⁰, over 80% of solar cell manufacturing³¹³¹ and almost 40% of heat pump manufacturing³¹³². These positions are primarily the result of prior Chinese government interventions that have left the global market in these sectors dominated by Chinese firms³¹³³.

21.2. REGULATORY AND POLICY FRAMEWORK

21.2.1. 14TH FIVE YEARS PLAN FOR NATIONAL ECONOMIC AND SOCIAL DEVELOPMENT

In 2016, China promulgated the 13th FYP (see Section 2.2.5), which included the goal of establishing a modern energy system³¹³⁴. The 13th FYP included ambitions around wind and solar power generation and accelerating the development of geothermal energy³¹³⁵.

The 14th FYP – the current centrepiece of China’s industry policy and planning system (see more in Section 2.2.5) – builds upon the 13th FYP in its emphasis on a modern energy system, calling for the promotion of an energy revolution and for building a clean, low carbon, safe and efficient energy system³¹³⁶. The 14th FYP further focuses on expanding the scale of wind and solar power generation, developing offshore wind power and developing and utilising geothermal energy, where permitted by local conditions³¹³⁷. The plan designates energy storage as a cutting-edge sector for which research through ‘national future industrial technology research institutes’ will be conducted³¹³⁸. The plan also proposes the accelerated development of pumped storage power stations and the large-scale implementation of new energy storage technologies³¹³⁹.

³¹³⁵ *Ibid.*

³¹³⁶ See Chapter 11, Section 3 of the 14th FYP for National Economic and Social Development and Long-range Objectives for 2035 of the PRC, National People’s Congress, 2021; available at: http://www.gov.cn/xinwen/2021-03/13/content_5592681.htm (accessed on 24 August 2023).

³¹³⁷ *Ibid.*, Chapter 11, Section 3.

³¹³⁸ *Ibid.*, Chapter 9, Section 2.

³¹³⁹ *Ibid.*, Chapter 11, Section 3.

Made in China 2025 (see Section 4.2.3) addresses also ‘green development’, describing the need to popularise and apply technologies, processes and equipment for energy conservation and environmental protection³¹⁴⁰. Made in China 2025 selects 10 key industries for achieving breakthroughs and for which global leadership or advanced technological development is sought by 2025³¹⁴¹. One such key industry is electrical equipment, under which Made in China 2025 calls for the development of renewable energy equipment and advanced energy storage devices³¹⁴².

The Made in China 2025 Roadmap (see Section 4.2.3) includes as key products renewable energy power generation equipment and intelligent control systems, such as the 5 MW-class wind turbine and advanced solar power generation equipment, including large-scale photothermic power generation. The Made in China 2025 Roadmap also lists ultra-long blades and intelligent control systems of large wind turbines as key parts and components, and lists wind turbine blade design technology for 5 MW and greater, wind turbine intelligent control systems, 10 MW-class superconducting wind turbine technology and overall structure design, efficient solar energy heat collection, heat storage and exchange systems and equipment, intelligent control technology and system integration as key technologies for China to develop³¹⁴³. The Made in China 2025 Roadmap authorises the use of the full suite of taxation and fiscal policy tools and administrative processes to support technological progress and industrialisation of clean and efficient power generation equipment, and to build a major national innovation base for clean and efficient power generation technology³¹⁴⁴.

Furthermore, China promulgated the Industrial Four Bases Catalogue in 2016³¹⁴⁵. For the 10 fields identified by Made in China 2025, the catalogue explained that industrial and manufacturing capacity should be promoted in (1) ‘core basic components’, (2) ‘key basic materials’, (3) ‘advanced basic technology’ and (4) the ‘industrial technology base’. Included within the catalogue are various environmental goods in the new energy sector, such as large-scale composite wind power blades and composite pole towers, anode and cathode materials of water-based batteries for wind- and solar-scale energy storage, ultra-efficient III-V crystal solar cells and thin-film gallium arsenide solar cells³¹⁴⁶. The catalogue was published in part to “guide financial institutions, credit guarantee industries and insurance industries to make full use of various financial means to support research and development”³¹⁴⁷.

21.2.3. PLANS ON RENEWABLE ENERGY DEVELOPMENT

³¹⁴⁰ See Article 2, Section 1 of the *Made in China 2025*, State Council, 2015; available at: http://www.gov.cn/zhengce/content/2015-05/19/content_9784.htm (accessed on 24 August 2023).

³¹⁴⁷ *Ibid.*, Foreword.

21.2.3.1. 13TH FIVE YEARS PLANS

The 13th Five Years Plan for Renewable Energy Development focused directly on the development and efficient utilisation of various forms of renewable energy, including wind power, solar energy and geothermal energy, and it included as one of the main development targets the application of energy storage technologies in the renewable energy sector³¹⁴⁸. It also aimed to accelerate technological innovation related to renewable energy, including by improving technology for product preparation, production processes and the localisation of production equipment for the entire supply chain, while also advancing R&D of key technologies³¹⁴⁹.

The 13th Five Years Plan for Solar Energy Development included goals related to the solar cell industry, such as improving the conversion efficiency of advanced crystalline silicon PV cells to more than 23%, improving the conversion efficiency of thin-film PV cells and the industrial development of several new types of PV cells³¹⁵⁰. The plan “[e]ncourage[d] financial regulators and financial institutions to implement green credit policies that promote the development of clean energy” and “actively promote[d] cooperation between banks and other financial institutions and local governments to establish investment and financing service platforms for photovoltaic power generation projects”³¹⁵¹. Moreover, the plan suggested that state funding, enterprise investment and social capital participation could be used to establish a national photovoltaic industry investment fund to provide funds for innovative businesses.³¹⁵²

In the 13th Five Years Plan for Wind Energy Development, China called for increased performance of wind turbines, achieving breakthroughs in the design and manufacturing of large-capacity (10 MW) wind turbines and key components, and mastering other technologies related to wind turbines, such as intelligent diagnosis and cooperative control technology³¹⁵³. The plan also authorised developing and amending standards related to wind turbines. The plan “[e]ncourage[d] financial institutions to issue green bonds, encourage[d] policy banks to increase support for the wind power industry by means of lower interest rates, and encourage[d] commercial banks to promote project financing models”³¹⁵⁴. The plan also aimed to support offshore wind industrial policy by, in part, “improv[ing] offshore wind power development plans in coastal provinces” and “encourag[ing] coastal provinces (autonomous regions, municipalities) and major development companies to build offshore wind power demonstration projects”³¹⁵⁵.

³¹⁴⁸ See Chapter 4, Sections 2, 3, 5 and 7 of the 13th Five-Year Plan for the Development of Renewable Energy, NDRC, 2016; available at: http://www.nea.gov.cn/135916140_14821175123931n.pdf (accessed on 11 October 2023).

³¹⁵⁴ *Ibid.*, Section 4.3.

³¹⁵⁵ *Ibid.*, Section 4.4.

The 13th Five Years Plan for Geothermal Energy Development was the first national-level plan focused on the geothermal industry³¹⁵⁶. The plan highlighted the increasingly important role of the geothermal energy industry for the clean energy transition, and it established the goal of achieving breakthroughs in heat pump technology³¹⁵⁷. The plan promoted the development of investment support policies, the provision of policy support in the form of land and sea use provisions and electricity price support and increased investment in R&D³¹⁵⁸.

Independent analyses of China's renewable energy commitments during the 13th FYP period indicate that China has seen success in achieving its ambitions, at least at a high level. By 2020 – the end of the 13th FYP period – China had 530 GW of installed solar and wind capacity, vastly exceeding the goal of 320 GW³¹⁵⁹. Moreover, China surpassed its target for the non-fossil fuel share of energy consumption, reaching 16% by 2020, slightly ahead of the goal of 15%³¹⁶⁰.

21.2.3.2. 14TH FIVE YEARS PLAN ON RENEWABLE ENERGY DEVELOPMENT

The 14th Five Years Plan on Renewable Energy Development describes the support that the government will provide to promote the development of renewable energy, such as land and sea use planning to develop and utilise renewable energy; increasing the collection of renewable energy development funds; improving support policies for renewable energy such as deep-sea wind power, biomass energy and geothermal energy; incorporating the financing of renewable energy projects into local governments' incentive plans, such as through low-interest rate financing; and establishing a financial support mechanism to support distributed renewable energy³¹⁶¹.

The 14th Five Years Plan on Renewable Energy Development is predicated upon the expectation that global energy consumption will transition to a low- or zero-carbon future, and as such, renewable energy will gradually become the main energy source for supporting economic and social development³¹⁶². Accordingly, during the period covered by the 14th FYP, China's renewable energy sectors should enter a new stage of 'high-quality leapfrog development'³¹⁶³.

³¹⁶² *Ibid.*, Article 1.2.

³¹⁶³ *Ibid.*, Article 1.2.

By the end of 2030, China's goal is that the total installed capacity for wind and solar power will exceed 1.2 billion KW³¹⁶⁴.

The 14th Five Years Plan on Renewable Energy Development ('14th Renewable Energy FYP') addresses multiple areas of development for the renewable energy sector. It promotes the development of solar cell technologies³¹⁶⁵, improvements to wind turbine technology, upgrades to existing wind turbines and an emphasis on the R&D of large offshore wind turbines and high-altitude and high-power wind turbines, as well as achieving breakthroughs in large-capacity wind turbines³¹⁶⁶, as well as calls for the active utilisation of GHPs for heating and cooling services³¹⁶⁷.

In regions with ample wind and solar energy sources and with the conditions necessary for sustainable large-scale development, China aims to improve the capacity of local renewable energy consumption and transmission. China focuses on building new energy generation sites in XUAR, the upper reaches of the Yellow River, the Hexi Corridor, the Yellow River Jiziwan, northern Hebei Province, the Songliao region and the lower reaches of the Yellow River. Moreover, the 14th Renewable Energy FYP sets the goal of building five offshore wind power bases in the Shandong Peninsula, the Yangtze River Delta, southern Fujian, eastern Guangdong and the Beibu Gulf³¹⁶⁸.

In addition to emphasising the development of wind and solar power generation bases, the 14th Renewable Energy FYP also promotes the deployment of distributed wind and solar energy – i.e., smaller-scale wind and solar generation sites located near where the energy will be consumed³¹⁶⁹ – in industrial parks, economic development zones and oil, gas and mining and their surrounding areas. The plan also focuses on the promotion and application of low-wind speed wind power technology, the promotion of local and nearby development of wind power in central, southeast and eastern China according to local conditions and the development of wind power capacity in rural areas. With solar generation, the plan references a focus on promoting the development and utilisation of rooftop solar panels in industrial parks, economic development zones and public buildings; the development of building-integrated PV power generation in new factories and public buildings and the implementation of the comprehensive utilisation of 'Photovoltaic +' such as through integrating the development of solar power generation with information technology industries, including 5G base stations and big data centres, and the application of solar power in new energy vehicle charging, facilities along railway lines, expressway service areas and other transportation fields³¹⁷⁰.

³¹⁷⁰ See Article 3.2. of the *14th Five-Year Plan on Renewable Energy Development*, NDRC, NEA, MOF, the MLR, MEE, Ministry of Housing and Urban-Rural Development, Ministry of Agriculture and Rural

The 14th Renewable Energy FYP promotes the use of medium and deep geothermal energy to provide heating in the northern regions of China, and to explore the application of medium and deep geothermal energy refrigeration technology on the south-eastern coast of China. The plan also encourages the development of soil source heat pumps, recycled water source heat pumps and surface water source heat pumps. It aims to expand the scale of development and utilisation of shallow geothermal energy. Moreover, the plan calls for promoting the development of high-temperature geothermal power generation in regions such as Tibet, Qinghai and Sichuan, supporting the demonstration of advanced technologies such as hot dry rock and enhanced geothermal power generation and promoting medium and low temperature geothermal power generation in areas rich in medium and low temperature geothermal resources, such as the eastern and central regions of China³¹⁷¹.

21.2.4. 14TH FIVE YEARS PLAN FOR A MODERN ENERGY SYSTEM

During the 13th FYP period, China sought to modernise its energy system and continued to pursue that ambition during the 14th FYP period. The 14th Five Years Plan for a Modern Energy System ('14th Modern Energy FYP') describes expediting the green and low-carbon transformation of energy as a key aspect of developing a modern energy system³¹⁷² and references expanding the clean energy industry, implementing the renewable energy transition, promoting the construction of a new electricity power system and gradually increasing the proportion of new energy in China's energy sector. According to the plan, China can then reach its carbon peak and achieve carbon neutrality in a 'scientific and orderly' manner while continuously improving its green development³¹⁷³.

Accelerating large-scale and high-quality wind and solar power generation development is one way China plans to realise its green and low-carbon energy transformation goals³¹⁷⁴. Doing so, according to the plan, requires developing both centralised and distributed wind and solar power generation capabilities³¹⁷⁵. Additionally, the plan identifies geothermal resources as another way to realise the green and low-carbon energy transformation and actively promotes using geothermal power to provide heating and cooling where viable³¹⁷⁶.

The 14th Modern Energy FYP explains the various fiscal, taxation and financial support measures that should be put in place to implement these goals, and mention, in particular, 'preferential tax policies', 'increase[d] support for renewable energy, energy conservation and carbon reduction' and the development of a 'green financial system'.³¹⁷⁷

³¹⁷⁶ *Ibid.*

³¹⁷⁷ *Ibid.*, Chapter 7.

21.2.5. 14TH FIVE YEARS PLAN FOR NEW ENERGY STORAGE DEVELOPMENT

China emphasizes that new energy storage is important for building a modern electrical power system and achieving its carbon peak and carbon neutrality goals, an ambition embodied in its *14th Five Years Plan for New Energy Storage Development*³¹⁷⁸. By the end of 2025, China aims to have new energy storage capacity for large-scale commercial applications, and by the end of 2030, new energy storage should be ‘fully market oriented’, with technological innovation allowing China to be a world leader in new energy storage³¹⁷⁹.

The 14th Five Years Plan for New Energy Storage Development promotes R&D of new energy system technologies, the development of joint industry-academic research programs, industrialising new energy storage systems, developing large-scale new energy systems, increasing the speed at which these systems can be brought to market, providing necessary ‘policy guarantees’ and improving the management of new energy storage systems³¹⁸⁰. On R&D related to key technologies and equipment, the plan mentions conducting research on key technologies and equipment for sodium-ion batteries, new lithium-ion batteries, lead-carbon batteries, liquid flow batteries, compressed air, hydrogen (ammonia) energy storage and thermal (cold) energy storage; conducting research on energy storage technologies such as superconducting and supercapacitors and conducting research on new generation high-energy density storage technologies such as liquid metal batteries, solid-state lithium-ion batteries and metal-air batteries³¹⁸¹. The plan also calls for achieving breakthroughs in safety technology and smart-control technology related to new energy storage³¹⁸².

On policy support, the plan directs localities to increase their support for large-scale energy storage projects, including by using existing funds to support the industrialisation and application of new energy storage technology, and by supporting the energy storage development fund to integrate new energy storage into the green energy financial system³¹⁸³.

21.2.6. OTHER STRATEGIES AND PLANS

21.2.6.1. NATIONAL STRATEGIES AND PLANS

The Strategy for the Revolution in Energy Production and Consumption (2016-2030) calls for the aggressive development of wind and solar energy and the utilisation of geothermal energy in cities and regions where conditions permit³¹⁸⁴. This strategy also instructs government agencies to promote the acceleration of technological R&D and the production of equipment for large-scale land and offshore wind power. For efficiently generating solar power, the strategy focuses on R&D related to solar cell materials, PV conversion technology, smart PV

³¹⁸⁴ NDRC and NEA, *Strategy for the Revolution in Energy Production and Consumption (2016-2030)*, 2016, Chapter 5, Section 2; available at: <http://www.gov.cn/xinwen/2017-04/25/5230568/files/286514af354e41578c57ca38d5c4935b.pdf> (accessed on 24 August 2023).

power stations and wind-PV-water complementary power generation technology. The strategy also prioritises the development of energy storage technology.

In 2023, MIIT, Ministry of Education, MOST, PBOC, CBIRC and Energy Bureau issued the Guiding Opinions on Promoting the Development of the Energy Electronics Industry³¹⁸⁵ that explicitly proposes developing efficient solar products and technologies. The Guiding Opinions encourage R&D spending and breakthroughs in various PV technologies, including smart PVs, high efficiency and low-cost crystalline silicon cells, N-type high-efficiency cells and flexible thin-film cells, among others³¹⁸⁶. On policy support, the Guiding Opinions direct the “*full use of relevant central and local channels to implement relevant preferential policies and measures*”³¹⁸⁷. Moreover, firms in the industry should be identified for special policy treatment (e.g., as a ‘little giant’ enterprise for small- and medium-enterprises). The Guiding Opinions promote the “*use [of] credit, bonds, funds, insurance and other financial instruments to increase support for the supply chain of the energy and electronics industry*”³¹⁸⁸.

In 2022, China promulgated the 14th FYP on the Development of Energy Efficient Buildings and Green Construction³¹⁸⁹. The ambitions of the plan include that by the end of 2025, the installed capacity of solar power in new buildings across China will reach more than 50 million KW, the application area of buildings with geothermal energy will exceed 100 million square metres and the replacement rate of renewable energy in urban buildings will reach 8%³¹⁹⁰. The plan seeks to promote the use of solar energy in buildings by coordinating the use of solar PV and solar thermal systems based on the resources available³¹⁹¹. It also calls for promoting the application of geothermal energy (including through GHP technology and other geothermal technologies), air heat energy and biomass energy, among others, to meet the various energy demands of buildings³¹⁹². The plan directs policy support for energy-saving renovations of existing structures, renewable energy application and green farmhouses. The plan also encourages the development of green finance, credit and insurance support, improved government procurement standards for green building materials and carbon emission trading for larger buildings³¹⁹³.

Promotion of power generation and the comprehensive utilisation of technologies for advanced renewable energy is one of the five key tasks listed in the 14th FYP on Technological Innovation

in the Energy Sector³¹⁹⁴. The plan includes the development of new high-efficiency and low-cost wind power technology, technology for the recycling and reuse of decommissioned wind turbines, high-powered medium-voltage DC PV power generation systems and high-powered DC boost converters, high-efficiency perovskite battery production, high-efficiency and low-cost PV cell technology, technology for the recycling and reuse of PV modules, solar thermal power generation and utilisation technology and geothermal energy technology³¹⁹⁵.

21.2.6.2. SUB-NATIONAL PLANS

On the subnational level, Shanxi issued in August 2022 the Guiding Opinions on Fully Promoting the High-quality Development of Geothermal Energy Industry, which included the promotion of GHP technologies to achieve the goal of realizing low-cost heating and cooling in residential buildings in rural regions and encouraged the adoption of heat pump technologies in mines³¹⁹⁶. Policy support measures include the provision of land, tax relief, reduced benchmark prices for the transfer of geothermal mining rights and R&D subsidies, among others³¹⁹⁷.

Hunan's 14th Five Years Plan on Renewable Energy lists the development of wind power, solar power and geothermal power as key tasks during the plan's lifespan. By the end of 2025, Hunan aims to achieve total installed wind turbine power generation capacity of over 12 million KW, and total installed solar PV power generation capacity of over 13 million KW. The plan also calls for promoting the centralised supply of geothermal energy³¹⁹⁸. In furtherance of these ambitions, the plan directs certain cities and prefectures to provide incentives and guidance to promote the accelerated development of renewable energy³¹⁹⁹.

Qinghai's 14th FYP on Energy Development sets the goal of generating 45.8 million KW of solar PV power and 16.5 million KW of wind power by 2025, adding 30 million KW of solar PV power and 8.07 million KW of wind power over 2020 capacity levels³²⁰⁰. The plan promotes the large-scale development of bases for solar PV and wind power generation, distributing new energy generation capabilities throughout the province, strengthening clean power transmission across provinces, developing projects that integrate energy from multiple sources and regulating capacity from multiple complementary energy sources³²⁰¹. To achieve these goals,

³²⁰¹ *Ibid.*

the plan notes that “[f]inancial and taxation support will be increased, and relevant tax preferential policies will be implemented for qualified clean energy projects”, and that financial institutions should provide credit, bonds, and insurance to green projects that support clean energy development³²⁰². The plan will also provide “construction land plan guarantees” to projects “included in the list of national and provincial key projects”³²⁰³.

For wind power, Shandong’s 14th FYP on Energy Development focuses on offshore capacity, aiming to building a 10 million KW offshore wind power base that focuses on three major geographies – Bozhong, southern peninsula and northern peninsula – and sets the goal that by the end of 2025, the installed capacity of wind power turbines in Shandong Province will reach 25 million KW. For solar PV power generation, the plan aims to have by the end of 2025 installed PV power generation capacity of 57 million KW. The plan also discusses other forms of clean energy, including geothermal energy³²⁰⁴. Policy incentives include land and sea use provisions, encouraging policy banks to support major energy project construction, credit for green projects and tax preferences for emission reduction and energy conservation³²⁰⁵.

In May 2021, the Zhejiang Provincial Development and Reform Commission issued the 14th FYP on Renewable Energy Development³²⁰⁶, pursuant to which Zhejiang encourages companies to pursue technological transformation and upgrade wind turbines with a capacity of less than 1.5 MW per turbine. The plan also calls for the vigorous development of wind and solar power and the development of biomass energy, geothermal energy and ocean energy depending on local conditions. The plan aims for installed capacity that exceeds 27.5 KW for solar power and 6.4 million KW for wind power turbines in the province by the end of the 14th FYP period. The plan promotes the deeper implementation of various preferential policies for renewable energy, including tax, land and lending policies³²⁰⁷.

21.3. KEY CHINESE ENVIRONMENTAL GOODS INDUSTRIES

21.3.1. SOLAR CELL INDUSTRY

The solar cell value chain can be categorised into three main segments³²⁰⁸. The first segment consists of upstream raw materials and equipment for solar cells, including silica; silicon wafers; silver or aluminium paste; copper, indium and selenium; gallium arsenide (‘GaAs’) and cadmium telluride (‘CdTe’); polymer compounds; plasma-enhanced chemical vapour deposition (‘PECVD’); automatic sorting machines and fast sintering furnaces; screen printing

³²⁰⁸ *Analysis of Upstream, Midstream, and Downstream Sectors of Value Chain of the Solar Cell Industry in China in 2022*, ASKCI, 16 August 2022; available at: <https://www.askci.com/news/chanye/20220816/1722431958188.shtml> (accessed on 24 August 2023).

equipment and etching machines. The second segment consists of solar cells, including crystalline silicon PV cells; monocrystalline silicon PV cells; polycrystalline silicon PV cells; thin film PV cells; silicon-based thin-film PV cells; copper, indium, gallium, and selenium-based thin film PV cells and CdTe-based thin film PV cells. The third segment consists of downstream sectors, including PV modules, crystalline PV modules and thin-film PV modules. These modules are then incorporated into PV power stations, PV heating, building-integrated PV systems and PV transportation.

Like in many strategic industry sectors, many Chinese solar cell companies are closely connected to the government. For example, *Shanghai Academy of Spaceflight Technology*³²⁰⁹ – a division of *China Aerospace and Technology Corporation*, the state-owned military and defence company – is the major shareholder and actual controller³²¹⁰ of *Shanghai Aerospace Automobile Electromechanical Co, Ltd* ('HT-SAAE')³²¹¹, a company mainly engaged in the integration of polysilicon, solar cells, battery packs and new 'PV + energy storage' systems as well as other products and technologies in the civil-military integration field³²¹². Furthermore, it is worth noting that 83% of China's large-scale grid-connected solar power plants were SOEs as of 2020³²¹³, thus it may potentially influence the whole manufacturing industry chain.

China has achieved a dominant position in the solar industry across the supply chain, including in solar cells. The IEA reported that from 2010 to 2021 China became dominant in the global supply of wafer, cell and module manufacturing while China's share of global polysilicon production capacity almost tripled during this period³²¹⁴. IEA estimated that China's global share in all stages of PV power manufacturing exceeded 80%, more than double of its 36% share in global PV deployment³²¹⁵. China accounts for the vast majority of announced manufacturing capacity expansion plans for solar PV components through 2030, including 85% for solar cells and 90% for wafers³²¹⁶.

China is also the largest exporter of solar cells, exporting 3.201 billion solar cells for a total value of USD 28.46 billion (~EUR 24.06 billion) in 2021. In quantity, the 2021 figures reflected a 17.56% increase over 2020 export levels, while the value of solar cell exports increased 43.79% over the previous year³²¹⁷. From January to October 2022, China increased its exports of solar cells by 24.06% over the same period in 2021, exporting a total 3.294 billion solar cells over that period; this represented an increase in total export value of 75.58% to USD 40.033 billion (~EUR 37.915 billion)³²¹⁸. These increases mirror an increase in Chinese exports of PV products overall: in 2018, the value of Chinese exports of PV products was USD 15 billion (~EUR 12.7 billion), which increased to USD 21 billion (~EUR 18.8 billion) in 2019, to USD 22 billion (~EUR 19.3 billion) in 2020, before increasing again to USD 32 billion (~EUR 27.1 billion) in 2021 and growing 64% to USD 52 billion (~EUR 49.4 billion) in 2022³²¹⁹.

21.3.2. WIND TURBINE INDUSTRY

The wind industry value chain consists of five main segments: raw materials (rare earth metals, steel and copper wire), components (blades, towers and blade bearings), wind turbines (turbines that either have a horizontal axis or a vertical axis), wind farms and grids³²²⁰.

The actual controller of several large wind turbine companies in China – including Zhejiang Windey Co, Ltd (*‘Windey’*)³²²¹, CRRC Shandong Co Ltd (*‘CRRC Shandong’*)³²²², China State Shipbuilding Corporation (*‘CSSC’*)³²²³, Shanghai Electric Wind Power Group (*‘Electric Wind Power’*)³²²⁴, Dongfang Electric Corporation (*‘Dongfang Electric’*)³²²⁵ and Guodian United Power Technology Co, Ltd (*‘United Power’*)³²²⁶ – is the SASAC or its local counterparts, or

the State Council itself. Windey, CRRC Shandong, CSSC, Electric Wind Power, Dongfang Electric and United Power collectively have 38.5% market share in China³²²⁷.

China occupies a major share of the global wind turbine market. In component manufacturing, China accounts for 60% of global capacity and almost half of exports, with most destined for Europe and other countries in Asia³²²⁸. Further, China accounts for the vast majority of announced manufacturing capacity expansion for onshore wind turbine components through 2030, including 85% for turbine blades and 90% for nacelles and towers³²²⁹.

In 2021, the top 15 manufacturers globally accounted for almost 90% of the wind turbine capacity deployed, and more than 55% of them were Chinese companies³²³⁰. In its 2023 European Wind Power Action Plan, the Commission also noted that out of the world's 10 largest wind turbine manufacturing companies (covering over 80% of demand for wind turbines globally), 4 have their headquarters in the EU, while 4 are located in China³²³¹. According to BloombergNEF, China added 49 GW of new wind capacity in 2022, which amounted to more than half of the wind capacity additions globally that year³²³². Accordingly, BloombergNEF listed six Chinese firms in its list of the 10 wind turbine manufacturers with the largest added installed capacity in 2022³²³³. Xinjiang Goldwind Science & Technology Co, Ltd ('Goldwind') – a Chinese wind turbine manufacturer – was the largest manufacturer globally by GW of commissioned wind capacity. Other Chinese companies in the top 10 included Envision Energy, Ming Yang Wind Power Group ('Mingyang'), Windey, Sany Heavy Industry Co Ltd and CRRC³²³⁴.

It should be further mentioned that in its past TDI investigations concerning the wind energy industry, the Commission established the presence of significant distortions in the sector, such as concerning wind towers³²³⁵ or glass fibre fabrics³²³⁶.

21.3.3. GEOTHERMAL HEAT PUMP INDUSTRY

³²²⁷ CWEA 2023, *Statistics Report on Wind Installed Capacity in 2022 in China*, available at : <http://www.eastwp.net/news/show.php?itemid=68198> (accessed on 28 August 2023).

³²³⁵ See the Commission Implementing Regulation (EU) 2021/2239 of 15 December 2021 imposing a definitive anti-dumping duty on imports of certain utility scale steel wind towers originating in the People's Republic of China, *OJ L 450*, 16.12.2021, p. 59–136, rec. 52-135.

³²³⁶ See the Commission Implementing Regulation (EU) 2020/492 of 1 April 2020 imposing definitive anti-dumping duties on imports of certain woven and/or stitched glass fibre fabrics originating in the People's Republic of China and Egypt, *OJ L 108*, 6.4.2020, p. 1–91, rec. 98-167.

GHPs use the more consistent temperature below the earth's surface to heat or cool a space or to heat water³²³⁷. Other types of heat pumps include air-source and water-source heat pumps³²³⁸. The value chain includes heat pump components, such as fans, pumps, tanks, expansion valves, heat exchanges and compressors; the manufacturing of the heat pumps themselves and the application of the heat pumps in various settings to provide climate control³²³⁹.

The GHP industry engages SOEs in manufacturing. For example, SASAC is the actual controller of both Tsinghua Tongfang Artificial Environment Co, Ltd³²⁴⁰ and Beijing Yongyuan Heat Pump Co, Ltd³²⁴¹. China's share of the global geothermal market has grown significantly since the 1990s. In 1995, China accounted for only a 0.04% share of installed GHP capacity³²⁴², but by 2015, it held a 23.61% share³²⁴³. By 2020, China's share of global installed GHP capacity reached 34.11%, the largest share of any country³²⁴⁴. Although heat pump manufacturing is often done in the market it serves, China is unique as an exporter of a large amount of heat pumps³²⁴⁵. China is a net exporter of heat pumps, generally, and accounted for almost 40% of the manufacturing capacity for mass-manufactured heat pump technologies and components in 2021³²⁴⁶. Relative to other types of heat pump products in China, the scale of GHPs is relatively small, with the size of the GHP market at only CNY 1.3 billion (~EUR 170.4 million) – 6.2% of the overall heat pump market – in 2021³²⁴⁷.

It is important to note that China’s horizontal market distortive policies discussed in other sections in this report – such as the special privileges afforded to SOEs (see Chapter 5) – apply equally to the environmental goods.

21.4.1. PUBLIC PROCUREMENT AND PURCHASING

China’s *Government Procurement Law* specifically includes a preference for domestic content over foreign content when possible and subject to few exceptions³²⁴⁸ (see more in Chapter 7). China has historically provided traditional domestic preferences to the renewable energy sector. Moreover, with a near-100% share in the domestic market for these industries, Chinese manufacturers are well-positioned to take advantage of the domestic demand generated by feed-in tariffs (*FITs*) and competitive auction policies, which can, in turn, insulate the industry from varying demand dynamics outside of China³²⁴⁹. Although not considered public procurement in the traditional sense³²⁵⁰, these government purchases function similarly, with the government purchasing the output of these industries.

21.4.2. GRANTS AND OTHER SUBSIDIES

China has used grant and subsidy schemes to foster its domestic solar industry. As the IEA noted, China’s solar industry policies focused less on promoting domestic demand but rather focused on generating supply in response to “*the considerable export opportunities*”³²⁵¹. Accordingly, China provided “[g]rants, low-cost loans from state banks and funds from the Science and Technology Ministry”, which “*led to the establishment of several pioneering domestic manufacturers*”³²⁵².

21.4.3. TAX RELIEF

China’s main tax on businesses is the EIT, for which HNTes have received a preferential rate of 15% – 10 points lower than the typical 25% – since 2008³²⁵³. Businesses in the renewable energy industry – including companies in the solar, wind and geothermal energy industries –

can qualify for the HNTE preferred rate³²⁵⁴. Chinese law sets out certain conditions that eligible businesses must meet to qualify as HNTEs, which include that no more than 40% of R&D expenses are incurred outside of China³²⁵⁵. Moreover, the HNTE must own the intellectual property of the critical technologies for its products or services, which it can acquire through its own R&D or through transfer, donation or M&A³²⁵⁶.

21.4.4. PREFERRED ACCESS TO CREDIT

The solar and wind industries' status as a strategic emerging industry and a high-technology sector meant that they could access lines of credit at preferred rates for expanding manufacturing capacity³²⁵⁷. In 2021, pursuant to guiding opinions of the CCP and the State Council³²⁵⁸, the CDB established a special loan programme for '*carbon peaking and carbon neutrality*', which would provide CNY 100 billion (~EUR 13.1 billion) in 2021 and CNY 500 billion (~EUR 65.6 billion) over the lifespan of the 14th FYP, which was made available to solar power generation projects³²⁵⁹. Moreover, the *Action Plan for Carbon Peaking Before 2030* released by the State Council in 2021 directed "*financial institutions to provide long-term and low-cost funds for green and low-carbon projects and encourage[d] development policy financial institutions to provide long-term and stable financing support for carbon peaking actions in accordance with the principle of market-oriented rule of law*"³²⁶⁰. In 2021, the PBOC announced it would provide preferential access to loan and credit support to the wind and solar industries to counteract production and operations difficulties stemming from tight cash

flows³²⁶¹, suggesting that the government is ready to intervene to assist the renewable energy industries, when needed.

21.4.5. EXPORT FINANCING

Historically, China's two major policy banks – CDB and EXIM – have been the dominant players in energy financing, providing the same amount in loans as all Western development banks combined³²⁶². China's export financing in the renewable energy sector was a minor share of its overall financing of global energy projects³²⁶³. China's policy banks offered minimal financing for renewable energy projects abroad³²⁶⁴. In September 2021, President Xi Jinping announced that China would no longer build coal-powered projects abroad³²⁶⁵, thus, an uptick in future overseas financing of renewable energy projects remains possible. Moreover, the 14th FYP specifically promotes the “vigorous [...] develop[ment of] green finance”³²⁶⁶.

China's BRI is increasingly prioritising infrastructure investments in renewable energy following President Xi Jinping's September 2021 announcement. In August 2023, Reuters reported – based upon a report from Fudan University's Green Finance and Development Centre – that 56% of China's construction and investment in the energy sector under BRI was in renewable energy projects³²⁶⁷. Included among these projects were solar and wind projects³²⁶⁸.

21.4.6. USE OF FORCED LABOUR

Manufacturers sourcing polysilicon made with forced labour obtain cost advantages over those manufacturers who procure polysilicon from ethical sources³²⁶⁹ (see also Section 13.9.).

According to researchers at Sheffield Hallam University, approximately 45% of the global supply of polysilicon – an input found in approximately 95% of solar modules – is sourced from XUAR, 11 companies in XUAR engaged in forced labour, and 4 other companies were situated within industrial parks that had ‘accepted labour transfers’ from other provinces³²⁷⁰.

China’s largest wind turbine manufacturer, Goldwind is also based in XUAR and is linked to the Xinjiang Production and Construction Corps, which the EU and the US have sanctioned for human rights violations³²⁷¹. In December 2022, a report by the UK-based Hong Kong Watch listed Goldwind as a firm that has likely engaged in forced labour in XUAR³²⁷².

21.5. CHAPTER SUMMARY

Solar cells, wind turbines, and GHPs are all environmental goods that play major roles in the transition to more renewable sources of energy. Chinese firms manufacturing these goods have become dominant players in their respective global markets. These positions of dominance reflect a decades-long focus by China on using state support to foster domestic manufacturing capabilities. Moreover, these industries continue to benefit from the distortionary policies that apply horizontally across the Chinese economy. In all three mentioned sectors, China has the largest manufacturing capacity and is likely to continue its growth based on current projections³²⁷³. Certain forms of support – such as access to the HNTE reduction on EIT and the use of forced labour in the production of needed components – continue to provide Chinese firms with market distortive advantages over their international competitors. Accordingly, the global markets for these environmental goods are distorted by the lingering effects of China’s subsidies specific to these industries, the impact of horizontal subsidies across the Chinese economy and the ongoing use of specific forms of state support.

22.1. INTRODUCTION

The current automotive landscape is comprised of six types of powertrains. Three have an internal combustion engine as the primary source of propulsion: (i) internal combustion engine vehicles (*ICEs*), (ii) hybrid electric vehicles (*HEVs*)³²⁷⁴, and (iii) plug-in hybrid electric vehicle (*PHEVs*)³²⁷⁵. Three others have electric motors as the primary mover: (iv) battery electric vehicle (*BEVs*)³²⁷⁶, (v) range extended electric vehicle (*REEVs*)³²⁷⁷, and (vi) fuel cell electric vehicle (*FCEVs*), also called hydrogen electric vehicles (*H₂EVs*)³²⁷⁸.

The global automotive market is going through a profound structural change in the coming years because of the phasing out of ICEs in favour of the other propulsion systems, in particular in the EU, the USA and China.

³²⁷⁴ HEVs have an internal combustion engine and an electric motor that assists only at low speeds. The battery cannot be charged from off-board sources, but it is charged either by the internal combustion engine or through recuperation when braking.

³²⁷⁵ PHEVs have both an internal combustion engine and an electric motor as source of propulsion and can be charged from an external charging point.

³²⁷⁶ BEVs use only electric motors as a source of propulsion and store energy in the battery. The battery can only be charged from the grid while stationary.

³²⁷⁷ REEVs are BEVs that run on electricity but include an auxiliary power unit known as a ‘range extender’.

³²⁷⁸ FCEVs or H₂EVs use electric motors. The electricity is generated in fuel cells and can be stored in a small buffer battery. FCEVs or H₂EVs require hydrogen (compressed into tanks) as fuel.

The products concerned by this chapter are new energy vehicles ('NEVs'), a definition developed in China which include (iii) PHEVs, (iv) BEVs, (v) REEVs and (vi) FCEVs or H₂EVs³²⁷⁹.

On the contrary, ICEs are not included because they are motored by the traditional propulsion system. Not even HEVs are included because, in addition to being motored primarily by an internal combustion engine, their electric motor cannot be charged from off-board sources and are therefore unconcerned with most of the issues and needs related to the spread of the electric mobility, like the range limit and the deployment of the charging infrastructure.

The products concerned by this chapter are NEVs of all types and segments. Therefore, this chapter deals not only with passenger cars (including small vans for passengers), but also light commercial vehicles and heavy-duty vehicles, like buses and heavy-duty trucks.

NEV powertrains involve considerably fewer components (around 200) and less labour compared to ICEs' powertrains (around 1 400 components). However, NEVs require more raw materials compared to ICEs. In particular, the most important and expensive cost item in the production of the NEVs is the electric battery. While the weight of the battery in the production cost of a NEV depends on the type of NEV, it generally represents around one third of the production cost³²⁸⁰, reaching 40% of the production cost of BEVs³²⁸¹. In turn, China has an abundance of essential raw materials used in batteries or easy access to them through other Asian or African countries. Thus, China can use these materials – including lithium, cobalt and nickel – for the production of batteries. Due to their impact on the cost of NEVs, this chapter takes into consideration also Chinese policies regarding batteries for NEVs.

22.2. THE CHINESE NEV AND BATTERY INDUSTRIES

In the past, China did not have the capability to develop the technology for the production of ICEs. From the 1980s, growing demand in China for ICEs was fulfilled at first by imports, mainly from Japan, and then through joint ventures with overseas manufacturers. Whilst this allowed a certain degree of technology transfer into China, the Chinese automobile industry still had no ICE-based intellectual property rights it could exploit, or the access to the global supply chains that underpinned the success of Japanese, Korean, European and US automotive manufacturers.

Due to the lack of access to the ICE technology and to the drivers for its development, China decided to instead focus on the entry into the NEV market in advance compared to foreign automakers and to bet on its major development in the following decades. As described in Section 22.3, already in 2005, the Government started to direct this strategic shift to turn the country's automotive industry into a global powerhouse for the development of NEVs.

22.2.1. PRODUCTION

³²⁷⁹ According to Section 1 of the NEV Plan 2012-2020, as defined below in Section 22.3.4.

³²⁸⁰ International Center for Trade and Sustainable Development ('ICTSD') (2017), *International Trade Governance and Sustainable Transports: The Expansion of Electric Vehicles*, Geneva, ICTSD.

³²⁸¹ See at: <https://www.fleetnews.co.uk/electric-fleet/costs-and-incentives/tackling-the-rising-cost-of-electric-vehicle-batteries> (accessed on 12 June 2023).

At least since 2015, China has been the largest producer of NEVs in the world³²⁸².

In 2020, 1 366 000 NEVs were produced in China and in 2021 this figure increased to 3 545 000 NEVs. In 2022, China produced 7 058 000 NEVs, representing an increase of 99% as compared to 2021³²⁸³. In the first half of 2023, China produced 3 788 000 NEVs³²⁸⁴.

Broadening the view to the sales of NEVs, in 2015, Chinese brands accounted for 35% of global NEV sales³²⁸⁵. In 2022, this share increased to 45%³²⁸⁶. However, when considering the sales of NEVs in China, irrespective of whether made by Chinese brands or by foreign brands established in China, the share of the Chinese market increased even more: in 2022 the Chinese market accounted for around 60% of the global NEV market³²⁸⁷, with 6.9 million NEVs sold in China³²⁸⁸, compared to 2.6 million NEVs in the EU and less than 1 million in the USA³²⁸⁹. In the first half of 2023, sales of NEVs in China reached 3.8 million units³²⁹⁰. This share is in stark contrast with the 15% share of the global market that Chinese carmakers hold when considering the sales of both NEVs and ICEs in the passenger car segment.

With respect to the production of batteries, in 2022 China achieved a production of 545.9 GWh³²⁹¹. 1 GWh of batteries can be installed on at least 13 000 NEVs³²⁹². Chinese producers were responsible for 56% of the sales in the global market of batteries for NEVs in 2022³²⁹³.

22.2.2. MANUFACTURERS

There are around 300 NEV producers in China³²⁹⁴. This figure is subject to fluctuation for two reasons. First, the NEV market relies on innovative technologies and is therefore still dynamic. Indeed, NEV manufacturers in China include both (i) subsidiaries or JVs with local manufacturers of US, EU and Japanese brands, and (ii) Chinese brands, which are, in turn, either (a) self-standing companies, or (b) specialised business units of wider groups. While the subsidiaries or JVs of foreign manufacturers, once set up, tend to have a continuous production, Chinese brands include, besides established traditional automakers, also short-lived start-ups and industrial experiments of wider groups attracted by the innovative market, which may stop

production soon after their inception. Second, the Government is engaged in an effort of consolidation of the NEV market, encouraging NEV producers to merge, thus reducing their number, in order to create larger NEV producers³²⁹⁵. For this reason, there is not a complete list of NEV producers in China. This section includes below an overview of the main NEV producers.

Amongst the main NEV producers, in 2022, the top selling NEV producer in the world was the Chinese brand BYD Auto Co., Ltd. (*‘BYD’*), with a market share of 18% of the global NEV market. It was followed by Tesla, a US producer with NEV production also in China, with a 13% market share in the global NEV market. Down the ranking, in fourth place, the Chinese brand Zhejiang Geely Holding (Group) Co., Ltd. (*‘Geely’*) held a 6% market share³²⁹⁶.

The largest NEV producers in China include also two groups of companies, dubbed the ‘Big Four’ and the ‘Four Dragons’ respectively. The ‘Big Four’ are four State-owned traditional automakers – (i) SAIC Motor Corporation Ltd. (*‘SAIC’*), (ii) Dongfeng Motor Corporation Ltd. (*‘Dongfeng’*), (iii) China FAW Corporation Ltd. (*‘FAW Group’*), and (iv) Chang’an Automobile Co., Ltd. (*‘Chang’an’*) – which are transitioning to various extent from the production of ICEs to NEVs. The ‘Four Dragons’ include the four largest companies established as NEV producers in the last decade: (i) Nio Inc. (*‘NIO’*), (ii) WM Motor Technology Group Co., Ltd. (*‘WM Motor’*), (iii) Byton Ltd. (*‘Byton’*), and (iv) Guangzhou Xiaopeng Motors Technology Co., Ltd. (*‘Xpeng’*). However, in 2021 Byton suspended operations due to financial difficulties³²⁹⁷ and its role in the ‘Four Dragons’ has been taken by Li Auto Inc. (*‘Li Auto’*).

Finally, other large Chinese traditional automakers which leveraged their presence in the ICE market to become important players in the Chinese NEV market are: Chery Automobile Co., Ltd. (*‘Chery’*), Great Wall Motors Co., Ltd. (*‘GWM’*), Guangzhou Automobile Group Motor Co., Ltd. (*‘GAC’*) and Wuling Motors Holdings Ltd. (*‘Wuling’*).

The main Chinese manufacturers of batteries for NEVs are also listed in the overview of the main NEV and battery manufacturers below. Indeed, some NEV producers are also battery manufacturers and are therefore vertically integrated, notably BYD. Instead, the largest non-integrated players in the Chinese battery production are Contemporary Amperex Technology Ltd. (*‘CATL’*), China Aviation Lithium Battery Technology Group Ltd. (*‘CALB’*) and Ganfeng Lithium Co., Ltd. (*‘Ganfeng Lithium’*), also known as Guoxuan. Overall, there are around 50 NEV battery producers in China.³²⁹⁸

Chinese brands³²⁹⁹

- Aiyas Automobile Co., Ltd. (*‘Aiyas’*)

³²⁹⁵ See Section 2(2) of the 2017 Automobile Plan, as defined in Section 22.3.8, and Chapter VIII, Section 1 of the NEV Plan 2021-2035, as defined in Section 22.3.13.

Aiways is a pure NEV manufacturer with headquarters in Shanghai. It also produces batteries.

- Alibaba Group Holding Ltd. (*‘Alibaba’*)
Alibaba is active in the Chinese NEV market through its joint venture Zhiji Motors, also known by its English name IM Motors, together with SAIC.
- BAIC Motor Corporation Ltd. (*‘BAIC Motor’*)
BAIC Motor is a traditional auto maker with headquarters in Beijing. BAIC Motor is part of the BAIC Group and is controlled by the Beijing municipality. It is active in the manufacturing of NEVs through the JV Beijing Electric Vehicle with Daimler, under the brand Arcfox. It also has a second JV with Didi Chuxing in the sector. In addition, it has a JV with Hyundai and the JV Beijing Benz with Mercedes-Benz, not active in the NEV market.
- Shenyang Jinbei Automotive Company Ltd. (*‘Brilliance’*)
Brilliance is one of the leading State-owned³³⁰⁰ Chinese automakers, with headquarters in Shenyang. Originally named Brilliance Auto Group Holdings Co. Ltd., in 2020 Brilliance went bankrupt and took the current company name after that in 2023 the city of Shenyang took over the control of the ailing company³³⁰¹. Besides its own production of NEVs, Brilliance has the JV BMW Brilliance Automotive Ltd. (*‘BMW Brilliance Automotive’*) with BMW, which produces also NEVs under the BMW brand. It used to have also the JV Renault Brilliance Jinbei Automotive with Renault, which however filed for bankruptcy in 2021³³⁰².
- BYD
BYD is a NEV producer with headquarters in Shenzhen, in the Guangdong province. It is referred to also with the full name Build Your Dreams. It is part of the Chinese multinational BYD Company Ltd. The US company Berkshire Hathaway owns a stake of approx. 15% in BYD. In 2021 it reached a total turnover of RMB 211 billion (EUR 27,68 billion)³³⁰³.
The NEV business unit was born in 2002 from the acquisition of Tsinchuan Automobile, then the sixth-largest car manufacturer in China by sales volume. Aside from its own NEVs, BYD also supplies other NEV manufacturers, including the FAW Group. In April 2020, BYD and Toyota announced a joint partnership in a new company – BYD Toyota EV Technology – that would research and manufacture NEVs for the Chinese market.
- Byton
Byton was a NEV manufacturer with headquarters in Nanjing. It was formerly known as Future Mobility. As mentioned above, in 2021 it suspended its operations. Shareholders

included the FAW Group, the Nanjing city government³³⁰⁴ and Taiwanese company Foxconn.

- Chang'an

Chang'an – one of the largest State-owned automakers – started producing NEVs under the brand Oshan and through its subsidiary Avatr Technology. Avatr Technology was initially established as Chang'an NIO, a JV with NIO, but later NIO reduced its interest and Chang'an NIO was rebranded as Avatr Technology with the entry in the share capital of CATL and Huawei. Chang'an has also JVs with Ford and Mazda for the production of ICEs. It used to have a JV with the PSA Group, now part of the Stellantis Group, for the production of ICEs under the DS brand, but the JV ceased its operations in 2019.

- Chery

Chery is a State-owned traditional automaker which transitioned to NEVs, with headquarters in the Anhui province.

- Zhejiang Dianka Automobile Technology Co. Ltd. ('Dianka')

Dianka is a NEV producers with headquarters in the Zhejiang province. It used to market NEVs under the brand DearCC, but since 2018 it sells them under the Enovate brand.

- Dongfeng

Dongfeng is a State-owned company³³⁰⁵ involved in the production of NEVs through the brand Skio and through JVs with foreign brands such as Renault and Nissan. Dongfeng has also a JV with Honda and used to have the JV Dongfeng Peugeot-Citroën Automobiles with the PSA Group, now part of the Stellantis Group, which are not involved in the production of NEVs. In 2022, the Stellantis Group sold its interest in the JV to Dongfeng³³⁰⁶.

- Evergrande New Energy Vehicles

Evergrande New Energy Vehicles is a branch of the Evergrande conglomerate. It has production facilities in Shanghai and in Guangzhou, in the Guangdong province. Evergrande New Energy Vehicle was also the parent company of NEVS AB, a Swedish NEV producer which had purchased the assets of Saab Automobile and which stopped production in 2023³³⁰⁷. Following the default of the Evergrande conglomerate, Evergrande New Energy Vehicles was, as of writing of this Report, to issue new shares to pay off loans which would dilute the stake of Evergrande in its NEV subsidiary down to 46,86%³³⁰⁸.

- FAW Group

FAW Group is headquartered in Changchun, in the Jilin province. It is referred to also with the full name First Automotive Works. It is State-owned³³⁰⁹. It started producing

NEVs under the luxury brand Hongqi and under the JV FAW-Volkswagen Automobile Co., Ltd. (*FAW-VW*) with Volkswagen and Audi.

- GAC

GAC is owned by the city of Guangzhou. It has a NEV subsidiary called Guangzhou New Energy Automobile which produces NEVs under the brand Aion. GAC has a number of JVs with foreign brands, which do not produce NEVs in China: Honda, Toyota, Mitsubishi and Isuzu. It also used to have a JV with Fiat Chrysler, a subsidiary of the Stellantis Group, which filed for bankruptcy in 2022³³¹⁰.

- Geely

Geely is one of the largest Chinese traditional automakers, which recently started transitioning from ICEs to NEVs, with headquarters in Hangzhou, in the Zhejiang province. In 2010 Geely acquired Volvo Car AB (*Volvo*) and in 2013 the production business of the London Taxi Company, rebranded London EV Company Ltd. (*LEVC*). Thus, Geely is active in the NEV market also with the brands Volvo, LEVC, Geometry, Lynk & Co, Zeekr and Polestar. In particular, NEVs under the Volvo brand are produced in China by the JV Daqing Volvo Car Manufacturing Co., Ltd. established between Geely and its subsidiary Volvo. Moreover, as of July 2023, Geely set up a new JV with Renault also for the production of motors for HEVs and PHEVs³³¹¹.

- GWM

GWM is a traditional automaker which entered the NEV market, with headquarters in Baoding, in the Hebei province. It has a JV with BMW to produce NEVs under the brand Mini³³¹². GWM markets NEVs also under the Link Tour brand, as part of the JV Link Tour Automobile Co., Ltd. (*Link Tour*), formerly known as Hebei Yogomo Vehicle Co., Ltd. (*Yogomo*)³³¹³.

- Hozon New Energy Automobile Co., Ltd. (*Hozon Auto*)

Hozon Auto is a NEV producer with headquarters in Shanghai. In 2022, it started exporting to Thailand and it has now covered ASEAN, South Asia and Middle East markets, with a view to enter the European markets³³¹⁴.

- Human Horizons (Shanghai) New Energy Powertrain Technology Co., Ltd. (*Human Horizons*)

Human Horizons is a producer focused on high-end NEV models, with headquarters in Shanghai. It is part of a group of companies focusing on technology and connectivity.

- Anhui Jianghuai Automobile Co., Ltd. (*JAC Motors*)

JAC Motors is a State-owned traditional automaker which is transitioning to NEVs³³¹⁵.

- Li Auto Inc.

Li Auto is a NEV producer with headquarters in Beijing. It was formerly known as CHJ Automotive. Shareholders include the cities of Changzhou and Xiamen, the State-run investment bank China International Capital Corporation³³¹⁶ and the online platforms Meituan and ByteDance. It is specialised in the production of PHEVs.

- Nanjing Golden Dragon Bus Co., Ltd. ('NGDB')

NGDB is a traditional bus manufacturer which transitioned to NEVs of different categories, including passenger cars. It is active in the NEV market under the Skywell brand, through its subsidiary Skywell New Energy Automobile Group Co., Ltd., and the Kaiwo brand, through its subsidiary Kaiwo New Energy Automobile Group Co., Ltd. ('Kaiwo').

- NIO

NIO is a NEV producer which initially had its headquarters in Shanghai, later moved to Hefei, in the Anhui province. Shareholders in the company include the Hefei city government through various entities, Tencent as a second-largest shareholder, Baidu, funds managed by Sequoia China³³¹⁷ and funds managed by private equity Warburg Pincus³³¹⁸. In 2021, it reached a total turnover of RMB 36,13 billion (EUR 4,73 billion)³³¹⁹. NIO is also active in the Chinese NEV market through its related company NIO NextEV Ltd. In 2020, NIO – which was experiencing a financial reverse – reached an agreement with the Hefei city government whereby the latter would have invested in the company, reaching a 24,1% stake through various entities, and in exchange NIO would have moved its headquarters to Hefei from Shanghai³³²⁰.

- SAIC

SAIC is one of the largest State-owned Chinese traditional automakers, which recently transitioned from ICEs to NEVs. It is also referred to with the full name Shanghai Automobile Industry Corporation. Its headquarters are in Shanghai. In 2021, it reached a total turnover of RMB 779,85 billion (EUR 102,15 billion)³³²¹. It is active in the NEV market also as part of the JVs SAIC-Volkswagen, SAIC-GM, SAIC-GM-Wuling, and Zhiji Motors, also known with its English name IM Motors, together with online platform Alibaba. In the wider automobile market, SAIC is the parent company of the British brand MG Motor, acquired in 2005³³²², which together with the brand Roewe constitutes the SAIC Passenger Vehicle branch. This branch is an organisational unit within SAIC, as opposed to the JVs which are separate legal entities.

- China National Heavy Duty Truck Group Co., Ltd. (*‘Sinotruck’*)
Sinotruck is the main Chinese producer of heavy-duty vehicles and is transitioning to NEVs³³²³.
- WM Motor
WM Motor is a NEV producer with headquarters in Shanghai, established in 2015 by a former executive of Geely and of Volvo, and by former executives of SAIC. Shareholders include State-owned investors (notably a 5,7% stake of the city of Kunshan³³²⁴ and funds of the Hubei province, of the Shanghai municipality and of the cities of Suzhou, Hengyang, Hefei and Guangzhou³³²⁵), SAIC³³²⁶, the tech companies Baidu and Tencent, and funds managed by Susquehanna International Group³³²⁷ and Sequoia China³³²⁸. Weltmeister is the brand under which NEVs produced by WM Motor are sold.
- Wuling
Wuling is a State-backed automaker which produces not only cars but also trucks, buses and autoparts. It is active in the Chinese NEV market through the joint venture SAIC-GM-Wuling, which produces some of China’s cheapest NEV model.
- XEV Ltd. (*‘XEV’*)
XEV is a NEV producer incorporated in Hong Kong, which has its production facility in Shanghai. It has become well-known for its leading NEV model called Yoyo, a 2-seat mini-car increasingly used in EU urban contexts.
- Xiaomi
Xiaomi (see Section 18.8.2.), which was already a shareholder in the NEV producer Xpeng, started its own production of NEVs in 2023.
- Xpeng
Xpeng is a NEV producer with headquarters in Guangzhou, in the Guangdong province. The online platform Alibaba owns a 14% stake in Xpeng. Other shareholders include the Guangzhou provincial government through a state industrial fund³³²⁹, Xiaomi and funds managed by Sequoia China³³³⁰. Xpeng drew its employees from many well-known tech giants, including Xiaomi, Tencent, Samsung and Huawei. Their expertise helped Xpeng become competitive in NEV technologies.

Youxing is active as a NEV producer through its brand Singulato Motors. In 2021, Singulato Motors was reported to have found itself in judicial difficulties³³³¹. As of writing this Report, it was unclear if it was still active.

- Zotye International Automobile Trading Co. Ltd. ('Zotye')

Zotye is known for producing Western and luxury look-alike cars, including NEVs. Its headquarters are in Yongkang, in the Zhejiang province.

Foreign brands³³³²

- BMW
BMW is active in the NEV market in China through its joint venture BMW Brilliance Automotive with Brilliance under the BMW brand and with GWM under the Mini brand.
- General Motors ('GM')
GM is active in the Chinese NEV market through the JVs SAIC-GM and SAIC-GM-Wuling.
- Nissan
Nissan is active in the production of NEVs in China through its JV with Dongfeng.
- Renault
Renault is active in the production of NEVs in China through its JV with Dongfeng. Moreover, it has a JV with Geely for the production of motors, including motors for HEVs and PHEVs³³³³. It used to have a JV for the production of NEVs with Brilliance, which filed for bankruptcy in 2021³³³⁴.
- Tesla
Tesla produces NEVs in China in a gigafactory in Shanghai. Tesla is the only foreign company which was granted a waiver to own 100% of an EV factory in China³³³⁵.
- Toyota
Toyota is active as a NEV manufacturer in the Chinese market through BYD Toyota EV Technology, a JV with BYD.
- Volkswagen
Volkswagen is active in the Chinese market through the JVs SAIC-Volkswagen and FAW-VW. SAIC-Volkswagen is established in Shanghai and sells cars, including NEVs, under the Volkswagen and Skoda brands. FAW-VW, in which Audi – a wholly-owned subsidiary of Volkswagen – has also a 10% stake, produces also NEVs. Volkswagen is

also active in the production of batteries for NEVs in China, as it is the biggest shareholder of Gotion High-tech Co., Ltd. (*Gotion High-tech*).

Battery manufacturers

- A123 Systems LLC. (*A123 Systems*)
A123 Systems is a US-incorporated company which was acquired by the Chinese Wanxiang Group Holdings, with headquarters in Hangzhou. It produces lithium iron phosphate batteries and energy storage systems. It has a joint venture with SAIC for the production of batteries for NEVs in China.
- Aiways
Aiways is a vertically integrated manufacturer, as it produces batteries, in addition to NEVs.
- BYD
BYD manufactures also batteries, in addition to NEVs. It is the second-largest battery producer in the world and in China, in both cases after CATL, with a market share in the global market of batteries for NEVs of 6,9% in 2021 and 12% in 2022, when it overtook an established player, Panasonic³³³⁶. As of 2023, in China it held a market share of 23,16%³³³⁷. Thus, it is the main vertically integrated NEV manufacturer.
- CALB
CALB is a State-owned company initially established by Aviation Industry Corporation of China Ltd. It held a market share of 2,7% in 2021 and 4% in 2022 in the global market of batteries for NEVs³³³⁸.
- CATL
As of writing of this Report, CATL is the largest manufacturer of batteries for NEVs in the world and in China. CATL is also known in Chinese by the name The Age of Ningde, as it is headquartered in Ningde, in the Fujian province. It held a market share of 32,5% in 2021 and 34% in 2022 in the global market of batteries for NEVs³³³⁹. As of 2023, in China it held a market share of 47,76%³³⁴⁰. It has the JV CATL-Geely Power Battery Co. together with Geely³³⁴¹ and two JVs with SAIC (United Auto Battery System Co., Ltd. and United Auto Battery Co., Ltd.) for the production of batteries for NEVs³³⁴². In addition, it supplies batteries to Tesla, Volkswagen, BMW and NIO³³⁴³. CATL opened a plant in Germany and was, as of writing of this Report, about to open another plant in Hungary, the only two production sites outside China³³⁴⁴. It also signed a deal in February

2023 with Ford to license its battery technology for use in Ford's US factory in Michigan³³⁴⁵.

- EVE Energy Co., Ltd. (*'EVE Energy'*)
EVE Energy produces both lithium batteries and batteries for consumer electronics.
- Ganfeng Lithium
Ganfeng Lithium is a vertically integrated lithium manufacturer, which produces also batteries.
- Geely
Geely is active in the production of batteries through its JV CATL-Geely Power Battery Co. with CATL.
- Gotion High-tech
Gotion High-tech, previously known as Dongyuan Electric Appliance Group, focuses on lithium iron phosphate batteries. Volkswagen is its biggest shareholder with a 26,47% stake. It held a market share of 2,0% in 2021 and 3% in 2022 in the global market of batteries for NEVs³³⁴⁶.
- NIO
While NIO is not a producer of batteries in itself, it has developed a network of public stations where users can swap used batteries for fully charged ones. This also allows for the NEVs to be sold at a lower price, not including the price of the battery³³⁴⁷. Moreover, it has opened a plant in Hungary of its subsidiary in charge of the deployment of its swapping infrastructure in the EU, in support of its EU sales³³⁴⁸.
- SAIC
SAIC is active in the production of batteries through a JV with A123 Systems and two JVs with CATL (United Auto Battery System Co., Ltd. and United Auto Battery Co., Ltd.)³³⁴⁹.
- Sunwoda Electronic Co., Ltd. (*'Sunwoda'*)
Sunwoda held a market share of 2% in 2022 in the global market of batteries for NEVs³³⁵⁰.
- SVOLT Energy Technology Co., Ltd. (*'SVOLT'*)
SVOLT held a market share of 1% in 2022 in the global market of batteries for NEVs³³⁵¹.

22.2.3. EXPORTS AND IMPORTS

In 2023, China became the largest automobile exporting country³³⁵². In particular, concerning only NEVs, in the first half of 2023 China exported 534 000 NEVs, an increase by 160%

³³⁴⁵ See at: <https://www.ft.com/content/9f411244-eb72-493f-86d2-e7bf77de757e> (accessed on 13 June 2023).

³³⁵⁰ See at: <https://www.visualcapitalist.com/the-top-10-ev-battery-manufacturers-in-2022/> (accessed on 13 June 2023).

³³⁵¹ *Ibid.*

³³⁵² See at: <https://www.bbc.com/news/business-65643064> (accessed on 13 June 2023).

compared to the same period in 2022³³⁵³. Chinese share of global exports of NEVs grew from 9,9% in 2020 to 35% in 2022³³⁵⁴, to more than 60% in the first semester of 2023³³⁵⁵. SAIC, BYD and Tesla are the top Chinese exporters of NEVs³³⁵⁶.

In particular, the share of NEVs in the Chinese automobile export mix rose by more than 90%, compared to 2022. This allowed China between 2022 and 2023 to become, for the first time, an exporter rather than an importer of automobiles, as it had been so far due to the technology and know-how disadvantage in the production of ICEs³³⁵⁷.

The Government is encouraging Chinese NEV brands to explore markets overseas and has policies in place to support those enterprises in many ways. In this regard, the New Energy Vehicle Industry Development Plan (2021-2035) (see Section 22.3.13) sets five strategic tasks for China's NEV industry for the 15 years it spans: (1) improve capacity for technology innovation; (2) build a NEV industry ecosystem; (3) advance industrial integration and development; (4) build a sound infrastructure system; and (5) increase openness and deepen international cooperation. As concerns the international cooperation, domestic firms were encouraged to make strategic plans for international development, exploit overseas markets, and establish warehouses and post-sale service platforms abroad. It is also emphasized that supporting services for international cooperation such as corporate compliance and legal consulting and test and certification services were to be strengthened. Additionally, task 5 entails China's proactive participating in setting international rules and standards³³⁵⁸.

The EU market is one of the main export destinations of Chinese NEV brands³³⁵⁹. This is shown by the increasing market share of Chinese brands in the EU market. In fact, Chinese NEV brands accounted for 4% of the EU NEV market in 2021, 6% in 2022 and 8% in the first eight months of 2023³³⁶⁰.

Export strategies to the EU/Europe differ amongst Chinese brands. NIO entered the Norwegian market, where it appears to have more sales than in the EU market, as a preparatory move before obtaining an established presence in the EU market³³⁶¹. BYD plans to supply 100 000 EVs to the German-based car rental company SIXT over six years between 2022 and 2028, as it expands its presence into all major markets of the EU³³⁶². Aiways regarded penetration of

export markets as a way to overcome the competitive pressure in the Chinese market³³⁶³. Lynk & Co, a brand part of Geely, offers subscription services of shared NEVs to EU customers³³⁶⁴. XEV was born as a Chinese producer of NEVs destined for the EU export market and started selling on the Chinese market only two years after it started selling to the EU³³⁶⁵.

Conversely, due to the development of its production, China imports under 1% of the NEVs sold in its domestic market³³⁶⁶.

Concerning the exports of foreign brands active as NEV producers in China, Renault and BMW appear to export NEV produced in China to the EU³³⁶⁷. Moreover, Tesla ships NEVs destined for the EU market from its Chinese plant³³⁶⁸, where at the beginning of 2022 more than half of the production was destined for export³³⁶⁹. However, this trade pattern is changing, as the Chinese plant was unable to keep up with orders and in March 2022, Tesla opened a production plant in Germany, which allowed to reduce the production pressure on the Chinese plant, then able to supply more the demand of the Chinese market³³⁷⁰. As a result, in the first quarter of 2023, 75% of newly registered Tesla BEVs in Western Europe was produced in Germany, nearly 25% was imported from China and few thousand units were imported from the USA³³⁷¹.

Concerning the Chinese export of batteries, in 2022 108.1 GWh of batteries and batteries incorporated in NEVs were exported³³⁷². Indeed, batteries are often exported already installed in the NEVs because the export of batteries for NEVs is difficult due to their weight, the fact that they contain hazardous materials and the need for matching with the relevant NEV model³³⁷³. For these reasons, Chinese producers prefer to establish new production plants abroad. For example, in 2023 Chinese battery producers accounted for 40% of the planned production capacity in Europe, notably with the project of CATL's second European plant in Hungary after the first one in Germany³³⁷⁴. Moreover, as of 2023, CATL was the second-largest producer in the EU after LG Energy Solution Ltd., with a 27,47% market share³³⁷⁵. Still, China is the world top exporter of batteries, with 56.7 GWh of self-standing batteries exported in the

first semester of 2023³³⁷⁶ – which allows to foresee an increase in exports compared to 2022 – and a share of global exports estimated at 31,1% in 2021³³⁷⁷ and at 35% in 2022³³⁷⁸. Also, in the case of batteries, the EU is one of the main export destinations, accounting for 31,21% of Chinese exports of lithium-ion batteries – the main type used in NEVs – in 2021³³⁷⁹ and for approximately one third in 2022³³⁸⁰.

22.2.4. OVERCAPACITY

The rapid growth NEVs production in China highlighted in Section 22.2.1 has already led to a situation of overcapacity. By the end of 2021, the total production capacity of NEVs in China reached 5.69 million NEVs, yet the total production was only 3.55 million NEVs. Despite the overall overcapacity in place, as of 2023, China still had an additional passenger car capacity of 10.46 million vehicles under construction, most of which for manufacturing NEVs³³⁸¹. Once all these factories are operating, China is therefore expected to reach a capacity of 16 million vehicles. While it is true that production of NEVs increased by 99% between 2021 and 2022, in the first half of 2023 it increased by 42,4% compared to the same period in 2022³³⁸². It is therefore debatable if China will be able to run NEV production plants at full capacity or if a certain share of the capacity will be likely to remain idle.

For this reason, the Government encourages NEV producers to explore markets overseas and export NEVs, with governmental support for enterprises in place. At the same time, the Government appears to encourage overcapacity to a certain extent. Indeed, the Dual-Credit Policy described in Section 22.3.10 sanctions the failure to reach certain targets measured on the average fuel consumption and on production or import. Since the average fuel consumption depends on the NEVs or other low-emission vehicles produced or imported, the targets are measures on production or imports (essentially production, given how negligible imports are in the Chinese NEV market (see Section 22.2.3)). Therefore, these targets could act as an incentive for producing increasingly more NEVs, not only to meet the targets but also to lower the average fuel consumption. Thus, they could be intended also as factors contributing to the overcapacity of the NEV industry.

³³⁸² See at: <http://en.caam.org.cn/Index/show/catid/65/id/2033.html> (accessed on 12 June 2023).

Overcapacity is also a feature of the Chinese battery industry, together with oversupply. In 2022 China's battery production totalled 545.9 GWh, meanwhile the volume installed in NEVs for the domestic market was 294.6 GWh, accounting only for 53,96% of the production. Even adding 108.1 GWh of battery exports and exports of batteries incorporated in the NEVs, the ratio is only 73,77% of the production³³⁸³. This left more than a quarter of the battery production not used for NEVs. The same pattern appeared to continue in the first half of 2023, when 293.6 GWh were produced but only 152.1 GWh installed in NEVs³³⁸⁴. This stockpiled production could theoretically find other applications, as battery cells constituting this volume of production could be assembled in battery module packs for applications other than NEVs. However, even if that were the case, additional capacity can be devoted to the production of batteries for NEVs, as the battery production capacity developed by China is considerable. In fact, in terms of lithium-ion batteries, which is the most used type of battery for NEVs, the production capacity reached 893 GWh in 2022, corresponding to 77% of the global capacity³³⁸⁵. Even considering that this capacity was used not only for the lithium-ion batteries in the 545.9 GWh of batteries produced for NEVs, but also for other applications, this figure shows that Chinese producers have idle capacity for batteries for NEVs. Moreover, in perspective, it is foreseen that Chinese battery manufacturers will be able to manufacture 4 800 GWh of batteries in 2025, four times the demand of the country's NEV makers³³⁸⁶. Therefore, the battery production capacity in China does not appear to be developed only to supply the domestic demand, but also export markets.

22.3. REGULATORY FRAMEWORK

NEVs have been the subject of Chinese governmental guidelines, both at central and local level, at least since 2005. A number of policy documents and regulatory measures show the increased attention devoted by the Chinese authorities to the development of the production of NEVs and their components, in particular batteries, into a strategic industry. The following policy documents and regulatory measures in relation to NEVs will be analysed in more detail below:

- Decision No. 40 (see Section 4.2.9);
- the 2010 SEI Decision (see also Section 2.3.2.);
- the 2010 Notice on the Pilot Subsidy Scheme for the Private Purchase of New Energy Vehicles;
- the 12th FYP;
- the 2012-2020 Energy-saving and New Energy Vehicle Industry Development Plan;

³³⁸³ See at: <https://equalocean.com/analysis/2023021519466> and <https://thechinaproject.com/2023/06/20/china-now-has-a-lot-more-batteries-than-electric-vehicles/#:~:text=In%202022%2C%20a%20battery%20shortage,GWh%20were%20installed%20in%20EVs> (accessed on 12 June 2023).

³³⁸⁵ See at: <https://www.visualcapitalist.com/chinas-dominance-in-battery-manufacturing/> (accessed on 12 June 2023).

³³⁸⁶ See at: <https://www.scmp.com/business/china-business/article/3228224/overcapacity-chinas-ev-battery-industry-reach-four-times-demand-2025-putting-small-players-risk> (accessed on 12 June 2023).

- the 13th FYP;
- Made in China 2025 (see Section 4.2.3);
- the 2017 Medium and Long-Term Development plan for the Automobile Industry;
- the 2017 Action Plan for Promoting the Development of the Automotive Power Battery Industry;
- the 2017 Dual-Credit Policy;
- the Recommendations for the 14th FYP;
- the 14th FYP (see Section 4.2.5);
- the 2021-2035 New Energy Vehicle Industry Development Plan;
- the 2023 Announcement on the Continuation and Optimization of the New Energy Vehicle Purchase Tax Reduction Policy;
- the 2023 Measures to further promote the automobile consumption and Plans to boost the NEV industry; and
- certain provincial, regional, municipal and local plans of areas where NEV manufacturers are located.

22.3.1. DECISION NO. 40 AND GUIDING CATALOGUES

As recalled in Section 4.2.9, Decision No. 40 was adopted in the context of the 11th FYP. It shows a serious commitment of the Government, as early as 2005, to support the development of new industries fostering the sustainable development, including NEVs.

Indeed, in Chapter II dedicated to ‘*Directions and Key Points of Industrial Structure Adjustment*’, Article 7 states that the Government “shall [...] make great efforts to develop industries in the areas of [...] new energy”. Moreover, Article 6 refers to batteries when it states that “[t]he equipment manufacturing industry shall [...] break through especially in the areas such as [...] advanced power equipment, energy conservative and consumption reducing equipment”.

Chapter III defines the principles identifying the ‘*encouraged category*’ of industries included in the Guiding Catalogue for Industrial Structure Adjustment, which, as explained in Section 4.2.9, “is the important basis for guiding investment directions, and for the governments to administer investment projects, to formulate and enforce policies on public finance, taxation, credit, land, import and export, etc.”³³⁸⁷ applicable to Chinese companies³³⁸⁸. One of the principles is that encouraged industries should meet “the requirements of the sustainable development strategy” and should lead “to the development and utilization of new energy and renewable energy”³³⁸⁹.

It is noteworthy that another principle refers to the ability of encouraged industries to allow China to exert its “comparative advantages, especially the advantages of energy, mineral resources and labour resources”³³⁹⁰.

³³⁸⁷ Decision No. 40, Article 12.

³³⁸⁸ Indeed, a different list of encouraged industries applies to foreign investors.

³³⁸⁹ Decision No. 40, Article 14(4).

³³⁹⁰ Decision No. 14, Article 14(5).

Decision No. 40 tasked the NDRC with releasing and updating the Guiding Catalogue. All the four successive versions of the Guiding Catalogue (2005, 2011 – later amended in 2013 –, 2019 and 2023, effective as of 6 February 2024) mentioned NEVs among the encouraged industries. Indeed, already the 2005 version mentioned the “[d]evelopment and manufacturing of new energy vehicles and key components such as compressed natural gas, hydrogen fuel, synthetic fuel, liquefied petroleum gas, alcohol ether fuel vehicles, hybrid vehicles, electric vehicles, fuel cell vehicles, etc” as an encouraged industry³³⁹¹. The 2011 version mentioned ‘key parts and components’ of NEVs, which included, among others: ‘power battery packs’ ‘battery cathode material’, ‘electric vehicle electronic control integration’ and ‘electric vehicle drive motor’³³⁹². The 2013 amendment kept them in the list³³⁹³. The 2019 version included ‘key parts and components’ and ‘R&D capacity building’ of NEVs³³⁹⁴. The 2024 version refers to ‘key parts and components’ (including batteries) and ‘R&D and testing capabilities for new energy vehicles’³³⁹⁵.

22.3.2. THE 2010 STATE COUNCIL DECISION ON ACCELERATING THE DEVELOPMENT OF STRATEGIC EMERGING INDUSTRIES

The 2010 SEI Decision (see Section 2.3.2’) which lists the industrial sectors to be developed with priority and sets objectives for them, with NEVs included among the initial seven SEIs³³⁹⁶. NEVs remained a strategic emerging industry throughout the successive revisions made by the NDRC of the Strategic Emerging Industries Key Product and Services Catalogue in 2013 and 2017.

In the 2010 SEI Decision, the Government sets quantitative objectives: for example, by 2015 the strategic emerging industries were to represent 8% and by 2020 15% of the country’s GDP.

22.3.3. THE 2010 NOTICE ON THE PILOT SUBSIDY SCHEME FOR THE PRIVATE PURCHASE OF NEW ENERGY VEHICLES

In May 2010 the MOF, the Ministry of Science and Technology, the MIIT and the NDRC issued the Notice on the Pilot Subsidy Scheme for the Private Purchase of New Energy Vehicles

³³⁹¹ NDRC Order No. 40 of 2005, available at: https://www.ndrc.gov.cn/xxgk/zcfb/fzggwl/200512/t20051222_960679.html (accessed on 14 June 2023).

³³⁹² NDRC Order No. 9 of 2011, available at: https://www.ndrc.gov.cn/fggz/cyfz/zcyfz/201104/t20110426_1149263.html (accessed on 14 June 2023).

³³⁹³ NDRC Order No. 21 of 2013, available at: https://www.gov.cn/gongbao/content/2013/content_2404709.htm (accessed on 14 June 2023).

³³⁹⁴ NDRC Order No. 29 of 2019, available at: <https://www.gov.cn/xinwen/2019-11/06/5449193/files/26c9d25f713f4ed5b8dc51ae40ef37af.pdf>; an English translation is available on the website of the Australian trade defence authority: https://www.industry.gov.au/sites/default/files/adc/public-record/exhibit_d16.1_-_catalogue_for_guiding_industry_restructuring_-_en.pdf (accessed on 14 June 2023).

³³⁹⁵ See 2024 Guidance Catalogue for the industrial structure adjustment ; Section I-16 Automobile, available at: <P020231229700886191069.pdf> ([ndrc.gov.cn](http://www.ndrc.gov.cn)) (accessed on 15 January 2024).

³³⁹⁶ For wider context of the policies related to SEI sectors, see also Section 4.2.1.

(‘Purchase Subsidy Notice’)³³⁹⁷. The Purchase Subsidy Notice was meant to encourage the sale of NEVs for personal use by granting consumers a one-off subsidy³³⁹⁸ for the purchase or the lease of an NEV³³⁹⁹. In particular, NEVs concerned included both BEVs and PHEVs³⁴⁰⁰. The subsidy was paid directly to the NEV producer, which could have therefore sold the NEV to the customers at a discounted price³⁴⁰¹. In order to benefit from the purchase subsidy, the NEV purchased or leased should have fulfilled certain minimum performance and quality requirements³⁴⁰². The amount of the subsidy disbursed depended on the power of the battery, measured in kilowatt hours³⁴⁰³. A maximum amount of the individual subsidy was provided, higher for BEVs than for PHEVs³⁴⁰⁴.

Originally, the purchase subsidy was set to stop at the end of 2020. However, due to the economic impact of the COVID-19 pandemic, its end was delayed to the end of 2022. Between 2010 and 2020, the sale of 3.17 million NEVs benefitted from the purchase subsidy. Over the years, the purchase subsidy scheme was revised several times, making NEV criteria to award the subsidy more stringent and reducing the individual amount of the subsidy³⁴⁰⁵. The rationale for this was that the subsidy scheme was meant to support the spread of the use of NEVs but, once the general public had become accustomed to them, their sale and spread would have continued thanks to the market development.

This measure had an impact on NEV prices in China. Indeed, thanks to purchase subsidies, NEV prices were suppressed. This is shown by the fact that, once the purchase subsidy was withdrawn, NEV prices immediately increased³⁴⁰⁶. As a consequence, sales of NEVs in January 2023 dropped to a minimum of 408 000 units, signalling a decrease by 49,9% compared to December 2022 and a decrease by 6,3% compared to the same period in 2022³⁴⁰⁷.

However, the clear-cut strategy of progressively reducing the purchase subsidies down to their termination does not appear to have been completely followed. Indeed, other measures meant to encourage the sale of NEVs, such as the purchase tax exemption (see Section 22.3.15), had initially the same duration as the purchase subsidies but were continued beyond the end of the purchase subsidy scheme, and measures similar to the purchase subsidy were introduced at the lower administrative levels of government (see Section 22.4.5). This is a sign that as of 2023, the NEV market in China still enjoys economic stimulus pushed by the Government rather than relying solely on market forces.

22.3.4. NEVs IN THE 12th FYP

³³⁹⁷ https://www.ndrc.gov.cn/fggz/hjzy/jnhnx/201006/t20100603_1134366.html?code=&state=123 (accessed on 14 June 2023).

³³⁹⁸ Article 4, Purchase Subsidy Notice.

³³⁹⁹ Article 5, Purchase Subsidy Notice.

³⁴⁰⁰ Article 2, Purchase Subsidy Notice.

³⁴⁰¹ Article 5, Purchase Subsidy Notice.

³⁴⁰² Article 8, Purchase Subsidy Notice.

³⁴⁰³ Article 9, Purchase Subsidy Notice.

³⁴⁰⁴ Article 9, Purchase Subsidy Notice.

³⁴⁰⁵ See at: <https://www.sixthtone.com/news/1012221> (accessed on 14 June 2023).

³⁴⁰⁶ For example, in January 2023 BYD increased the prices of several models. See at: <https://www.sixthtone.com/news/1012221> (accessed on 14 June 2023).

³⁴⁰⁷ See at: <http://en.caam.org.cn/Index/show/catid/66/id/2050.html> (accessed on 14 June 2023).

The 12th FYP³⁴⁰⁸ mentioned the NEVs in Section 1 of Chapter 10 among the strategic emerging industries that the Government intends to develop³⁴⁰⁹. Specifically, the 12th FYP indicated that the focus of the NEV industry in the 2011-2015 period should have been “*the development of plug-in hybrid electric vehicles, pure electric vehicles and fuel cell automobile technologies*”.

22.3.5. THE ENERGY-SAVING AND NEW ENERGY VEHICLE INDUSTRY DEVELOPMENT PLAN (2012-2020)

In the context of the 12th FYP, the State Council issued the Energy-Saving and New Energy Vehicle Industry Development Plan (2012-2020) (‘*NEV Plan 2012-2020*’)³⁴¹⁰ with the strategic goal of developing energy-saving vehicles (i.e., ICEs with reduced fuel consumption) and NEVs, expressly including BEVs, PHEVs and FCEVs.

Article II(2), listing the basic principles, specified that the NEV Plan 2012-2020 should have employed a “*combination of government guidance and market drive. In the industrial start-up period, [the Government] will actively play the role of planning guidance and policy incentives, gather scientific and technological and industrial resources, encourage the development and production of energy-saving and new energy vehicles, and guide market consumption. After entering the mature period of the industry, [the Government will] give full play to the driving role of the market in industrial development and the basic role of resource allocation*”. The development of the industry was not limited to the NEVs, but also to their components throughout the value chain, including “*power batteries, motors, automotive electronics, advanced internal combustion engines, and high-efficiency transmissions*”.

In Article III(2)(1), the NEV Plan 2012-2020 also set specific quantitative objectives:

- by 2015, the production together with the sales of BEVs and PHEVs should have reached 500 000 units³⁴¹¹; and
- by 2020 the production capacity of BEVs and PHEVs should have reached 2 000 000 units and their production and sales taken together should have exceeded 5 000 000 units³⁴¹², while FCEVs and H₂EV should have developed following the international trends. It appears that the 2020 objective of NEV production and sale was not reached, as NEV production reached 1 366 000 units and sales 1 367 000 units, their sum thereby having fallen short of the 5 000 000 objective³⁴¹³.

³⁴⁰⁸ Section 4.1 of the 2017 version of this Report.

³⁴⁰⁹ See: https://www.gov.cn/2011lh/content_1825838_4.htm; an English translation is available at: <https://policy.asiapacificenergy.org/sites/default/files/12th%20Five-Year%20Plan%20%282011-2015%29%20for%20National%20Economic%20and%20Social%20Development%20%28EN%29.pdf> (accessed on 14 June 2023).

³⁴¹⁰ See at: https://www.gov.cn/zwggk/2012-07/09/content_2179032.htm (accessed on 14 June 2023).

³⁴¹¹ The figure of 500,000 units in this objective includes the units produced added to the units sold, double-counting units produced and sold in the same year.

³⁴¹² The figure of 5,000,000 units in this objective includes the units produced added to the units sold, double-counting units produced and sold in the same year. This is confirmed by separate data on production and sales of NEVs in 2021, which amounted to 2.6 and 2.5 million units respectively and reached 5.1 million units only by summing them up, see page 21 of the report by Shanxi Securities Co., Ltd. available at: https://dfscdn.dfcfw.com/download/A2_cms_f_20211202113558364819&direct=1&abc1432.pdf (accessed on 14 June 2023).

³⁴¹³ See at: <http://en.caam.org.cn/Index/show/catid/34/id/140.html> (accessed on 14 June 2023).

22.3.6. NEVs IN THE 13th FYP

The 13th FYP³⁴¹⁴, in Section 1 of its Chapter 23, renews the commitment of the Government to “support the development of [...] new-energy vehicles”.

In addition, in Section 4 of Chapter 23, the 13th FYP lists the actions meant to support the development of the NEV sector:

- *Promote the use of new-energy vehicles;*
- *Encourage the use of new-energy vehicles for urban public transport and taxi services;*
- *Develop all-electric vehicles and hybrid electric vehicles with a focus on making advancements in key technological areas such as battery energy density and battery temperature adaptability;*
- *Facilitate the development of a network of charging facilities and services that are compatible with each other and come under unified standards; [...]*
- *Ensure the cumulative total production and sales figures for new-energy vehicles in China reach five million;*
- *Strengthen efforts to recover and dispose of used batteries from new-energy vehicles.*

22.3.7. NEVs IN MADE IN CHINA 2025

As explained in Section 4.2.3, Made in China 2025³⁴¹⁵ is a comprehensive long-term programme issued in the context of the 13th FYP and applicable until the end of the 14th FYP. Its main goal is to shift Chinese manufacturing upwards to higher value-added products, emphasizing in particular the use of innovative manufacturing technologies. Indeed, NEVs are among the ten sectors for which Made in China 2025 specified strategic tasks and goals and laid down government support measures.

In relation to NEVs, Made in China 2025 indicates that the Government would:

Continue to support the development of electric vehicles and fuel cell vehicles, master the core technologies of low-carbon, informatized, and intelligentized automobiles, improve the engineering and industrialization capabilities of core technologies such as starter batteries, drive motors, high-efficiency internal combustion engines, advanced transmissions, lightweight materials, and intelligent controls, form a complete industrial system and innovation system from key components to complete vehicles, and promote the integration of energy-saving and new energy vehicles with independent brands at internationally advanced levels³⁴¹⁶.

More specifically, the Government would “[o]rganize and implement a number of special projects and major projects for innovation and industrialization for [...] new energy vehicles [...]”³⁴¹⁷.

³⁴¹⁴ Available at: <https://en.ndrc.gov.cn/policies/202105/P020210527785800103339.pdf> (accessed on 14 June 2023).

³⁴¹⁶ Section 3(6)(6), Made in China 2025.

³⁴¹⁷ Box 5, Section 3(6), Made in China 2025.

To achieve these objectives, the Government commits to “[a]ctively leverage the advantages of policy finance [...] and increase support for key areas such as new generation IT, high-end equipment, and new materials”, as well as to “[s]upport the Export-Import Bank of China in increasing services for the manufacturing industry to go global within its business scope, encourage China Development Bank to increase loans to manufacturing enterprises, and guide financial institutions to innovate products and services that meet the characteristics of manufacturing enterprises”³⁴¹⁸.

22.3.8. THE 2017 MEDIUM AND LONG-TERM DEVELOPMENT PLAN FOR THE AUTOMOBILE INDUSTRY

In 2017 the State Council approved the Medium and Long-Term Development Plan for the Automobile Industry (*‘2017 Automobile Plan’*)³⁴¹⁹, which was published by the MIIT, together with the NDRC and the MOST.

In analysing the situation of the automobile industry at the time, the Government acknowledges that one of the issues affecting the sector is *overcapacity*³⁴²⁰ and that as the sector is undergoing a main transformation “w]ith the continuous breakthrough of energy revolution”, an essential objective is “accelerating towards the direction of new energy”³⁴²¹. On these grounds, the 2017 Automobile Plan states that “[t]here is a good foundation and favourable conditions for building a powerful automobile country” and, in particular, “[n]ew energy vehicles and intelligent connected vehicles are expected to become breakthroughs” which would lead the transformation and the upgrade of the industry.

According to the 2017 Automobile Plan, in 2016, China’s automobile production and sales exceeded 28 million units, ranking first in the world for 8 consecutive years. While sales of Chinese brand automobiles accounted for about 50% of the total sales³⁴²², the 2017 Automobile Plan envisages a special “focus on making Chinese brand cars stronger and bigger” and on developing a group of companies able to be competitive on the international level³⁴²³.

In terms of future plans, in the 2017 Automobile Plan the Government expects to reach a production of about 30 million of automobiles in 2020 and 35 million in 2025³⁴²⁴, an industrial development which would also be supported by the *‘manufacturing power strategy’* and by the BRI (see Section 4.2.4). It appears that the 2020 objective was not reached, as China produced 25.23 million of automobiles in 2020³⁴²⁵.

³⁴¹⁸ Section 4(3), Made in China 2025.

³⁴¹⁹ See at: https://www.most.gov.cn/xxgk/xinxifenlei/fdzdgknr/fgzc/gfxwj/gfxwj2017/201705/t20170517_132856.html (accessed on 14 June 2023).

³⁴²⁰ Section 1(1), 2017 Automobile Plan.

³⁴²¹ Section 1(2), 2017 Automobile Plan.

³⁴²² Section 1(1), 2017 Automobile Plan.

³⁴²³ Section 2(1), 2017 Automobile Plan.

³⁴²⁴ Section 1(3), 2017 Automobile Plan.

³⁴²⁵ According to data of the China Association of Automobile Manufacturers reported in <http://en.caam.org.cn/Index/show/catid/27/id/42.html>. However, it is unclear if these data include also the production of NEVs. In any case, even summing up the production of NEVs in 2020, reaching 1.37 million units, the objective remains not fulfilled.

In operational terms, the 2017 Automobile Plan is supposed to be “market-led” but “government-driven”, whereby the nominal “*decisive role of the market in resource allocation*” is to be balanced by the “*guiding role of the government in macro-control, improving the legal system [...] standardizing the order of industrial development, highlighting the dominant position of enterprises, encouraging mergers and reorganizations, optimizing industrial layout*”³⁴²⁶.

The objectives of the 2017 Automobile Plan include having (i) several Chinese companies among the top ten NEV companies in the world by 2020, (ii) several Chinese automobile parts companies having a turnover of RMB 100 billion by 2020, (iii) several Chinese companies among the top ten automobile parts companies in the world by 2025, and (iv) several Chinese companies among the top ten automobile sellers in the world by 2025. It appears that the 2020 objective of having several Chinese companies among the top ten NEV companies in the world was at least partially fulfilled, as BYD and Geely were respectively the fourth and the fifth NEV producer (on an equal footing with other foreign brands) in the world by market share³⁴²⁷.

At the international level, the 2017 Automobile Plan aims (i) by 2020, to have gradually exported Chinese car brands to developed countries, (ii) by 2025, to further enhance the global influence of Chinese car brands, and (iii) by 2025, to reduce the energy consumption of NEVs to the world’s leading level. The 2020 objective appears to have been partially fulfilled with regard to NEV brands, as in 2020 China held a 10% share of global export of NEVs, almost exclusively directed – among developed countries – to the EU³⁴²⁸.

The 2017 Automobile Plan covers also batteries. It encourages “*enterprises, institutes, universities and other innovation subjects to allocate innovation resources across the industrial chain, and establish manufacturing innovation centres in the automotive field such as power batteries*”³⁴²⁹. The spread of innovation across the value chain, especially in favour of the best performing companies, should be supported by the Joint Fund for the Automobile Industry Innovation and Development (‘*Automobile Industry Joint Fund*’ – see Section 22.4.5)³⁴³⁰.

Also, FCEVs are mentioned as an area where R&D must be strengthened³⁴³¹, as well as hybrid vehicles and alternative fuel vehicles³⁴³².

More concretely, the 2017 Automobile Plan outlines the project for the establishment of innovation centers, which will follow the formulation of “*technology roadmaps for [...] pure electric vehicles and plug-in hybrid vehicles, hydrogen fuel cell vehicles [...] automotive power batteries ... and automobile manufacturing*”³⁴³³. The establishment of the innovation centres was scheduled to be completed by 2020 and they should have been devoted to innovation in the

³⁴³² Section 3(3)(3), 2017 Automobile Plan.

³⁴³³ Column 1, 2017 Automobile Plan.

automotive industry, for example to “*power batteries*” and “*intelligent connected vehicles*”³⁴³⁴. By 2025, it was envisaged that the innovation centres would have been instrumental for the development of the industry and would have a strong international competitiveness. In this connection, two innovation centres were indeed established: the China Automotive Battery Research Institute³⁴³⁵ (which was founded already in 2016, before the issuance of the 2017 Automobile Plan) and the National Innovation Center of Intelligent and Connected Vehicles³⁴³⁶ as consortias of State entities and NEV producers.

In parallel, the strengthening of manufacturing technologies of key parts such as the “*electric drive system*” is to be encouraged³⁴³⁷ and the integration and relationship in the production of vehicles and their parts is to be developed by national science and technology plans promoted through special projects and funds³⁴³⁸. In this respect, the 2017 Automobile Plan foresees (i) by 2020, the creation of a number of Chinese automobile parts companies able to become competitive in key technological fields, and (ii) by 2025, the positioning of a number of Chinese automobile parts among the top ten automobile parts companies in the world in terms of production value.

NEVs are considered as a key sector for the industrial transformation and upgrade. The 2017 Automobile Plan provides for an acceleration of the R&D and of the industrialisation of NEV technologies. To this end, “*corporate investment, social capital, and national science and technology plans (special projects, funds, etc.)*” should be used to coordinate and organise companies, universities and scientific research institutes in order to tackle key problems “*focusing on power batteries and battery management systems, motor drives and power electronics assemblies [...] innovation chains including technology, fuel cell power system, plug-in/range -extended hybrid power system and pure electric power system*”³⁴³⁹. With specific regards to batteries, the 2017 Automobile Plan calls for an implementation of power battery upgrade projects, unleashing the potential of the Power Battery Innovation Centre (set up as the China Automotive Battery Research Institute referred to above) and of the Power Battery Industry Innovation Alliance (i.e., the NEV and battery producers involved in the creation of the Centre)³⁴⁴⁰ carrying out joint research on technologies such as “*key materials for power batteries, single batteries, and battery management systems*” and accelerating “*the realization of revolutionary breakthroughs in power batteries*”³⁴⁴¹. This focus on the development of the battery industry in the 2017 Automobile Plan is part of a wider effort of the Government to foster the development of the automobile power battery value chain, shown also by the 2017 Action Plan for Promoting the Development of the Automotive Power Battery Industry (see Section 22.3.9).

³⁴⁴⁰ The NEV and battery producers involved in the creation of the Centre are listed here: <http://www.glabat.com/class/54> (accessed on 14 June 2023).

³⁴⁴¹ Section 3(3)(1), 2017 Automobile Plan.

More generally, the Government intends to “[i]mprove the support policy system for the promotion and application of new energy vehicles”, fostering the transition from encouraged purchases of NEVs to a use of NEVs which would be cost-effective, to “establish a long-term mechanism to promote the development of new energy vehicles” and to “guide manufacturers to continuously increase the proportion of production and sales of [NEVs]”³⁴⁴².

In terms of specific objectives for NEVs, (i) by 2020, (a) annual production and sales of NEVs was supposed to reach 2 million units, (b) the specific energy of the batteries to exceed 300 Wh/kg, aiming at reaching 350 Wh/kg, and (c) the specific energy of the system was to reach 260 Wh/kg, with costs dropping below 1 RMB/Wh, and (ii) by 2025, (a) NEVs should account for more than 20% of car production and sales, and (b) the specific energy of the batteries is supposed to reach 350 Wh/kg. It appears that the 2020 objective of NEV production and sale was reached, if the two indicators were considered cumulatively, as NEV production reached 1 366 000 million units and sales 1 367 000 units³⁴⁴³.

In the 2017 Automobile Plan, the Government further expresses the need for raising awareness for Chinese brands among consumers, based on quality control and brand strategy³⁴⁴⁴. In this endeavour, the role of the Government consists in guiding industry organisations to establish a quality brand evaluation system and to “actively promote the construction of a new international order for auto brand evaluation”. It is noteworthy that the Government promises also to support profitable companies “in the acquisition and operation management of internationally renowned brands” and its strategy to build leading companies entails also supporting profitable companies in order “to grow bigger and stronger, become a leading automobile enterprise with strong international competitiveness”³⁴⁴⁵. Beyond car producers, the Government intends to support also the growth of automobile parts, maintenance and consulting services companies with technological innovation capacities in order to develop them into ‘little giants’ (see Section 2.3.2)³⁴⁴⁶.

This Government’s strategy for the automotive sector fits in the wider Chinese ‘go out’ policy and the Belt and Road Initiative. Indeed, the 2017 Automobile Plan invites car companies to adopt a “strategic concept of international development” and to outline an “international development strategy”³⁴⁴⁷. In particular, car manufacturing companies cooperating with car parts manufacturing companies would qualify for governmental support to identify “key development areas to build automobile industrial parks” and for support related to establishing ‘overseas development alliances’³⁴⁴⁸. Furthermore, the Government is intent on promoting the setting up by car manufacturing companies of “overseas development funds for the automobile industry” and it correspondingly encourages banking institutions to establish a “credit management and loan review system suitable for the overseas development of automobile companies” and “a multi-level overseas investment guarantee system for the automobile

³⁴⁴² Section 3(3)(1), 2017 Automobile Plan.

³⁴⁴⁴ Section 5(1)-(2), 2017 Automobile Plan.

³⁴⁴⁵ Section 5(4), 2017 Automobile Plan.

³⁴⁴⁶ Section 3(5)(4), 2017 Automobile Plan.

³⁴⁴⁷ Section 6(1), 2017 Automobile Plan.

³⁴⁴⁸ Section 6(2), 2017 Automobile Plan.

industry”. Concretely, the 2017 Automobile Plan calls for the establishment of Overseas Development Projects, in the context of a “*strategic framework agreement on cooperation in the automobile industry*” to be “*based on the multilateral and bilateral high-level cooperation mechanism*”³⁴⁴⁹. In short, the Government actively promotes a “*coordinated overseas expansion*” of Chinese brands³⁴⁵⁰.

Among the implementing measures, the 2017 Automobile Plan lists increased fiscal and taxation financial support. For example, relying on funding sources such as the Automobile Industry Joint Fund (see Section 22.4.5), the support for the implementation of eight major projects, including the construction of innovation centres, is foreseen in the Plan. In addition, leveraging “*policy finance and commercial finance*” and supporting the EXIM to increase its services “*for auto companies going global*” feature among the implementing measures³⁴⁵¹.

Therefore, the 2017 Automobile Plan is a comprehensive policy document which shows how important NEVs became in the wider automotive sector for the Government. The policy guidance of the Government is well shown not only by the quantitative objectives and by the channelling of R&D efforts, but also by the push for the creation of larger companies. This influence hampers ordinary competitive dynamics among market players and favours domestic producers. To these, the Government appears to offer the means for an easy access to finance, especially to fund their international expansion, granted in turn by banking institutions which follow the NEV policy and objectives of the 2017 Automobile Plan.

22.3.9. THE 2017 ACTION PLAN FOR PROMOTING THE DEVELOPMENT OF THE AUTOMOTIVE POWER BATTERY INDUSTRY

In the framework of the NEV Plan 2012-2020, in 2017 the MIIT, together with the NDRC, the MOST and the MOF, issued the Action Plan for Promoting the Development of the Automotive Power Battery Industry (‘*2017 Battery Action Plan*’)³⁴⁵². The 2017 Battery Action Plan tackles the development of the upstream part of the value chain for the production of NEVs, whereas the downstream part is the subject of the 2017 Automobile Plan. As the 2017 Automobile Plan, the 2017 Battery Action Plan foresees a development of the battery industry with a goal to serve in turn the development of the NEV industry. Therefore, the growth of the battery industry must be ‘*coordinated*’³⁴⁵³ and the R&D is directed towards the improvement of lithium-ion power batteries³⁴⁵⁴ – the main battery type used for NEVs. To achieve these goals, the 2017 Battery Action Plan provides for an “*increase [of] policy support*”³⁴⁵⁵. This policy support includes the “*guiding role of the government*” and the “[e]xemption from excise tax if the power battery product is eligible; [p]ower battery enterprises are eligible to benefit from tax incentives such as high-technology enterprises, technology transfer and technology development”³⁴⁵⁶. As for

³⁴⁵⁶ Section 4(1), 2017 Battery Action Plan.

the NEV industry, the Government intends also to “support [...] investments and the construction of factories of domestic power battery companies abroad”³⁴⁵⁷.

Therefore, the 2017 Battery Action Plan shows how the policy guidance of the Government encompasses the whole value chain of the NEVs. In particular, it shows that the development of the battery industry is directed to serve the purposes of the development of the NEV industry. Finally, it shows the preference accorded by the Government to domestic battery producers, with a view to strengthen them and encourage their market penetration abroad.

22.3.10. THE 2017 DUAL-CREDIT POLICY

In 2017, the MIIT, together with MOF, the MoC, the General Administration of Customs and the General Administration of Quality Supervision, Inspection and Quarantine, issued the Parallel Management Method for Corporate Average Fuel Consumption and New Energy Vehicles Credits for Passenger Vehicles (*‘Dual-Credit Policy’*)³⁴⁵⁸.

The Dual-Credit Policy is a system of points attributed to companies on two parallel scales: on the one side, the reduction of the average fuel consumption for all their passenger vehicles (including NEVs), on the other side, the production or import of NEVs. The Dual-Credit Policy applies only to the average fuel consumption and the production of passenger vehicles, and not to other categories of vehicles. The points can be positive, i.e. credits, or negative, i.e. debits. Positive points are generated when a company remains *below* the standard of assessment for its average fuel consumption and *above* the standard of assessment for the production volume or import volume of passenger NEVs. Negative points are generated when a company exceeds the standard for average fuel consumption or does not meet the standard for the production or imports of NEVs. Negative points can be offset by purchasing them from NEV producers with a positive balance. Failure to offset negative points implies administrative penalties, such as a compulsory stop to the production of high fuel consumption vehicles, to the registration of new vehicles and to capacity expansion. While positive and negative points are attributed on two different scales, what matters is the combination between the two. This means that, for example, a company with a high fuel consumption can still have a positive balance if it produces a lot of NEVs. Moreover, negative points appear to be calculated at consolidated level. Therefore, one producer can offset its negative points with the positive points of a related company. While this mechanism appears to be automatic for fully controlled entities³⁴⁵⁹, it is unclear if this works automatically also for minority stakes³⁴⁶⁰. For example, the need to offset its negative points is the reason why in 2017 GWM acquired a 25% stake in Yogomo (rebranded on the occasion of the share purchase as Link Tour). At the same time, Yogomo sold to GWM all its corporate average fuel consumption credits and a certain amount of NEV credits³⁴⁶¹. Thus, in this

³⁴⁵⁷ Section 4(5), 2017 Battery Action Plan.

³⁴⁵⁹ See at: <https://auto.cctv.com/2022/07/18/ARTIhUdJiLnh2aaBKQAhSaBL220718.shtml> (accessed on 12 June 2023).

³⁴⁶⁰ Certain sources claim that this would be the case, see at: <https://www.sciencedirect.com/science/article/pii/S0921344920300343#kwd0005> (accessed on 12 June 2023).

³⁴⁶¹ See at: <https://gasgoo66.wordpress.com/2018/07/24/yogomo-changes-name-as-link-tour-to-target-new-energy-pvs/> (accessed on 12 June 2023).

instance, while an agreement was concluded, GWM obtained more credits than it would have been entitled to consolidate with only a 25% stake.

The methodology for the calculation related to the average fuel consumption was included in the successive reviews of the Fuel Consumption Evaluation Methods and Targets for Passenger Vehicles, initially issued for other purposes in 2011³⁴⁶², then reviewed in 2014 and once more in 2019, with application as of 1 January 2021³⁴⁶³. The standard for the average fuel consumption is the ratio between the actual value of the average fuel consumption of a company in a certain year and a target value for the same company in the same year. The actual value of the average fuel consumption of a company in a certain year is calculated using the amount of fuel consumed by each individual vehicle type of the company, multiplied by the corresponding annual production or import volume, divided by the total annual production or import of passenger vehicles of the company. The target value of the average fuel consumption in the 2011 version was a certain value of fuel consumption set for each vehicle type³⁴⁶⁴, which then developed into a formula in the 2019 version³⁴⁶⁵. Therefore, in the 2019 update, the standard for the average fuel consumption in 2021 was set at 123% of the target value, progressively decreasing in the following years: in 2022 120% of the target value, in 2023 115% of the target value, in 2024 108% of the target value and finally, as of 2025, actual and target value should coincide³⁴⁶⁶.

The methodology for the calculation related to the production of NEVs was included in the Dual-Credit Policy and in the Passenger NEV Model Credit Calculation Method³⁴⁶⁷. On this scale, the points correspond to the difference between the actual production and import and the target production and import. To calculate the actual production and import, a formula in the Passenger NEV Model Credit Calculation Method ensures a certain amount of points for each type of NEV produced or imported. The target production and import of NEVs is instead established in relation to the total production and import of passenger vehicles of each company.

Points awarded to the actual production and import of NEVs in the formula have been progressively decreased, in order to compel companies to produce and import more NEVs³⁴⁶⁸.

The Dual-Credit Policy deeply affects competitive dynamics in the Chinese NEV market, as it concurs in further enlarging and reinforcing companies which are already large. Indeed, as mentioned, the focus of the Dual-Credit Policy is on the production or import, given that also the average fuel consumption depends on the NEVs or other low-emission vehicles produced or imported. Thus, companies with a good fuel performance or high production have the possibility to offset losses or obtain additional income through the sale of credits. On the

contrary, smaller or non-established companies, with a bad fuel consumption or low production have to invest resources in offsetting their debits, automatically reducing potential investments in R&D and production. Furthermore, companies backed by wealth investors have the means to afford the purchase of credits or shares in companies with credits, whereas start-ups and smaller companies have lower chances to offset their debits. In essence, the Dual-Credit Policy favours the consolidation of the market, contributing to the objective already outlined by the Government in the 2017 Automobile Plan³⁴⁶⁹.

22.3.11. NEVs IN THE RECOMMENDATIONS FOR THE 14th FYP

In October 2020, the CCP Central Committee approved its Recommendations for the Formulation of the 14th FYP (2021-2025) for National Economic and Social Development and the Long-Range Objectives Through the Year 2035 (*‘14th FYP Recommendations’*)³⁴⁷⁰. The 14th FYP Recommendations provide the basic guidance for the full formulation of the 14th FYP. NEVs are mentioned among the SEIs whose development the Party intends to foster and expand. Moreover, automobiles more generally are indicated as a consumer product of which the Party intends to foster consumption, promoting “*a shift from purchase management to usage management*”.

22.3.12. NEVs IN THE 14th FYP

NEVs are firstly mentioned in Article VIII of the 14th FYP, entitled “*Deepen the implementation of the manufacturing powerhouse strategy*”, and included in Part Three of the 14th FYP, dedicated to “*Accelerate the development of a modern industrial system and consolidate and strengthen the foundation of the real economy*”. NEVs are listed, together with intelligent (connected) vehicles, among the sectors for which an increase of the manufacturing core competitiveness is prescribed. The 14th FYP envisages to “*make breakthroughs in key technologies such as high-safety power batteries, high-efficiency drive motors, and high-performance power systems for new energy vehicles and accelerate the R&D of key components such as the basic technology platforms for intelligent (connected) vehicles, software and hardware systems, steer-by-wire chassis, and smart terminals*”.

Mirroring the 14th FYP Recommendations, the 14th FYP also mentions the NEVs as a strategic emerging industry in Article IX, titled “*Develop and expand strategic emerging industries*”, and specifically in Section 1 therein, dedicated to “*Build new pillars of the industrial system*”.

22.3.13. THE NEW ENERGY VEHICLE INDUSTRY DEVELOPMENT PLAN (2021-2035)

Following up on 14th FYP Recommendations for the NEV sector, the State Council approved in October 2020 the New Energy Vehicle Industry Development Plan (2021-2035) (*‘NEV Plan*

³⁴⁶⁹ See Section 2(2), 2017 Automobile Plan.

³⁴⁷⁰ Chinese version available on https://web.archive.org/web/20201104114039/http://www.xinhuanet.com/politics/zywj/2020-11/03/c_1126693293.htm, English translation available at: <https://cset.georgetown.edu/publication/proposal-of-the-central-committee-of-the-chinese-communist-party-on-drawing-up-the-14th-five-year-plan-for-national-economic-and-social-development-and-long-range-objectives-for-2030/> (accessed on 12 June 2023).

2021-2035’)³⁴⁷¹. This was not the first time that the State Council issued directives on NEVs, indeed, the NEV Plan 2021-2035 follows up on the NEV Plan 2012-2020 described in Section 22.3.4. Since 2012, the NEV industry in China experienced a substantial growth, but in 2020 the State Council acknowledged certain issues affecting the industry. These issues included weak capabilities for innovation in core technologies, the need for improvement of the systems to ensure quality, the deployment of related infrastructure still lagging behind, a flawed industrial ecosystem and increased market competition. Thus, the declared objectives of the NEV Plan 2021-2035 are to promote the high-quality development of the NEV industry and to accelerate the establishment of an automobile powerhouse.

According to Section 1 of Chapter II, the general strategy for the development of the NEV industry has a supply-side structural reform as one of its main lines of actions and focuses on integrated innovation, on key core technologies, on improving the industrial basic capabilities, on building a new industrial ecosystem, on improving the infrastructure system, on enhancing the industrial development context, on promoting a high-quality and sustainable development of the industry and on accelerating the establishment of an automobile powerhouse.

Pursuant to Section 2 of Chapter II, even though one of the basic principles of the NEV Plan 2021-2015 is the decisive role of the market in resource allocation and in companies’ positioning, this role is to be balanced by the Government’s role in the strategic planning guidance and in keeping the ‘*market order*’ and by the Government’s support offered to all operators to develop key core technologies, to increase business model innovation and to form an innovative industrial ecosystem. Moreover, advancements in the field of NEVs will be ‘*coordinated*’, both horizontally and vertically, in order to bring forward also sectors integrated with NEVs, such as energy, transports, information and communications.

Section 3 of Chapter II sets a clear target for the development of the NEV industry: by 2025, NEVs must reach 20% of the sale volume of new vehicles.

Section 1 of Chapter III, labelled “*Deepen the ‘three vertical and three horizontal’ R&D layout*”, clarifies that the 3 vertical layouts correspond to the three technologies of NEVs to which the NEV Plan 2021-20135 applies: (i) BEVs, (ii) PHEVs, and (iii) FCEV. On the contrary, the 3 horizontals correspond to the key technological components of the supply chain of NEVs: (i) power battery and management system, (ii) motor and power electronics, and (iii) networks and intelligent technologies. R&D is, therefore, a key factor for the development of the NEV industry according to the NEV Plan 2021-2035 and Section 2 of Chapter III provides for the establishment and improvement of joint R&D mechanisms of leading companies, national key laboratories and national manufacturing innovation centres.

Chapter IV, Section 1, dedicated to the “*Support the development of eco-oriented companies*”, foresees strengthening the role of leading companies in areas with a solid industrial and innovation background by promoting both upstream and downstream collaborative innovation,

³⁴⁷¹ Chinese version available at: http://www.gov.cn/zhengce/content/2020-11/02/content_5556716.htm and https://www.ndrc.gov.cn/fggz/fzzlgh/gjjzxgh/202111/t20211101_1302487.html?code=&state=123, English overview available at: <https://theicct.org/wp-content/uploads/2021/12/China-new-vehicle-industrial-dev-plan-jun2021.pdf> (accessed on 12 June 2023).

the integrated development of large and small companies, industrial clusters capable of projecting their influence and competitiveness at international level, and the modernisation of the industrial value chains.

The NEV Plan 2021-2035 is not limited to NEVs but extends also to batteries for NEVs. Section 2 of Chapter IV labelled “*Promote the innovative application of key systems*” strives to promote the development of the whole value chain of batteries. This includes, notably, encouraging companies to secure access to key resources such as lithium, nickel, cobalt and platinum. More widely, the focus is placed on the improvement of modular standard systems of batteries, on accelerating developments in key manufacturing equipment, on improving process and production efficiency, on improving the recycling of batteries (including the efficient extraction of valuable elements of scrapped power batteries), the cascading of their use and shared recycling channels.

The NEV Plan 2021-2035 considers also the impact of the growing use of NEVs and its impact on the electric grid. The proposed solutions to improve the interaction between NEVs and the grid include strengthening the research on high-cycle life batteries and promoting the application of low-power direct current technologies. The NEV Plan 2021-2035 envisages also to “*encourage local governments*” to carry out pilot applications of the NEVs-grid interaction³⁴⁷², to coordinate the charging and discharging of NEVs and the power dispatching needs. Local governments are also empowered to fully make use of peak/valley electricity prices and preferential charging for NEVs in order to achieve an efficient NEVs-grid interaction.

In addition, the NEV Plan 2021-2035 covers hydrogen as a fuel for NEVs. In this respect, companies will be guided to rationally deploy the hydrogen refuelling infrastructure, based on the hydrogen fuel supply and on consumer demand, and to improve the safety level of operations. The use of existing facilities for supply services of oil, gas, hydrogen and electricity will be supported.

The plan is intended for the domestic NEV market, but it takes into account the international dimension as well. In fact, Section 2 of Chapter VII, labelled “*Accelerating integration into global value chains*”, states that guidance will be provided to companies to prepare international development strategies, to continuously improve their international competitiveness, to increase their international market developments and to promote cooperation between production and R&D, marketing, other value chains. Companies are also encouraged to make full use of their domestic and foreign financial resources and to internationalise the consumer credit system, in order to offer also consumers abroad an incentive to purchase Chinese NEVs. Support will also be available to companies to establish international marketing services networks and joint service platforms such as overseas warehouses and after-sales service centres in key export markets.

Concerning the domestic Chinese industry, Section 1 on “*Deepening Industry Management Reform*”, included in Chapter VIII on ‘*Implementing Measures*’, plans to improve the management of the corporate average fuel consumption and of NEV credits in the framework

³⁴⁷² Pilot applications are tests to show the relevance of a new device.

of the Dual-Credit Policy and to “*effectively undertake financial subsidy policies*”. Moreover, the intention is to reduce confusion concerning “*blindly launching*” NEV manufacturing projects. While the NEV Plan 2021-2035 refers in this respect to the market competitive dynamics, it also mentions the support for mergers and reorganizations in order to structure bigger and stronger companies and to further improve the degree of industrial concentration.

More broadly, Section 2 of the same chapter provides for the implementation of “*preferential tax policies*” for NEVs, for “*financial support*” for the deployment of public charging infrastructure and for “*preferential policies*” for NEVs, such as parking and charging. The NEV Plan 2021-2035 mandates that, by 2021, the proportion of NEVs in public areas in National Ecological Civilization Pilot Zones – selected areas established to improve the coordinated development of economy and environment – and in key areas for air pollution prevention and control was to be at least 80%. It is unclear if this target was met, but in January 2022 the Government announced that it intended to equip 80% of the National Ecological Civilization Pilot Zones and of the key areas for air pollution prevention and control with rapid charging stations by 2025³⁴⁷³.

Finally, given the importance of NEVs, in the same chapter, Section 5 on ‘*Strengthening Organizational Coordination*’ aims at strengthening the overall policy planning of NEVs and energy, transport, information and communication, standard and regulations, with a specific attention to the concrete implementation of the planning. All relevant administrative departments should formulate their own work plans and support policies and measures according to their function. The implementation of the policies will involve all regions, in light of their specific local conditions. The NEV Plan 2021-2035 also acknowledges the role of industry organizations as a bridge between companies and the Government and to coordinate cross-border exchanges and collaboration platforms (see also Section 2.3.3). In particular, the MIIT is tasked with the smooth implementation of the NEV Plan 2021-2035.

22.3.14. THE 2023 ANNOUNCEMENT ON THE CONTINUATION AND OPTIMIZATION OF THE NEW ENERGY VEHICLE PURCHASE TAX REDUCTION POLICY

In June 2023, the MOF, the State Administration of Taxation and the MIIT released their Announcement No. 10 of 2023 on the Continuation and Optimization of the New Energy Vehicle Purchase Tax Reduction Policy (‘*Purchase Tax Exemption Announcement*’)³⁴⁷⁴. In fact, NEVs would normally be subject to a 10% purchase tax. However, starting from 2014, the Government exempted the purchase of NEVs produced in China or imported, and fulfilling certain technical requirements, from the purchase tax. The purchase tax exemption was meant to expire at the end of 2020 but was prolonged until the end of 2022 in the wake of the economic impact of the COVID-19 pandemic, and then further extended to the end of 2023. The

³⁴⁷³ See at : http://english.www.gov.cn/statecouncil/ministries/202201/22/content_WS61eb3b40c6d09c94e48a415d.html (accessed on 12 June 2023).

³⁴⁷⁴ See at: http://szs.mof.gov.cn/zhengcefabu/202306/t20230620_3891500.htm (accessed on 16 June 2023).

exemptions from the purchase tax on NEVs accounted for more than RMB 80 billion (USD 11.9 billion) in 2022³⁴⁷⁵.

The Purchase Tax Exemption Announcement provides that the purchase tax exemption will last until the end of 2027. Between January 2024 and December 2025, the purchase tax will be capped at a higher amount, which will be halved between January 2026 and December 2027 with the purpose to gradually reduce the Government's support. The purchase tax exemption applies to passenger BEVs, PHEVs and FCEVs meeting the technical requirements indicated in a separate act.

The further prolongation of the purchase tax exemption shows that the Government keeps intervening into the NEV market with a view to ensuring its economic viability. Indeed, in an article reported on the State Council's website it is stated that the Purchase Tax Exemption Announcement is "*expected to further stimulate consumer buying sentiment for NEVs and inject strong impetus into the world's biggest auto market*"³⁴⁷⁶.

The purchase tax exemption on NEV prices may contribute to suppress NEV prices. This role would be even enhanced after that the purchase subsidy scheme was terminated in December 2022 (see Section 22.3.3). However, it is unclear how NEV producers would react should the tax exemption be terminated: they could either raise the prices by the corresponding 10% or they could be able to absorb the 10% increase without raising the prices or raising the prices by a lower percentage. This would mean that for the period of tax exemption in place, the NEV could producers to benefit from additional streams of income which would have been otherwise levied by the Government's tax administration.

22.3.15. THE 2023 MEASURES TO FURTHER PROMOTE THE AUTOMOBILE CONSUMPTION AND PLANS TO BOOST THE NEV INDUSTRY

In July 2023, the NDRC announced a series of measures meant to further increase the automobile consumption, and notably the purchase of NEVs³⁴⁷⁷. These measures include the reduction of the purchase and use cost of NEVs, such as through the adjustment of the price of the electricity linked to the use of NEVs, and an increased credits support, such as for the battery insurance. The set of measures also recalls the prolongation of the purchase tax exemption (see Section 22.3.14) and the measures adopted to facilitate the spread of NEVs in rural areas.

In parallel, the State Council published its Plans to boost NEV industry³⁴⁷⁸. These Plans are articulated around three pillars: (i) further promote NEV sales, (ii) facilitate the purchase of electric cars in rural areas, and (iii) improve the NEV charging infrastructure. The further promotion of NEV sales will take the form of the purchase tax exemption (see Section 22.3.14),

³⁴⁷⁵ See at: <http://www.chinatax.gov.cn/eng/c101269/c5183762/content.html> (accessed on 16 June 2023).

³⁴⁷⁷ See at: https://english.www.gov.cn/news/202307/21/content_WS64ba4441c6d0868f4e8de048.html (accessed on 12 June 2023).

³⁴⁷⁸ See at: http://english.www.gov.cn/policies/featured/202308/12/content_WS64d6b984c6d0868f4e8de7d7.html (accessed on 12 June 2023).

with specific tax exemption provision to be adopted for NEVs with battery swap technology, and through the promotion of the use of NEVs in public transport, in the CCP and Government offices and in taxi services. The spread of NEVs in rural areas is to be achieved by improving the deployment of the charging infrastructure and of NEV sale and after-sale services, by developing NEV segments such as vans and trucks and by offering promotional coupons to rural residents. The improvement of the NEV charging infrastructure will be obtained by applying household electricity rates to battery charging and battery swapping in residential areas and by providing increased credit support, notably on battery insurance.

These measures show the Government's continued efforts to foster NEV consumption. Moreover, it shows that the Government's support widened – instead of shrinking – to ancillary aspects of the use of NEVs, such as the price of the electricity needed for their use or the safety of the batteries, which justify the focus on the credit support for battery insurance.

22.3.16. PROVINCIAL, REGIONAL, MUNICIPAL AND LOCAL PLANS

The instructions of the 14th FYP and of the NEV Plan 2021-2035 are reflected and implemented in the corresponding provincial, regional, municipal and local plans.

The provincial plans ensure the effectiveness of the implementation of the provisions of the central plans and provide more details on how the objectives of the central plans should be translated into policies within individual provinces (see also Section 4.2.1). In particular, this Report looked at the plans of the following provinces and provincial-level administrative units where NEV manufacturers are located:

- Anhui, where Chery is headquartered;
- Guangdong, where Xpeng is headquartered;
- Guizhou;
- Fujian, where CATL is headquartered;
- Jiangsu;
- Zhejiang, where Geely's main production plant is located;
- Guangxi Zhuang; and
- Shanghai, where SAIC is headquartered.

In turn, local plans implement provincial and provincial-level plans at lower administrative levels, such as the main industrial cities. Lower administrative entities analysed include:

- the city of Hefei, where NIO is located; and
- the Pingshan district in the city of Shenzhen, where BYD is headquartered.

Anhui provides an example of this cascade of plans. Anhui drafted its provincial High-quality Development Plan of Automobile Industry in Anhui Province during the 14th FYP ('*Anhui 14th Automobile Provincial Plan*')³⁴⁷⁹, with a corresponding plan put in place by Hefei, the

³⁴⁷⁹ Available at: <http://jx.ah.gov.cn/group6/M00/05/3A/wKg8BmJGrKiADusMAAY2nfCCzQM591.pdf> (accessed on 14 June 2023).

province's capital city: 14th FYP for the Development of New Energy Vehicle Industry in Hefei (*'Hefei 14th NEV Local Plan'*)³⁴⁸⁰.

The following elements included in the above sub-central plans provide a non-exhaustive overview of the planning policies by which the Chinese authorities intend to shape the development and structure of the NEVs sector.

In the Hefei 14th NEV Local Plan, the general governmental control over the industry is based on the principle of “[g]overnment guidance, market leadership”. This basic principle requires to “[g]ive full play to the role of the government in various aspects such as top-level design, platform construction, pilot applications, application and promotion, etc. Strengthen policy support and further create an environment guiding high-end production factors to concentrate towards the new energy vehicle industry”. At the same time, under this principle, the local authorities are supposed to “[be g]uided by market demand, give full play to the decisive role of the market as regards resource allocation, strengthen the key position of enterprises in the selection of technological paths and product manufacturing capacity layout, foster a better combination of an efficient market with a favourable government, and establish a dynamic development environment”³⁴⁸¹.

Still, the role of the market seems to be subordinate to the role that governmental authorities have in competitive dynamics between market players. Indeed, the 14th FYP New Energy Vehicle Industry Development Plan of the Jiangsu Province (*'Jiangsu 14th NEV Provincial Plan'*)³⁴⁸² intends to “promote industry mergers and reorganizations”³⁴⁸³ in order to foster the development of the Jiangsu NEV industry.

The Hefei 14th NEV Local Plan also set detailed quantitative production targets: “Strive to ensure that by 2025, the scale of the city's new energy automobile industry exceeds RMB 700 billion and the production capacity of complete vehicles exceeds 3 million, to foster 10 enterprises with a scale of RMB 10 billion and to ensure that the output value and output volume rank first in the country; [d]evelop a new energy vehicle and parts industry system with a comprehensive layout and a reasonable structure, the annual production capacity of batteries shall exceed 300 GWh, and the annual production capacity of drive motor systems shall exceed 3 million sets”³⁴⁸⁴.

The Hefei 14th NEV Local Plan also envisaged to support several investments to: “Strive to build by 2025, 1 national new energy vehicle industry innovation center, 5 public innovation centers, and to foster 1 business model innovation project as well as 10 new innovation platforms above the provincial level by 2025”³⁴⁸⁵.

This last provision of the Hefei 14th NEV Local Plan implements the Anhui 14th Automobile Provincial Plan, where this support was addressed also to specific industrial parks and

³⁴⁸⁵ *Ibid.*

companies in the area: “Accelerate and promote the construction of the Xinqiao Smart Electric Vehicle Industrial Park, and create a world-class smart electric vehicle industrial cluster with a complete industrial chain and integrating R&D and manufacturing, pilot applications and application, as well as industry and supporting services. Support NIO’s long-term development planning and layout around Xinqiao Industrial Park, and establish R&D, manufacturing, marketing and management teams within the park. Establish NIO R&D and Innovation Center, carry out innovative research and development concerning complete vehicles, core components and autonomous driving, create a globally competitive and leading innovation chain; attract R&D staff and technical workers and strive to form an innovative place gathering high-level talents. [...] After completion of the park, it is estimated that the final vehicle production capacity will be 1 million vehicles per year, and the battery production capacity will be 100GWh per year”³⁴⁸⁶.

Evidence of this support was the framework agreement signed by Hefei and NIO to jointly plan and build the Xinqiao Industrial Park, for an initial investment of RMB 5 billion³⁴⁸⁷.

An express support for specific companies was also included in the Implementation Plan for Accelerating the Development of the New Energy Vehicle Industry in Shanghai (2021-2025) (*‘Shanghai NEV Municipal Plan’*)³⁴⁸⁸, which pledged to: “Support SAIC Motor to develop new energy vehicles. By 2025, the sales of self-owned brand passenger vehicles and new energy vehicles will account for more than 30% and the group’s new energy vehicle sales will account for more than 20%, ensuring that the core technology is under independent control and a comprehensive position of strength and domestic leadership. Encourage domestic and foreign strong companies with leading technology to invest in complete vehicle manufacturing and R&D projects in Shanghai”³⁴⁸⁹. Furthermore, according to SAIC’s 2021 annual report, the company received regional subsidies for project development in excess of RMB 1.13 billion, with a significant proportion of that support being directly tied to the NEV sector³⁴⁹⁰.

The support to the growing NEV industry is not limited to government authorities, but extends also to the banking sector, as it is shown by the 14th FYP for the Development of the New Energy Automobile Industry in the Guangxi Zhuang Autonomous Region (*‘Guangxi Zhuang 14th NEV Regional Plan’*)³⁴⁹¹. Indeed, the Guangxi Zhuang 14th NEV Regional Plan endeavoured not only to “[a]ctively play a policy and commercial financial role and increase the financial support for the development of the new energy automobile industry”, but it also stated expressly that “[f]inancial institutions are encouraged to provide full-industry-based financial services for new energy automobiles”³⁴⁹².

Each province appears to support NEV producers established in its territory. In particular, marketing and branding are common concerns for lower levels of government. Typically, the

³⁴⁹² Chapter VI, Section 1, Guangxi Zhuang 14th NEV Regional Plan.

14th FYP for the Development of the New Energy Automobile Industry in the Zhejiang Province (*‘Zhejiang 14th NEV Provincial Plan’*)³⁴⁹³ intended to “[s]upport Geely Group’s deployment in the mid-to-high-end passenger car market and build a world-renowned brand of new energy vehicles. Promote Weima, Hezhong, Leapao, Tianji and other new car manufacturers to improve their positive development capabilities and brand marketing capabilities”³⁴⁹⁴.

Leading NEV companies are often identified in provincial and local plans as models for further development of the industry through governmental support. In the Brand-building Plan for the New Energy Automobile Industry in Pingshan District, Shenzhen (*‘Pingshan NEV Local Plan’*)³⁴⁹⁵, BYD and Kaiwo are identified as the model for the implementation of the ‘Headquarters R&D + High-end Manufacturing’ layout³⁴⁹⁶:

Relying on the research and development strong capacities of high-quality new energy automobile enterprises in the Pingshan District, such as BYD and Kaiwo, strengthen the building of colleges and universities, research institutions, national key laboratories, national engineering laboratories and engineering centers and improve innovation at the regional level. Complement the innovation chain around the new energy vehicle industry chain, improve the upstream and downstream industry chains of new energy vehicles, batteries, communication power supplies, UPS [uninterruptible power supply], charging guns, wires and cables, supercapacitor chemicals, semiconductor chemicals, etc.so as to form a complete industry chain. Ensure a high degree of clustering of the new energy vehicle industry, continue to build and introduce a number of technology industry innovation platforms that closely support new energy vehicles R&D and manufacturing, and accelerate the construction of a technological innovation system that deeply integrates production, academics, research and application. Focus on ‘integrating headquarters, R&D and production’, develop actions for listed companies to take root, actions for key enterprises to stabilize growth, and accelerate the formation of a functional layout of ‘headquarters R&D + high-end manufacturing’.

The development of the NEV industry is not based only on the development of new plants and capacities, but also on the conversion of existing automobile capacities for the production of ICEs. The Jiangsu 14th NEV Provincial Plan correspondingly intends to “[a]ccelerate the transformation of Nanjing, Xuzhou, Suzhou, Yancheng, Yangzhou and other automobile production bases to the direction of new energy vehicles”³⁴⁹⁷.

³⁴⁹³ Available at: https://www.zj.gov.cn/art/2021/6/24/art_1229540815_4671257.html (accessed on 14 June 2023).

³⁴⁹⁴ Chapter 3, Section 1, Zhejiang 14th NEV Provincial Plan.

³⁴⁹⁵ Available at: https://www.sist.org.cn/psqxnyqccyq/yqppjs/202008/t20200812_2302116.html (accessed on 14 June 2023).

³⁴⁹⁶ Chapter IV, Section 1, Point 3, Pingshan NEV Local Plan.

³⁴⁹⁷ Chapter 5, Jiangsu 14th NEV Provincial Plan.

In the Anhui 14th Automobile Provincial Plan, the support to the activity of the NEV industry and of specific NEV companies is not limited to the domestic market but directed also to exports already at provincial level:

Support the e-commerce of component supplying companies, build public overseas warehouses for export products, share channels to overseas markets and service support systems. Create tools such as import and export trade platforms, overseas industry parks as well as trade parks and guide the development of clusters of Chinese overseas investment enterprises. [...] By 2025, Chery Automobile shall export 500,000 vehicles with an export value of USD 5 billion. Foster Chery to further enhance its international competitiveness, [...] focus on expanding on strategic markets such as Europe, North America, and ASEAN countries [...] Support NIO to expand on the European market. Foster NIO to implement the 'Marco Polo Plan' [NIO's codename for its entry into the European market³⁴⁹⁸], adopt a differentiated development path and turn the 'NIO China Model' into the 'NIO Overseas Model' according to local conditions. [...] Support NIO to continue to expand on the European market, to expand on 5 national markets by 2025, and to select opportunities to build factories overseas³⁴⁹⁹.

The geographical distribution of the NEV industry is also controlled by the government authorities, as is clear from the 14th FYP for the Development of Electric Vehicle Charging Infrastructure in Guangdong Province ('Guangdong 14th EV Infrastructure Provincial Plan')³⁵⁰⁰:

Rely on Guangzhou, Shenzhen, Zhuhai, Foshan, Zhaoqing, Dongguan, Huizhou, Zhanjiang, Maoming, Shanwei, Yunfu and other cities and speed up the development pace of new energy vehicles. Guangzhou shall speed up the construction of new energy vehicle production bases and promote the quick industrialization of new energy vehicle models. Shenzhen, with Pingshan District as the core, shall build a national-level new energy vehicle industry base. Zhuhai, with Jinwan District as the core, shall focus on developing the manufacturing of complete new energy vehicles, lithium battery materials, powertrain, charging equipment and key components of new energy vehicles.

The support for key projects in the NEV industry covers also NEVs' related parts and components. The Development Plan of New Energy Automobile Industry in Fujian Province (2022-2025) ('Fujian 2022-2025 NEV Provincial Plan')³⁵⁰¹ identified the electric battery, the electric motor and the electronic control unit as the "three electric systems and other key components"³⁵⁰². Thus, as regards batteries, the government in the Fujian 2022-2025 NEV

³⁴⁹⁸ See at: <https://finance.sina.com.cn/stock/relnews/us/2020-11-01/doc-iiznezxr9218648.shtml> (accessed on 14 June 2023).

³⁴⁹⁹ Chapter VI, Section 2, Project 9, Anhui 14th Automobile Provincial Plan.

³⁵⁰¹ Available at: <https://fdi.swt.fujian.gov.cn/uploadfiles/file/20220426/1650941604952489.pdf> (accessed on 14 June 2023).

³⁵⁰² Chapter I, Section 1, Fujian 2022-2025 NEV Provincial Plan.

Provincial Plan foresees to provide “[s]upport for power and storage batteries such as the [battery producers established in Fujian]”³⁵⁰³ and “to increase credit support for full car leases and battery leasing”³⁵⁰⁴. Moreover, as regards the motor and the electronic control unit, the government intends to provide “[s]upport for the development of new energy motors and electronic control systems, and [envisages that] the Xiamen Tungsten industry develops the automobile industry using the advantage of rare earth eternal magnetic materials”³⁵⁰⁵.

Similarly, the 14th FYP Development Plan for the New Energy Automobile Industry in Guizhou Province (‘Guizhou 14th NEV Provincial Plan’)³⁵⁰⁶ seeks to:

Support the construction of key projects. Speed up and foster the Guiyang BYD’s power battery project with an annual output of 10GWH, the Evergrande new energy power battery project [...], Dongfang Electric’s hydrogen fuel cell project, Anda Technology’s 30,000-ton/year lithium iron phosphate and supporting construction projects as well as its 20,000-ton/year lithium iron phosphate smart manufacturing technical transformation and expansion project, Anda Technology’s 50,000 tons/year new energy vehicle waste battery recycling technical transformation project, Wuchuan Automobile’s annual production of 1 million tons of automotive aluminium alloy die-casting projects, Baike automobile brake molds production line project, a number of key projects such as the Guizhou Aerospace Smart Manufacturing Industry Cluster Base Project in Guiyang Economic and Technological Development Zone, Zhenhua New Materials Production Line Construction Project with an annual output of 12,000 tons of lithium-ion battery cathode materials [...].

Consequently, the competitive dynamics seem to be distorted also in the industry of parts and components. Indeed, the Jiangsu 14th NEV Provincial Plan intends to “[e]ncourage key parts and components companies: to focus on increasing their market share, on mastering core technologies, on increasing quality and cost controllability etc.; and to proceed to mergers and reorganizations and speed up the fostering and emergence of automobile parts industry clusters with a systematic development, a modular manufacturing pattern and integrated supplies”³⁵⁰⁷. Moreover, authorities try to redirect the production of automobile parts and components specifically towards the NEV industry.

22.4. MARKET DISTORTIONS

The amount and detail of the regulatory and policy documents concerning NEVs and batteries in China shows the importance that the Government attaches to these industrial sectors. Due to the combination of the different measures, the level of supervision that the Government exercises is so high that its intervention directly interferes with free market forces. In this

³⁵⁰³ Section III(I), Fujian 2022-2025 NEV Provincial Plan.

³⁵⁰⁴ Section IV(III), Fujian 2022-2025 NEV Provincial Plan.

³⁵⁰⁵ Section III(I), Fujian 2022-2025 NEV Provincial Plan.

³⁵⁰⁷ Chapter 5, Section 1, Jiangsu 14th NEV Provincial Plan.

section these measures and their application (or lack of application) are systematised based on the elements on which they could have an impact.

22.4.1. STATE OWNERSHIP AND CONTROL

State-owned companies constitute a considerable share of the NEV and battery sectors. As mentioned in Section 22.2.2, the State owns four large traditional automakers which produce also NEVs, dubbed the ‘Big Four’: SAIC, Dongfeng, FAW Group and Chang’an. In addition, it owns some important NEV producers, including NIO, Brilliance, Chery, GAC and JAC Motors.

The most notable example is NIO. Several entities controlled by the Anhui province (Hefei Construction Investment Holdings (Group) Co., Ltd., SDIC Investment Management Co., Ltd. and Anhui High-tech Industry Investment Co., Ltd. hold 24,1% of NIO (Anhui) Holdings Co., Ltd., the legal entity owning NIO’s core business and related assets in China³⁵⁰⁸. As mentioned in Section 22.2.2, the capital injection by the Anhui province happened at the same time of the move of NIO’s headquarters to Hefei at a moment when NIO was experiencing a financial reverse. Together with the capital injection, NIO received also loans from State-owned banks, as mentioned in Section 22.4.5. NIO’s story is an example of what happens also for other NEV producers, which need considerable funds for the investments for NEV production and find them in the form of equity from State lower administrative entities. Indeed, provinces and other lower levels of government are in competition to attract revenues and employment from NEV producers and try to establish and develop successful NEV companies to reach relevance in the eyes of the central Government.

In the battery sector, in addition to the State-owned NEV producers SAIC and NIO, which are also active as battery manufacturers, CALB is the main State-owned battery producer.

However, State ownership is not limited to NEV and battery manufacturers but extends also to their upstream value chain. Considering for instance lithium, one of the essential raw materials for the production of batteries, China’s Yichun city (Jiangxi) has been dubbed as “Asia’s lithium capital”³⁵⁰⁹ and several lithium mining companies are located there. In August 2022, BYD signed a strategic cooperation framework agreement with the Yichun city government, the Yichun Economic Development Zone and Yichun Mining Company, to invest RMB 28.5 billion in the construction of a 30 GWh battery plant and a 100 000 tonnes capacity lithium carbonate and lithium-containing ceramic facility³⁵¹⁰. In September 2022, Yichun BYD Mining

³⁵¹⁰ See at: https://autonews.gasgoo.com/new_energy/70021077.html (accessed on 14 June 2023).

Co., Ltd. was established. The company is jointly held by BYD and Yichun Mining Industry Co., Ltd.³⁵¹¹, a wholly State-owned company under the Yichun city government³⁵¹².

Even in the absence of equity shareholdings by the State, NEV producers still engage in cooperation with State-owned companies. This is the case of NIO, which in April 2023 signed a strategic cooperation framework agreement with China Resources (Group) Co., Ltd., a state-owned diversified holding company under the supervision of SASAC. The two parties intend to cooperate in the fields of commercial space leasing and construction, investment in and construction of charging and battery swapping infrastructure, plant and community energy management, new material applications and consumer services. This will mainly allow NIO to open centers and stores in real estate areas owned by the State-owned company³⁵¹³.

Beyond State ownership and participation in NEV producers, the Government exerts control over all NEV producers by a number of other means. Firstly, the combination of the Government's measures influences the prices of NEVs, leaves little discretion to NEV producers as regards business decisions in the R&D and product development. The technical requirements which used to allow for the disbursement of the purchase subsidy (and still does in the case of purchase subsidies granted by the Government's lower administrative levels, such as those mentioned in Section 22.4.5) and which allow to access the purchase tax exemption have an effect on the price of the NEV benefitting from them, which is lower than it would otherwise be. Beyond that, it favours certain NEV models and technologies, making them cheaper and, consequently, more attractive to customers than models which do not benefit from the subsidy and from the tax exemption. Therefore, companies are encouraged to adopt those models and technologies that benefit from governmental measures. In doing so, the Government is directing R&D and the product development in a specific direction. The technical requirements are therefore actual market drivers.

Secondly, while subsidies and tax exemptions concern the sale of the NEVs, the Dual-Credit Policy, with its negative points, acts as a sanction for non-compliance with the targets. Also in the case of the Dual-Credit Policy there are technical parameters, namely the average fuel consumption and the production or import targets. As mentioned, both of them are actually linked to the production or import, because the average fuel consumption depends on the NEVs produced or imported.

Therefore, it is virtually impossible for a company not to abide by the production targets of the Dual-Credit Policy or the technical requirements for the purchase subsidy and the purchase tax exemption. If it reaches the production targets with models not benefitting from the subsidy and the tax exemption, its sales will be negatively affected. If the company instead produces models benefitting from the tax exemption but it does not meet the production targets, it is still sanctioned with negative points, which are difficult to offset, absent wealth investors with sufficient purchasing power to acquire positive points from other companies or shares in other

NEV producers. Therefore, the Government put in place a comprehensive system of control able to direct and determine the business strategies of the NEV producers.

22.4.2. CCP PRESENCE IN FIRMS

NEV and battery producers, as all companies in China, are obliged to host a CCP cell in their organisation (see Section 3.3.2.). The importance of this cell is confirmed by the articles of association of some of the main NEV producers. For instance, SAIC's articles of association provide for the "*establishment of party organizations and their disciplinary bodies at all [company's] levels*"³⁵¹⁴. Moreover, SAIC engages to form "*an institutional mechanism for the participation of party organizations in decision-making on important questions, and supports boards of directors, supervisors and operators in the exercise of their functions*"³⁵¹⁵. Furthermore, as of writing of this Report, SAIC's chairman is also SAIC's party secretary³⁵¹⁶. To provide a further example, in GAC, the CCP is also involved in the selection of the senior management. According to the company's articles of association: "[w]hen the board appoints the company's senior management, the party committee prepares and advises on the selection of persons nominated by the board or general manager"³⁵¹⁷. Therefore, the CCP does not have only a representative role, but it actively takes part in the strategic decision-making of NEV producers and in the selection of their senior management.

22.4.3. SPECIAL TREATMENT OF DOMESTIC NEV BRANDS AND COMPETITIVE DISTORTIONS

The regulatory framework shows that the focus of the Government's action is devoted to Chinese domestic production and, specifically, to Chinese NEV brands. This is clear from the wording of the objectives in the 2017 Automobile Plan, which refer to Chinese companies and "*Chinese brand cars*" (see Section 22.3.8). Moreover, it is noteworthy that only one foreign NEV brand – Tesla – was able to establish a production of NEVs in China not as part of a JV with a Chinese brand. Apart from Tesla, all the other producers are Chinese brands or in JVs with Chinese brands.

In a wider perspective, the Government's measures appear to unduly interfere with free competitive dynamics. Indeed, in the 2017 Automobile Plan and in the NEV Plan 2021-2035 the Government encourages a consolidation of the NEV market through mergers between the NEV producers³⁵¹⁸. The Dual-Credit Policy, insofar it allows to offset negative points by purchasing shares of a NEV producer with positive points, provides precisely for a means to achieve the Government's intended objective. As recalled in Section 22.3.10, GWM acquired a 25% stake in Yogomo with the sole objective of obtaining Yogomo's corporate average fuel consumption credits and a certain amount of its NEV credits. As explained in Section 22.3.10, the Dual-Credit Policy ultimately ensures that large companies will become even larger and

that small companies will have even less resources and will eventually disappear absorbed by others through Government-induced mergers.

22.4.4. UNDERENFORCEMENT OF BANKRUPTCY LAWS

A further measure that is likely to cause market distortions in the NEV market is the Government's intervention on the occasion of the bankruptcy of NEV producers. Two notable examples can show this. First, the capital injection of the Anhui province in Nio, together with the loans granted by policy banks on the same occasion, with the condition that Nio had to move its headquarters to the Anhui province, were granted at a moment when Nio was on the brink of bankruptcy³⁵¹⁹. Second, Brilliance actually ended up in a debt restructuring procedure³⁵²⁰ and the Shenyang city government purchased all its shares³⁵²¹ to the point that Brilliance – originally called Brilliance Auto Group Holdings Co. Ltd. – even changed company name to the current one. Originally, Brilliance was already a State-owned company, being owned by the Liaoning province³⁵²², of which Shenyang is the capital. The intervention of the Shenyang city government could be seen as an attempt to retain Brilliance – together with the related employment, revenues and relevance of the area for the central Government – in the province. In other terms, the Government's intervention does not breach bankruptcy laws, but happens in a way as to prevent the full bankruptcy of the NEV producers and the dispersion of their assets. Notably, such interventions are made by State-owned actors and not by private capital. As a consequence, bankruptcy laws are enforced less frequently than they should and they end up being actually underenforced (see also Section 6.7).

22.4.5. PREFERENTIAL ACCESS TO FINANCE

The NEV industry is an innovative industry which needs continuous investments to improve the performance of NEVs so that they can become attractive to customers as a viable alternative to ICEs. Furthermore, it is a risky investment as NEV start-ups may not always be able to continue their business. In China, the NEV producers' need for investments is mainly covered by provincial and local governments in the form of equity injections and by State-owned or policy banks (see Section 6.3.3.1) in the form of loans, with the result that a significant part of the equity and debt of the NEV producers is State-owned or granted in application of the Government's policies.

The support by the Government is not channelled only through State-owned companies, but also through State funds (see in particular Section 6.5.1). In the 2017 Automobile Plan, the Automobile Industry Joint Fund is mentioned. The Automobile Industry Joint Fund was created in 2015³⁵²³. Its shareholders include the China Association of Automobile Manufacturers ('CAAM'), the National Natural Science Foundation of China and eight NEV producers: FAW

Group, Dongfeng, SAIC, Chang'an, GAC, Brilliance, JAC Motors and Sinotruck³⁵²⁴. The CAAM, according to its articles of association, “adheres to the overall leadership of the Communist Party of China and, in accordance with the provisions of the Constitution of the Communist Party of China, establishes organizations of the Communist Party of China”³⁵²⁵. Moreover, the CAAM acknowledges “the business guidance, supervision and management of [...] party structure leading organs” and that “the leading organ of the Party structure is the Party Committee of the State-owned Assets Supervision and Administration Commission of the State Council”³⁵²⁶. The National Natural Science Foundation of China was established following the approval of the State Council and it is still “under the correct leadership of the Party Central Committee and the State Council, with the support of relevant departments of the State Council”³⁵²⁷. All the eight NEV producers which are shareholders in the Automobile Industry Joint Fund are State-owned. The role of the Automobile Industry Joint Fund is to “unite the strength of China’s automotive industry enterprises, promote the close integration of production, education and research [...] especially to invest in basic research and technology major innovation”³⁵²⁸. Therefore, the Government, which already directs the NEV producers towards certain R&D objectives through the technical requirements for benefitting from the purchase subsidy, the purchase tax exemption and the positive points under the Dual-Credit System, also offers direct support for R&D investments to NEV producers.

Moreover, another way the Government has to indirectly fund NEV producers is the monetisation of NEV credits under the Dual-Credit Policy. Once the Government created the system whereby negative points can be offset by purchasing positive points from performing companies, these positive points acquire a value. Many NEV producers, including Tesla, BYD and Li Auto, have increased corporate profits or made up for losses by selling NEV credits for money. Taking Li Auto as an example, according to its 2021 financial report, the company sold a total of about 70 000 positive points and the related income was RMB 200 million (EUR 26,2 million)³⁵²⁹. This shows how a system created by the Government contributes to the income of the most performing and, as seen in Section 22.4.3, largest NEV producers.

A link to the Government in the form of equity injection or other direct support is important especially for NEV start-ups, because closer ties with the Government often translate into better access to bank loans, notably from State owned and policy banks. This was the case of NIO. In July 2020, after the agreement with the Anhui province for the move of its headquarters mentioned in Section 22.4.1, the local branches of six State-owned banks³⁵³⁰ agreed to extend RMB 10.4 billion credit lines to the loss-making company in a ceremony attended by a member

of the Hefei CCP Committee³⁵³¹. NIO raised a further USD 430 million through sales of its American depositary shares in June, with Tencent Holdings, NIO's second-largest shareholder in which the Government holds a 'golden share'³⁵³², buying a quarter of them.

Finally, the Government's financial support is not inconsequential as it has the potential to direct the companies towards the policy objectives of the Government. One of them is the market penetration of Chinese NEV producers abroad, following the 'Going Out' policy. Even if at the end of 2022 the Government stopped its purchase subsidy scheme in the attempt to scale back its intervention in the domestic market, at the same time it promised its full support to ensure the successful entry of Chinese companies into markets abroad, notably the EU market: *"The Ministry of Commerce will continue to work with relevant departments to support new energy vehicle companies to speed up the construction of overseas marketing and after-sales service networks and increase brand promotion efforts. Encourage qualified overseas institutions of Chinese-funded banks to provide overseas consumer financial products. Research to expand export transportation channels and transport new energy vehicles through China-Europe trains"*³⁵³³.

In any case, the fact that the Government stopped granting the purchase subsidy to NEV producers does not mean that such type of support stopped completely in China. Indeed, lower-level authorities continued similar schemes in the form of State funds to support NEV producers and the spread of NEVs among companies and consumers. China's 2023 WTO subsidies notification includes several examples of such funds³⁵³⁴. The following State funds and subsidies dedicated to NEV producers and to the spread of the use of NEVs among companies can be enumerated:

- the Fund for New Energy Passenger Vehicles, established by the Beijing municipality, to support NEV producers through grants. Despite its duration being foreseen from 2017 until June 2019, disbursements in application of the Fund continued in 2021 and 2022;
- the Fund for Promotion and Using of New Energy Light Trucks, established by the Beijing municipality, to encourage the use of NEVs among eligible road freight transport companies through rewards offered as of 2020;
- the Special Fund for the Development of Renewable and New Energy, established by the Shanghai municipality, to support NEVs producers through rewards offered for the period 2022-2026;
- the Fund for Promotion and Application of New Energy Vehicles, established by the city of Suzhou, in the Jiangsu province, to promote the use of NEVs among companies through grants in 2021 and 2022. It was also available to consumers;

- the Subsidy Fund for Hydrogen Fuel Cell Industry, established by the city of Changshu, in the Jiangsu province, to support producers of FCEVs through grants in the period 2020-2022;
- the Subsidy for Promotion and Application of New Energy Vehicles, established by the city of Yangzhou, in the Jiangsu province, to promote the use of NEVs by eligible companies through grants as of 2019. It is also available to consumers;
- the Special Fund for Promotion and Application of New Energy Vehicles, established by the Hunan province, to promote the use of NEVs among eligible companies through grants. Despite its duration been foreseen from 2016 to 2020, disbursements in application of the Special Fund still occurred in 2021 and 2022;
- the Fund for New Energy Vehicle Promotion and Application Projects, established by the city of Xi'an, in the Shaanxi province, to support companies purchasing NEVs through rewards as of 2019;
- the Reward Fund for Promotion and Using of New Energy Taxi, established by the city of Hohhot, in the Inner Mongolia autonomous region, to encourage the use of NEVs among taxi operators through grants in the period 2021-2025; and
- the Subsidy for Charging Infrastructure Construction and Supporting Operation Services of New Energy Vehicles, established by the Guangxi Zhuang autonomous region, to support companies active in the deployment of the NEV charging infrastructure through grants in the period 2019-2022.

The following are instead examples of State funds dedicated to fostering the use of NEVs by consumers:

- the Fund for Promotion and Application of New Energy Vehicles, established by the city of Suzhou, in the Jiangsu province, to promote the use of NEVs among consumers through grants in 2021 and 2022. It was also available to companies;
- the Subsidy for Promotion and Application of New Energy Vehicles, established by the city of Yangzhou, in the Jiangsu province, to promote the use of NEVs by eligible consumers through grants as of 2019. It is also available to companies;
- the Subsidy for Promotion and Using of New Energy Vehicles, established by the Hainan province, to promote the use of NEVs among consumers through grants as of 2017; and
- the Fund for Promotion and Application of New Energy Vehicles, established by the city of Qingdao, in the Shandong province, to support consumers purchasing NEVs through grants. Despite the duration been foreseen from 2018 and 2020, in 2022 there were still disbursements in application of the Fund.

These funds and subsidies show that, despite the termination of the purchase subsidy scheme managed by the central Government, support for the purchase of NEVs is available to both companies and consumers offered by lower administrative levels of government. In addition, some of the funds and subsidies listed above appear to support directly NEV producers, thus adding further support layers to the investments ensured by State-owned companies and policy banks.

22.5. CHAPTER SUMMARY

This chapter shows that the lack of tradition and technology to produce ICEs brought China to develop a regulatory background for the transition to the NEV industry as early as 2005 (see Section 22.3.1). Having started this transition in advance compared to other countries, the Government is seeking the opportunity to make China the powerhouse for the production of NEVs to be exported to developed economies, reversing the roles in the ICE market. Leveraging on a comprehensive framework of support from the central and local Government throughout the value chain – from essential raw materials to batteries to the NEVs – China turned into the first producer and exporter of NEVs in the world as a matter of national interest (see Sections 22.2.1-22.2.3). Thus, after creating the industry, the Government put in place a set of measures that, when considered together, allows it to exercise control over the growth of the industry and to direct its development (see Section 22.3). At the heart of it, the Dual-Credit Policy (see Section 22.3.10) rewards NEV producers fulfilling production targets and sanctions companies failing to meet them, compelling them to offset their ‘debts’ by purchasing ‘credits’ from performing companies or the performing companies altogether. This focus on production favours larger companies and the consolidation of the market. At the same time, the Government controls also the sales by suppressing the prices of the NEV types and models it intends to favour through a purchase subsidy paid to the NEV producers (see Section 22.3.3) and a purchase tax exemption (see Section 22.3.14). The termination of the purchase subsidy granted by the central Government at the end of 2022 did not prevent the continuation of other programs and of similar subsidies granted by lower administrative levels of government (see Section 22.3.3). Indeed, the provinces and the main cities appear to be in competition amongst them to have NEV producers in their area, in order to attract employment, revenues and the attention of the central Government. Thus, many local Governments and local branches of State-owned banks provided the investments needed by NEV start-ups to develop their operations, so that considerable shares of the equity and debt of NEV producers have become State-owned (see in particular Sections 22.3.16 and 22.4.5). Against this background, the intervention of the Government at both central and local level is liable to give rise to market distortions in the Chinese NEV and battery industries.

Órgano de Examen de las Políticas Comerciales

EXAMEN DE LAS POLÍTICAS COMERCIALES

INFORME DE LA SECRETARÍA

CHINA

El presente informe, preparado para el noveno examen de las políticas comerciales de China, ha sido redactado por la Secretaría de la OMC bajo su responsabilidad. Como exige el Acuerdo por el que se establece el Mecanismo de Examen de las Políticas Comerciales (Anexo 3 del Acuerdo de Marrakech por el que se establece la Organización Mundial del Comercio), la Secretaría ha pedido aclaraciones a China sobre sus políticas y prácticas comerciales.

Cualquier pregunta técnica que se plantee en relación con este informe puede dirigirse al Sr. Masahiro Hayafuji (tel. 022 739 5873), al Sr. Arne Klau (tel. 022 739 5706) o al Sr. Michael Kolie (tel. 022 739 5931).

En el documento [WT/TPR/G/458](#) figura la exposición de políticas presentada por China.

ÍNDICE

RESUMEN	10
1 ENTORNO ECONÓMICO.....	17
1.1 Principales características de la economía	17
1.2 Evolución económica reciente.....	18
1.2.1 Crecimiento económico.....	18
1.2.2 Política monetaria y cambiaria	21
1.2.3 Política fiscal	22
1.2.4 Medidas estructurales.....	22
1.2.5 Balanza de pagos.....	22
1.3 Evolución del comercio y la inversión	24
1.3.1 Tendencias y estructura del comercio de mercancías y servicios	24
1.3.2 Tendencias y estructura de la inversión extranjera directa	27
2 RÉGIMENES DE COMERCIO E INVERSIÓN.....	31
2.1 Marco general	31
2.2 Formulación y objetivos de la política comercial.....	33
2.3 Acuerdos y arreglos comerciales.....	35
2.3.1 OMC.....	35
2.3.2 Acuerdos regionales y preferenciales.....	35
2.3.2.1 Acuerdos recíprocos	35
2.3.2.2 Preferencias unilaterales	37
2.3.3 Otros acuerdos y arreglos	37
2.4 Régimen de inversión.....	37
2.4.1 Marco reglamentario y acceso a los mercados	37
2.4.2 Procedimientos de examen y aprobación	41
2.4.3 Incentivos a la inversión extranjera directa	42
2.4.4 Acuerdos bilaterales fiscales y de inversión	43
3 POLÍTICAS Y PRÁCTICAS COMERCIALES, POR MEDIDAS.....	45
3.1 Medidas que afectan directamente a las importaciones.....	45
3.1.1 Procedimientos y requisitos aduaneros, y valoración en aduana.....	45
3.1.1.1 Inspección previa a la expedición	50
3.1.1.2 Valoración en aduana	50
3.1.1.3 Facilitación del comercio	50
3.1.2 Normas de origen	52
3.1.3 Aranceles.....	52
3.1.3.1 Aranceles NMF aplicados	52
3.1.3.2 Contingentes arancelarios	55
3.1.3.3 Aranceles consolidados	55
3.1.3.4 Aranceles preferenciales	55
3.1.3.5 Exenciones o concesiones arancelarias	57

3.1.4	Otras cargas que afectan a las importaciones	58
3.1.4.1	Impuesto sobre el valor añadido (IVA).....	58
3.1.4.2	Impuesto (especial) sobre el consumo	59
3.1.4.3	Impuesto sobre la compra de vehículos automóviles	61
3.1.5	Prohibiciones, restricciones y licencias de importación	62
3.1.5.1	Prohibiciones de importación	62
3.1.5.2	Prescripciones en materia de licencias de importación	64
3.1.5.2.1	Prescripciones en materia de licencias automáticas de importación	64
3.1.5.2.2	Prescripciones en materia de licencias no automáticas de importación	65
3.1.6	Medidas antidumping, compensatorias y de salvaguardia.....	66
3.1.6.1	Medidas antidumping	66
3.1.6.2	Medidas compensatorias	68
3.1.6.3	Medidas de salvaguardia	69
3.2	Medidas que afectan directamente a las exportaciones.....	69
3.2.1	Procedimientos y requisitos aduaneros	69
3.2.2	Impuestos, cargas y gravámenes.....	70
3.2.3	Prohibiciones, restricciones y licencias de exportación	71
3.2.4	Apoyo y promoción de las exportaciones.....	75
3.2.5	Financiación, seguro y garantías de las exportaciones	78
3.3	Medidas que afectan a la producción y al comercio	78
3.3.1	Incentivos.....	78
3.3.2	Normas y otras prescripciones técnicas	84
3.3.2.1	Panorama general y tendencias	84
3.3.2.2	Normas y reglamentos técnicos	86
3.3.2.3	Certificación de productos	87
3.3.2.4	Etiquetado y envasado	87
3.3.3	Prescripciones sanitarias y fitosanitarias	89
3.3.3.1	Marco general.....	89
3.3.3.2	Normas sobre inocuidad de los alimentos, los animales, las plantas y sus productos.....	90
3.3.3.3	Medidas sanitarias y fitosanitarias	91
3.3.3.4	Inspección y cuarentena	93
3.3.4	Política de competencia y controles de precios.....	94
3.3.4.1	Política de competencia	94
3.3.4.1.1	Marco legislativo e institucional.....	94
3.3.4.1.2	Principales modificaciones legislativas.....	95
3.3.4.1.3	Observancia	96
3.3.4.1.4	Cooperación internacional	97
3.3.4.2	Controles de precios.....	98
3.3.5	Comercio de Estado y empresas públicas.....	100
3.3.6	Contratación pública	103

3.3.6.1	Panorama general	103
3.3.6.2	Marco jurídico e institucional	103
3.3.6.2.1	Marco vigente y evolución reciente	103
3.3.6.2.2	Revisiones en curso de la Ley de Contratación Pública y la Ley de Licitaciones	106
3.3.6.3	Métodos de contratación y utilización de la contratación electrónica	106
3.3.6.4	Procedimientos internos de revisión	107
3.3.6.5	Adhesión al ACP de 2012 y otra cooperación internacional	107
3.3.7	Derechos de propiedad intelectual	108
3.3.7.1	Panorama general	108
3.3.7.2	Reformas institucionales y políticas relacionadas con la PI	108
3.3.7.3	Contexto internacional	109
3.3.7.4	Derecho de autor y derechos conexos	110
3.3.7.5	Propiedad industrial	111
3.3.7.5.1	Marcas de fábrica o de comercio	111
3.3.7.5.2	Indicaciones geográficas	112
3.3.7.5.3	Patentes	112
3.3.7.5.4	Modelos de utilidad	115
3.3.7.5.5	Dibujos y modelos industriales	116
3.3.7.5.6	Esquemas de trazado (topografías) de los circuitos integrados	116
3.3.7.5.7	Obtenciones vegetales	116
3.3.7.5.8	Información no divulgada y secretos comerciales	116
3.3.7.6	Observancia	117
3.3.7.6.1	Panorama general	117
3.3.7.6.2	Procedimientos administrativos	118
3.3.7.6.3	Medidas judiciales	119
3.3.7.6.4	Medidas aduaneras	119
3.3.7.6.5	Procedimientos penales	119
4	POLÍTICAS COMERCIALES, POR SECTORES	121
4.1	Agricultura, silvicultura y pesca	121
4.1.1	Agricultura	121
4.1.1.1	Características del comercio en la agricultura	121
4.1.1.2	Marco jurídico e institucional	123
4.1.1.3	Objetivos de política y reformas	126
4.1.1.4	Instrumentos de política	127
4.1.1.4.1	Medidas en frontera	127
4.1.1.4.2	Medidas que afectan a las exportaciones	129
4.1.1.4.3	Medidas internas	130
4.1.1.4.3.1	Medidas de ayuda	130
4.1.1.4.3.2	Controles de precios y sistemas de sostenimiento de los precios del mercado	132
4.1.1.4.3.3	Otras medidas	133

4.1.1.4.4 Niveles de ayuda.....	134
4.1.2 Silvicultura.....	135
4.1.3 Pesca	135
4.1.3.1 Características y evolución del mercado	135
4.1.3.2 Marco jurídico, institucional y normativo	137
4.1.3.3 Ayuda del Gobierno al sector pesquero	138
4.1.3.4 Medidas de conservación de la pesca.....	139
4.2 Minería y energía.....	140
4.2.1 Minería	140
4.2.2 Energía.....	144
4.2.2.1 Panorama general y cesta energética	144
4.2.2.2 Electricidad	146
4.3 Manufacturas	149
4.3.1 Principales características y evolución reciente	149
4.3.2 Subsectores seleccionados.....	152
4.3.2.1 Automóviles, aeronaves, y sus partes y componentes.....	152
4.3.2.2 Maquinaria, equipo, electrónica e industrias conexas	153
4.3.2.3 Hierro, acero y construcción naval.....	153
4.4 Servicios	154
4.4.1 Servicios de telecomunicaciones	154
4.4.1.1 Panorama general.....	154
4.4.1.2 Marco de políticas y reglamentario	156
4.4.1.3 Evolución de la economía digital	157

APÉNDICE - CUADROS

Cuadro A1. 1 Exportaciones de mercancías de China por destino, 2018-2023	178
Cuadro A1. 2 Importaciones de mercancías de China por origen, 2018-2023	179
Cuadro A1. 3 Exportaciones de mercancías por Secciones y principales Capítulos/partidas del SA, 2018-2023	180

Cuadro A1. 4 Importaciones de mercancías por Secciones y principales Capítulos/partidas del SA, 2018-2023	181
Cuadro A1. 5 Comercio de bienes intermedios por categorías, 2013-2023	182
Cuadro A2. 1 Principales notificaciones efectuadas en el marco de los Acuerdos de la OMC, 13 de abril de 2021-15 de enero de 2024	183
Cuadro A2. 2 Asuntos de solución de diferencias en la OMC en los que ha intervenido China, 13 de abril de 2021-15 de enero de 2024	185
Cuadro A3. 1 Resumen de los aranceles NMF aplicados, 2024.....	186
Cuadro A3. 2 Medidas aplicadas a las importaciones originarias de interlocutores comerciales específicos sobre la base de los anuncios/decretos de la GACC y otros ministerios y organismos competentes, marzo de 2024.....	187
Cuadro A4. 1 Ayuda del Gobierno central a la pesca, según se ha notificado a la OMC	191
Cuadro A4. 2 Ayuda de los Gobiernos locales a la pesca, según se ha notificado a la OMC	193

RESUMEN

1. Durante el período objeto de examen, China siguió siendo un importante motor del crecimiento económico mundial. La economía se recuperó bien de las perturbaciones relacionadas con la pandemia, y las exportaciones e importaciones del país siguieron aumentando. El crecimiento del comercio de bienes intermedios superó con creces el crecimiento del comercio de mercancías en general, lo que indica una mayor integración de China en las cadenas de suministro internacionales. No obstante, se detuvo el cambio estructural emprendido anteriormente para pasar de la industria a los servicios.

2. En los últimos decenios, las reformas orientadas al mercado realizadas por China, su liberalización económica y su integración en la economía mundial han permitido una mejora considerable del nivel de vida, la aparición de una gran clase media y la erradicación de la pobreza extrema. El PIB per cápita aumentó de USD 10.144 en 2019 a USD 12.614 en 2023. Sin embargo, el fuerte crecimiento de China ha ido también acompañado de niveles elevados de desigualdad de ingresos y de grandes contrastes entre zonas urbanas y rurales en lo relativo a la riqueza.

3. Si se compara a nivel internacional, la tasa de ahorro de China sigue siendo muy elevada, debido principalmente a la importancia del ahorro preventivo. El consumo se podría impulsar a largo plazo mediante reformas de las pensiones, la atención sanitaria y la vivienda, así como mediante la liberalización de los servicios. La deuda pública aumentada ascendió al 116% del PIB en 2023, frente al 99% en 2020.

4. La estabilidad de los precios sigue siendo el principal objetivo de la política monetaria de China. Las tasas de inflación han permanecido bajas en los últimos años, con un máximo del 2,9% en 2019. China ha mantenido su régimen de tipo de cambio flotante dirigido. El tipo de cambio del yuan (CNY) se determina en función de una cesta de monedas de conocimiento público. El Banco Popular de China (PBOC) solo interviene en el mercado cambiario para evitar fluctuaciones excesivas a corto plazo. El yuan es plenamente convertible para las transacciones por cuenta corriente y parcialmente convertible para algunas transacciones por cuenta de capital. A finales de febrero de 2024, las reservas de divisas notificadas oficialmente ascendían a USD 3,2 billones.

5. El superávit por cuenta corriente de China aumentó considerablemente entre 2018 y 2022, año en que ascendió al 2,24% del PIB, pero en 2023 disminuyó hasta situarse en el 1,5% del PIB. El aumento del superávit por cuenta corriente hasta 2022 se explica principalmente por el aumento del superávit del comercio de mercancías, y la considerable disminución del déficit de la balanza de servicios, debida en gran medida a la caída del turismo emisor. El déficit de la cuenta financiera (excluidos los activos de reserva) puede deberse a las presiones generadas por la salida de capital, causadas principalmente por las diferencias con los tipos de interés de otras grandes economías, la preocupación por las perspectivas de crecimiento de China y el aumento de los riesgos geopolíticos.

6. Las exportaciones de mercancías aumentaron de USD 2.589 millones en 2020 a USD 3.594 millones en 2022, pero disminuyeron en 2023 a USD 3.380 millones. Los Estados Unidos y la Unión Europea siguen siendo los destinos más importantes para las exportaciones de mercancías de China. Las importaciones de mercancías también aumentaron significativamente, de USD 2.069 millones en 2020 a USD 2.716 millones en 2022, pero después disminuyeron en 2023 a USD 2.557 millones. Entre el 40% y el 50% de las importaciones de China proceden de Asia y Oceanía. La Unión Europea, el Territorio Aduanero Distinto de Taiwán, Penghu, Kinmen y Matsu (Taipei Chino), el Japón y los Estados Unidos son las fuentes más importantes de las importaciones. El sector de la maquinaria y el equipo eléctrico representa una proporción importante del comercio total de mercancías de China. Los productos agropecuarios solo desempeñan una función menor en las exportaciones de China y representan menos del 10% de las importaciones. Las exportaciones de servicios también aumentaron significativamente de 2020 a 2022, pero disminuyeron en 2023, mientras que las importaciones de servicios se incrementaron de manera considerable entre 2020 y 2023.

7. Las corrientes de inversión extranjera en China disminuyeron entre 2022 y 2023, pasando de USD 189.000 millones a USD 163.000 millones. El sector manufacturero sigue siendo el mayor receptor de inversión extranjera directa (IED). El volumen total de las entradas de IED en China ascendió a USD 3,8 billones en 2022 (el último año para el que se disponía de datos), frente

a USD 1,9 billones en 2020, mientras que las salidas de IED de China ascendieron a casi USD 3 billones en 2022, frente a USD 2,6 billones en 2020.

8. En el marco del Programa Quinquenal de Reforma de los Tribunales Populares para 2019-2023, China siguió revisando su sistema judicial con el fin, entre otros, de fortalecer la observancia de los derechos de propiedad, asegurar la previsibilidad jurídica, mejorar la eficiencia y reducir las costas procesales. Las autoridades han perseguido principalmente esos objetivos promoviendo la resolución en línea y estableciendo tribunales especializados (por ejemplo, tribunales centrados en asuntos de propiedad intelectual, cuestiones marítimas y cuestiones financieras). Además, se han realizado esfuerzos con objeto de mejorar el entorno empresarial para las empresas extranjeras mediante la aplicación de mecanismos alternativos de solución de diferencias, como el arbitraje y las jurisdicciones comerciales internacionales.

9. Con miras a poner fin a la protección local y las barreras regionales dentro de China, se adoptaron varias normas y mecanismos para revisar rigurosamente las medidas administrativas regionales, con objeto de establecer un mercado nacional armonizado. En 2021 se adoptó el 14º Plan Quinquenal de Desarrollo Económico y Social de China (2021-2025), en el que se exponen varias visiones en relación con la apertura del marco de comercio e inversión del país.

10. Las autoridades han seguido expresando su apoyo a un sistema multilateral de comercio que funcione adecuadamente, y han subrayado la importancia de, entre otras cosas, la reforma de la OMC, la facilitación de las inversiones para el desarrollo, el comercio electrónico y la reglamentación nacional en el ámbito de los servicios. China también ha ampliado su red de acuerdos comerciales regionales (ACR), que considera un complemento del sistema multilateral de comercio. A finales de 2023, China había firmado 22 ACR con 29 asociados. También mantiene regímenes unilaterales de preferencias arancelarias para los países menos adelantados.

11. China ha seguido liberalizando su marco de inversión extranjera. En principio, la Ley de Inversión Extranjera de 2020 protege a los inversores extranjeros frente a la expropiación, las restricciones a las remesas transfronterizas, la infracción de los derechos de propiedad intelectual (DPI) y la transferencia forzosa de tecnología. Las listas negativas de inversiones extranjeras se redujeron a 31 entradas. Además, se ha incluido un número creciente de sectores en el Catálogo de Sectores en los que se Incentiva la Inversión Extranjera del país, lo que les brinda la oportunidad de beneficiarse de determinados paquetes de incentivos. La versión actual del Catálogo refleja el compromiso de las autoridades de mejorar la posición de China en las cadenas de suministro en esferas como los semiconductores y el sector de la energía limpia.

12. Según las autoridades, el plazo de despacho de aduana para las importaciones y exportaciones era de 36,64 horas y 1,74 horas en 2021 y de 40,18 horas y 1,26 horas en 2022, respectivamente; en el primer trimestre de 2023, era de 33,05 horas y 1,05 horas, respectivamente. El 1 de enero de 2021 se eliminó el requisito de inspección previa a la expedición de los desechos importados como materias primas, y se prohibió la importación de desechos sólidos. Desde el anterior examen no se han introducido cambios importantes en las normas y procedimientos de valoración en aduana del país. China ha ratificado el Acuerdo sobre Facilitación del Comercio (AFC) y ha notificado sus compromisos de las categorías A y B. Según la Base de Datos del AFC de la OMC, China ha aplicado plenamente el Acuerdo. Desde su anterior examen, China no ha introducido cambios en las leyes o reglamentos relativos a las normas de origen.

13. La estructura del Arancel no ha registrado apenas variaciones desde el anterior examen. El promedio aritmético de los tipos NMF aplicados en 2024 fue del 7,0%, frente al 7,1% en 2021. Los aranceles fueron más elevados en el caso de los productos agropecuarios (definición de la OMC), del 12,6%. El arancel medio aplicado a los productos no agropecuarios se redujo al 6,1% (frente al 6,2% en 2021). El porcentaje de aranceles superiores al 15% (crestas arancelarias internacionales) fue del 4,3% (en 2021 fue del 4,5%). El porcentaje de aranceles sujetos a crestas arancelarias nacionales fue del 1,9% (sin cambios desde 2021). China impone contingentes arancelarios de importación universales a determinados productos, como el trigo (7 líneas arancelarias), el maíz (5 líneas), el arroz (14 líneas), el algodón (2 líneas), el azúcar (7 líneas), la lana y la lana peinada (9 líneas) y los abonos químicos (3 líneas). Aplica aranceles preferenciales en el marco de sus arreglos comerciales preferenciales (ACPR) y acuerdos comerciales regionales (ACR). Hong Kong, China y Macao, China están sujetos a los tipos arancelarios más bajos en promedio, seguidos de Chile y Nueva Zelanda. El porcentaje de líneas arancelarias libres de derechos en los ACR de China oscila entre el 99,2% (Hong Kong, China y Macao, China) y el 23,4%

(Taipei Chino). No se dispone de datos sobre la utilización de aranceles preferenciales en el marco de los ACR y los ACPR. Desde el examen anterior, no ha habido cambios en lo que se refiere a las exenciones, reducciones o concesiones de derechos.

14. Los tipos actuales del IVA no han variado desde el examen anterior y son del 13%, el 9%, el 6% y el 3%. El impuesto sobre el consumo sigue aplicándose a los productos que se consideran perjudiciales para la salud humana, el orden público y el medio ambiente; los bienes suntuarios; los productos que consumen mucha energía y los productos con un alto grado de elaboración; y los productos del petróleo no renovables y no reemplazables. En noviembre de 2022, China introdujo un impuesto sobre el consumo de cigarrillos electrónicos a un tipo del 36% en la etapa de producción e importación y del 11% en la etapa de venta al por mayor. En virtud de la Ley del Impuesto sobre la Compra de Vehículos de 2019, China aplica un impuesto del 10% a los vehículos de producción nacional y a los importados, sin variaciones desde el examen anterior.

15. En agosto de 2023, China anunció la suspensión de la importación de todos los productos acuáticos, incluidos los animales acuáticos comestibles, originarios del Japón. China notificó a la OMC las prohibiciones a la importación aplicadas durante el período 2020-2022; esas prohibiciones se aplicaban a determinadas sustancias tóxicas y productos de animales silvestres; determinados equipos mecánicos y eléctricos viejos o de segunda mano; determinados productos químicos peligrosos, plaguicidas, contaminantes orgánicos persistentes, y productos con mercurio añadido; los desechos sólidos; la ractopamina; determinados tipos de lámparas de filamento; y el carbón vegetal importado de Somalia. La lista más reciente de productos prohibidos se publicó en diciembre de 2023.

16. En 2024 había 24 categorías de productos sujetas a prescripciones en materia de licencias automáticas de importación aplicadas por el Ministerio de Comercio (MOFCOM), y otras 21 categorías de productos estaban sujetas a prescripciones de ese tipo aplicadas por los departamentos de comercio locales competentes a nivel provincial o las oficinas de electromecánica locales y departamentales, por autorización del MOFCOM. En el período objeto de examen se añadieron al Catálogo de Mercancías sujetas al Régimen de Licencias Automáticas de Importación el tetracloroetileno, el cloruro de polivinilo (PVC) y el neopreno. En 2024, en el Catálogo de Mercancías sujetas al Régimen de Licencias de Importación figuraban 149 líneas arancelarias al nivel de 10 dígitos del SA a las que era aplicable el régimen de licencias no automáticas de importación (frente a 118 líneas arancelarias al nivel de 10 dígitos del SA en 2020). En el período objeto de examen se introdujeron en el Catálogo algunos ajustes en relación con las sustancias que agotan la capa de ozono. Las importaciones sujetas a licencias no automáticas consisten principalmente en el equipo mecánico y electrónico usado y las sustancias que agotan la capa de ozono.

17. Entre enero de 2021 y diciembre de 2023, China inició tres investigaciones antidumping. Al final de diciembre de 2023, China aplicaba 120 medidas antidumping definitivas. El número de investigaciones en materia de derechos compensatorios iniciadas por China, y el número de medidas en vigor, han disminuido gradualmente en los últimos años. En el período objeto de examen, China no inició ninguna nueva investigación en materia de salvaguardias.

18. El 1 de enero de 2023, 102 líneas arancelarias estaban sujetas a derechos de exportación legales, el mismo número que desde 2015, y 67 líneas arancelarias estaban sujetas a derechos provisionales, frente a 75 líneas en 2021. El tipo más alto (del 50%) se aplica a los minerales de estaño y sus concentrados.

19. Al igual que en el anterior examen, China impone restricciones y prohibiciones a la exportación de determinados productos con miras, entre otras cosas, a proteger la seguridad nacional y el interés público, la salud y seguridad humanas, la vida y salud animal y vegetal y el medio ambiente; preservar los recursos naturales que escasean en el país o pueden agotarse en el futuro; mantener el sistema comercial; proteger determinadas ramas de producción y la balanza de pagos; y cumplir las obligaciones contraídas en virtud de tratados y acuerdos internacionales.

20. El Anuncio de 2023 del Catálogo de Mercancías sujetas al Régimen de Licencias de Exportación, cuya aplicación está prevista para 2024, contiene 43 categorías (el mismo número que desde 2020). La mayor parte del contenido de estas categorías no ha variado desde 2020, mientras que se han añadido algunos productos de las categorías de regaliz y sus productos, productos químicos, algunos materiales de grafito y sus productos, sustancias que agotan la capa de ozono,

algunos vehículos aéreos no tripulados, algunos motores de aviación, algunos artículos de galio y germanio, madera aserrada y algunos automóviles. China aplica un sistema de gestión de licencias para la exportación de determinados productos de doble uso; durante el período objeto de examen, China impuso un control de las exportaciones de productos relacionados con el perclorato de potasio, los cañones de agua a alta presión, el galio y el germanio y los productos relacionados con drones, y realizó ajustes a las medidas temporales de control aplicables a la exportación de grafito. El MOFCOM y el Ministerio de Ciencia y Tecnología modificaron el Catálogo de Tecnologías sujetas a Restricciones o Prohibiciones de Exportación en diciembre de 2023.

21. En 2023, el volumen total de importaciones y exportaciones en las 22 zonas francas experimentales alcanzó los CNY 7,67 billones (con un incremento interanual del 2,7%), lo que representó el 18,4% del comercio total del país. Entre los beneficios disponibles para las empresas que operan en zonas francas experimentales figuran un tipo reducido del impuesto sobre la renta de las sociedades del 15% que se aplicará durante cinco años desde su constitución y trámites aduaneros simplificados para las importaciones y exportaciones en esas zonas de las empresas que se dediquen a productos o tecnologías esenciales en esferas clave como los circuitos integrados, la inteligencia artificial, la biomedicina y la aviación civil.

22. En 2022, el Banco EXIM realizó operaciones por valor de CNY 1.418,6 millones en concepto de liquidación internacional (CNY 843.600 millones), garantía (CNY 88.800 millones) y financiación del comercio (CNY 486.200 millones); el saldo pendiente de los préstamos al comercio exterior del Banco registró un aumento interanual del 20%. El Banco EXIM proporciona préstamos en apoyo de la Iniciativa "Cinturón y Ruta" (BRI). A finales de 2022, el saldo de los préstamos en apoyo a la BRI ascendía a CNY 2,2 billones, con una cobertura de más de 130 países. En 2022, la cuantía total de los seguros de crédito a la exportación fue de USD 753.000 millones, gran parte de los cuales eran seguros de crédito a la exportación a corto plazo. En 2021 y 2022, los seguros de crédito a la exportación proporcionados por la Corporación de Seguros de Crédito y Exportación de China representaron el 20,3% y el 21,0%, respectivamente, de las exportaciones totales.

23. En el período considerado China siguió proporcionando apoyo financiero y otros incentivos a diferentes sectores y ramas de producción. En agosto de 2021 y julio de 2023 China notificó sus programas de apoyo para los períodos 2019-2020 y 2021-2022, respectivamente. Las notificaciones contienen información sobre numerosos programas de nivel central y subcentral. Las dos notificaciones presentadas a la OMC durante el período considerado y las respuestas dadas por China no permiten a la Secretaría tener una visión general clara de los programas de ayuda de China. En particular, la Secretaría no ha podido conocer con mayor profundidad los niveles de apoyo financiero para determinados sectores de intensa actividad comercial, como los del aluminio, los vehículos eléctricos, el vidrio, la construcción naval, los semiconductores o el acero. La bases de datos comerciales disponibles documentan niveles importantes de apoyo público a las empresas en sectores clave, con una fuerte concentración en el sector manufacturero, así como aumentos significativos del apoyo desde 2018. Los llamados "fondos gubernamentales de orientación", o "fondos gubernamentales de inversión", siguen utilizando recursos públicos para realizar inversiones de capital en sectores y actividades que el Gobierno considera importantes. Las autoridades no han facilitado información sobre la dotación total de esos fondos, que según diferentes estimaciones realizadas en el marco de estudios académicos y por empresas de capital privado está comprendida entre CNY 1,89 billones y CNY 6,51 billones. En general, los incentivos proporcionados por esos fondos no se han notificado a la OMC; las autoridades afirman que esos fondos operan con arreglo a los principios del mercado. Si bien es necesario seguir trabajando en esta esfera para poder tener una visión más clara, la falta general de transparencia en lo que respecta a la ayuda del Gobierno de China también puede contribuir a generar debates sobre lo que algunos perciben como un exceso de capacidad en determinados sectores.

24. La Ley de Normalización (1988) y el Reglamento de Aplicación de la Ley de Normalización (1990) son los principales textos jurídicos de China en materia de normas; no han experimentado ningún cambio durante el período considerado. La Administración Estatal de Reglamentación del Mercado (SAMR) está a cargo de la elaboración de las normas y de velar por el cumplimiento de la legislación, así como de la supervisión del mercado en lo que concierne a la calidad de los productos, la inocuidad de los alimentos, la metrología, la certificación, la acreditación y las normas. El plan Normas de China 2035 proyecta establecer normas mundiales en materia de tecnologías emergentes, como la internet 5G, la internet de las cosas y la inteligencia artificial. Entre enero de 2021 y febrero de 2024 China presentó 315 notificaciones OTC, principalmente en virtud del artículo 2.9 del Acuerdo OTC. La mayoría de los reglamentos técnicos notificados tiene por objeto

proteger la salud y la seguridad humanas, establecer prescripciones en materia de calidad, o prevenir prácticas que puedan inducir a error a los consumidores. Entre enero de 2021 y febrero de 2024 los Miembros plantearon a China un total de 21 preocupaciones comerciales específicas relacionadas con los OTC. Ocho de esas preocupaciones se planteaban por primera vez.

25. En lo que concierne a las medidas sanitarias y fitosanitarias, China pretende establecer una gobernanza eficaz de la inocuidad de los alimentos, como piedra angular del desarrollo de la industria alimentaria. Entre las esferas a las que se orientó la reforma se incluían el aumento de las inspecciones y pruebas, la mejora de las normas sobre inocuidad de los alimentos y su integración con las normas internacionales pertinentes, el aumento de la capacidad de investigación y realización de pruebas y el fortalecimiento de las medidas para garantizar la observancia de las leyes y reglamentos en materia de inocuidad de los alimentos. Entre abril de 2021 y marzo de 2024 China notificó 101 medidas sanitarias y fitosanitarias a la OMC, de las cuales 2 eran medidas de emergencia que afectaban a Miembros específicos. Durante el período considerado se plantearon 13 preocupaciones comerciales específicas relacionadas con medidas chinas en el Comité MSF de la OMC.

26. Las Ley Antimonopolio de China se modificó en 2022 para incluir normas de "puerto seguro" para los acuerdos verticales y reforzar el régimen de observancia, en particular aumentando las sanciones por infracción. También hay nuevas normas que elevan los umbrales para la notificación de fusiones y adquisiciones. En 2021 se estableció la Administración Antimonopolio, dependiente de la Administración Estatal de Reglamentación del Mercado (SAMR).

27. Las empresas comerciales del Estado de China tienen el derecho exclusivo de importar o exportar los siguientes productos: tabaco, petróleo crudo y elaborado, carbón refinado, abonos químicos, tungsteno y sus productos, antimonio y sus productos y plata. Además, las empresas comerciales no estatales con derechos registrados pueden utilizar parte del contingente de importación para determinados productos, como el trigo, el maíz, el arroz, el azúcar y el algodón. La propiedad estatal sigue siendo muy importante en la economía; incluso en muchos sectores de orientación comercial las empresas de propiedad estatal siguen teniendo cuotas de mercados sustanciales y representan una gran proporción del activo y los beneficios totales de esos sectores. No ha tenido lugar ninguna privatización importante durante el período objeto de examen; la reforma de las empresas públicas tuvo lugar casi exclusivamente en el contexto de la propiedad mixta. En el período considerado el número de empresas de propiedad estatal ha aumentado tanto el sector industrial como en el de la construcción. Aunque las empresas de propiedad estatal pueden servir de instrumento para aplicar las políticas gubernamentales, apoyar los objetivos industriales nacionales y mantener el control estatal de sectores esenciales, las autoridades afirman que las empresas de propiedad estatal de China basan sistemáticamente su actuación en consideraciones comerciales y participan en las actividades empresariales ateniéndose a criterios de mercado y al imperio de la ley.

28. No han tenido lugar cambios importantes en el marco legislativo e institucional de China en materia de contratación pública desde el anterior examen. La Ley de Contratación Pública y sus normas de aplicación siguen siendo el principal instrumento legislativo que rige las actividades de contratación pública. El régimen no se aplica a las compras de las empresas de propiedad estatal. El valor total de la contratación pública en China ascendió a CNY 3,5 billones en 2022, lo que representa un 2,9% del PIB. La licitación pública es el principal método de contratación pública. La mayor parte de la contratación pública, con amplia diferencia, tiene lugar a nivel de los Gobiernos subcentrales. En el período considerado se han hecho progresos limitados en lo que concierne a la adhesión de China al Acuerdo sobre Contratación Pública.

29. China ha llevado a cabo varias reformas en su régimen de propiedad intelectual durante el período objeto de examen, en particular una revisión de la Ley derecho de Autor, que entró en vigor en junio de 2021, modificaciones de la Ley de Patentes y una nueva Ley de Semillas, vigente desde marzo de 2022. En 2022 se concedieron más de 1,6 millones de patentes, de las que aproximadamente 155.000 se otorgaron a no residentes. Los ingresos por exportación de propiedad intelectual aumentaron acusadamente durante el período considerado. En lo que concierne a la exigencia del cumplimiento, los tribunales examinan más de 500.000 asuntos relacionados con la propiedad intelectual cada año. La SAMR también organiza periódicamente operaciones nacionales para destruir productos infractores, falsificados o de deficiente calidad.

30. En el período considerado se han revisado o introducido diversas leyes relacionadas con la agricultura, como la Ley de Fomento de la Revitalización del Medio Rural (adoptada en 2021), la Ley de Protección de la Tierra Negra (adoptada en 2022) y la Ley de Ganadería (revisada en 2022). La estrategia agrícola de China se establece principalmente el Documento Central Nº 1 sobre el Desarrollo Agrícola y Rural, que se publica cada año. Los productos agropecuarios (definición de la OMC) están sujetos a tipos aplicados *ad valorem*, con excepción de algunos productos de origen animal. En 2024 el arancel NMF medio aplicado a los productos agropecuarios era del 12,6% (12,7% en 2021). Entre los grupos de productos que se benefician de una protección arancelaria superior a la media figuran los azúcares y artículos de confitería (30,6%); los cereales y las preparaciones alimenticias (20,2%); las bebidas y el tabaco (15,8%); el algodón, la seda y la lana (14,2%); y el café, el té, el cacao y las especias (12,7%). China aplica un tipo provisional en forma de derecho móvil, que no puede exceder del 40%, a una determinada cantidad de algodón sin peinar (SA 5201.00.00) importado fuera del contingente. Desde 2020 la tasa de utilización de los contingentes arancelarios ha fluctuado en el caso de algunos productos, entre ellos el trigo, el arroz, la lana y el algodón. Las autoridades han indicado que las fluctuaciones de las tasas de utilización se deben a los cambios en las condiciones de los mercados interno e internacional. China ha notificado a la OMC que en los años civiles 2020 y 2022 no se concedieron subvenciones a la exportación de productos agropecuarios. China ofrece programas de financiación de las exportaciones (créditos a la exportación, garantías de créditos a la exportación y programas de seguro) que abarcan los productos agropecuarios. China ha indicado en sus respuestas al cuestionario sobre la competencia de las exportaciones que ofrece programas de financiación de las exportaciones (por ejemplo, apoyo a corto plazo a la financiación del comercio para la exportación de productos agropecuarios sobre la base de facturas, recibos o cartas de crédito, etc.; préstamos de capital de explotación para proveedores; seguros de crédito a la exportación a medio y largo plazo, seguros de inversión en el extranjero y seguros de crédito a la exportación a corto plazo) que abarcan los productos agropecuarios.

31. En 2024 el promedio aritmético de los aranceles aplicados al pescado y los productos de pescado (definición de la OMC) fue del 6,8%, con tipos comprendidos entre el 0% y el 15%. En 2021 el Ministerio de Agricultura y Asuntos Rurales publicó el 14º Plan Quinquenal para el Desarrollo de la Pesca Nacional, en el que se especifica que para 2025 la producción nacional de pesca marítima se limitará a 10 millones de toneladas. Tanto el Gobierno central como los Gobiernos locales y provinciales prestan ayuda al sector. La última notificación presentada por China a la OMC abarca el período 2021-2022 y contiene tres programas de incentivos o de apoyo aplicados a nivel del Gobierno central, que guardan relación con un fondo de subvenciones para el desarrollo del sector pesquero y con el pago de transferencias para fines generales. Veintidós de los programas relativos al sector pesquero adoptados por los Gobiernos locales durante el período 2021-2022 también se han notificado a la OMC. China aceptó formalmente el Protocolo del Acuerdo sobre Subvenciones a la Pesca depositando su instrumento de aceptación ante la OMC el 27 de junio de 2023. En 2021 China suprimió las subvenciones a los combustibles.

32. Entre las prioridades de China en el sector minero figuran reducir la producción de minerales para los que hay exceso de capacidad y garantizar el suministro de minerales en las industrias emergentes estratégicas. Entre las medidas comerciales adoptadas en este sector se incluye la introducción de un régimen de licencias de exportación para determinados minerales. Aunque en China se permite a los particulares o empresas extranjeros la titularidad de derechos de explotación minera, se les prohíbe invertir, de manera directa o indirecta, en la prospección o explotación de volframio (tungsteno), tierras raras y minerales radiactivos. Para satisfacer las necesidades de consumo de energía se sigue dependiendo principalmente del carbón, pero China prevé apartarse de esta fuente. No obstante, las autoridades reconocen que el carbón sigue siendo esencial para preservar la seguridad energética, en particular en períodos en que se reduce la disponibilidad de energía. La importancia relativa del consumo de carbón ha ido disminuyendo en los últimos años. China ha seguido mejorando su cesta energética al favorecer el uso las fuentes de energía no fósiles, como la energía hidroeléctrica, la nuclear, la eólica y la fotovoltaica. Para apoyar la inversión en energías limpias, China ha introducido mecanismos como las subvenciones en forma de tarifas reguladas

33. El sector manufacturero aportó entre el 26% y el 28% del PIB en el período objeto de examen. En los últimos decenios China se ha convertido en un importante centro manufacturero a nivel mundial. Los notables resultados de China en el sector manufacturero pueden atribuirse a su creciente integración en las cadenas de valor mundiales, impulsada por la liberalización del comercio y las inversiones, la abundancia y productividad de la mano de obra, el vasto mercado interno, la

alta calidad de la infraestructura y la innovación. Los productos manufacturados constituyen más del 95% de las exportaciones de China. La iniciativa "Made in China 2025" (o China Manufacturing 2025) es el principal programa de fomento del sector. El sector manufacturero de China es un receptor significativo de donaciones, financiación para investigación y concesiones fiscales. Varios fondos gubernamentales de orientación se centran específicamente en el sector manufacturero.

34. El comercio de servicios de telecomunicaciones ha seguido expandiéndose en los últimos años, impulsado principalmente por la innovación digital y el aumento de la demanda de servicios digitales. En los servicios de telecomunicaciones fijas y móviles la presencia del Estado es sustancial, aunque ha disminuido durante el período considerado. Los segmentos de telecomunicaciones emergentes, como los centros de datos de internet, la computación en la nube y la internet de las cosas, son explotados principalmente por empresas privadas. La proporción de participación extranjera en los servicios de telecomunicaciones de valor añadido (con exclusión del comercio electrónico, las comunicaciones nacionales entre múltiples partes, los servicios de almacenamiento y reenvío y los centros de atención telefónica) está limitada a un máximo del 50%. Las autoridades han adoptado recientemente un conjunto de medidas de ciberseguridad para reducir los riesgos de seguridad derivados de la transformación digital. China también ha puesto en marcha la Iniciativa Mundial para la Gobernanza de la IA, con el objetivo de promover un enfoque de la inteligencia artificial que equilibre el desarrollo de esa tecnología con la seguridad en su utilización.

35. La estructura del sector financiero sigue caracterizándose por una preponderancia significativa de los bancos sobre los otros tipos de instituciones financieras; el activo de los seis mayores bancos de propiedad estatal constituía el 40,8% del total. La evolución del sector financiero ha estado marcada por una profundización de la liberalización, que ha permitido aumentar la participación extranjera y atraer capital a largo plazo para operaciones e inversiones en China. Se han hecho esfuerzos significativos para promover la financiación verde en el país. A este respecto se han adoptado diversas políticas, en particular instrumentos de política monetaria estructural y pruebas de resistencia relativas a los riesgos climáticos, así como proyectos piloto específicos.

36. En el sector de transporte aéreo, China se propone desarrollar un sector de la aviación civil que observe prácticas respetuosas del medio ambiente y cumpla exigentes criterios de desempeño. En el período considerado se han adoptado varias medidas para promover la construcción de aeropuertos verdes e inteligentes. También se ha adoptado un plan de trabajo con el objetivo de seguir reduciendo en el transporte aéreo la contaminación causada por los plásticos. La construcción y la explotación de los aeropuertos civiles han de estar bajo el control de empresas chinas, lo que limita las posibilidades de inversión extranjera. China se propone establecer un sector de transporte marítimo de alta calidad para 2035, con especial atención a los sistemas de gobernanza modernos, el ahorro de energía y los procesos inteligentes, con el objetivo de seguir consolidando la competitividad del sector. Aunque en general está permitida la inversión extranjera en la industria, en las empresas nacionales de transporte por vía acuática la participación mayoritaria debe pertenecer a una persona u organización china.

37. En resumen, durante el período objeto de examen la importancia de China en la economía y el comercio mundiales ha seguido acentuándose. De cara al futuro, el FMI ha previsto un tasa de crecimiento del 4,6% —menor, pero aún sustancial— para 2024, así como la posibilidad de un posterior descenso a largo plazo, a causa del envejecimiento de la población, la disminución de la población activa y la desaceleración de los aumentos de la productividad. Otros riesgos de deterioro en los próximos años son las tensiones geopolíticas, una contracción más profunda de lo previsto en el sector inmobiliario y un crecimiento mundial más débil de lo esperado que afecte a la demanda. Si continúan las reformas estructurales dictadas por el mercado, así como la liberalización económica y la integración internacional, el comercio será probablemente un factor crucial para las perspectivas de crecimiento de China en el futuro.

1 ENTORNO ECONÓMICO

1.1 Principales características de la economía

1.1. Durante el período objeto de examen, China mantuvo su importancia como motor del crecimiento económico mundial, con un PIB per cápita de USD 12.614 en 2023, frente a USD 10.144 en 2019. Aunque la economía experimentó una gran variabilidad en el crecimiento del PIB real, debido principalmente a la pandemia de COVID-19 y a las políticas conexas, China sigue siendo una importante fuerza motriz del crecimiento mundial.

1.2. El crecimiento de China durante el período objeto de examen siguió siendo superior al de otros países con niveles de desarrollo similares. Las reformas orientadas al mercado, la liberalización económica y la integración en la economía mundial han permitido la mejora del nivel de vida, la aparición de una gran clase media y la erradicación de la pobreza extrema. En consecuencia, China ha pasado a ser la segunda mayor economía del mundo en dólares de los Estados Unidos y, según el Banco Mundial, la mayor en términos de paridad de poder adquisitivo (PPA).¹

1.3. El fuerte crecimiento de China ha ido acompañado tradicionalmente de niveles relativamente elevados de desigualdad de ingresos y de contrastes entre zonas urbanas y rurales en lo relativo a la riqueza, aunque recientemente la diferencia de ingresos entre los residentes en zonas urbanas y rurales se ha ido reduciendo. Según datos del Banco Mundial, el coeficiente de Gini disminuyó hasta el 37,1 en 2020.²

1.4. A finales de 2023, la población de China ascendía a 1.410 millones de habitantes. En 2022, se contrajo por primera vez desde 1961, en 850.000 habitantes. También en 2022, por primera vez desde 1949, nacieron menos de 10 millones de niños. La tasa de natalidad ha seguido disminuyendo; a finales de 2022 era de 6,77 por cada 1.000 habitantes. El porcentaje de la población que tiene 65 años o más aumentó del 12,6% en 2020 al 13,6% en 2022. Más del 65% de la población vive en zonas urbanas; en 2021, la esperanza de vida se estimaba en unos 78 años.³ En este contexto, las autoridades atribuyen gran importancia al envejecimiento de la población que conlleva, entre otras cosas, la previsión de aumentar gradualmente la edad de jubilación obligatoria.⁴

1.5. Si se comparan a nivel internacional, las tasas de ahorro de China son muy elevadas, debido principalmente a la importancia del ahorro preventivo.⁵ Las reformas en materia de pensiones, atención médica y vivienda, así como la liberalización de los servicios, pueden impulsar el consumo a largo plazo.⁶

1.6. En el marco de la Iniciativa "Cinturón y Ruta" (BRI), emprendida en 2013, el Gobierno se propone conectar casi 140 países y regiones mediante grandes proyectos de infraestructura. En ese contexto, China ha concedido cuantiosos préstamos para la construcción de infraestructuras en países en desarrollo. Las autoridades indican que el Banco de Desarrollo de China y el Banco de Exportación e Importación de China han establecido préstamos especiales para la BRI y un servicio de financiación dotado con CNY 350.000 millones, respectivamente, con el fin de prestar apoyo a la comercialización de los proyectos en el marco de la BRI. Según un estudio, a finales de 2023 el gasto total en el marco de la BRI ascendía a USD 1,053 billones, frente a USD 640.000 millones en 2021.⁷ Aunque algunos estudios han señalado que la BRI puede afectar negativamente a la carga

de la deuda de los países beneficiarios⁸, las autoridades no están necesariamente de acuerdo con esta opinión.

1.2 Evolución económica reciente

1.2.1 Crecimiento económico

1.7. En general, la economía de China se ha recuperado bien de las perturbaciones relacionadas con la pandemia que experimentó en 2020. Tras una impresionante recuperación de los efectos iniciales de la pandemia, con una tasa de crecimiento superior al 8% en 2021, el crecimiento se ralentizó al 3% en 2022, debido en parte a los efectos de la pandemia de COVID-19 (cuadro 1.1).⁹ En 2023, tras la reapertura en el período posterior a la COVID-19, el PIB real creció a un ritmo del 5,2%, en consonancia con el objetivo de crecimiento de las autoridades del 5%. Entre las principales fuerzas impulsoras de la recuperación cabe citar el aumento del consumo privado, la flexibilización de la política monetaria y las desgravaciones fiscales.¹⁰

1.8. En los últimos años, según el FMI, el elevado ahorro de los hogares de China se destinó en gran medida a la financiación de inversiones en bienes inmuebles e infraestructura; no obstante, el rendimiento de las inversiones en infraestructura ha ido disminuyendo con el tiempo, lo que ha contribuido a un crecimiento más lento de la productividad y, en consecuencia, al aumento de los desequilibrios internos (por ejemplo, el aumento de la deuda entre los promotores y los Gobiernos locales).¹¹ Esos desequilibrios y el debilitamiento de las perspectivas de crecimiento, así como la ralentización de la productividad y el rápido envejecimiento, pueden aumentar las vulnerabilidades. Sin embargo, las autoridades consideran que el rendimiento de las inversiones en infraestructura no es el principal factor que afecta a la productividad.

Cuadro 1.1 Determinados indicadores macroeconómicos, 2018-2023

	2018	2019	2020	2021	2022	2023
PIB nominal (miles de millones de CNY)	91.928,1	98.651,5	101.356,7	114.923,7	120.472,4	126.058,2

1.9. El crecimiento en general y la recuperación posterior a la pandemia en concreto han contado con el firme apoyo del crecimiento del consumo, sostenido por una clase media cada vez más numerosa y con mayores ingresos medios. Según el FMI, la inversión pública y la inversión privada en el sector manufacturero han impulsado la inversión total y han compensado las carencias de la inversión en bienes inmuebles.¹²

1.10. El FMI prevé que, para 2024, el crecimiento del PIB de China se ralentice hasta el 4.6%.¹³ De cara a los próximos años, es probable que el crecimiento económico siga siendo elevado, pero se ralentizará con el envejecimiento de la población, la disminución de la fuerza de trabajo y la desaceleración del aumento de la productividad. Por consiguiente, para que crezca la productividad interna, será fundamental llevar a cabo reformas estructurales orientadas al mercado.¹⁴ Entre los riesgos para el mantenimiento de las elevadas tasas de crecimiento cabe citar las tensiones geopolíticas, una contracción más profunda de lo previsto en el sector inmobiliario y un crecimiento mundial más débil de lo previsto.

1.11. La tasa de desempleo declarada oficialmente se mantuvo baja durante el período objeto de examen, en torno al 5%. No obstante, el desempleo juvenil sigue siendo muy elevado, con tasas superiores al 20% en las zonas urbanas.¹⁵ Se han introducido nuevas reformas del sistema *hukou*¹⁶, principalmente a nivel provincial, aunque siguen en vigor restricciones en materia de residencia en las ciudades más grandes y en las capitales de provincia.

1.12. En lo que respecta a la composición sectorial del PIB de China, durante el período objeto de examen se detuvo el cambio estructural a largo plazo anterior para pasar de la industria a los servicios (cuadro 1.2). La contribución de la agricultura al PIB se mantuvo constante, entre el 7,5% y el 8%. La contribución de la industria aumentó ligeramente después de la pandemia, hasta situarse en torno al 33% en 2022, y luego disminuyó ligeramente hasta el 31,7% en 2023. Los servicios representaron cerca del 55% del PIB de China en 2023, la misma proporción que en 2020. Los sectores de servicios que crecieron con mayor rapidez durante el período objeto de examen fueron los de transmisión de información, programas informáticos e intermediación financiera, mientras que la importancia relativa del sector inmobiliario disminuyó.

Cuadro 1.2 PIB por sectores, 2018-2023

	2018	2019	2020	2021	2022	2023
PIB por sectores, a precios constantes (variación porcentual anual)						
Agricultura, ganadería, silvicultura y pesca	3,6	3,2	3,3	7,1	4,4	4,2
Industria ^a	6,1	4,8	2,4	10,4	2,7	4,2

¹⁵ China dejó de publicar las tasas de desempleo juvenil en junio de 2023, cuando alcanzaron un máximo sin precedentes del 21,3%. Reanudó la publicación en 2024, con una metodología diferente. Utilizando esta metodología, el desempleo juvenil fue del 14,9% en diciembre de 2023.

¹⁶ El *hukou* es un sistema de registro de residencia. Las reformas del sistema *hukou* son una forma importante de ampliar la red de seguridad social, y permiten a los trabajadores migrantes y a sus familias acceder a los servicios públicos y las ayudas de que disponen los residentes en zonas urbanas.

	2018	2019	2020	2021	2022	2023
Actividades de alojamiento y servicio de comidas	1,8	1,8	1,5	1,6	1,5	1,7
Transporte, almacenamiento y comunicaciones	4,4	4,3	4,0	4,2	4,2	4,6
Intermediación financiera	7,7	7,7	8,2	7,9	7,7	8,0

1.2.2 Política monetaria y cambiaria

1.13. La estabilidad de los precios sigue siendo el principal objetivo de la política monetaria. Con arreglo a la Ley del Banco Popular de China (PBOC), la finalidad de la política monetaria es preservar la estabilidad del valor de la moneda y fomentar así el crecimiento económico. Las tasas de inflación se han mantenido muy bajas en los últimos años, con un máximo del 2,9% en 2019 y tasas más bajas en los años siguientes. La política monetaria fue en general flexible en el período de recuperación posterior a la pandemia.

1.14. La vigilancia de las corrientes transfronterizas de capital por el Banco Popular de China y la Administración Estatal de Divisas (SAFE) puede afectar a las corrientes de divisas. Las empresas deben informar a la SAFE de cualquier pago en el extranjero para la liquidación de los pagos de importación que estén previstos en un plazo de 90 días contados desde la fecha indicada en el formulario de declaración de importación.

1.15. China ha mantenido su régimen de tipo de cambio flotante dirigido. El tipo de cambio del yuan se determina en función de una cesta de monedas cuya composición es de conocimiento público. La paridad central del yuan se establece a diario como una paridad "fija". El Banco Popular de China solo interviene para evitar fluctuaciones excesivas a corto plazo.¹⁷ El yuan viene depreciándose frente al dólar de los Estados Unidos desde 2022, y la depreciación fue relativamente fuerte en 2023 (cuadro 1.1).

1.16. Hasta la fecha, el yuan es plenamente convertible para las transacciones por cuenta corriente y parcialmente convertible para algunas transacciones por cuenta de capital. Los residentes y los no residentes pueden utilizar el yuan en la inversión extranjera directa.

1.17. China ha proseguido sus esfuerzos por internacionalizar el yuan y su utilización como moneda de reserva; por ejemplo, según algunas obras académicas, aumentando el número de préstamos denominados en yuan que concede a países de ingresos bajos y medianos.¹⁸ Sin embargo, las autoridades afirman que los bancos comerciales determinan los destinos de los préstamos en el extranjero de forma independiente con arreglo al principio de orientación al mercado. El uso internacional del yuan sigue siendo muy limitado, con alrededor del 4% de todos los pagos transfronterizos a nivel mundial. Desde 2014, el PBOC ha desarrollado también una moneda digital denominada yuan digital (e-yuan).

1.18. A finales de febrero de 2024, las reservas de divisas notificadas oficialmente ascendían a USD 3,2 billones, un valor ligeramente superior al de 2016. La SAFE y el PBOC gestionan las reservas de divisas.

¹⁷ FMI (2024), IMF Country Report N° 24/38.

¹⁸ A. Gelpern *et al.* (2021), "How China Lends: A Rare Look into 100 Debt Contracts with Foreign Governments", *Economy Policy*, volumen 38, N° 114, páginas 345-416.

1.19. Según el FMI, las vulnerabilidades del sector financiero son elevadas y aumentaron en 2023 debido al mayor riesgo de los créditos y la menor rentabilidad de los bancos.¹⁹ Al mismo tiempo, los datos facilitados por las autoridades indican que la proporción de préstamos fallidos de los bancos comerciales fue del 1,59% al final de cuarto trimestre de 2023, lo que supone una disminución interanual de 0,04 puntos porcentuales.

1.2.3 Política fiscal

1.20. Durante la pandemia, la política fiscal de apoyo contó con un paquete equivalente al 3% o el 4% del PIB. Desde 2022, el objetivo de la política fiscal ha sido apoyar la recuperación después de la pandemia mediante la ampliación de la inversión pública y una serie de medidas fiscales y otras medidas de alivio.

1.21. La relación entre los impuestos y el PIB de China fue del 14% en 2022, frente al 17% en 2018. No se ha facilitado información sobre la contribución de cada impuesto a los ingresos fiscales totales.

1.22. La relación entre la deuda total y el PIB de China siguió aumentando acusadamente durante el período objeto de examen, tras una breve estabilización anterior a la pandemia. La deuda pública aumentada²⁰ ascendió al 116% del PIB en 2023, frente al 99% en 2020²¹, debido principalmente a la deuda extrapresupuestaria del Gobierno central y a la deuda presupuestaria de los Gobiernos locales. La deuda de las empresas, principalmente la deuda de las empresas de propiedad estatal, también aumentó notablemente durante el período objeto de examen, mientras que el crédito a los hogares disminuyó ligeramente. En un contexto de rápida acumulación de deuda desde 2008, escaso margen de actuación fiscal y rápido envejecimiento de la población, es importante mantener la consolidación fiscal a medio plazo.²²

1.2.4 Medidas estructurales

1.23. Las reformas estructurales llevadas a cabo desde el anterior examen de China incluyen eliminación de las restricciones a la participación extranjera en los sectores de telecomunicaciones y financiero (secciones 4.4.1 y 4.4.2), el establecimiento de tribunales especializados para acelerar la liquidación de empresas estatales ineficientes (sección 3.3.5) y algunas reducciones arancelarias moderadas (sección 3.1.3).

1.24. La gran participación del Estado sigue siendo una característica importante de la economía de China; incluso en los sectores con orientación comercial, las empresas de propiedad estatal tienen cuotas de mercado sustanciales y una posición dominante en el mercado. Durante el período objeto de examen, la reforma de las empresas estatales se llevó a cabo casi exclusivamente en el contexto de la propiedad mixta; no tuvo lugar ninguna privatización importante (sección 3.3.5).

1.2.5 Balanza de pagos

1.25. El superávit por cuenta corriente de China aumentó considerablemente entre 2018 y 2022, año en que ascendía a USD 402 billones, cifra equivalente al 2,24% del PIB (cuadro 1.3). En 2023, el superávit disminuyó hasta situarse en el 1,5% del PIB. El aumento del superávit por cuenta corriente se explica por el fuerte aumento del superávit del comercio de mercancías, con un crecimiento de las exportaciones que superó al crecimiento de las importaciones en muchos momentos, y la considerable disminución del déficit de la balanza de servicios, debido en gran medida a la caída del turismo emisor. La participación de las exportaciones e importaciones de mercancías en el PIB fue del 32,2% en 2023, frente al 30,5% en 2020, lo que indica la mayor apertura de la economía.

¹⁹ FMI (2024), IMF Country Report N° 24/38.

²⁰ Según la definición del FMI, el déficit aumentado incluye las entidades de financiación de los Gobiernos locales, los fondos dirigidos por el Estado y otras actividades extrapresupuestarias. FMI (2024), IMF Country Report N° 23/67, página 54.

²¹ FMI (2024), IMF Country Report N° 24/38.

1.26. La cuenta financiera (excluidos los activos de reserva) viene registrando un déficit desde 2020, que puede deberse a la crecientes presiones generadas por la salida de capital, como la ampliación de las diferencias con los tipos de interés de otras grandes economías en 2022 y 2023, la preocupación por las perspectivas de crecimiento de China y el aumento de los riesgos geopolíticos. En 2022, el déficit aumentó a USD 311.000 millones, pero en 2023 disminuyó hasta unos USD 244.000 millones. La inversión directa registró un superávit en cada uno de los últimos años. Los proyectos en el marco de la BRI siguieron desempeñando un papel importante en las inversiones en el exterior.

1.3 Evolución del comercio y la inversión

1.3.1 Tendencias y estructura del comercio de mercancías y servicios

1.27. Las exportaciones de mercancías de China aumentaron significativamente, de USD 2.589 millones en 2020 a USD 3.594 millones en 2022, pero disminuyeron en 2023 (cuadro A1. 1 y gráfico 1.1). Las exportaciones a algunas regiones, como las Américas y Europa, disminuyeron en términos relativos, mientras que las exportaciones a África, Oriente Medio y la Federación de Rusia aumentaron sus porcentajes durante el período objeto de examen, si bien partían de niveles más bajos. A pesar de su relativa disminución, los Estados Unidos y la Unión Europea siguen siendo los destinos individuales más importantes para las exportaciones de mercancías de China. Entre el 40% y el 45% de las exportaciones de mercancías se destina a Asia y Oceanía. África y Oriente Medio representan aproximadamente el 5% de las exportaciones, con una tendencia ligeramente al alza.

1.28. Las importaciones de mercancías de China también experimentaron un sólido aumento, de USD 2.069 millones en 2020 a USD 2.716 millones en 2022, pero disminuyeron en 2023 (cuadro A1. 2 y gráfico 1.1). La Unión Europea, el Territorio Aduanero Distinto de Taiwán, Penghu, Kinmen y Matsu (Taipei Chino), el Japón y los Estados Unidos son las fuentes geográficas individuales más importantes de las importaciones de mercancías de China. Entre el 40% y el 50% de las importaciones proceden de Asia y Oceanía, aproximadamente el 17% de las Américas, aproximadamente el 14% de Europa, alrededor del 9% de Oriente Medio y aproximadamente el 5% de África.

Gráfico 1.1 Distribución geográfica del comercio de mercancías, 2020 y 2023

a Comunidad de Estados Independientes, incluidos determinados Estados asociados y antiguos Estados miembros.

b Incluidos los bienes exportados de China y posteriormente reimportados a China.

Fuente: Cálculos de la Secretaría de la OMC a partir de la base de datos UN Comtrade e información de la Administración General de Aduanas de la República popular China (GACC)

1.29. La maquinaria y el equipo eléctrico siguen constituyendo una gran parte de las exportaciones de China, con una participación de más del 40% en cada año del período objeto de examen; la maquinaria eléctrica representó por sí sola más del 26% (cuadro A1. 3 y gráfico 1.2). La participación de las materias textiles y sus manufacturas continuó su tendencia descendente durante el período objeto de examen y representó menos del 9% en 2023. Los productos químicos mantuvieron su participación de entre el 5% y el 7%, mientras que los productos agropecuarios representaron únicamente una participación menor en las exportaciones de China.

1.30. La maquinaria y el equipo eléctrico también ocupan una participación importante en las importaciones totales de China, aunque su participación cayó a menos del 30% en 2023 (cuadro A1. 4 y gráfico 1.2). La participación de los productos minerales en las importaciones de mercancías de China aumentó del 23% en 2018 a más del 30% en 2023, lo que es atribuible principalmente a los aumentos del precio de los combustibles minerales y petróleo. Los productos agropecuarios representan menos del 10% de las importaciones.

Gráfico 1.2 Composición del comercio de mercancías por principales Secciones del SA, 2020 y 2023

Fuente: Cálculos de la Secretaría de la OMC a partir de la base de datos UN Comtrade e información de la GACC.

1.31. El crecimiento del comercio de bienes intermedios superó con creces el crecimiento del comercio de mercancías en general, lo que indica una mayor integración de China en las cadenas de suministro internacionales (cuadro A1. 5). Los bienes intermedios más importantes objeto de comercio internacional son las partes, accesorios y demás suministros industriales.

1.32. Las exportaciones de servicios aumentaron considerablemente, de USD 229.000 millones en 2020 a USD 369.000 millones en 2022, pero disminuyeron a USD 323.000 millones en 2023 (cuadro 1.4). El aumento fue especialmente notable en el caso de los servicios de transporte, debido al sólido crecimiento de la demanda y al incremento de los precios del sector. Las importaciones de servicios de China se contrajeron después de 2018, aunque a partir de un nivel elevado, y se recuperaron hasta un valor de USD 553.000 millones en 2023. El bajo nivel de turismo de salida, que comenzó antes de la pandemia, fue un factor importante de la disminución de las importaciones de servicios de China entre 2020 y 2022.

1.33. Los principales interlocutores comerciales de China para los servicios son los Estados Unidos; Hong Kong, China; el Japón; Singapur; y la República de Corea.²³

1.3.2 Tendencias y estructura de la inversión extranjera directa

1.34. Las corrientes de inversión extranjera en China siguieron siendo importantes durante el período objeto de examen, y aumentaron a USD 189.000 millones en 2022; en 2023 se redujeron

²³ SAFE, *China Balance of Payment Report*, varios años; y Banco Mundial, *WITS Data, China Trade Balance, Exports and Imports by Country 2021*. Consultado en: <https://wits.worldbank.org/CountryProfile/en/Country/CHN/Year/2021/TradeFlow/EXPIMP/Partner/by-country>.

a USD 163.250 millones.²⁴ Hong Kong, China es, con diferencia, la principal fuente de IED en China (cuadro 1.5). Otras fuentes importantes son Singapur, las Islas Vírgenes Británicas, la República de Corea, el Japón y los Países Bajos. Según datos de la UNCTAD, el volumen de las entradas de IED en China ascendió a USD 3,8 billones en 2022, un aumento con respecto a USD 1,9 billones en 2020.²⁵

1.35. El sector manufacturero sigue siendo el mayor receptor de IED en China, seguido de los servicios de arrendamiento financiero y servicios prestados a las empresas y los servicios de investigación científica y técnicos (cuadro 1.6). Sectores como la agricultura, la minería y la construcción tienen poca importancia para la IED.

1.36. Según las autoridades, los proyectos en el marco de la BRI siguen siendo receptores significativos de la inversión saliente de China. Los datos facilitados por las autoridades indican que, en 2023, las inversiones directas no financieras de empresas chinas en países de la BRI ascendieron aproximadamente a CNY 224.000 millones, un aumento del 28,4% con respecto al año anterior; en términos de proyectos contratados en el extranjero, el valor de nuevos proyectos contratados firmados por empresas chinas en los países de la BRI fue de aproximadamente CNY 1.600,7 millones, un aumento del 10,7%.²⁶ Una estimación muestra que el 34% del volumen total de IED de China se invierte en proyectos relacionados con la BRI; estas inversiones tienen una amplia distribución geográfica, con una concentración en Asia Central y Sudoriental, y normalmente se centran en infraestructura.²⁷

1.37. En términos de salidas de IED, China sigue siendo un importante inversor en el extranjero. Tras una significativa disminución de las salidas de IED china entre 2017 y 2019, hubo aumentos en 2020 y 2021, y otra reducción en 2022. Los principales destinos son Hong Kong, China; las Islas Vírgenes Británicas; Singapur; los Estados Unidos; e Indonesia (cuadro 1.7). Las salidas de IED se centraron en cuatro sectores fundamentales: servicios de arrendamiento financiero y servicios prestados a las empresas, comercio mayorista y minorista, manufacturas e intermediación financiera (cuadro 1.8). Las salidas de IED de China ascendieron a casi USD 3 billones en 2022, un aumento con respecto a USD 2,6 billones en 2020.

2 RÉGIMENES DE COMERCIO E INVERSIÓN

2.1 Marco general

2.1. El marco jurídico e institucional general de China apenas ha cambiado durante el período objeto de examen. En la Constitución de la República Popular China se establecen las funciones y responsabilidades del Congreso Nacional del Pueblo y su Comité Permanente (poder legislativo), el Consejo de Estado (órgano ejecutivo y órgano supremo de administración del Estado) y el poder judicial, constituido por el Tribunal Supremo del Pueblo, los tribunales populares locales en los diferentes niveles y los tribunales especializados. También se establece que los congresos populares y los gobiernos populares locales ejercerán y aplicarán el poder estatal en el ámbito local.

2.2. Los proyectos de ley y de reglamento se publican en línea en chino durante un mínimo de 30 días para que el público pueda formular observaciones, salvo que el Consejo de Estado decida que se debe mantener su carácter confidencial. En la Gaceta de Comercio Exterior y Cooperación Económica de China, editada por el Ministerio de Comercio (MOFCOM), se publican las leyes, los reglamentos y las normas de China relacionados con el comercio.¹ En diversas ocasiones China también publica las políticas adoptadas en el sitio web del Gobierno, entre otros lugares.²

2.3. Las decisiones administrativas pueden ser objeto de recurso, salvo que se relacionen con cuestiones comerciales que afecten a la seguridad nacional. Los comerciantes pueden solicitar una revisión judicial de asuntos comerciales ante los tribunales pertinentes. Cuando se realizó el examen anterior, las autoridades indicaron que se habían establecido varias comisiones de reexamen administrativo independientes con carácter experimental. El 1 de septiembre de 2023, se promulgó la Ley de Reexamen Administrativo, que entró en vigor el 1 de enero de 2024. Se prevé que en virtud de esta ley se dispondrá el establecimiento de comités de reexamen administrativo integrados por representantes de los departamentos gubernamentales pertinentes, expertos, académicos y otros individuos, entre otras cosas. Estos comités ofrecerán asesoramiento para la gestión de los casos de reexamen administrativo y emitirán opiniones sobre cuestiones conexas. Las autoridades han indicado que los órganos de reexamen administrativo del Consejo de Estado están adoptando disposiciones respecto de la composición de los comités y sus facultades. Las autoridades han señalado que, en la próxima etapa, se establecerán comités de reexamen administrativo a nivel de los gobiernos locales.

2.4. La principal novedad que se produjo en relación con el marco jurídico general de China durante el período objeto de examen fue la puesta en marcha del programa de reforma judicial. El quinto Programa Quinquenal de Reforma de los Tribunales Populares (2019-2023) sigue orientando diversas reformas judiciales. Este documento estratégico se centra, entre otras cosas, en las medidas que se han de adoptar para mejorar el entorno empresarial de China mediante una aplicación coherente y previsible de los principios jurídicos pertinentes.³ En el marco de este plan, las autoridades prevén i) establecer mecanismos de apoyo para salvaguardar los derechos de propiedad y ii) reforzar los sistemas de observancia, en particular en los casos que involucren a empresas. El quinto Programa Quinquenal de Reforma Judicial de China incluye el establecimiento de tribunales especializados en asuntos de propiedad intelectual, así como cuestiones marítimas y financieras. Estos tribunales especializados tienen por objeto promover la especialización funcional y mejorar la aplicación de los principios jurídicos en el contexto del desarrollo económico y social. Cuando se realizó el examen anterior, ya se había avanzado considerablemente en la especialización en determinadas cuestiones⁴, como las relacionadas con el comercio electrónico, al haberse

³ Por ejemplo, Chemin constató que las reformas judiciales pueden mejorar la productividad de las empresas y contribuir al desarrollo económico general. M. Chemin (2020), "Judicial Efficiency and Firm Productivity: Evidence from a World Database of Judicial Reforms", *The Review of Economics and Statistics*, vol. 102, N°1, páginas 49-64. Consultado en: <https://direct.mit.edu/rest/article-abstract/102/1/49/58536/Judicial-Efficiency-and-Firm-Productivity-Evidence?redirectedFrom=fulltext>.

⁴ Desde 2019, se han establecido tribunales de propiedad intelectual en Beijing, Shanghai, Guangzhou y el Puerto Franco de Hainan.

establecido tribunales de Internet en Hangzhou, Beijing y Guangzhou.⁵ Las autoridades han indicado que, al promover mecanismos de solución de diferencias especializados y herramientas de apoyo inteligentes, los tribunales de Internet han contribuido significativamente a mejorar la eficiencia y reducir el costo de los litigios. Por ejemplo, a finales de 2023 las audiencias duraban un promedio de 34,13 minutos y los procesos judiciales se completaban en 64,78 días, lo que permitía ahorrar una cuarta parte del tiempo en comparación con los litigios que no se desarrollaban en línea. Las autoridades también han señalado que se está trabajando para racionalizar aún más el funcionamiento de los tribunales de Internet, con miras a proporcionar una mayor protección judicial para el desarrollo de la economía digital y la gobernanza del ciberespacio.

2.5. Como parte de los esfuerzos realizados por las autoridades para promover el derecho mercantil internacional, el Tribunal de Comercio Internacional de China (CICC), establecido en 2018, resuelve los casos relativos al comercio internacional. El Primer Tribunal de Comercio Internacional se sitúa en Shenzhen (provincia de Guangdong), y el Segundo Tribunal de Comercio Internacional se ubica en Xi'an (provincia de Shaanxi). El CICC examina los casos relativos al comercio internacional admitidos a trámite en primera instancia en los que las partes optan por someter el asunto al Tribunal Supremo del Pueblo y cuya cuantía supera CNY 300 millones, los casos relativos al comercio internacional admitidos a trámite en primera instancia que tienen importantes repercusiones a nivel nacional y los casos relativos al comercio internacional que, a juicio del Tribunal Supremo del Pueblo, han de ser resueltos por los tribunales de comercio internacional. Según las autoridades, en febrero de 2024 los tribunales habían aceptado 34 casos, cuyas partes involucraban a 14 entidades. Las diferencias se referían a cuestiones relacionadas con la distribución de las utilidades de las empresas, la determinación de la condición de los accionistas, el establecimiento de responsabilidad por el menoscabo de intereses empresariales y la transferencia de capital.

2.6. Por lo que se refiere al arbitraje, las autoridades han indicado que se están realizando esfuerzos por promover la puesta en marcha experimental del Centro de Arbitraje Comercial Internacional, centrado en establecer instituciones de arbitraje internacional plenamente operativas. Se ha establecido un mecanismo para que el CICC y las instituciones de mediación y arbitraje puedan funcionar de manera integrada.⁶ El objetivo es que algunas diferencias se puedan resolver mediante métodos alternativos, cuando proceda, en lugar de recurrir a litigios.

2.7. En cuanto al marco jurídico e institucional relacionado con la gestión empresarial, la Ley de Sociedades de China establece que las empresas que emplean a miembros del Partido Comunista integrarán a organizaciones del Partido en su estructura.⁷ En septiembre de 2020, el Partido y el Consejo de Estado emitieron conjuntamente un dictamen destinado a mejorar los intercambios institucionales informales entre el Partido y el sector privado.⁸ Según las autoridades, el objetivo de esta iniciativa era alentar a las empresas del sector privado a adoptar un "sistema empresarial moderno" que se ajustara a las "características chinas" únicas y gestionar, servir y unir a los miembros del Partido, orientándolos para que respeten las leyes, los reglamentos y el código de conducta de las empresas. En 2016 se utilizó un enfoque similar con respecto a las empresas de propiedad estatal, en el marco de lo cual las autoridades chinas señalaron que las "características chinas" entrañaban la integración de la dirección del Partido en todas las facetas de la gestión de las empresas de propiedad estatal y una especificación de la condición jurídica de las organizaciones del Partido en la estructura de gestión de dichas empresas.⁹

2.8. Las autoridades señalan que, para promover una mayor interacción entre el Partido y el sector privado, se ha de promover la actividad empresarial y se ha de asesorar a las empresas privadas sobre cómo lograr un desarrollo estable en medio de los riesgos que van surgiendo en el ámbito

⁵ Los tribunales de Internet se encargan principalmente de casos relacionados con los derechos en materia de datos, las transacciones en línea, la gestión de plataformas, la utilización de algoritmos y la protección de la información personal en Internet.

⁶ Hasta la fecha, se han adherido a ese mecanismo 10 organizaciones de arbitraje comercial internacional y organizaciones de mediación comercial internacional.

⁷ "En una empresa, se establecerá una organización del Partido Comunista de China para llevar a cabo las actividades del Partido de conformidad con la carta del Partido Comunista de China. La empresa proveerá las condiciones necesarias para las actividades de la organización del Partido". (artículo 19 de Ley de Sociedades).

⁸ State Council, "Opinions on Strengthening the United Front Work of the Private Economy in the New Era". Consultado en: https://www.gov.cn/zhengce/2020-09/15/content_5543685.htm.

⁹ Discurso del Presidente en la Conferencia Nacional sobre el Desarrollo del Partido en las Empresas de Propiedad Estatal, 10 de octubre de 2016. Consultado en https://www.sohu.com/a/307762296_364628.

internacional. También señalan que para establecer la "economía de mercado socialista" deseada, es fundamental que el mercado funcione de manera fluida y de acuerdo a normas coherentes. En este sentido, durante el período objeto de examen China aplicó medidas para mejorar el funcionamiento de su mercado nacional. En el marco de estas medidas se abordaron las discrepancias que había en los marcos reglamentarios de comercio e inversión de las diversas provincias del país. Como se puso de relieve en el examen anterior, esta situación dio lugar a que algunas autoridades locales adoptaran ciertas medidas proteccionistas a nivel provincial con el fin de favorecer el comercio y las inversiones locales con respecto a otras provincias. Según las autoridades, durante el período objeto de examen, la Comisión Nacional de Desarrollo y Reforma (NDRC) estableció un sistema para recopilar y notificar casos de infracción de la Lista Negativa para el acceso a los mercados, con miras a mantener la coherencia en el mercado nacional.

2.9. En 2022 se emitió el Dictamen sobre la aceleración del establecimiento de un mercado unificado nacional, que tenía por objeto "poner fin al proteccionismo local y las barreras regionales" y eliminar los obstáculos administrativos entre las provincias de China.¹⁰ Las autoridades han señalado que, en consonancia con este objetivo, en 2022 las administraciones y departamentos locales revisaron más de 615.000 medidas de política, entre las que había 163.700 medidas nuevas que se examinaron antes de su adopción, examinaron 452.000 medidas existentes, y derogaron, revisaron y corrigieron más de 20.000 medidas que eran incompatibles con las leyes y reglamentos estatales pertinentes.

2.10. La política de competencia de China también se ha ajustado para tener en cuenta el imperativo de "unificar el mercado" (sección 3.3.4). Se revisaron las Disposiciones Provisionales sobre la Prohibición de Eliminar o Restringir la Competencia mediante un Abuso de las Facultades Administrativas y se emitieron las Disposiciones sobre la Prohibición de Eliminar o Restringir la Competencia mediante un Abuso de las Facultades Administrativas (Anuncio N° 64 de la Administración Estatal de Reglamentación del Mercado, de 2023), que entraron en vigor el 15 de abril de 2023.¹¹ En estas se aclaran en mayor medida las prácticas de abuso de las facultades administrativas que impiden la competencia, como la coacción de operadores no locales respecto de inversiones locales o el establecimiento de sucursales y la exclusión de determinados operadores de los procesos de licitación o una limitación de su capacidad a estos efectos.

2.11. Las autoridades señalan que los departamentos encargados de regular la competencia investigan los abusos de las facultades administrativas que restringen la competencia, y también han realizado una rectificación a nivel nacional de los derechos y las cargas que se habían aplicado indebidamente a determinadas empresas. Las autoridades consideran que estas medidas han reducido los costos de las transacciones en la economía nacional y han creado un entorno propicio para las pequeñas y medianas empresas.

2.2 Formulación y objetivos de la política comercial

2.12. El marco institucional que rige la formulación de la política comercial de China no cambió durante el período objeto de examen. La NDRC y el MOFCOM son los principales órganos encargados de gestionar la elaboración de las medidas comerciales y los reglamentos conexos. La NDRC coordina las tareas relacionadas con la planificación económica de China, y define en particular los objetivos y las reformas necesarias en el marco de los Planes Quinquenales de Desarrollo Económico y Social Nacional, y el MOFCOM gestiona principalmente la coordinación y la promulgación de políticas y reglamentos relativos al comercio, la inversión y la cooperación económica.

2.13. También contribuyen a formular y ejecutar la política comercial varios otros órganos, en particular en el ámbito de la agricultura, la sostenibilidad ambiental, las telecomunicaciones, las finanzas, la industria y la tecnología y el transporte.

2.14. Las autoridades son conscientes de que el comercio puede contribuir de manera fundamental a mejorar el nivel de vida de la población. Señalan que es fundamental que China siga fomentando

¹⁰ State Council, "The Opinions of the Central Committee of the Communist Party of China and the State Council on Accelerating the Construction of a National Unified Market". Consultado en: https://www.gov.cn/xinwen/2022-04/10/content_5684388.htm.

¹¹ Decreto N° 64 de la Administración Estatal de Reglamentación del Mercado, de 10 de marzo de 2023. Consultado en: https://www.samr.gov.cn/zw/zfxxgk/fdzdgknr/fgs/art/2023/art_b96953818d5a4737a60527c675c1d1cb.html.

una amplia apertura mediante un aumento del comercio de bienes y servicios, un desarrollo del comercio digital, una intensificación de la colaboración económica y comercial a nivel internacional y una consolidación de su marco de gestión de riesgos. Además, abogan por una evolución paralela de la demanda interna y extranjera, así como de las importaciones y exportaciones, para contribuir a lograr un desarrollo continuo.

2.15. La orientación estratégica de las políticas de China en materia de comercio e inversión se define principalmente en el 14º Plan Quinquenal de Desarrollo Económico y Social Nacional (2021-2025), adoptado por el Congreso Nacional del Pueblo el 11 de marzo de 2021. Con arreglo a la estrategia, China se propone promover una mayor apertura de su mercado y crear asociaciones comerciales beneficiosas para todas las partes. Las autoridades consideran que China seguirá flexibilizando su marco de comercio e inversión, como demuestra una mayor liberalización del acceso a los mercados para el comercio y la inversión mediante la reducción del número de elementos que integran la lista negativa de inversiones extranjeras, entre otras cosas (sección 2.4.1).

2.16. La liberalización gradual del marco de inversión de China también forma parte de la intención del país de promover la participación extranjera en su economía. Durante este 14º bloque quinquenal, China procurará adoptar medidas graduales para reducir las restricciones a la inversión extranjera en todos los sectores de la economía, centrándose en especial en los servicios. Se estima que la plena aplicación de la Ley de Inversión Extranjera permitirá establecer un entorno de mercado justo e imparcial al reforzar las disposiciones sobre trato nacional y mejorar la protección de los derechos de propiedad intelectual.

2.17. En su visión estratégica, las autoridades recuerdan que el creciente proteccionismo y unilateralismo afectan a la economía mundial, y que diversas fuentes de tensión siguen poniendo a prueba las cadenas de suministro mundiales. En respuesta, estas prevén seguir apoyando el sistema multilateral de comercio y participar activamente en las reformas de la OMC con miras a promover un sistema de gobernanza económica mundial razonable y más equitativo.¹²

2.18. Las zonas de desarrollo de China, integradas por las zonas económicas especiales, las zonas de desarrollo económico y tecnológico, las zonas de desarrollo industrial de alta tecnología y las zonas francas experimentales, siguen desempeñando una función fundamental, puesto que obran como campo de pruebas para la liberalización del comercio y la inversión a nivel nacional y la simplificación de los reglamentos aplicables. En estas zonas se aplican políticas preferenciales para facilitar la importación, manipulación, fabricación y exportación de bienes y servicios. Estas políticas incluyen incentivos fiscales, la libre circulación y el intercambio de capitales y procedimientos acelerados para las inversiones.

2.19. Con el fin de alcanzar sus objetivos de lograr su nivel máximo de emisiones de dióxido de carbono antes de 2030 y la neutralidad en emisiones de carbono antes de 2060, China está aplicando activamente diversas medidas, como la optimización de sus fuentes de energía a través de varias medidas relacionadas con el comercio (impuestos, subvenciones y diversos reglamentos) y el establecimiento de un mercado para el comercio de derechos de emisión de carbono.

2.20. Las autoridades indican que su objetivo es elaborar una estrategia de desarrollo con bajas emisiones de carbono a largo plazo a nivel nacional, sectorial y local, y adoptar medidas específicas en esferas como la financiación de los créditos de carbono, a fin de que China esté a la altura de las responsabilidades que le incumben como país que contribuye de manera importante a las soluciones adoptadas a nivel mundial para hacer frente al cambio climático. Entre los esfuerzos concretos que se han realizado en los últimos años cabe destacar las iniciativas gubernamentales (incluidos los programas de formación) destinadas a alentar a diversas entidades a formular normas para la fabricación de productos ecológicos y con bajas emisiones de carbono, y a mejorar la sensibilización y capacidad de las empresas para proseguir un desarrollo ecológico y con bajas emisiones de carbono. Durante el período objeto de examen, las autoridades formularon normas nacionales y aplicaron un sistema nacional de certificación de productos ecológicos para los tableros de madera y los suelos de madera; las pinturas; los artículos sanitarios de cerámica; los productos de vidrio para acristalamiento; los sistemas de calentamiento solar de agua; los muebles; el aislamiento térmico; los productos de impermeabilización y sellado; las baldosas de cerámica; los productos de

¹² Chinese People's Institute for Foreign Affairs, *The 14th Five-Year Plan: China Advances High-Level Opening-Up and Brings New Opportunities for the World*. Consultado en: <https://www.cpifa.org/en/cms/book/333>.

madera y plástico; los productos textiles; los productos de plástico; el papel y los productos de papel; los productos para lavar ropa; los embalajes utilizados para envíos urgentes; los refrigeradores, los acondicionadores de aire y las lavadoras; los neumáticos; los equipamientos para baño y cocina; y los aparatos de gas de uso doméstico.

2.21. Según las autoridades, en febrero de 2024, el Gobierno había habilitado a 90 organismos de certificación para que llevaran a cabo las certificaciones de productos ecológicos y había expedido 26.000 certificados de productos ecológicos correspondientes a más de 6.000 empresas certificadas. En 2025 se prevé establecer un sistema de certificación a mayor escala, con miras a apoyar los objetivos generales de China en lo que respecta al logro de un nivel máximo de carbono y la neutralidad en emisiones de carbono.

2.3 Acuerdos y arreglos comerciales

2.3.1 OMC

2.22. China considera que la OMC y el sistema multilateral de comercio son fundamentales para el comercio y el crecimiento económico. Se ha reconocido ampliamente que, desde que China se adhirió a la OMC en 2001, su economía se ha beneficiado en gran medida de la apertura del comercio en el marco de la OMC y de la previsibilidad que ofrece el sistema multilateral de comercio.¹³ China sigue desempeñando un papel importante en las negociaciones comerciales y contribuye de manera significativa al sistema multilateral de comercio.

2.23. Dado que China es una de las principales economías comerciales del mundo, algunos Miembros de la OMC esperan que "asum[a] más responsabilidad en el respeto y la defensa de los principios de la OMC, en consonancia con su peso comercial".¹⁴ Las autoridades afirman que la OMC apoya de manera crucial el multilateralismo y constituye una plataforma importante para la gobernanza económica mundial. Además, ponen de relieve los esfuerzos que han realizado recientemente para examinar la reforma de la OMC, y subrayan el compromiso de China con la apertura, así como su determinación a defender el sistema multilateral de comercio centrado en la OMC.

2.24. China participa en los debates sobre la reforma de la OMC y en los últimos años ha presentado documentos de posición y propuestas al respecto.¹⁵ China se ha adherido al procedimiento arbitral multipartito de apelación provisional (PAMAP), el mecanismo alternativo que se ha establecido para resolver las diferencias en la OMC respecto de las cuales un Miembro haya planteado una apelación en ausencia de un Órgano de Apelación de la OMC activo. Durante el período objeto de examen, China también ha colaborado con otros Miembros para hacer avanzar los debates sobre la facilitación de las inversiones para el desarrollo, el comercio electrónico y la reglamentación nacional en el ámbito de los servicios. China participa en los diálogos informales sobre la contaminación producida por los plásticos y el comercio de plásticos ambientalmente sostenible, el empoderamiento económico de las mujeres, y el comercio y la sostenibilidad ambiental.

2.25. Durante el período objeto de examen, China presentó varias notificaciones a la OMC (Cuadro A2. 1). Por lo que se refiere a las diferencias, desde el 13 de abril de 2021 China ha participado en cinco casos de solución de diferencias como reclamante, y en seis como demandado (cuadro A2. 2).

2.3.2 Acuerdos regionales y preferenciales

2.3.2.1 Acuerdos recíprocos

2.26. Las autoridades consideran que los acuerdos comerciales regionales (ACR) complementan de una manera valiosa el sistema multilateral de comercio y permiten crear una red mundial de zonas de libre comercio de alto nivel que contribuyen a establecer una economía mundial abierta. Los

¹³ Véanse, por ejemplo, el documento [WT/TPR/S/230](#) de la OMC, de 2 de junio 2010; y Foro Económico Mundial (2015), *How Did China's WTO Entry Affect Its Companies?* Consultado en: <https://www.weforum.org/agenda/2015/06/how-did-chinas-wto-entry-affect-its-companies/>.

¹⁴ OMC, Observaciones formuladas por el Presidente a modo de conclusión, examen de las políticas comerciales de China, 22 de octubre de 2021. Consultado en: https://www.wto.org/spanish/tratop_s/tptr_s/tp515_crc_s.htm.

¹⁵ Documento [WT/GC/W/773](#) de la OMC, de 13 de mayo de 2019.

acuerdos tienen un alcance cada vez más amplio, principalmente en lo que respecta a temas relacionados con el comercio, lo que permite a China profundizar aún más la cooperación comercial y la convergencia normativa con los interlocutores comerciales. Al negociar algunos de sus acuerdos comerciales, China contrae compromisos respecto de paquetes limitados, por ejemplo, la liberalización del comercio de mercancías en la etapa inicial, que posteriormente se profundizan y amplían para abarcar esferas como los servicios, la política en materia de competencia, los derechos de propiedad intelectual y la inversión.

2.27. China aplica su arancel medio preferencial más bajo en el marco del Acuerdo para Establecer una Asociación Económica más Estrecha con Hong Kong, China, y Macao, China (cuadro 3.3).

2.28. A finales de 2023, China había firmado 22 ACR con 29 asociados.¹⁶ El más reciente se firmó el 17 de octubre de 2023 entre China y Serbia. Una vez que se aplique plenamente, el acuerdo reducirá a cero los aranceles aplicados a alrededor del 90% de las mercancías importadas en cada país, a saber, 10.412 productos serbios (líneas arancelarias) y 8.930 productos chinos. Se prevé un plazo de liberalización de 10 años para la mayoría de los productos, y de 15 años para los demás. El Acuerdo aún no ha entrado en vigor.

2.29. En mayo de 2023 China firmó un acuerdo de libre comercio con el Ecuador, cuyas negociaciones se habían puesto en marcha en febrero de 2022. Si bien el acuerdo prevé principalmente una reducción de los aranceles, también incluye disposiciones sobre normas de origen, procedimientos aduaneros y facilitación del comercio, medidas comerciales correctivas, medidas sanitarias y fitosanitarias, obstáculos técnicos al comercio, la cooperación en materia de inversiones, la promoción del comercio electrónico, la competencia, la transparencia la solución de diferencias y la cooperación económica. En virtud del acuerdo, China y el Ecuador eliminarán los aranceles sobre el 90% de sus productos, y el 60% se eliminarán inmediatamente después de que el ALC entre en vigor. China y el Ecuador han puesto en marcha sus respectivos procedimientos internos para la ratificación y aplicación del acuerdo. Se prevé un plazo de liberalización de 10 años para la mayoría de los productos, y de 15 a 20 años para los demás.

2.30. El 12 de julio de 2022, las autoridades chinas y nicaragüenses firmaron un acuerdo sobre resultados iniciales como prelude de un ALC. El acuerdo entró en vigor en mayo de 2023 y las autoridades anunciaron conjuntamente que iniciarían las negociaciones para concluir un ACR entre ambos países. También firmaron un Memorando de Entendimiento sobre el Establecimiento de una Comisión Mixta de Cooperación en Asuntos Económicos, Comerciales y de Inversiones entre China y Nicaragua, por el que se estableció oficialmente un mecanismo intergubernamental bilateral de cooperación económica y comercio. A partir del 1 de mayo de 2023, algunos productos procedentes de Nicaragua pudieron entrar en China libres de aranceles en el marco del acuerdo sobre resultados iniciales. En julio de 2022 se iniciaron negociaciones formales para la conclusión de un ACR, y el 31 de agosto de 2023 se firmó un acuerdo que entró en vigor el 1 de enero de 2024. Alrededor del 60% de las mercancías objeto de comercio bilateral pasan a estar exentas de aranceles desde la entrada en vigor del acuerdo, y los aranceles aplicados a más del 95% de los productos se reducirán gradualmente a cero (la mayoría de las líneas se liberalizarán en un plazo de 10 años, y las demás en un período de 15 años).¹⁷ En el marco del acuerdo, China procederá por primera vez a abrir su mercado al comercio transfronterizo de servicios y la inversión con sujeción a una lista negativa.

2.31. Durante el período objeto de examen anterior, China firmó un ALC con Camboya y se adhirió a la Asociación Económica Amplia Regional (RCEP), y ambos acuerdos entraron en vigor en enero de 2022.¹⁸ En enero de 2021 entró en vigor el ALC entre China y Mauricio. Además, el 26 de enero de 2021 se firmó el Protocolo de Actualización del Acuerdo de Libre Comercio entre China y Nueva Zelanda, que entró en vigor el 7 de abril de 2022.

¹⁸ Documento WT/TPR/S/415 de la OMC, de 22 de octubre de 2021.

2.32. Según las autoridades, se están celebrando debates con miras a firmar o actualizar los ALC concluidos con Belarús, Honduras, el Consejo de Cooperación del Golfo, Islandia, Israel, la República de Corea, la República de Moldova, Noruega, Palestina, Panamá, el Perú y Sri Lanka.

2.3.2.2 Preferencias unilaterales

2.33. China mantiene un régimen de preferencias arancelarias para los países menos adelantados (PMA), cuyo alcance se ha ampliado recientemente de conformidad con acuerdos diplomáticos suscritos con países específicos. En noviembre de 2021, el Presidente de China indicó en el discurso introductorio que pronunció en la octava Conferencia Ministerial del Foro de Cooperación entre China y África que China ampliaría el alcance de los productos abarcados por el régimen de franquicia arancelaria aplicable a las exportaciones a China procedentes de 44 PMA que habían establecido relaciones diplomáticas con China.

2.34. La Comisión Arancelaria del Consejo de Estado ha emitido los instrumentos pertinentes para poner en funcionamiento el régimen de franquicia arancelaria actualizado, que ahora abarca el 98% de las líneas arancelarias correspondientes a productos originarios de 34 PMA que han firmado acuerdos bilaterales con China. Entre estos instrumentos figuran la lista de productos que se benefician del trato preferencial y las normas de origen aplicables para el trato preferencial.

2.35. El régimen de trato arancelario preferencial se empezó a aplicar el 1 de septiembre de 2022 para Bangladesh, Camboya, el Chad, la República Centroafricana, Djibouti, Eritrea, Guinea, Kiribati, la República Democrática Popular Lao, Mozambique, Nepal, Rwanda, las Islas Salomón, el Sudán, el Togo y Vanuatu; el 1 de diciembre de 2022 para el Afganistán, Benin, Burkina Faso, Guinea-Bissau, Lesotho, Malawi, Santo Tomé y Príncipe, Tanzania, Uganda y Zambia; y el 1 de marzo de 2023 para Angola, Burundi, la República Democrática del Congo, Etiopía, Gambia, Malí, Madagascar, Mauritania y Níger.

2.36. La Exposición Internacional de Importaciones de China (CIIE), puesta en marcha en Shanghái en 2018, es una plataforma importante que tiene por objeto impulsar las importaciones en China.¹⁹ La CIIE, organizada por el MOFCOM y el gobierno municipal de Shanghái, se centra en facilitar la adquisición de mercancías importadas por las empresas chinas. Además, las autoridades chinas han aprovechado la CIIE para ofrecer a las empresas de los PMA la posibilidad de explorar oportunidades de entrar o ampliar su presencia en el mercado chino. Esta iniciativa les permite entrar en contacto con posibles inversores y facilita la colaboración empresarial.

2.37. Teniendo en cuenta que Vanuatu se graduó de la categoría de PMA en diciembre de 2020, el 1 de enero de 2024 se suprimió al país de la lista de PMA a los que China concedía preferencias unilaterales.

2.3.3 Otros acuerdos y arreglos

2.38. Las autoridades han señalado que tienen la intención de adherirse al Tratado Integral y Progresista de Asociación Transpacífico y al Acuerdo de Asociación sobre Economía Digital. También señalan que, en el contexto de la ASEAN, en 2022 se completó un estudio conjunto de viabilidad para seguir mejorando el Acuerdo de Libre Comercio entre China y la ASEAN (CAFTA 3.0). En 2022 se iniciaron las negociaciones orientadas a mejorar dicho acuerdo, en las cuales se abarcaron diversos temas, como la economía digital, la economía ecológica y las cadenas de suministro.

2.4 Régimen de inversión

2.4.1 Marco reglamentario y acceso a los mercados

2.39. Durante el período objeto de examen, los obstáculos a las inversiones extranjeras siguieron reduciéndose significativamente tras la promulgación de la Ley de Inversión Extranjera en 2020. En principio, la Ley protege a los inversores extranjeros frente a la expropiación, las restricciones a las remesas transfronterizas, la infracción de los DPI y la transferencia forzosa de tecnología.

¹⁹ CIIE, *About Us*. Consultado en: <https://www.ciie.org/zh/en/AboutUs/Inten/>.

2.40. Puede haber más margen para mejorar el entorno de inversión de China a fin de atraer inversión extranjera. En determinados sectores sigue habiendo restricciones y/o requisitos en materia de propiedad en el sentido de que hay que establecer empresas conjuntas con entidades locales. Las autoridades señalan que la Ley de Inversión Extranjera ha establecido un sistema de trato nacional previo al establecimiento y de lista negativa y, aparte de la Lista Negativa, no hay restricciones a la inversión y la propiedad de los inversores extranjeros; la Lista Negativa de 2021 se ha reducido a 31 partidas.

2.41. Algunas empresas extranjeras han planteado preocupaciones en relación con el trato preferencial percibido otorgado a las empresas de propiedad estatal, en particular en esferas como la contratación pública y los préstamos bancarios.²⁰ Como parte de los esfuerzos de las autoridades para mejorar el marco de inversión extranjera, en agosto de 2023, el Consejo de Estado publicó un nuevo conjunto de opiniones (los 24 artículos sobre inversión extranjera) que impulsaron el aumento del apoyo fiscal para las empresas financiadas con capital extranjero y mejoraron el servicio para las empresas con inversión extranjera; también proporciona directivas para hacer frente a los desafíos a los que se enfrentan las empresas extranjeras en China, entre ellos el acceso desigual a la contratación pública, la infracción de los DPI y los procedimientos engorrosos de transferencia transfronteriza de datos.²¹ Se adoptaron varias medidas específicas para aplicar la orientación proporcionada en el conjunto de opiniones. Las autoridades señalan, por ejemplo, que la Oficina Estatal de la Propiedad Intelectual y el Ministerio de Justicia publicaron, el 15 de septiembre de 2023, los Dictámenes sobre el Fortalecimiento de la Resolución Judicial de Diferencias relacionadas con la Infracción de Patentes en la Nueva Era para seguir mejorando el sistema de resolución administrativa.²² Además, la SAMR publicó un aviso de trabajo para aplicar diversas políticas destinadas a evitar la discriminación contra las empresas con financiación extranjera. Según las autoridades, en febrero de 2024 el MOFCOM celebró una mesa redonda sobre la aplicación de los 24 artículos sobre inversión extranjera, a la que se invitó a varias asociaciones empresariales extranjeras en China. Las autoridades han publicado anteriormente documentos similares para impulsar la inversión extranjera y mejorar el entorno empresarial.²³

2.42. La Administración del Ciberespacio de China (CAC) sigue regulando Internet, incluidas determinadas plataformas de noticias y redes sociales, con miras a asegurar su conformidad con las leyes y reglamentos chinos. En algunos casos, estas medidas tienden a causar dificultades a los trabajadores en línea y las empresas de comercio electrónico, lo hace que la eficiencia sea menor. Algunos señalan una consecuencia económica derivada de la incapacidad de los usuarios internos de acceder a sitios web y servicios en línea extranjeros es que puede dar lugar a obstáculos a la información y reducir la productividad de la mano de obra.²⁴ Las autoridades afirman que para regular la comunicación de información en línea y proteger los derechos e intereses legítimos de los ciudadanos y las organizaciones, China ha formulado, entre otras cosas, la Ley de Ciberseguridad (artículo 4.4.1.4), que dispone que, al utilizar Internet, todas las personas y organizaciones deberán cumplir la Constitución y otras leyes, respetar el orden público y respetar la moral social, y que no utilizarán redes en particular para realizar actividades ilegales y difundir información ilegal. Las autoridades afirman que, con respecto a la difusión o transmisión de información ilegal en algunos sitios web extranjeros en violación de sus leyes y reglamentos, China adoptará medidas técnicas y otros medios necesarios para bloquear esa transmisión de conformidad con, entre otras cosas, la Ley.

²³ Véase, por ejemplo, el Aviso de la Oficina General del Consejo de Estado sobre la Priorización de las Preocupaciones de las Preocupaciones de las Empresas y la Mayor Promoción de la Aplicación de Políticas para Optimizar el Entorno Empresarial.

²⁴ J. Fan y R. Guan (2023), "Estimating the Cost of Internet Censorship in China: Evidence from a Gamified Remote Platform", *Journalism and Media*, volumen 4, páginas 413-429.

2.43. La Ley de Inversión Extranjera y su Reglamento de Aplicación siguen siendo la base legislativa principal para las inversiones de las empresas extranjeras en China. En principio, la Ley de Inversión Extranjera concede un trato nacional a las inversiones extranjeras, excepto las que están comprendidas en una categoría especificada en las Listas Negativas. Esto implica recibir un trato equiparable al otorgado a las empresas nacionales. La otra excepción al trato nacional previo al establecimiento se refiere a las inversiones extranjeras que pueden afectar a la seguridad nacional o pueden tener tales consecuencias. Esas transacciones pueden estar sujetas a un examen de seguridad nacional separado.

2.44. En principio, las inversiones extranjeras no comprendidas en ninguna de las categorías restringidas (como las que se refieren a listas negativas o que afectan a la seguridad nacional) están sujetas únicamente a prescripciones en materia de registro, las mismas que las empresas nacionales. Durante el anterior EPC, las autoridades señalaron que se tardaba menos de cinco días hábiles en establecer una empresa en China; afirman que la SAMR ha estado trabajando con los ministerios y organismos competentes para acortar el tiempo del proceso de registro de las empresas y simplificar los procedimientos, con objeto de acortar el tiempo de establecimiento de una empresa a menos de tres días hábiles. Un inversor extranjero o una empresa con inversión extranjera presentará la información relativa a la inversión a la autoridad de comercio a través del sistema de registro de empresas en línea.

2.45. El marco de registro de las empresas se simplificó aún más durante el período objeto de examen. El 27 de julio de 2021, el Consejo de Estado publicó el Reglamento Administrativo de la República Popular China sobre el Registro de Entidades Mercantiles, que entró en vigor el 1 de marzo de 2022. El Reglamento es el primer documento jurídico que regula de manera uniforme el registro y la administración de todos los tipos de empresas.

2.46. El Reglamento y sus Normas de aplicación prescriben un texto normalizado para delimitar el ámbito de actividad de las empresas. Esto permite a las empresas examinar de manera proactiva las descripciones de su actividad utilizando un "sistema de consulta" específico para cerciorarse de si sus operaciones están comprendidas en una prescripción en materia de licencias. Con la aplicación de este nuevo sistema se espera ganar tiempo y eficiencia en comparación con el enfoque anterior, en virtud del cual las empresas tenían describir su ámbito de actividad y presentarlo a las autoridades sin normas establecidas, lo que complicaba y prolongaba los procesos.

2.47. Antes de abrir una empresa en China, los inversores extranjeros deben examinar primero la Lista Negativa para el Acceso a los Mercados a fin de determinar si el sector está abierto a la inversión privada, ya sea nacional o extranjera. A continuación, los inversores extranjeros deben examinar las Medidas Administrativas Especiales relativas al Acceso a la Inversión Extranjera (Lista Negativa Nacional) y las Medidas Administrativas Especiales relativas al Acceso de la Inversión Extranjera a las Zonas Francas Experimentales (Lista Negativa para las Zonas Francas Experimentales).

2.48. No se permite la inversión extranjera en las industrias sujetas a prohibiciones enumeradas en la Lista Negativa Nacional o en la Lista Negativa para las Zonas Francas Experimentales. La inversión extranjera en sectores sujetos a restricciones que figuren en cualquiera de las dos listas debe ser examinada por la autoridad de reglamentación del mercado para verificar si los inversores cumplen las medidas administrativas prescritas, como las relativas a la participación social y a los títulos de aptitud de los altos cargos directivos.

2.49. La actual Lista Negativa para el Acceso a los Mercados (versión de 2022) redujo el número de sectores sujetos a restricciones o prohibiciones de 151 en 2018 (el primer año en que existía la lista) a 117. Esto continúa la tendencia a la reducción gradual de las restricciones/prohibiciones. Las revisiones afectan principalmente al sector financiero al levantar las restricciones a actividades tales como la emisión de acciones, las fusiones, las adquisiciones de compañías cotizadas en bolsa y los servicios de información financiera por Internet. Los inversores privados están ahora exentos del requisito de obtener la aprobación previa para participar en esos sectores. La Versión de 2022 también incorpora disposiciones que prohíben que el capital no estatal participe en actividades como la recopilación de noticias, la edición y las operaciones de radiodifusión.

2.50. En 2021 se llevaron a cabo revisiones tanto de la Lista Negativa Nacional como de la Lista Negativa para las Zonas Francas Experimentales, que entraron en vigor el 1 de enero de 2022. En conjunto, el número de medidas restrictivas incluidas en la Lista Negativa Nacional se ha reducido anualmente, de 63 en 2017 a 31 en 2021, mientras que el número de medidas incluidas en la Lista Negativa para las Zonas Francas Experimentales ha disminuido de 95 en 2017 a 27 en 2021 (gráfico 2.1).

Gráfico 2.1 Número de medidas restrictivas del acceso a la inversión extranjera, 2017-2021

Fuente: Medidas Administrativas Especiales relativas al Acceso a la Inversión Extranjera y Medidas Administrativas Especiales relativas al Acceso a la Inversión Extranjera en las Zonas Francas (ediciones de 2017 a 2021).

2.51. Las principales restricciones a la inversión extranjera abarcan actividades específicas en las siguientes industrias: agricultura, silvicultura, ganadería y pesca; minería; manufacturas; generación de energía eléctrica, calor y gas y suministro de agua; comercio mayorista y minorista; transporte, almacenamiento y servicios postales; servicios de transmisión de información, *software* y tecnología de la información; servicios de arrendamiento y comerciales; servicios de investigación científica y servicios técnicos; enseñanza; actividades de atención de la salud y de asistencia social; y cultura, deportes y espectáculos. Los cambios introducidos durante el período objeto de examen se referían a los servicios de manufactura y de arrendamiento (recuadro 2.1).

Recuadro 2.1 Cambios en la Lista Negativa Nacional y la Lista Negativa para las Zonas Francas Experimentales en 2022

Lista Negativa Nacional

Actividades eliminadas

Actividades manufactureras

1. Salvo en el caso de los vehículos para usos especiales, los vehículos propulsados por energías nuevas y los vehículos comerciales, la parte china (en una asociación) en la fabricación de vehículos completos no podrá ser inferior al 50% de las acciones; un inversor extranjero podrán establecer un máximo de dos empresas conjuntas de capital en China para fabricar el mismo tipo de productos de automóviles completos.
2. Fabricación de instalaciones receptoras en tierra para televisión satelital y de componentes esenciales.

Lista Negativa para las Zonas Francas Experimentales

Actividades eliminadas

Actividades manufactureras

1. Salvo en el caso de los vehículos para usos especiales, los vehículos propulsados por energías nuevas y los vehículos comerciales, la parte china (en una asociación) en la fabricación de vehículos completos no podrá ser inferior al 50% de las acciones; un inversor extranjero podrán establecer un máximo de dos empresas conjuntas de capital en China para fabricar el mismo tipo de productos de automóviles completos.
2. Fabricación de instalaciones receptoras en tierra para televisión satelital y de componentes esenciales.

Servicios de arrendamiento financiero y servicios prestados a las empresas

1. Los estudios de mercado se limitarán únicamente a la forma de empresa mixta por acciones; en el caso de los estudios de audiencia de radio y televisión, la participación mayoritaria de control corresponderá a la parte china.
2. Se prohibirá la inversión en estudios sociales.

Actividades añadidas**Servicios de arrendamiento financiero y servicios prestados a las empresas**

1. Los inversores chinos mantendrán una participación mayoritaria en los estudios de audiencia de radio y televisión. Los inversores chinos en servicios de estudios sociales poseerán no menos del 67% de las acciones y el representante legal será un ciudadano chino.

Fuente: Medidas Administrativas Especiales relativas al Acceso de la Inversión Extranjera (Lista Negativa) (edición de 2021), Medidas Administrativas Especiales de las Zonas Francas Experimentales relativas al Acceso a la Inversión Extranjera en las Zonas Francas Experimentales (Lista Negativa) (edición de 2020) y Medidas Administrativas Especiales de las Zonas Francas Experimentales relativas al Acceso a la Inversión Extranjera en las Zonas Francas Experimentales (Lista Negativa) (edición de 2021).

2.4.2 Procedimientos de examen y aprobación

2.52. Las Medidas para el Examen de Seguridad de las Inversiones Extranjeras, que se adoptaron el 19 de diciembre de 2020, entraron en vigor el 18 de enero de 2021. Proporcionan un marco general para la realización de exámenes de seguridad de las inversiones extranjeras en China. En el nuevo reglamento se establece un proceso de examen de la seguridad nacional mediante un documento jurídico único, que prevé distintos criterios y un marco de procedimiento a seguir por el organismo encargado del examen durante la evaluación. Como indicó en el examen anterior, también existe un mecanismo similar en las zonas francas experimentales de China. Además, las fusiones y adquisiciones en las que interviene una entidad extranjera y una empresa nacional también pueden ser objeto de un examen de seguridad de conformidad con la Circular sobre el Establecimiento del Examen de Seguridad Nacional de las Adquisiciones de Empresas Nacionales por Inversores Extranjeros.

2.53. El "Mecanismo de Trabajo" de un órgano de examen, establecido para llevar a cabo exámenes de la seguridad, se centra en la inversión extranjera que afecta o es probable que afecte a la seguridad nacional. Entre los sectores sujetos a examen figuran la industria militar y sus instalaciones de apoyo y otras esferas relacionadas con la seguridad nacional de la defensa, los lugares que rodean las instalaciones militares y las instalaciones industriales militares, así como los productos agropecuarios, la energía y los recursos, la fabricación de equipo, la infraestructura, los servicios de transporte, los productos y servicios culturales, la tecnología de la información y los productos y servicios de Internet, los servicios financieros, las tecnologías y otras esferas consideradas importantes desde el punto de vista de la seguridad nacional.

2.54. Si sus transacciones están comprendidas en el ámbito del proceso de examen, los inversores extranjeros deben presentar una solicitud de examen al Mecanismo de Trabajo antes de implementar la inversión. De no hacerlo, el Mecanismo de Trabajo conserva la facultad de pedir la que el inversor la presente. La iniciación de un examen puede llevarse a cabo antes o después de que se establezca la inversión extranjera, siempre que el Mecanismo de Trabajo determine que la inversión representa una amenaza para la seguridad nacional. El proceso de examen de la seguridad de las inversiones extranjeras comprende un examen general y un examen especial, que se realiza cuando es necesaria una investigación detallada. Las decisiones relativas al examen general deben alcanzarse en un plazo de 30 días, y las relativas al examen especial en un plazo de 60 días. De conformidad con la Ley de Inversión Extranjera, las determinaciones en el marco del examen de la seguridad realizadas de conformidad con los procedimientos legales se consideran definitivas.

2.55. China también mantiene un sistema de aprobación de las inversiones extranjeras, que es un procedimiento de licencias administrativas (distinto del Mecanismo de Trabajo). Este sistema se aplica a los proyectos de inversión extranjera especificados en el Catálogo de Proyectos de Inversión sujetos a Aprobación Gubernamental (2016) y requiere la aprobación, sobre la base de su valor, de entidades como el Consejo de Estado, la NDRC o los departamentos provinciales.²⁵ En el Catálogo, los proyectos de inversión que requieren aprobación son los que conllevan inversión de inmovilizado en esferas como la agricultura, la energía, el transporte, la tecnología de la información, las materias primas, la fabricación de maquinaria, la industria ligera, la alta y nueva tecnología y la construcción en zonas urbanas. Los que no están incluidos en él están sujetos a registro (sección 2.4.1). Por lo

²⁵ Las inversiones por valor de USD 300 millones o más requieren la aprobación de la NDRC, y se presentan al Consejo de Estado para su registro, siempre que la inversión total ascienda por lo menos a USD 2.000 millones. Los Gobiernos provinciales pueden aprobar proyectos por un monto máximo de USD 300 millones.

general, los proyectos de inversión se evalúan teniendo en cuenta su impacto en la seguridad nacional, el medio ambiente o el interés público, y si cumplen las leyes, reglamentos y Catálogos pertinentes, así como los planes y de desarrollo nacional y las políticas industriales. En los casos en que se cumplan las condiciones para activar el examen de seguridad, se deben aplicar las Medidas para el Examen de Seguridad de las Inversiones Extranjeras.

2.4.3 Incentivos a la inversión extranjera directa

2.56. El Catálogo de Sectores en los que se Incentiva la Inversión Extranjera (versión de 2022) (que fue publicado el 26 de octubre de 2022 y entró en vigor el 1 de enero de 2023) consta del catálogo de los sectores con incentivos a la IED en todo el país y el catálogo de sectores con incentivos a la IED en las regiones central y occidental de China. Tanto la sección nacional como la sección regional del Catálogo de 2022 siguen incluyendo un número cada vez mayor de sectores (gráfico 2.2). Las actualizaciones más recientes de estas listas reflejan en gran medida el compromiso de China de promover una agricultura inteligente y mejorar las cadenas industriales y de suministro de China en esferas como los semiconductores y el sector de la energía limpia. Las adiciones al catálogo regional también pueden considerarse parte de los esfuerzos de China por reducir la desigualdad de riqueza y equilibrar el nivel de desarrollo social y económico en distintas regiones del país.

Gráfico 2.2 Número de actividades con incentivos, 2017, 2019, 2020 y 2022

Nota: En 2018 y 2021 no se publicó un Catálogo actualizado.

Fuente: Catálogo de Sectores en los que se Incentiva la Inversión Extranjera (2017, 2019, 2020 y 2022).

2.57. Sectores como la programación totalmente autónoma y la fabricación de equipos de gas de esquisto se eliminaron de la lista nacional de sectores con incentivos, de conformidad con las prioridades de China en materia de desarrollo económico y social.

2.58. El trato favorable en vigor para las empresas con inversión extranjera que participan en sectores incluidos en el Catálogo de Sectores con Incentivos a la IED no ha cambiado y consiste principalmente en exenciones arancelarias para los equipos para uso propio importados con la cuantía total de la inversión, a menos que se determine otra cosa en los reglamentos pertinentes²⁶; se pueden suministrar terrenos preferentemente para proyectos con incentivos a la inversión extranjera intensiva en los que se haga un uso intensivo de la tierra; y el precio mínimo para la transferencia de tierras puede fijarse en el 70% del precio mínimo nacional de las tierras industriales en los lugares específicos donde ocurre la transferencia. Las empresas con inversión extranjera que realizan actividades comerciales en sectores con incentivos a la inversión en las regiones occidentales y en la provincia de Hainan pueden beneficiarse de un tipo reducido del impuesto sobre la renta de las sociedades del 15% (el tipo normal es del 25%).

2.59. Durante el período objeto de examen, las autoridades subrayaron además la importancia de la investigación y la innovación para la competitividad y el desarrollo a largo plazo de China. En general, hay diversos canales por medio de los cuales la I+D y la innovación pueden repercutir en

²⁶ El Catálogo de Equipos y Productos Técnicos Esenciales No Exentos de Derechos de Importación (publicado el 10 de diciembre de 2021) y el Catálogo de Mercancías Importadas en el marco de Proyectos con Inversión Extranjera No Exentos de Derechos de Importación (publicado el 4 de abril de 2022).

la productividad, los resultados comerciales y el crecimiento económico de un país. Entre esas vías figuran la diferenciación de los productos, la reducción de los costos de producción y el aumento de la competitividad de las exportaciones.²⁷

2.60. En abril de 2021 se adoptaron medidas para aclarar las condiciones de los centros de I+D financiados con capital extranjero para beneficiarse de las exenciones de los derechos de importación en apoyo de la innovación científica y tecnológica.²⁸ En enero de 2023, las autoridades propusieron 16 iniciativas de política en 4 esferas para seguir reforzando el apoyo a los centros de I+D con inversión extranjera.²⁹ Las autoridades sostienen que sus iniciativas tienen por objeto apoyar la innovación tecnológica y el progreso de las industrias. Además, tienen por objeto fomentar un entorno propicio tanto a la apertura como a la innovación, con el objetivo de lograr la competitividad mundial.

2.61. Si bien las medidas mencionadas son un ejemplo de que las actividades de I+D extranjera es cada vez más fundamental para el sistema nacional de innovación de China, puede haber margen para mejorar la externalidad positiva que genera, especialmente en el sector de la alta tecnología.³⁰ Por ejemplo, establecer políticas de innovación provinciales activas podría contribuir a crear un entorno propicio para aprovechar todo el potencial de las actividades de I + D extranjera y maximizar sus efectos positivos en la innovación y el crecimiento económico nacionales.³¹

2.62. De conformidad con el Anuncio del Ministerio de Hacienda y la Administración Estatal de Impuestos relativo a la Continuación de la Aplicación de la Política del Impuesto sobre la Renta de las Personas Físicas a los Subsidios y las Subvenciones para las Personas Extranjeras (Anuncio Nº 29 de Ministerio de Hacienda y la Administración Estatal de Impuestos, de 2023), otros incentivos a disposición de los inversores extranjeros son las políticas preferenciales en materia de exenciones fiscales para las personas extranjeras con respecto a las subvenciones para la vivienda, los gastos de formación en idiomas y los subsidios de educación para los niños. Estas medidas estarán en vigor hasta el 31 de diciembre de 2027.

2.63. En cuanto a los programas de incentivos en regiones determinadas, desde marzo de 2021 se aplica una política de aranceles nulos a los equipos de producción importados para uso propio por las empresas admisibles en el Puerto Franco de Hainan. A fin de apoyar el desarrollo de alta calidad del Puerto Franco de Hainan, se han aplicado varios otros incentivos, como permitir el repostaje de los buques internacionales con petróleo bajo control aduanero en la provincia.³² Según las autoridades, la política preferencial respecto del impuesto sobre la renta de las sociedades sigue siendo eficaz en la Zona Experimental Integral de Pingtan, en Fujian, y la Zona de Cooperación entre Qianhai Shenzhen y Hong Kong, China en el Sector de los Servicios Modernos, en Shenzhen.

2.4.4 Acuerdos bilaterales fiscales y de inversión

2.64. Las autoridades indican que China ha firmado acuerdos bilaterales de inversión con 135 entidades, y que hay 112 acuerdos de ese tipo en vigor actualmente. Durante el período objeto de examen, solo se firmó un acuerdo de ese tipo, con Angola, en diciembre de 2023.

²⁷ Véase, por ejemplo, P. Ghazalian y W. Hartley Furtan (2007), "The Effect of Innovation on Agricultural and Agri-food Exports in OECD Countries", *Journal of Agricultural and Resource Economics*, volumen 32, Nº 3, páginas 448-461.

2.65. Durante el período objeto de examen, China firmó acuerdos para evitar la doble imposición con Rwanda, el Senegal y el Camerún; revisó completamente y firmó un nuevo acuerdo con Noruega; y modificó los acuerdos con el Brasil, Qatar y Australia. A finales de 2023, China había firmado acuerdos para evitar la doble imposición con 111 asociados, de los cuales 105 están en vigor actualmente. Además, China tiene acuerdos fiscales con Hong Kong, China; Macao, China; y el Territorio Aduanero Distinto de Taiwán, Penghu, Kinmen y Matsu (Taipei Chino).³³

³³ Para más información sobre los acuerdos para evitar la doble imposición firmados antes de 2020, véase State Taxation Administration, Overview of the State Administration of Taxation. Consultado en: <https://www.chinatax.gov.cn/chinatax/n810341/n810770/index.html>.

3 POLÍTICAS Y PRÁCTICAS COMERCIALES, POR MEDIDAS

3.1 Medidas que afectan directamente a las importaciones

3.1.1 Procedimientos y requisitos aduaneros, y valoración en aduana

3.1. Los asuntos aduaneros son competencia de la Administración General de Aduanas (GACC). A finales de marzo de 2024, había 42 distritos aduaneros, 678 instituciones aduaneras subordinadas y 131 oficinas de aduanas subordinadas dependientes de la GACC.

3.2. La Ley de Aduanas y otros instrumentos legislativos regulan los procedimientos aduaneros (cuadro 3.1). Los cambios introducidos en 2021 en la Ley de Aduanas eliminaron las prescripciones sobre licencias administrativas para las importaciones y exportaciones temporales. Además, en diciembre de 2022, se suprimió el artículo 9 de la Ley de Comercio Exterior; en consecuencia, en el caso de las empresas y los particulares que solicitan licencias de importación o exportación y otros documentos pertinentes (por ejemplo, certificados de registro de contrato de importación o exportación, contingentes de exportación y derechos de comercio de Estado), las autoridades competentes ya no exigen la inscripción o el registro como operadores de comercio exterior (sección 2.4).¹ Por lo tanto, desde el 30 de diciembre de 2022, los departamentos gubernamentales locales encargados de los asuntos comerciales han dejado de inscribir o registrar operadores de comercio exterior.

3.3. En lo que respecta a las medidas aduaneras aplicables a las zonas francas experimentales (PFTZ), las Medidas para la Promoción de la Apertura Institucional de las Zonas Francas Experimentales y los Puertos Francos Calificados de conformidad con las Normas Internacionales de Alto Nivel² y el Plan General para la Promoción de la Apertura Institucional de la Zona Franca Experimental (Shanghái) de China en Consonancia con las Normas Económicas y Comerciales Internacionales de Alto Nivel³, ambos promulgados en 2023, contienen artículos sobre las medidas de facilitación relacionadas con las aduanas aplicables a las PFTZ y los puertos francos calificados.

Cuadro 3.1 Legislación de China relacionada con los procedimientos aduaneros, 2024

Legislación	Fecha de promulgación/modificación
Ley de Aduanas	Anuncio Nº 51, promulgado en 1987 y revisado en 2000, 2013, 2016, 2017 y 2021.
Reglamento sobre Derechos de Importación y Exportación	Anuncio Nº 392 del Consejo de Estado, promulgado en 2003 y revisado en 2011, 2013, 2016 y 2017.
Disposiciones sobre la Tramitación por la Administración de Aduanas de las Declaraciones de Importación y Exportación de Mercancías	Anuncio Nº 103 de la GACC, promulgado en septiembre de 2003 y revisado en 2014, 2017 y 2018.
Normas de la Administración de Aduanas sobre la Gestión de la Percepción de Derechos sobre las Importaciones y las Exportaciones	Anuncio Nº 124 de la GACC, promulgado en 2005 y revisado en 2010, 2014, 2017 y 2018.
Ley de Inspección de Mercancías de Importación y Exportación	Orden Nº 14 del Presidente, promulgada en 1989 y revisada en 2002, 2013, 2018 y 2021.
Reglamento de Aplicación de la Ley de Inspección de Mercancías de Importación y Exportación	Anuncio Nº 447 del Consejo de Estado, promulgado en 2005 y revisado en 2013, 2016, 2017, 2019 y 2022.
Reglamento sobre el Registro y la Gestión de Fabricantes Extranjeros de Productos Alimenticios Importados	Anuncio Nº 248 de la GACC, promulgado en 2021 y en vigor desde 2022.
Medidas sobre la Gestión de la Inocuidad de los Alimentos Importados y Exportados	Anuncio Nº 249 de la GACC, promulgado en 2021 y en vigor desde 2022.
Medidas para la Gestión del Crédito de las Empresas Registradas e Inscritas en la GACC	Anuncio Nº 251 de la GACC, promulgado en 2021.
Disposiciones sobre la Clasificación de las Mercancías de Importación y Exportación	Anuncio Nº 252 de la GACC, promulgado en 2021.
Disposiciones sobre la Inscripción de las Entidades Especializadas en Declaraciones de Aduana	Anuncio Nº 253 de la GACC, promulgado en 2021.
Medidas para la Gestión de los Exportadores Autorizados por la GACC	Anuncio Nº 254 de la GACC, promulgado en 2021.

Legislación	Fecha de promulgación/modificación
Medidas de la GACC para la Gestión del Origen de las Mercancías de Importación y Exportación en el marco del Acuerdo de Asociación Económica Amplia Regional	Anuncio Nº 255 de la GACC, promulgado en 2021.
Medidas de la GACC para la Gestión de Zonas Integradas bajo Control Aduanero	Anuncio Nº 256 de la GACC, promulgado en 2022.
Medidas de la GACC para Gestión de la Adopción de los Resultados de la Inspección de Productos Importados y Exportados	Anuncio Nº 259 de la GACC, promulgado en 2022.
Medidas de la GACC para la Supervisión de las Mercancías en Tránsito	Anuncio Nº 260 de la GACC, promulgado en 2022.
Medidas Administrativas para la Inspección y la Cuarentena de Animales Terrestres Comestibles Suministrados a Hong Kong, China y Macao, China	Anuncio Nº 266 de la GACC, promulgado en 2024.

Fuente: Información facilitada por las autoridades.

3.4. En las Disposiciones sobre la Tramitación por la Administración de Aduanas de las Declaraciones de Importación y Exportación de Mercancías se enumeran los documentos que deben presentarse con las declaraciones de importación.⁴ No se perciben derechos por la presentación de declaraciones de aduana ni por el uso de la ventanilla única nacional (véase *infra*). Los expedidores y los destinatarios de mercancías importadas y exportadas pueden declarar sus mercancías a las autoridades aduaneras por cuenta propia o a través de un declarante autorizado.⁵ La presentación de los formularios de declaración de importación y el despacho de aduana pueden tener lugar antes de la llegada de las mercancías a China.⁶ Se pueden llevar a cabo antes de la llegada de las mercancías.⁷ La GACC sigue aplicando el sistema de "declaración en dos etapas" de las importaciones, según el cual las empresas no necesitan presentar todas las declaraciones y documentos a la vez.⁸ Según las autoridades, las disposiciones están siendo revisadas.

3.5. El sistema de ventanilla única sigue permitiendo la presentación de las declaraciones de importación en papel o en formato electrónico. China sigue utilizando una ventanilla única nacional normalizada para el comercio internacional, que constituye el principal punto de entrada en línea para que los comerciantes presenten sus declaraciones de aduana y los documentos conexos.⁹ Las autoridades consideran que las ventanillas únicas se han integrado en los sistemas de 30 ministerios y ofrecen servicios como la declaración de carga, la presentación del manifiesto, la declaración del medio de transporte, la solicitud de licencias, la solicitud de certificados de origen, el pago de impuestos, el despacho de aduana de mercancías, el tráfico de perfeccionamiento bajo control aduanero y el comercio electrónico transfronterizo. Aunque el uso de la ventanilla única nacional sigue siendo voluntario, las autoridades indican que en 2023 casi el 100% de las importaciones se declaró a través de este sistema.

3.6. La GACC sigue gestionando la plataforma "Internet + Aduanas", que ofrece acceso en línea mediante una ventanilla única a los servicios aduaneros del Estado, como la información previa a la declaración, las desgravaciones aplicables a la exportación, la aprobación administrativa y el registro de los derechos de propiedad intelectual (DPI).¹⁰ Es independiente de la ventanilla única nacional (véase *supra*), que constituye una plataforma única para presentar a las autoridades competentes

⁴ Anuncio Nº 103 de la GACC. Consultado en: <http://english.customs.gov.cn/statics/5822c242-7473-4800-945c-3e8727f72157.html>.

⁵ Anuncio Nº 103 de la GACC.

⁶ De conformidad con las Disposiciones sobre la Tramitación por la Administración de Aduanas de las Declaraciones de Importación y Exportación de Mercancías, por "declaración" se entiende que el expedidor y el destinatario de las mercancías importadas y exportadas y el agente (empresa declarante) declaran a la Administración de Aduanas la situación real de las mercancías importadas y exportadas y aceptan la verificación por la Administración de Aduanas en un plazo y un lugar determinados mediante la presentación de formularios de declaración electrónicos o impresos conforme a la Ley de Aduanas y otras normas y reglamentos administrativos pertinentes.

⁷ Disposiciones sobre la Tramitación por la Administración de Aduanas de las Declaraciones de Importación y Exportación de Mercancías, capítulo III.

⁸ En el sistema de declaración en dos etapas, la primera etapa consiste en presentar la declaración resumida junto con el conocimiento de embarque para recoger las mercancías, y la segunda en completar todo el proceso de declaración en un plazo determinado.

⁹ Ventanilla única de China para el comercio internacional, consultado en: www.singlewindow.cn; y documento [WT/TPR/S/415/Rev.1](http://www.wto.org) de la OMC, de 9 de marzo de 2022.

¹⁰ GACC. Consultado en: <http://english.customs.gov.cn/>.

información y documentación normalizadas. Las autoridades indican que, durante el período objeto de examen, la GACC siguió mejorando la capacidad general de asistencia técnica de la plataforma, y llevando a cabo una armonización técnica completa de la plataforma "Internet + Aduanas" y la plataforma nacional de servicios del Gobierno, entre otras cosas. A finales de septiembre de 2023, la plataforma "Internet + Aduanas" había recibido 111,5 millones de visitas.

3.7. Los importadores deben cumplir las prescripciones en materia de inspección y cuarentena de la Administración de Aduanas, de conformidad con lo dispuesto en la Ley de Inspección de Mercancías de Importación y Exportación, en otras leyes y reglamentos conexos, y en el Catálogo de Mercancías de Importación y Exportación sujetas a Inspección Obligatoria.¹¹ Durante el período objeto de examen, en 2021 y 2022, se introdujeron modificaciones en el Catálogo que afectaron a 266 artículos en junio de 2021, 29 artículos en octubre de 2021 y 87 en octubre de 2022.¹² Las empresas se clasifican en diferentes grupos en función del análisis del riesgo, y se asignan diferentes índices de riesgo a los modos de transporte, por ejemplo, según las rutas sensibles o el país de salida.¹³ Las autoridades indican que no se dispone de datos sobre la proporción de importaciones sujetas a inspección física.

3.8. Durante el período objeto de examen, la GACC publicó diversas medidas administrativas para la inspección o la cuarentena de determinados productos; desde el 1 de diciembre de 2022, la Administración de Aduanas de China ha adoptado, sobre la base de la evaluación del riesgo, los resultados de inspección de organismos de inspección nacionales y extranjeros como base para la evaluación de la conformidad de algunos productos de importación y exportación sujetos a una inspección obligatoria. Las autoridades indican que la Administración de Aduanas de China ya no lleva a cabo inspecciones, salvo para controlar riesgos. Según las autoridades, la Administración de Aduanas de China ha adoptado una "modalidad de aceptación" para el despacho de aduana de las prendas de vestir y el cemento importados.¹⁴

3.9. Durante el período objeto de examen, China introdujo dos medidas adicionales relacionadas con la COVID-19 que afectaban a las mercancías: i) de conformidad con el Aviso sobre la Distribución de los Planes de Trabajo para la Realización de Pruebas y la Desinfección Preventiva de Productos Transportados de Alto Riesgo Importados que No Requieren Cadena de Frío (Anuncio N° 277 del Consejo de Estado de 2020, publicado por el Grupo de Asuntos Generales, Mecanismo Conjunto de Prevención y Control del Consejo de Estado, el 31 de diciembre de 2020), las autoridades aduaneras estaban encargadas de realizar pruebas de COVID-19 *in situ* en los puertos a las mercancías transportadas y de indicar a las empresas importadoras de dichas mercancías o a las entidades encargadas el lugar bajo supervisión aduanera donde llevar a cabo la desinfección preventiva de las mercancías tomadas como muestra¹⁵; y ii) de conformidad con el Aviso sobre la Distribución de los Planes de Trabajo para la Desinfección de los Aviones de Pasajeros de Llegada (Anuncio N° 100 del Consejo de Estado de 2021, publicado por el Grupo de Asuntos Generales, Mecanismo Conjunto de

¹¹ En el Catálogo se enumeran los productos, según sea necesario para proteger la salud de las personas y de los animales o preservar los vegetales y el medio ambiente, así como para impedir el fraude y salvaguardar la seguridad nacional.

¹² Anuncio N° 39 de la GACC, 2021, consultado en: <http://www.customs.gov.cn/customs/302249/302266/302267/3731229/index.html>; Anuncio N° 81 de la GACC, 2021, consultado en: <http://www.customs.gov.cn/customs/302249/302266/302267/3957218/index.html>; y Anuncio N° 79 de la GACC, 2022, consultado en: <http://fuzhou.customs.gov.cn/customs/302249/302266/302267/4548521/index.html>.

¹³ Documento [WT/TPR/S/415/Rev.1](#) de la OMC, de 9 de marzo de 2022. La calificación crediticia de una empresa se basa en los registros de importación y exportación y en si cumple la legislación. En función de su calificación crediticia, se asigna a las empresas la categoría de empresas autorizadas, empresas de integridad general o empresas deshonestas.

¹⁴ La "modalidad de aceptación" significa que en la inspección de productos importados y exportados, de conformidad con la ley, la Administración de Aduanas de China selecciona terceras instituciones de inspección nacionales y extranjeras calificadas como "organismos aceptados", y publica el catálogo de organismos aceptados junto con las normas y prescripciones relativas a la inspección de los productos pertinentes. Las empresas de importación y exportación pueden encomendar a los organismos aceptados que figuran en el catálogo que lleven a cabo las inspecciones necesarias por adelantado y faciliten los informes de inspección correspondientes al presentar la declaración de aduana. Durante el despacho de aduana, la Administración de Aduanas de China puede adoptar los informes de inspección emitidos por terceros organismos de inspección como base para la evaluación de la conformidad. El despacho de aduana basado en la modalidad de aceptación no es obligatorio.

¹⁵ Comisión Nacional de Salud. Consultado en: <http://www.nhc.gov.cn/jkj/s7914/202101/7de3622479294bd3a0a526c323745c32.shtml>.

Prevención y Control del Consejo de Estado, el 15 de septiembre de 2021), las autoridades aduaneras estaban encargadas de la cuarentena de los pasajeros entrantes y del personal del avión, y de la supervisión de la desinfección de los vuelos de alto riesgo y de los aviones con pasajeros entrantes que habían dado positivo en la prueba.¹⁶ Esas medidas se terminaron el 8 de enero de 2023.¹⁷

3.10. Desde el anterior examen de China, no ha cambiado el método de inspección y supervisión "inspección y levante antes de realizar las pruebas" para los minerales de bajo riesgo importados, como el mineral de hierro, el mineral de manganeso, el mineral de cromo, el mineral de plomo y sus concentrados, y el mineral de cinc y sus concentrados.

3.11. En junio de 2021, el Consejo de Estado publicó un Aviso sobre la Profundización de la Reforma destinada a Separar los Permisos de las Licencias Comerciales para Estimular la Vitalidad de los Agentes del Mercado¹⁸, en virtud del cual las competencias administrativas sobre las cuestiones relacionadas con las licencias para la inspección y evaluación de las mercancías importadas o exportadas se transfirieron en parte de la GACC a la Administración Estatal de Reglamentación del Mercado (SAMR).¹⁹ En este contexto, el 26 de mayo de 2022, la SAMR publicó las Condiciones Específicas para la Certificación, Calificación y Acreditación de los Organismos de Inspección de Mercancías de Importación y Exportación²⁰ y, en septiembre de 2022, la GACC publicó el Reglamento sobre la Aceptación de los Organismos de Inspección de Mercancías de Importación y Exportación.²¹

3.12. Las autoridades indican que el plazo de despacho de aduana para las importaciones y exportaciones era de 36,64 horas y 1,74 horas en 2021 y de 40,18 horas y 1,26 horas en 2022, respectivamente; en el primer trimestre de 2023, era de 33,05 horas y 1,05 horas, respectivamente.

3.13. Con respecto al Programa de Operadores Económicos Autorizados (OEA) de China, en noviembre de 2021, la GACC anunció las Medidas para la Gestión del Crédito de las Empresas Registradas e Inscritas²², que sustituyeron a las anteriores Medidas para la Gestión del Crédito. Con arreglo a este anuncio, el nivel de calificación crediticia se reduce de cuatro a tres y la condición de OEA se atribuye a una sola categoría, a saber, empresas certificadas avanzadas. Además, los OEA se examinan cada cinco años en lugar de cada tres años. En diciembre de 2023, la GACC había firmado acuerdos de reconocimiento mutuo de OEA con 52 países y regiones²³; y en China había 5.726 OEA, que representaban el 0,28% (0,26% a finales de 2021) de las empresas registradas en la GACC. En 2023, las importaciones y exportaciones realizadas por OEA representaron el 37,2% de las importaciones y exportaciones totales de China (35,0% a finales de 2021).

¹⁶ Estudio de Prevención y Control de las Infecciones. Consultado en: <https://www.gkgzj.com/zn/1925.jhtml>.

¹⁷ El 8 de enero de 2023, las medidas de prevención y control de enfermedades infecciosas de clase A previstas en la Ley de Prevención y Tratamiento de Enfermedades Infecciosas dejaron de aplicarse a la COVID-19, que dejó de estar sujeta a la gestión de enfermedades infecciosas susceptibles de cuarentena en el marco de la Ley de Salud en Frontera y Cuarentena.

¹⁸ Gobierno de China. Consultado en: https://www.gov.cn/zhengce/content/2021-06/03/content_5615031.htm.

¹⁹ El Aviso suprimió la aprobación del acceso a los mercados por la GACC para los organismos que realizan inspecciones y evaluaciones de las mercancías de importación o exportación. Para aplicar el Aviso, la SAMR puede formular prescripciones específicas sobre las calificaciones de los organismos de inspección de las importaciones y exportaciones. Los organismos de inspección de las importaciones y exportaciones que deseen expandirse, modificar su ámbito de actividad o prorrogar el período de vigencia de su permiso comercial pueden presentar su solicitud a las autoridades de reglamentación del mercado centrales o locales, que deben consultar a la GACC antes de dar su aprobación. La GACC puede formular reglamentos sobre la aceptación de los organismos de inspección de mercancías de importación y exportación y publicar la lista de organismos de inspección aceptados.

²³ MOFCOM, 26 de septiembre de 2021, consultado en: <http://asean.mofcom.gov.cn/article/jmxw/202109/20210903202266.shtml>; y GACC, consultado en: <http://www.customs.gov.cn/customs/302249/302266/302267/5340276/index.html>.

3.14. En cuanto a los obstáculos al comercio y las inversiones interprovinciales, en marzo de 2022 se publicaron los Dictámenes sobre la Aceleración de la Construcción de un Mercado Nacional Unificado, que entraron en vigor en abril de 2022, con miras a "eliminar los obstáculos locales y regionales de protección". Los Dictámenes prohíben a todas las regiones publicar listas negativas para el acceso a los mercados por cuenta propia; exigen que las regiones utilicen una única lista negativa y lleven a cabo evaluaciones del acceso a los mercados.²⁴ Según las autoridades, de acuerdo con los Dictámenes, los Gobiernos locales realizaron autoexámenes y empezaron a eliminar políticas y medidas que entorpecían la unificación del mercado; los departamentos competentes investigaron abusos de facultades administrativas cuyo objetivo era eliminar o restringir la competencia, notificaron varios casos típicos de infracción de la lista negativa de acceso a los mercados y corrigieron los derechos y cargas ilegales sobre las empresas. En 2022, la SAMR llevó a cabo una evaluación a nivel nacional por primera vez. Esta abarcó a 174 Gobiernos locales y 1.552 departamentos gubernamentales. Según las autoridades, el resultado de la evaluación indica que la razón entre las políticas y medidas ilegales y la muestra total disminuyó considerablemente, y el nivel de satisfacción de las personas con la política de examen de la competencia leal aumentó. En abril de 2023, la SAMR publicó las Directrices sobre la Evaluación por Terceros del Examen de la Competencia Leal para mejorar el sistema de evaluación.

3.15. A lo largo del período objeto de examen se mantuvieron sin cambios unas 170 "zonas especiales bajo supervisión aduanera", sujetas a su propia reglamentación, dedicadas al tráfico de perfeccionamiento, las actividades de logística y la prestación de servicios bajo control aduanero.²⁵ De acuerdo con los Dictámenes sobre la Aceleración del Desarrollo de Nuevas Formas y Modelos de Comercio Exterior²⁶, publicados en julio de 2021, el MOFCOM, el Ministerio de Ecología y Medio Ambiente y la GACC distribuyeron conjuntamente un Anuncio sobre la Publicación de un Catálogo de Productos Adicionales para la Prestación de Servicios de Mantenimiento en Zonas Integradas bajo Control Aduanero con miras a ayudar a las empresas de las zonas integradas bajo control aduanero a prestar servicios a las empresas que requieren alta tecnología, generar un alto valor añadido y cumplir determinadas prescripciones ambientales.²⁷ En enero de 2022, se publicaron las Medidas Administrativas para las Zonas Integradas bajo Control Aduanero (Anuncio N° 256 de la GACC, 2022) con miras a seguir normalizando la gestión de las zonas integradas bajo control aduanero.²⁸ De conformidad con el MOFCOM, el Ministerio de Ecología y Medio Ambiente (MEE), y los Anuncios N° 16 y 45 de la GACC, de 2020 y 2021 respectivamente, por ejemplo, las empresas de las zonas integradas bajo control aduanero pueden prestar servicios de mantenimiento de motores de combustión interna de aeronaves, trenes de aterrizaje de aeronaves, drones, instrumentos de diagnóstico ultrasónicos de tipo B y otros productos.²⁹ No hay ninguna norma que establezca que esos servicios solo se permiten en las zonas integradas bajo control aduanero.

3.16. En lo que respecta a los sistemas de exámenes administrativos relacionados con las infracciones aduaneras, el 1 de enero de 2024 entró en vigor la Ley de Reexamen Administrativo revisada. Además, el Reglamento de la GACC sobre el Procedimiento de Audiencia en el marco de Casos de Reexamen Administrativo (Anuncio N° 265 de la GACC) entró en vigor el 1 de marzo de 2024, y el mismo día se abolieron las Medidas de la GACC para el Reexamen Administrativo (Anuncio N° 166 de la GACC, modificado por el Anuncio N° 218 de la GACC).

²⁵ El Consejo de Estado aprueba las zonas especiales bajo supervisión aduanera, y la Administración de Aduanas de China las supervisa. Existen seis tipos: zonas bajo control aduanero, zonas de elaboración para la exportación, parques logísticos bajo control aduanero, puertos francos, zonas integradas bajo control aduanero y zonas industriales transfronterizas. Documento [WT/TPR/S/415/Rev.1](#) de la OMC, de 9 de marzo de 2022.

²⁸ Anuncio N° 256 de la GACC, 2022. Consultado en: <http://www.customs.gov.cn/customs/302249/302266/302267/4123714/index.html>.

²⁹ MOFCOM, consultado en: <http://www.mofcom.gov.cn/article/b/e/202005/20200502965882.shtml>; y <http://www.mofcom.gov.cn/article/zcfb/zcdwmy/202112/20211203233188.shtml>.

3.1.1.1 Inspección previa a la expedición

3.17. La inspección previa a la expedición sigue siendo obligatoria para determinadas importaciones, en particular para una gama concreta de productos mecánicos y eléctricos usados importados, conforme a ley de Inspección de Mercancías de Importación y Exportación. El 1 de enero de 2021, se prohibió la importación de desechos sólidos y se eliminó la inspección previa a la expedición de los desechos importados como materias primas; aparte de esto, durante el período objeto de examen no hubo cambios importantes en las prescripciones de inspección previa a la expedición. Tal como se notificó a la OMC³⁰, entre las leyes y reglamentos de China que permiten aplicar el Acuerdo sobre Inspección Previa a la Expedición figuran la Ley de Inspección de Mercancías de Importación y Exportación (última modificación en 2018)³¹; el Reglamento de Aplicación de la Ley de Inspección de Mercancías de Importación y Exportación (última revisión en 2022)³²; las Medidas para la Inspección, Supervisión y Administración de Productos Mecánicos y Eléctricos Usados Importados³³; y las Medidas para la Supervisión, Administración, Inspección y Cuarentena de los Residuos Sólidos Importados que Pueden Ser Utilizados como Materias Primas.³⁴

3.1.1.2 Valoración en aduana

3.18. Desde el anterior examen no se han introducido cambios importantes en las normas y procedimientos de valoración en aduana de China, que figuran en el Anuncio N° 213 de la GACC, 2013.³⁵ El valor en aduana se determina sobre la base del valor de transacción y, cuando este no puede utilizarse, se aplican los demás métodos de valoración por orden sucesivo, según se estipula en el Acuerdo sobre Valoración en Aduana de la OMC.

3.19. Desde 2021, la GACC ha aceptado 61 nuevos casos de reexamen administrativo relativos a la clasificación (31), la valoración (13) o las normas de origen (17), de los cuales se han cerrado 56. Asimismo, ha aceptado 13 nuevos casos de recurso administrativo, 10 relativos a la clasificación y 3 al país de origen. Se han cerrado 3 de ellos.

3.1.1.3 Facilitación del comercio

3.20. China ha ratificado el Acuerdo sobre Facilitación del Comercio y ha notificado sus compromisos de las categorías A y B.³⁶ Según la Base de Datos del AFC de la OMC, China ha aplicado plenamente el Acuerdo.³⁷ Durante el período objeto de examen, China adoptó diversas medidas de facilitación del comercio (recuadro 3.1); también compartió su experiencia en materia de gestión aduanera inteligente, digitalización y ventanilla única con el Comité de Facilitación del Comercio de la OMC.³⁸

Recuadro 3.1 Medidas de facilitación del comercio de la GACC

1. Simplificación del registro de las empresas y facilitación de los trámites de despacho de aduana.

En 2020, la GACC publicó medidas para apoyar el desarrollo de las zonas bajo control aduanero. En ellas se especificaba que el registro, la inscripción o la actualización de información de empresas establecidas en las zonas integradas bajo control aduanero se realizarían en línea. En 2020, la GACC publicó un Anuncio sobre la Prórroga Temporal del Plazo de Verificación de los Manuales (Cuentas) de Tráfico de Perfeccionamiento y sobre Asuntos Pertinentes relacionados con el Registro y la Inscripción (Anuncio N° 21 de la GACC, 2020), que establecía que se daría prioridad en el registro o inscripción a las empresas importadoras de materiales para el control y la prevención de la pandemia a fin de asegurar un despacho de aduana rápido de dichos productos. En mayo de 2021, la GACC empezó a exigir la inscripción (en lugar del registro, como se exigía anteriormente) en línea de todas las entidades de declaración en aduana. Todas las entidades pueden presentar sus solicitudes de inscripción en cualquier lugar del país conectándose a "la ventanilla única para el comercio internacional" o la plataforma "Internet + Aduanas", sin necesidad de entregar documentación impresa en las instalaciones de las autoridades aduaneras. Una vez inscritas, las entidades pueden imprimir un acuse de recibo obtenido en línea. Las autoridades señalan que, gracias a estas medidas, las solicitudes se tramitaron con prontitud en línea en todo el país mediante el proceso de inscripción, sin necesidad de diligencias y sin costo alguno.

2. Aceleración del despacho de aduana de los aparatos electromecánicos y las materias primas importados que se necesitan con urgencia para la producción nacional. En agosto de 2022, la GACC publicó el Anuncio relativo a la Actualización del Catálogo de Mercancías de Importación y Exportación sujetas a Inspección (Anuncio N° 79 de la GACC, 2022) y decidió eliminar la inspección obligatoria de las importaciones de determinados productos de riesgo relativamente bajo de seguridad y calidad. Entre estos productos, siete fueron importados como productos que se necesitaban con urgencia para el equipo de procesamiento de la industria electrónica.

3. Facilitación de las importaciones de productos alimenticios y agropecuarios. Las autoridades aceleraron el procedimiento para otorgar acceso a los mercados a más categorías de productos agroalimentarios procedentes de un mayor número de países y registrar más establecimientos.

4. Apoyo a las empresas en la expansión de las exportaciones. Las notificaciones OTC y MSF realizadas por los Miembros de la OMC se publicaron en el sitio web del Servicio Nacional de Información y de Notificación OTC y MSF de China para la OMC, con miras a ayudar a las empresas a acceder a la información y las tendencias más recientes de las medidas OTC y sanitarias y fitosanitarias aplicadas en el extranjero. Hasta la fecha se han publicado más de 70.000 notificaciones. Además, las empresas pueden consultar las medidas OTC y sanitarias y fitosanitarias en la columna "Notificaciones e información" que figura en el sitio web. En el sitio web de las medidas comerciales técnicas (<http://www.tbtsps.cn/>), se publicaron la información de alerta temprana y los informes de los análisis conexos sobre la retención de productos chinos de exportación para dar a las empresas de exportación acceso oportuno a la información y evitar la obstrucción de las exportaciones. Además, sobre la base de la ventanilla única de China, se desarrolló una plataforma única de punto a punto para las medidas comerciales técnicas.

5. Facilitación de los procedimientos para las empresas dedicadas al tráfico de perfeccionamiento.

El 16 de febrero de 2020, la GACC publicó 10 medidas para ayudar a las empresas de comercio exterior a reanudar la producción y promover el crecimiento del comercio exterior. Con arreglo a estas medidas, en caso de que las empresas dedicadas al tráfico de perfeccionamiento (en particular, las establecidas en zonas sujetas a supervisión especial de las autoridades aduaneras) no verificaran sus manuales (cuentas) de tráfico de perfeccionamiento o no declararan las operaciones sujetas a declaración, como el traslado de mercancías con fines de elaboración avanzada y la tributación de las ventas internas, en el plazo establecido debido a un retraso en la reanudación de la producción, podían beneficiarse de un período de gracia, previa presentación de una declaración a las autoridades aduaneras competentes, y presentar los documentos más adelante. El 27 de octubre de 2023, la GACC puso en marcha 16 medidas de reforma, que comprenden la prórroga del plazo para la declaración centralizada de un traslado con fines de elaboración avanzada, la mejora de la gestión de las devoluciones e intercambios de productos elaborados exportados, la simplificación del procedimiento para la declaración centralizada de las ventas internas y la relocalización de las empresas, la reforma de la gestión del consumo unitario, la ampliación del alcance del modo de supervisión del tráfico de perfeccionamiento de grupos empresariales, y la facilitación del procedimiento de tráfico de perfeccionamiento y la promoción del desarrollo sostenido de alta calidad del tráfico de perfeccionamiento.

6. Simplificación de los procedimientos de verificación y reducción de las inspecciones sobre el terreno. La GACC gestiona los trámites vinculados a las pérdidas sobre la base de los datos de inventario facilitados por las empresas. Las autoridades de la Administración de Aduanas de China realizarán inspecciones sobre el terreno en función de la supervisión de la situación de producción y el riesgo en las empresas que realizan la solicitud vinculada a las pérdidas. De ser posible, la GACC lleva a cabo auditorías *ex situ* por vídeo o mediante la transmisión electrónica de datos para reducir al mínimo las interrupciones en la producción y el funcionamiento de las empresas. En el marco de las medidas de la GACC publicadas el 16 de febrero de 2020 para ayudar a las empresas dedicadas al tráfico de perfeccionamiento a hacer frente al impacto de la pandemia, cuando una de estas empresas solicitaba la verificación de sus manuales (libros de contabilidad) bajo control aduanero, generalmente las autoridades aduaneras no los verificaban *in situ*, siempre que la empresa mantuviera de forma adecuada el material pertinente. En su lugar, las autoridades aduaneras utilizaban un sistema de "Internet + Auditoría", por ejemplo, mediante una auditoría remota a través de videoconferencia y la transmisión electrónica de documentos, siempre que la empresa estuviera en condiciones de hacerlo. Hasta la fecha, las autoridades de la Administración de Aduanas de China se han conectado a los sistemas de planificación de recursos empresariales (sistemas de gestión de almacenes) de 215 empresas con el fin de realizar auditorías remotas. Las autoridades consideran que, mediante la aplicación de un enfoque basado en el riesgo posterior al despacho, la Administración de Aduanas de China puede centrarse en las auditorías de alto riesgo y mejorar los niveles de cumplimiento y facilitar el comercio. Según las autoridades, en 2023, la GACC llevó a cabo 7.809 auditorías, es decir, un 10% menos que el año anterior. La GACC también ha adoptado una estrategia de divulgación voluntaria. Además, ha simplificado la divulgación mediante procedimientos electrónicos. En 2023, la Administración de Aduanas de China aceptó 3.026 casos de divulgación voluntaria en línea. A fin de reducir las inspecciones múltiples y repetitivas sobre el terreno, las diversas instrucciones de verificación con respecto al mismo período y la misma persona son impartidas por el mismo equipo.

7. Apoyo eficaz en el marco de la plataforma "Internet + Aduanas". Todas las autoridades aduaneras han adoptado el despacho de aduana sin papel, y el servicio de asistencia telefónica y el sitio web oficial de la GACC ofrecen respuestas a las preguntas a este respecto.

Fuente: Información facilitada por las autoridades.

3.21. Los datos facilitados por las autoridades indican que la importación y exportación del tráfico de perfeccionamiento ascendió a USD 1,3156 billones en 2021 y USD 1,2684 billones en 2022. Desde el anterior examen, el régimen del tráfico de perfeccionamiento no ha variado; los productos de papel (partidas 4801 a 4816 del SA) se eliminaron del Catálogo de Productos Prohibidos en el marco del Tráfico de Perfeccionamiento a partir del 15 de junio de 2021.³⁹

3.1.2 Normas de origen

3.22. Desde su anterior examen, China no ha introducido cambios en las leyes o reglamentos pertinentes.⁴⁰ China continúa aplicando normas de origen preferenciales y no preferenciales. Todas las normas de origen preferenciales de China se aplican con arreglo a diversos ACR en vigor, y los criterios utilizados para determinar el origen no han cambiado desde el examen anterior.

3.1.3 Aranceles

3.1.3.1 Aranceles NMF aplicados

3.23. La estructura del arancel de aduanas de China, que no ha cambiado desde el examen anterior, se compone de tipos NMF, tipos arancelarios "de acuerdo", tipos arancelarios preferenciales especiales, tipos arancelarios generales y tipos aplicados dentro de contingentes arancelarios. Además, se aplican tipos arancelarios provisionales, que suelen ser inferiores a los tipos NMF, durante un período especificado (normalmente un año).⁴¹

³⁹ MOFCOM. Consultado en: <http://www.mofcom.gov.cn/swfgzc/article.shtml?id=20210603070389>.

⁴⁰ Los detalles de las normas de origen no preferenciales y preferenciales se describen en el documento [WT/TPR/S/415/Rev.1](#) de la OMC, de 9 de marzo de 2022.

⁴¹ Los tipos establecidos en los acuerdos se aplican a los productos importados de los países y territorios aduaneros con los que China ha concertado acuerdos comerciales preferenciales (sección 2). Los tipos preferenciales especiales constituyen preferencias unilaterales que se aplican a las importaciones originarias de los PMA con los que China ha concluido un acuerdo comercial. Los tipos generales se aplican a los productos cuyo origen no puede determinarse, a los productos procedentes de países o territorios aduaneros que no han concertado un acuerdo comercial recíproco con China, a los países que no son Miembros de la OMC y a algunos territorios de los Estados miembros de la UE. Cuando un país o territorio aduanero aparece en varias listas, se le aplica el tipo más favorable teniendo en cuenta las normas de origen. Los derechos provisionales los fija

3.24. En 2024, el Arancel NMF aplicado por China comprende 8.957 líneas al nivel de 8 dígitos (SA 2022). La mayoría de las líneas arancelarias (el 99,6%) tienen aranceles *ad valorem*. Alrededor del 16% de todas las líneas estaban exentas de derechos.

3.25. La estructura del Arancel no ha registrado apenas variaciones desde el anterior examen. El tipo NMF medio aplicado en 2024 fue del 7,0%, frente al 7,1% en 2021. Los aranceles fueron más elevados en el caso de los productos agropecuarios (definición de la OMC), del 12,6% (cuadro 3.2). El arancel medio aplicado a los productos no agropecuarios se redujo al 6,1% (frente al 6,2% en 2021). El porcentaje de aranceles superiores al 15% (crestas arancelarias internacionales) fue del 4,3% (en 2021 fue del 4,5%). El porcentaje de aranceles sujetos a crestas arancelarias nacionales fue del 1,9% (sin cambios desde 2021).

Cuadro 3.2 Estructura del arancel de aduanas, 2017, 2021 y 2024

	Tipo NMF aplicado			Tipo final consolidado ^c
	2017 ^a	2021 ^b	2024	
Líneas arancelarias consolidadas (% del total de líneas arancelarias)	100,0	100,0	100,0	100,0
Promedio aritmético de los tipos	9,3	7,1	7,0	9,6
Productos agropecuarios (definición de la OMC)	14,6	12,7	12,6	15,1
Productos no agropecuarios (definición de la OMC)	8,5	6,2	6,1	8,7
Líneas arancelarias exentas de derechos (% de todas las líneas)	9,8	12,6	16,2	10,6
Promedio aritmético de los tipos de las líneas sujetas a derechos únicamente	10,3	8,1	8,3	10,7
Contingentes arancelarios (% del total de líneas arancelarias)	0,6	0,5	0,5	0,5
Aranceles no <i>ad valorem</i> (% del total de líneas arancelarias)	0,4	0,4	0,4	0,0
"Crestas" arancelarias nacionales (% del total de líneas arancelarias) ^d	1,8	1,9	1,9	2,0
"Crestas" arancelarias internacionales (% del total de líneas arancelarias) ^e	13,9	4,5	4,3	15,3
Desviación típica global de los tipos arancelarios	7,4	6,1	6,2	7,7
Coefficiente de variación de los tipos arancelarios	0,8	0,9	0,9	0,8
Tipos aplicados "de puro estorbo" (% del total de líneas arancelarias) ^f	3,2	4,3	2,5	2,5
Número de líneas	8.547	8.580	8.957	8.957
Tipos <i>ad valorem</i> (> 0%)	7.669	7.499	7.474	8.012
Libres de derechos	840	1.081	1.449	945
Tipos específicos	34	34	31	0
Tipos alternativos	3	3	3	0
Otros ^g	1	0	0	0

a Al 1 de diciembre.

b Al 1 de julio. Se incluyen las reducciones arancelarias aplicadas tras la ampliación del Acuerdo sobre Tecnología de la Información.

c Los tipos consolidados están basados en el Arancel de 2024.

d Se entiende por crestas arancelarias nacionales los tipos que exceden del triple del promedio global de los tipos aplicados.

e Se entiende por crestas arancelarias internacionales los tipos superiores al 15%.

f Los tipos "de puro estorbo" son los superiores a cero pero inferiores o iguales al 2%.

g Tipos *ad valorem*, si el precio es inferior o igual a determinada cantidad, o tipos compuestos si el precio es superior.

Nota: Los cálculos se basan en las líneas arancelarias nacionales (al nivel de 8 dígitos); se excluyen los tipos aplicables dentro de los contingentes y se incluyen los equivalentes *ad valorem* (EAV) de los derechos no *ad valorem* facilitados por las autoridades. Los tipos de los derechos temporales se utilizan para los cálculos cuando se aplican plenamente al nivel de 8 dígitos (si no se utilizan, el promedio aritmético de los tipos NMF aplicados es del 7,3% en 2024, por ejemplo). Los Aranceles de 2017 y 2021 se basan en la nomenclatura del SA 2017, y el de 2024, en la nomenclatura del SA 2022.

Fuente: Cálculos de la Secretaría de la OMC a partir de los datos facilitados por las autoridades.

anualmente la Comisión Arancelaria del Consejo de Estado y suelen aplicarse del 1 de enero al 31 de diciembre de cada año. Esos derechos se aplican en régimen NMF y sustituyen a los derechos NMF para las líneas afectadas. Los tipos de los derechos provisionales son inferiores a los tipos NMF y, en algunos casos, solamente se aplican a una parte de una línea arancelaria.

3.26. En 2024, los aranceles NMF aplicados por China incluyen 45 tipos arancelarios *ad valorem* distintos (frente a 50 en 2021). Esos tipos oscilan entre el 0% y el 65%, con una desviación típica de 6,2 (cuadro A3. 1). También en 2024, el 87,4% de todos los aranceles se sitúan en una horquilla que va de la franquicia arancelaria al 10%, algo menos que en 2021 (87,6%); esa pequeña diferencia puede explicarse por un cambio en la nomenclatura del SA.

3.27. En 2024, el 1,9% de las líneas arancelarias estaban sujetas a tipos superiores al 20% (gráfico 3.1). El arancel más elevado de China (65%) se aplica a 20 líneas arancelarias (trigo y morcajo (tranquillón); maíz, excepto para siembra; arroz; harina de trigo y morcajo (tranquillón); grañones, sémola y "pellets", de cereales; determinados cereales en grano, molidos o tratados (de maíz y cebada); y vermut y demás vinos preparados con plantas aromáticas (en recipientes con capacidad superior a 2 litros). Seis líneas arancelarias están sujetas a un tipo del 57% (los demás tabacos elaborados (partidas 2403 y 2404 del SA)), y 10 líneas arancelarias a un tipo del 50% (7 correspondientes a la partida azúcar de caña o de remolacha y sacarosa químicamente pura, en estado sólido (partida 1701 del SA) y 3 a la de abonos minerales o químicos (partidas 3102.10, 3105.20 y 3105.30 del SA)).

Gráfico 3.1 Distribución de los tipos arancelarios NMF aplicados, 2017, 2021 y 2024

Nota: Las cifras que figuran sobre las barras indican el porcentaje del total de líneas arancelarias. Los Aranceles de 2017 y 2021 se basan en la nomenclatura del SA 2017, y el de 2024, en el SA 2022.

Fuente: Cálculos de la Secretaría de la OMC a partir de los datos facilitados por las autoridades.

3.28. Entre 2021 y 2024, el promedio de los tipos arancelarios disminuyó principalmente para los artículos de las Secciones 09 (madera y manufacturas de madera), 10 (pasta de madera, papel, etc.) y 21 (objetos de arte). En el caso de otras Secciones del SA, la disminución es mínima. Algunas Secciones del SA muestran un aumento, que puede explicarse por un cambio en la nomenclatura del SA (gráfico 3.2).

Gráfico 3.2 Promedio de los tipos arancelarios, por Sección del SA, 2021 y 2024

Nota: Se excluyen los tipos aplicables dentro de los contingentes y se incluyen los equivalentes *ad valorem* (EAV) de los derechos no *ad valorem*. En los cálculos se utilizan los tipos provisionales cuando son aplicados en su totalidad al nivel de 8 dígitos.

Fuente: Cálculos de la Secretaría de la OMC a partir de los datos facilitados por las autoridades.

3.1.3.2 Contingentes arancelarios

3.29. China impone contingentes arancelarios de importación universales a productos como el trigo (7 líneas arancelarias), el maíz (5 líneas), el arroz (14 líneas), el algodón (2 líneas), el azúcar (7 líneas), la lana y la lana peinada (9 líneas) y los abonos químicos (3 líneas) (sección 4.1.1.4.1). Al importar se exige un certificado del contingente arancelario de importación para los productos agropecuarios y un certificado del contingente arancelario de importación para los abonos químicos, tanto para el comercio general como para el tráfico de perfeccionamiento, el comercio de trueque, el comercio fronterizo en pequeñas cantidades y el comercio con fines de asistencia o donación. Los productos procedentes del extranjero que entran en las zonas de vigilancia especial de las aduanas están exentos de ambos certificados de contingentes arancelarios de importación. Además, se han establecido contingentes arancelarios para determinados países en el marco de acuerdos bilaterales de libre comercio, como es el caso de los contingentes de la lana procedente de Australia, la lana y la lana peinada procedentes de Nueva Zelanda y el azúcar procedente de Mauricio y Nicaragua.

3.1.3.3 Aranceles consolidados

3.30. Cuando China pasó a formar parte de la OMC, en 2001, consolidó el 100% de sus aranceles a tipos *ad valorem* comprendidos entre el 0% y el 65% para los productos agropecuarios (según la definición de la OMC) y entre el 0% y el 50% para los productos no agropecuarios. El promedio aritmético de los tipos consolidados finales (y actuales) es del 9,6% (el 15,1% para los productos agropecuarios y el 8,7% para los no agropecuarios). Si bien todos los aranceles se consolidaron a tipos *ad valorem*, los aranceles NMF aplicados a 31 líneas arancelarias son a tipos no *ad valorem*. Las autoridades confirman que, en la práctica, los equivalentes *ad valorem* de esas líneas sujetas a tipos no *ad valorem* no son superiores a los tipos consolidados, puesto que se aplica el tipo más bajo.

3.1.3.4 Aranceles preferenciales

3.31. China aplica aranceles preferenciales en el marco de sus arreglos comerciales preferenciales (ACPR) y acuerdos comerciales regionales (ACR) (sección 2.3.2). Hong Kong, China y Macao, China están sujetos a los tipos arancelarios más bajos en promedio, seguidos de Chile y Nueva Zelanda

(cuadro 3.3). El porcentaje de líneas arancelarias libres de derechos en los ACR de China oscila entre el 99,2% (Hong Kong, China y Macao, China) y el 23,5% (Territorio Aduanero Distinto de Taiwán, Penghu, Kinmen y Matsu (Taipei Chino)). No se dispone de datos sobre la utilización de aranceles preferenciales en el marco de los ACR y los ACPR.

3.32. China también otorga un trato arancelario preferencial a las importaciones procedentes de PMA que han establecido relaciones diplomáticas con ella y ultimado el canje de notas diplomáticas. En febrero de 2023, China aplicaba aranceles nulos a entre el 95,4% y el 98,4% de las líneas arancelarias de esos 44 PMA. Los PMA y China han presentado al Comité de Normas de Origen de la OMC comunicaciones relativas a las tasas de utilización de las exportaciones de los PMA en el marco del arreglo comercial preferencial de China para los PMA.⁴²

Cuadro 3.3 Análisis recapitulativo de los aranceles preferenciales de China, 2024

	Total		Productos agropecuarios (definición de la OMC)		Productos no agropecuarios (definición de la OMC)

3.1.3.5 Exenciones o concesiones arancelarias

3.33. Desde el examen anterior, no ha habido cambios en lo que se refiere a las exenciones, reducciones o concesiones de derechos que pueden aplicarse de conformidad con las disposiciones establecidas en la reglamentación pertinente del Consejo de Estado, ni en lo que se refiere a las mercancías importadas en zonas designadas, para empresas específicas o para usos específicos.⁴³ Las importaciones y exportaciones de mercancías en determinadas regiones, de determinadas empresas o con fines específicos pueden estar sujetas a derechos de aduana reducidos o estar exentas de tales derechos. El Consejo de Estado establecerá el alcance y los métodos de las reducciones o exenciones fiscales específicas. Se notificaron al Comité de Subvenciones y Medidas Compensatorias de la OMC diversas exenciones de los derechos de aduana en vigor durante los

⁴³ Artículos 56 a 58 de la Ley de Aduanas; artículos 45 a 47 del Reglamento sobre Derechos de Importación y Exportación; y políticas pertinentes de reducción y exención de impuestos.

períodos 2019-2020 y 2021-2022.⁴⁴ Las autoridades indican que no se dispone de datos sobre los ingresos dejados de percibir debido a las concesiones o exenciones arancelarias durante el período.

3.1.4 Otras cargas que afectan a las importaciones

3.34. Las otras cargas que afectan a las importaciones son el impuesto sobre el valor añadido (IVA), el impuesto sobre el consumo y el impuesto sobre la compra de vehículos automóviles.

3.35. Para apoyar la prevención y el control de la COVID-19, se eximió a las sociedades y las empresas individuales del IVA y del impuesto sobre el consumo (así como de diversas otras cargas que no afectan a las importaciones) con respecto a las mercancías de producción propia, elaboradas por encargo, compradas o donadas con el fin de frenar la propagación de la COVID-19, bien a través de organizaciones sociales encargadas del bienestar público, el Gobierno central y los Gobiernos locales y sus departamentos a nivel nacional o superior, y otras entidades estatales, o directamente de hospitales encargados de la prevención y el control de la COVID-19. Esta exención entró en vigor el 1 de enero de 2020. El Anuncio del Ministerio de Hacienda y la Administración Estatal sobre la Prórroga del Período de Aplicación de Determinadas Políticas Fiscales Preferenciales en Respuesta a la Pandemia (Anuncio Nº 7 de 2021), publicado el 17 de marzo de 2021, prorrogó el período de aplicación de las políticas fiscales preferenciales⁴⁵ previstas en el Anuncio del Ministerio de Hacienda y la Administración Estatal sobre las Políticas relativas al Impuesto de Donaciones en Apoyo de la Prevención y el Control del Brote de COVID-19 (Anuncio Nº 9 de 2020) hasta el 31 de marzo de 2021, fecha en que estas políticas expiraron. Además, las empresas que produjeran determinados materiales de apoyo clave para la prevención y el control de la pandemia podían solicitar mensualmente la devolución íntegra del exceso acumulado del IVA retenido. Asimismo, quedaban exentos del pago del IVA los ingresos derivados del transporte de materiales de apoyo clave para la prevención y el control de la pandemia, así los derivados de la prestación de servicios de transporte público o servicios de entrega urgente de artículos de primera necesidad.⁴⁶ Con arreglo al Anuncio del Ministerio de Hacienda y la Administración Estatal sobre las Políticas Fiscales de Apoyo a la Prevención y el Control de la Pandemia de COVID-19 (Anuncio Nº 8 de 2020), las empresas que produjeran determinados materiales de apoyo clave para la prevención y el control de la pandemia podían solicitar mensualmente a las autoridades fiscales competentes la devolución íntegra del exceso acumulado del IVA retenido. Además, estaban exentos del pago del IVA los ingresos derivados del transporte de materiales de apoyo clave para la prevención y el control de la pandemia, así como los derivados de la prestación de servicios de transporte público o servicios de entrega urgente de artículos de primera necesidad. De conformidad con el Anuncio del Ministerio de Hacienda y la Administración Estatal sobre la Prórroga del Período de Aplicación de Determinadas Políticas Fiscales Preferenciales en Respuesta a la Pandemia (Anuncio Nº 7 de 2021), estas políticas preferenciales estuvieron en vigor hasta el 31 de marzo de 2021, fecha en que expiraron.

3.1.4.1 Impuesto sobre el valor añadido (IVA)

3.36. En 2022, el IVA representó el 29,2% de los ingresos fiscales totales (frente al 36,8% en 2021); las autoridades han señalado que se ha llevado a cabo una política de reembolso en gran escala del exceso de IVA retenido. Hay 13 ramas de producción (incluidas 11 categorías) beneficiarias de esta política de devolución íntegra del impuesto retenido, a saber: el sector manufacturero; la investigación científica y los servicios tecnológicos; la generación y suministro de electricidad, calefacción, gas y agua; el transporte, el almacenamiento y los servicios postales; la venta al por mayor y al por menor; la agricultura, la silvicultura, la ganadería y la pesca; los servicios de alojamiento y restauración; los servicios residenciales, de reparación y otros servicios; la

⁴⁴ Documentos [G/SCM/N/372/CHN](#) y [G/SCM/N/401/CHN](#) de la OMC, de 27 de agosto de 2021 y 20 de julio de 2023, respectivamente.

⁴⁵ En el marco de estas políticas, los empresarios individuales que donasen mercancías producidas, expedidas, elaboradas o adquiridas para luchar contra la pandemia de COVID-19, bien a través de organizaciones sociales encargadas del bienestar público, los Gobiernos locales y sus departamentos a nivel nacional o superior y otras entidades estatales, o directamente de hospitales encargados de la prevención y el control de la pandemia, estaban exentos del IVA, del impuesto sobre el consumo, del impuesto de construcción y mantenimiento urbano, del recargo de educación y del recargo local de educación..

⁴⁶ En abril de 2022, el Ministerio de Hacienda y la Administración Estatal publicaron el Anuncio sobre la Política de Exención del IVA para los Servicios de Entrega Urgente (Anuncio Nº 18 de 2022), en el que se especificaba que, entre el 1 de mayo de 2022 y el 31 de diciembre de 2022, los ingresos derivados de la prestación de servicios de entrega urgente de artículos de primera necesidad a los residentes estarían exentos del IVA.

enseñanza; los servicios de salud y asistencia social; la cultura, el deporte y el ocio; los servicios de transmisión de información, programas informáticos y tecnología de la información; y la conservación del agua, la protección del medio ambiente y la gestión de los servicios públicos de protección de los recursos ecológicos y ambientales. Según las autoridades, la política se aplicó, entre otras cosas, con el objetivo de aliviar la presión financiera sobre las empresas, promover la inversión y el consumo, mejorar el régimen del IVA y reflejar la neutralidad fiscal.

3.37. Los tipos actuales del IVA no han variado desde el examen anterior y son del 13%, el 9%, el 6% y el 3%. Antes del 31 de diciembre de 2023, se eximió a determinados pequeños contribuyentes del IVA del pago del impuesto o se redujo temporalmente del 3% al 1% el tipo aplicado a esos contribuyentes (Anuncio del Ministerio de Hacienda y la Administración Estatal de Impuestos sobre la Política de Desgravación y Exención del IVA para los Pequeños Contribuyentes del IVA (Anuncio N° 19 de 2023)).⁴⁷

3.38. Como se notificó a la OMC, durante el período examinado se aplicaron políticas preferenciales del IVA para: i) los parques científicos y tecnológicos de las universidades nacionales; ii) la utilización integrada de recursos; iii) los nuevos tipos de materiales murales; iv) las microempresas y las pequeñas empresas; v) las empresas que dan empleo a personas discapacitadas; vi) los productos importados que sean de uso exclusivo de las personas discapacitadas; vii) los productos para personas con discapacidad; viii) los medicamentos destinados al tratamiento del VIH-SIDA; ix) el té vendido en las zonas fronterizas; x) los productos importados con objeto de sustituir las plantaciones de adormidera; xi) las importaciones de semillas (plantones); xii) el sector de los circuitos integrados; xiii) las grandes aeronaves de pasajeros; y xiv) los fármacos antineoplásicos.⁴⁸

3.39. Con arreglo al Anuncio del Ministerio de Hacienda y la Administración Estatal sobre las Políticas Fiscales de Apoyo a la Industria Cinematográfica y Otras Industrias (Anuncio N° 25 de 2020), entre el 1 de enero de 2020 y el 31 de diciembre de 2021 los contribuyentes estaban exentos del pago del IVA respecto a los ingresos derivados de la prestación de servicios de proyección de películas. De conformidad con el Anuncio del Ministerio de Hacienda y la Administración Estatal sobre la Prórroga del Período de Aplicación de Determinadas Políticas Fiscales Preferenciales en Respuesta a la Pandemia (Anuncio N° 7 de 2021), esta política se prorrogó hasta el 31 de marzo de 2021⁴⁹, fecha en la que expiró. Del 1 de enero de 2019 al 31 de diciembre de 2022, los contribuyentes estuvieron exentos del IVA con respecto a las mercancías donadas para la reducción de la pobreza, en determinadas condiciones.

3.1.4.2 Impuesto (especial) sobre el consumo

3.40. En 2022, el impuesto (especial) sobre el consumo (cuadro 3.4) representó el 10% de los ingresos fiscales totales (frente al 8,0% en 2021) (cuadro 3.5). Este impuesto sigue aplicándose a los productos que se consideran perjudiciales para la salud humana, el orden público y el medio ambiente; los bienes suntuarios; los productos que consumen mucha energía y los productos con un alto grado de elaboración; y los productos del petróleo no renovables y no reemplazables. Los tipos del impuesto varían de un producto a otro; pueden ser *ad valorem*, específicos o compuestos. En noviembre de 2022, China introdujo un impuesto sobre el consumo de cigarrillos electrónicos a un tipo del 36% en la etapa de producción e importación y del 11% en la etapa de venta al por mayor.⁵⁰ No se han introducido otros cambios en los artículos sujetos al impuesto sobre el consumo ni en los tipos aplicados. Al igual que en el examen anterior, están exentos del impuesto los productos del petróleo producidos mediante el uso integral de los recursos y determinados tipos de petróleo refinado.⁵¹

⁴⁷ En el caso de los pequeños contribuyentes que realizan actividades de venta sujetas al impuesto, se aplica un método simplificado de cálculo de la cuota tributaria basado en el importe de las ventas y el tipo impositivo, y no se permite la deducción del impuesto soportado. El tipo del IVA aplicado a los pequeños contribuyentes es del 3%, a menos que el Consejo de Estado disponga otra cosa.

Cuadro 3.4 Impuesto sobre el consumo, junio de 2023

Producto	Tipo impositivo
Cigarros (puros)	36%
Cigarrillos	
Procedimiento de producción (importación)	
Precio igual o superior a CNY 70 (IVA excluido) por cartón	56% más CNY 0,003/cigarrillo
Precio inferior a CNY 70 (IVA excluido) por cartón	36% más CNY 0,003/cigarrillo
Venta al por mayor	11% más CNY 0,005/cigarrillo
Picadura de tabaco	30%
Cigarrillos electrónicos	
Procedimiento de producción (importación)	36%
Venta al por mayor	11%
Bebidas alcohólicas y alcohol	
Alcohol destilado de cereales, patata o uva	20% más CNY 0,5/500 g (o por 500 ml)
Vino amarillo de arroz	CNY 240/tonelada
Cerveza de malta cuyo precio en fábrica sea igual o superior a CNY 3.000 (excluido el IVA) por tonelada	CNY 250/tonelada
Cerveza de malta cuyo precio en fábrica sea inferior a CNY 3.000 (excluido el IVA) por tonelada	CNY 220/tonelada
Las demás bebidas alcohólicas fermentadas	10%
Cosméticos de lujo	15%
Joyas preciosas, perlas, jade y piedras preciosas	
Joyas de oro, plata y platino, y diamantes	5%
Perlas, jade y piedras preciosas	10%
Cohetes y artículos para fuegos artificiales	15%
Gasolina	
Gasolina para motores y gasolina de aviación	CNY 1,52/litro
Gasóleo	CNY 1,2/litro
Queroseno de aviación	CNY 1,2/litro
Nafta	CNY 1,52/litro
Disolventes	CNY 1,52/litro
Lubricantes	CNY 1,52/litro
Fuel	CNY 1,2/litro
Motocicletas	
De cilindrada no superior a 250 ml	3%
De cilindrada superior a 250 ml	10%
Vehículos de motor	
Vehículos de pasajeros con menos de nueve asientos, de cilindrada:	
igual o inferior a 1.000 ml	1%
superior a 1.000 ml, pero inferior a 1.500 ml	3%
superior a 1.500 ml, pero inferior a 2.000 ml	5%
superior a 2.000 ml, pero inferior a 2.500 ml	9%
superior a 2.500 ml, pero inferior a 3.000 ml	12%
superior a 3.000 ml, pero inferior a 4.000 ml	25%
Igual o superior a 4.000 ml	40%
Vehículos ligeros o medianos para pasajeros de uso comercial	5%
Vehículos de "gran lujo" (venta al por menor)	Además del impuesto sobre el consumo aplicable a la producción (importación) basado en los tipos indicados <i>supra</i> , el impuesto sobre el consumo aplicable a la venta al por menor se percibe a un tipo del 10%.
Yates	10%
Relojes de lujo de precio superior a CNY 10.000 por unidad	20%
Pelotas y palos de golf	10%
Revestimientos de madera maciza	5%
Palillos para comer, desechables	5%
Pilas	4%
Pinturas	4%

Cuadro 3.5 Ingresos fiscales, 2020-2022

(En miles de millones de CNY)

	2020	2021	2022
Ingresos públicos totales	18.291,4	20.255,5	20.364,9
Gobierno central (%)	45,3	45,2	46,6
Gobiernos locales (%)	54,7	54,8	53,4
Ingresos fiscales	15.421,2	17.273,6	16.662,0
Gobierno central (%)	51,6	51,5	54,0
Gobiernos locales (%)	48,4	48,5	46,0
Impuestos indirectos (% de los ingresos fiscales totales)			
Impuesto (especial) sobre el consumo	7,8	8,0	10,0
Impuesto sobre el valor añadido	36,8	36,8	29,2
Impuesto sobre el consumo e IVA aplicados en frontera	9,4	10,0	12,0
Desgravaciones del IVA y del impuesto sobre el consumo aplicadas a las exportaciones	8,8	10,5	9,8
Aranceles	1,7	1,6	1,7
Impuestos directos (% de los ingresos fiscales totales)			
Impuesto sobre la renta de las sociedades	23,6	24,3	26,2
Impuesto sobre la renta de las personas físicas	7,5	8,1	9,0
Gasto público total	24.567,9	24.567,3	26.055,2
Gobierno central (%)	14,3	14,3	13,7
Gobiernos locales (%)	85,7	85,7	86,3

Nota: Los ingresos y gastos totales de las administraciones públicas que figuran en el cuadro son los ingresos y gastos totales del presupuesto público general; no incluyen los ingresos y gastos de los fondos públicos ni el presupuesto de explotación del capital del Estado.

Fuente: Información facilitada por las autoridades.

3.41. El Anuncio del Ministerio de Hacienda y la Administración Estatal sobre la Prórroga de la Exención del Impuesto sobre el Consumo para los Productos de Aceites Minerales Usados y Reciclados (Anuncio Nº 69 de 2023) dispone que están exentos del citado impuesto los aceites industriales (como los aceites de base lubricantes, la gasolina o el gasóleo) elaborados a partir de aceites minerales por contribuyentes que reúnan determinados requisitos.⁵² El plazo de aplicación de la política de exención del impuesto sobre el consumo para los productos del petróleo reciclados a partir de aceites minerales usados se ha prorrogado hasta el 31 de diciembre de 2027.

3.1.4.3 Impuesto sobre la compra de vehículos automóviles

3.42. En virtud de la Ley del Impuesto sobre la Compra de Vehículos Automóviles de 2019, China aplica un impuesto del 10% a los vehículos de producción nacional y a los importados, que no se ha modificado desde el examen anterior. El impuesto es percibido por las autoridades fiscales solo cuando se produce la compra.⁵³ En el caso de los vehículos de producción nacional, el impuesto se aplica al precio íntegro pagado por el contribuyente al vendedor, excluido el IVA. En el caso de los vehículos importados, el precio imponible es el precio después de pagados los derechos, más el derecho de aduana y el impuesto sobre el consumo.⁵⁴ Los vehículos por los que ya se ha pagado el impuesto (por ejemplo, los coches usados) no están obligados a abonarlo de nuevo.

3.43. En junio de 2023, China anunció la prórroga de la exención: los vehículos adquiridos entre 2024 y 2025 estarán totalmente exentos; la exención fiscal máxima por cada vehículo de pasajeros propulsado por energías alternativas será de CNY 30.000. En cuanto a los vehículos

⁵² Administración Estatal de Impuestos. Consultado en: <https://fgk.chinatax.gov.cn/zcfgk/c102416/c5214575/content.html>.

⁵³ Según la Ley, las personas y entidades que adquieran vehículos sujetos a impuestos (es decir, automóviles, tranvías, remolques para automóviles y motocicletas de cilindrada superior a 150 mm) dentro de China están obligados a pagar el impuesto sobre la compra de vehículos de conformidad con la Ley. Con arreglo a la Ley, se entiende por "compra" el acto de adquirir y utilizar para uso propio vehículos sujetos a impuestos por medio de su compra, importación, autoproducción, donación, adjudicación u otros procedimientos. Los contribuyentes que compren vehículos sujetos a impuestos (para uso propio) y cumplan los criterios deben pagar el impuesto sobre la compra de vehículos durante el proceso de compra.

⁵⁴ Ley del Impuesto sobre la Compra de Vehículos Automóviles, artículo 6. El impuesto no se aplica a los vehículos ferroviarios urbanos (por ejemplo, metro y ferrocarril ligero), los vehículos mecánicos de ruedas especiales (como cargadoras, niveladoras, excavadoras y topadoras frontales), las grúas, las carretillas elevadoras y las motocicletas eléctricas. Desde 2014, están exentos del impuesto determinados vehículos propulsados por energías alternativas.

adquiridos entre 2026 y 2027, estarán sujetos a una desgravación del 50% y la desgravación fiscal máxima por cada vehículo de pasajeros propulsado por energías alternativas será de CNY 15.000.⁵⁵ La administración de los vehículos propulsados por energías alternativas que están exentos o pueden acogerse a desgravaciones del impuesto/gravamen corre a cargo del Ministerio de Industria y Tecnología de la Información (MIIT) y la Administración Estatal de Impuestos y se basa en el Catálogo de Modelos de Vehículos Propulsados por Energías Alternativas que se benefician de una Exención o Desgravación del Impuesto sobre la Compra de Vehículos Automóviles, que se actualiza periódicamente. Puede solicitarse la inclusión en el Catálogo de aquellos vehículos propulsados por energías alternativas (de producción nacional o importados) que cumplan todos los requisitos (entre los que figuran prescripciones técnicas y normas de prueba y de servicios). Todos los modelos enumerados en el Catálogo pueden beneficiarse de exenciones o desgravaciones fiscales. Según se ha notificado a la OMC, entre 2019 y 2021 se aplicaron otros tipos impositivos preferenciales a las empresas de transporte público urbano que adquirieran autobuses públicos eléctricos, los vehículos propulsados por energías alternativas, los remolques y otros vehículos similares.⁵⁶

3.1.5 Prohibiciones, restricciones y licencias de importación

3.44. China sigue clasificando las importaciones en tres categorías: no restringidas, restringidas y prohibidas. La importación de mercancías restringidas se administra mediante licencias o contingentes de importación. El régimen de licencias no establece diferencias en cuanto al origen de los productos, salvo que se disponga otra cosa en los ACR vigentes en China.⁵⁷ Desde 2021 no se han introducido cambios en las leyes y reglamentos que rigen la administración de las licencias de importación/exportación.⁵⁸

3.1.5.1 Prohibiciones de importación

3.45. Según las leyes y reglamentos pertinentes, se aplica un régimen de licencias de importación a determinadas mercancías sujetas a restricciones a la importación.

3.46. Con arreglo a la Ley de Comercio Exterior (modificada por última vez en 2022), China puede prohibir importaciones por razones de protección de la salud o la seguridad humanas, protección de la vida o la salud animal o vegetal, protección del medio ambiente, protección de la seguridad nacional y el interés público, cumplimiento de obligaciones jurídicas establecidas en virtud de tratados o acuerdos internacionales, o aplicación de medidas relacionadas con la importación o exportación de oro o plata.⁵⁹ También se aplican prohibiciones a la importación de mercancías originarias de interlocutores comerciales específicos (cuadro A3. 2); por ejemplo, como se notificó a la OMC en agosto de 2023, China anunció la suspensión de la importación de todos los productos acuáticos, incluidos los animales acuáticos comestibles, originarios del Japón.⁶⁰ China ha notificado a la OMC sus prohibiciones de importación correspondientes al período 2020-2022 (cuadro 3.6).⁶¹ Esas prohibiciones se aplicaban a determinadas sustancias tóxicas y productos de animales

⁵⁵ Anunció N° 10, de 2023, del Ministerio de Hacienda, la Administración Estatal de Impuestos y el Ministerio de Industria y Tecnología de la Información. Consultado en: https://www.gov.cn/zhengce/zhengceku/202306/content_6887734.htm.

Fuente: Documento [G/MA/QR/N/CHN/6](#) de la OMC, de 12 de mayo de 2022; e información facilitada por las autoridades.

3.47. Las importaciones de todos los desechos sólidos, de cualquier forma, están prohibidas desde enero de 2021.⁶³ El vertido, apilamiento y eliminación de productos de desecho procedentes del extranjero en el territorio de China también está prohibido. Los productos de desecho se enumeran en el Catálogo de Desechos Sólidos Restringidos (que pueden utilizarse como materias primas) y el Catálogo de Desechos Sólidos No Restringidos, elaborados por el Ministerio de Ecología y Medio Ambiente.

3.48. En abril de 2021 se revisaron las Medidas Administrativas sobre la Inocuidad de los Alimentos Importados y Exportados. Entre otras cosas, la revisión alentaba la utilización de la tecnología y el fortalecimiento de cooperación con las organizaciones internacionales.

3.1.5.2 Prescripciones en materia de licencias de importación

3.49. El régimen de licencias de importación de China, que no ha variado desde 2020, comprende licencias automáticas y no automáticas. Para la asignación de contingentes arancelarios debe obtenerse el correspondiente certificado de contingente arancelario de importación. Además, China exige licencias de importación para determinadas sustancias de doble uso, con objeto de proteger la seguridad nacional y el interés público y cumplir lo dispuesto en los acuerdos internacionales pertinentes.⁶⁴ Las autoridades indican que, con el fin de facilitar la expedición de licencias para artículos de doble uso, China ha digitalizado todo el proceso de solicitud de dichas licencias. La mayor parte de las prescripciones en materia de licencias automáticas de importación concierne a productos incluidos en la Sección 17 del SA (material de transporte). Los productos para los que se exigen licencias no automáticas de importación son, principalmente, las sustancias que agotan la capa de ozono y algunos productos mecánicos y eléctricos usados.

3.1.5.2.1 Prescripciones en materia de licencias automáticas de importación

3.50. Las principales leyes y reglamentos que rigen las licencias no automáticas de importación siguen siendo la Ley de Comercio Exterior, el Reglamento sobre la Administración de la Importación y Exportación de Mercancías y el Reglamento sobre la Administración de la Importación y Exportación de Tecnologías, que no han variado desde 2021

3.51. Todos los años se publica un Catálogo de Mercancías sujetas al Régimen de Licencias Automáticas de Importación.⁶⁵ Como anteriormente, todos los productos incluidos en el Catálogo pueden importarse libremente; las licencias automáticas de importación se mantienen únicamente con fines de vigilancia. En 2024 había 24 categorías de productos sujetas a prescripciones en materia

⁶³ Anuncio del Ministerio de Ecología y Medio Ambiente, el MOFCOM, la NDRC y la GACC sobre Cuestiones Pertinentes relativas a la Prohibición Total de la Importación de Desechos Sólidos (Anuncio N° 53, 2020). Consultado en: https://www.mee.gov.cn/xxqk2018/xxqk/xxqk01/202011/t20201125_809835.html.

⁶⁴ Documento [G/LIC/N/3/CHN/18](#) de la OMC, de 30 de enero de 2020; y Anuncio de la GACC sobre la Publicación del Catálogo de Artículos y Tecnologías de Doble Uso sujetos a Licencias de Importación y Exportación (Anuncio N° 68, 2019). Consultado en: <http://cys.mofcom.gov.cn/article/zcgz/201912/20191202927099.shtml>.

⁶⁵ Catálogo de Mercancías sujetas al Régimen de Licencias Automáticas de Importación correspondiente al año 2024, y Anuncio Conjunto N° 62 del MOFCOM, 2023. Consultado en: <http://www.mofcom.gov.cn/article/zcfb/zcfb/202312/20231203463866.shtml>.

de licencias automáticas de importación aplicadas por el MOFCOM⁶⁶, y otras 21 categorías de productos⁶⁷ estaban sujetas a prescripciones de ese tipo aplicadas por los departamentos de comercio locales competentes a nivel provincial o las oficinas de electromecánica locales y departamentales, por autorización del MOFCOM. En el período objeto de examen se añadieron al Catálogo el tetracloroetileno, el cloruro de polivinilo (PVC) y el neopreno.

3.52. No ha habido cambios importantes en los procedimientos de solicitud de licencias automáticas de importación, ni en las condiciones para su concesión, desde el anterior examen.⁶⁸ Las licencias automáticas de importación tienen una validez de seis meses, prorrogable en ciertos casos. Las solicitudes se pueden presentar ante el MOFCOM o las instituciones autorizadas por este. La autoridad responsable de emitir las licencias debe aprobar las solicitudes con carácter inmediato (o en un plazo máximo de 10 días hábiles en circunstancias especiales). Las licencias automáticas de importación no son transferibles. Se permite a las empresas solicitar y recibir en línea las licencias de importación, y se las alienta a hacerlo por ese medio.

3.1.5.2.2 Prescripciones en materia de licencias no automáticas de importación

3.53. Los productos sujetos al régimen de licencias no automáticas se indican en el Catálogo de Mercancías sujetas al Régimen de Licencias de Importación.

3.54. En 2024 el Catálogo de Mercancías sujetas al Régimen de Licencias de Importación contenía 149 líneas arancelarias a nivel de 10 dígitos del SA que estaban sujetas al régimen de licencias no automáticas de importación (frente a 118 líneas arancelarias a nivel de 10 dígitos del SA en 2020).⁶⁹ Según las autoridades, en el período objeto de examen se han introducido en el Catálogo algunos ajustes en relación con las sustancias que agotan la capa de ozono, a consecuencia de la ratificación de la Enmienda de Kigali, así como del Plan de Ajuste Arancelario de la Comisión Arancelaria del Consejo de Estado correspondiente a 2022.⁷⁰ Como se señaló en anteriores exámenes, las importaciones sujetas a licencias no automáticas consisten principalmente en el equipo mecánico y electrónico usado y las sustancias que agotan la capa de ozono. El procedimiento para la obtención de una licencia no automática de importación no ha cambiado desde el anterior examen.

⁶⁶ Se trata de las siguientes categorías: carne de bovino; carne de porcino; carne de cordero; leche fresca; leche en polvo; yuca; cebada; sorgo; habas de soja; colza; azúcar; granos de destilería de maíz; harina de soja; tabaco; crudo; petróleo refinado; abonos; ácido diacético; estopas de fibra; máquinas para la industria del tabaco; productos de comunicaciones móviles; equipo de comunicación por satélite y de radio y televisión; productos del automóvil; aeronaves; y buques.

⁶⁷ Se trata de las siguientes categorías: pollo de engorde, aceites vegetales, mineral de hierro, concentrados de cobre, carbón, petróleo refinado, tetracloroetileno, abonos, cloruro de polivinilo (PVC), neopreno, acero, maquinaria de construcción, máquinas impresoras, maquinaria textil, equipo de fundición y elaboración de metales, máquinas herramienta para la elaboración de metales, equipo eléctrico, productos del automóvil, aeronaves, buques, y equipo médico.

⁶⁸ Para más información sobre el procedimiento de obtención de licencias automáticas de importación, véase la última notificación presentada por China en virtud del artículo 7.3 del Acuerdo sobre Procedimientos para el Trámite de Licencias de Importación (documento [G/LIC/N/3/CHN/18](#) de la OMC, de 30 de enero de 2020).

⁶⁹ Catálogo de Mercancías sujetas al Régimen de Licencias de Importación correspondiente al año 2024, y Anuncio Conjunto N° 64 del MOFCOM y la GACC, 2023. Consultado en: <http://www.mofcom.gov.cn/article/zwgk/qkzcfb/202312/20231203463753.shtml>.

⁷⁰ El 15 de septiembre de 2021 entró en vigor en China la Enmienda de Kigali. En consecuencia, el Ministerio de Ecología y Medio Ambiente, junto con el MOFCOM y la GACC, revisó y publicó el Catálogo de Importación y Exportación de Sustancias que Agotan la Capa de Ozono Controladas, al que se incorporaron los HFC. Desde el 1 de noviembre de 2021 los HFC están sujetos al control del sistema de licencias de importación y exportación. Posteriormente, en consonancia con el Aviso de la Comisión Arancelaria del Consejo de Estado sobre el Plan de Ajuste Arancelario de 2022, el MOFCOM y la GACC publicaron conjuntamente el Catálogo de Mercancías sujetas al Régimen de Licencias de Importación (2022) y el Catálogo de Mercancías sujetas al Régimen de Licencias de Exportación (2022) para ajustar la designación y el código arancelario de las partidas.

3.1.6 Medidas antidumping, compensatorias y de salvaguardia

3.1.6.1 Medidas antidumping

3.55. Desde su anterior examen China no ha introducido ningún cambio en la legislación y las normas administrativas sobre los procedimientos relacionados con las medidas antidumping.⁷¹ Las principales disposiciones relativas la realización de investigaciones antidumping y la aplicación de medidas antidumping son la Ley de Comercio Exterior, el Reglamento Antidumping⁷² y varias Normas publicadas, algunas de ellas provisionales.⁷³

3.56. Entre enero de 2021 y diciembre de 2023, China inició tres investigaciones antidumping (cuadro 3.7). Esas investigaciones concernían a los siguientes productos e interlocutores comerciales: policarbonato (Taipei Chino, noviembre de 2022); ftalocianina (India, marzo de 2022); y ácido propiónico (Estados Unidos, julio de 2023).

Cuadro 3.7 Investigaciones antidumping y medidas impuestas, enero de 2021-diciembre de 2023

	2021	2022	2023
Investigaciones iniciadas	0	2	1
Medidas provisionales	2	1	1
Medidas definitivas	2	2	1
Medidas que expiraron/terminaron	7	5	3

Fuente: Documentos de la OMC [G/ADP/N/391/CHN](#), de 28 de febrero de 2024; [G/ADP/N/384/CHN](#), de 4 de septiembre de 2023; [G/ADP/N/377/CHN](#), de 6 de marzo de 2023; [G/ADP/N/370/CHN](#), de 16 de agosto de 2022; [G/ADP/N/364/CHN/Corr.1](#), de 7 de julio de 2022; [G/ADP/N/364/CHN](#), de 1 de abril de 2022; [G/ADP/N/357/CHN/Corr.1](#), de 6 de julio de 2022; y [G/ADP/N/357/CHN](#), de 16 de septiembre de 2021.

3.57. En el período objeto de examen se puso fin a las medidas antidumping impuestas a los siguientes productos: cebada (Australia, agosto 2023); bisfenol-A (Tailandia, marzo de 2023); papel y cartón fotográficos (Reino Unido, marzo de 2023); caprolactama (Estados Unidos, Reino Unido y Unión Europea, octubre de 2022); cables de fibra óptica monomodo, de dispersión sin cambios (Reino Unido, abril de 2022); caucho cloropreno (Reino Unido, mayo de 2022); cintas (bandas) de aleación amorfa a base de hierro (Estados Unidos y Japón, noviembre de 2021); ácido tereftálico puro (República de Corea y Tailandia, agosto de 2021); acero magnético laminado plano de grano orientado (Reino Unido, julio de 2021); papel para sacos, crudo (Reino Unido, abril de 2021); y poliamidas-6 (Reino Unido, abril 2021).⁷⁴

3.58. Al final de diciembre de 2023 China aplicaba 120 medidas antidumping definitivas. Esas medidas afectaban a las importaciones procedentes de 17 países o territorios (contando a la Unión Europea como uno cuando las medidas se aplican a todos los Estados miembros de la UE). Entre todos los interlocutores comerciales afectados, las importaciones procedentes de los Estados Unidos eran las que estaban sujetas al mayor número de medidas antidumping, seguidas de las procedentes del Japón, la Unión Europea y la República de Corea, en consonancia con la tendencia observada en años anteriores (cuadro 3.8).

3.59. En período objeto de examen el MOFCOM admitió tres casos de examen administrativo de medidas comerciales correctivas (dos en 2021, ninguno en 2022 y uno en 2023); no recibió ninguna solicitud de iniciación de procedimientos contencioso-administrativos conexa. En el período

⁷¹ Se ofrece información detallada a este respecto en el documento [WT/TPR/S/415/Rev.1](#) de la OMC, de 9 de marzo de 2022.

Arabia Saudita, Reino de la	1	1	1
Sudáfrica	1	1	1
Türkiye	1	1	1
Total	125	121	120

Nota: Las cifras correspondientes al período 2021-2022 reflejan las medidas antidumping en vigor el 31 de diciembre de cada año. Los compromisos y los derechos se consideran medidas distintas.

Fuente: Documentos de la OMC [G/ADP/N/384/CHN](#), de 4 de septiembre de 2023; [G/ADP/N/377/CHN](#), de 6 de marzo de 2023; [G/ADP/N/364/CHN](#), de 1 de abril de 2022; [G/ADP/N/364/CHN/Corr.1](#), de 7 de julio de 2022; [G/ADP/N/350/CHN](#), de 9 de marzo de 2021; y [G/ADP/N/350/CHN/Corr.1](#), de 6 de julio de 2022.

3.60. Las medidas antidumping en vigor más antiguas de China conciernen al caucho cloropreno procedente de los Estados Unidos, el Japón y la Unión Europea; los cables de fibra óptica monomodo, de dispersión sin cambios, procedentes de la República de Corea y el Japón; la fécula de patata (papa) procedente de la Unión Europea; el nonilfenol procedente de la India y el Taipei Chino; el papel para condensadores electrolíticos procedente del Japón; y el bisfenol A procedente de la República de Corea, el Japón, Singapur y el Taipei Chino.

3.61. Los productos químicos siguen siendo los más afectados por las medidas vigentes al final de junio de 2023, seguidos de los metales comunes y sus manufacturas (gráfico 3.3).

Gráfico 3.3 Medidas antidumping en vigor, por productos, 31 de diciembre de 2023

Nota: "Otros productos" comprende animales vivos y productos del reino animal (dos medidas); alimentos precocinados (tres medidas) y vino (una medida).

3.1.6.2 Medidas compensatorias

3.62. Desde el anterior examen, en China no ha habido cambios en la legislación ni las normas administrativas existentes sobre medidas compensatorias y procedimientos de investigación en materia de derechos compensatorios.⁷⁵

3.63. El número de investigaciones en materia de derechos compensatorios iniciadas por China, y el número de medidas en vigor, han disminuido gradualmente en los últimos años (cuadro 3.9). No se ha iniciado ninguna nueva investigación en materia de medidas compensatorias en el período objeto de examen. Se han examinado y prorrogado las medidas relativas a los siguientes productos: fécula de patata (papa) (Unión Europea); y granos de destilería desecados, con o sin solubles (Estados Unidos). Se ha puesto fin a las siguientes medidas: fécula de patata (papa) (Reino Unido, septiembre de 2022); y cebada (Australia, agosto de 2023).

3.64. En los informes de los anteriores exámenes figura información detallada acerca de las disposiciones en materia de medidas compensatorias de los ACR concluidos por China.⁷⁶

⁷⁵ Se ofrece información detallada a este respecto en el documento [WT/TPR/S/415/Rev.1](#) de la OMC, de 9 de marzo de 2022.

⁷⁶ Documentos [WT/TPR/S/415/Rev.1](#) y [WT/TPR/S/375/Rev.1](#) de la OMC, de 9 de marzo de 2022 y 14 de septiembre de 2018, respectivamente.

Fuente: Documentos de la OMC [G/SCM/N/414/CHN](#), de 7 de febrero de 2024; [G/SCM/N/407/CHN](#), de 30 de agosto de 2023; [G/SCM/N/399/CHN](#), de 1 de marzo de 2023; [G/SCM/N/392/CHN](#), de 12 de septiembre de 2022; [G/SCM/N/386/CHN](#), de 1 de abril de 2022; [G/SCM/N/379/CHN](#), de 23 de septiembre de 2021; [G/SCM/N/371/CHN](#), de 26 de febrero de 2021; y [G/SCM/N/363/CHN](#), de 16 de octubre de 2020.

3.1.6.3 Medidas de salvaguardia

3.65. En el período objeto de examen China no ha iniciado ninguna nueva investigación en materia de salvaguardias.

3.66. Las leyes y reglamentos que rigen las medidas de salvaguardia en China no han cambiado en el período objeto de examen.⁷⁷ El MOFCOM sigue estando a cargo de investigar y determinar si se ha producido un aumento de las importaciones y si se ha causado daño.⁷⁸ El procedimiento de las investigaciones no ha variado en el período considerado. En los informes de los exámenes anteriores figura información detallada sobre las disposiciones en materia de medidas de salvaguardia de los ACR suscritos por China.⁷⁹

3.2 Medidas que afectan directamente a las exportaciones
3.2.1 Procedimientos y requisitos aduaneros

3.67. El marco general de los procedimientos de exportación, entre los que figuran el registro y la documentación, apenas ha variado durante el período objeto de examen. Los trámites de registro para las exportaciones de mercancías con fines comerciales son similares a los de las importaciones y se rigen por la misma reglamentación; la expedición de licencias/permisos para la exportación de mercancías es de competencia del MOFCOM y China ha digitalizado el procedimiento de solicitud de ese tipo de licencias (sección 3.1.1).

3.68. Como parte del procedimiento de exportación, las declaraciones de exportación deben presentarse en papel o en formato electrónico. Al igual que cuando se realizó el examen anterior, las declaraciones puede presentarlas el expedidor o una empresa especializada en declaraciones de aduana autorizada por el expedidor.

3.69. Tal como estipula la Ley de Inspección de Mercancías de Importación y Exportación, los exportadores deben cumplir los requisitos establecidos en el Catálogo de Mercancías de Importación y Exportación sujetas a Inspección Obligatoria. La Administración de Aduanas de China inspecciona la exportación de productos incluidos en el Catálogo, como los productos químicos peligrosos, los artículos para fuegos artificiales, los encendedores, los productos alimenticios y las tierras raras. Esos productos deben ser inspeccionados en su lugar de producción. El embalaje de los productos peligrosos de exportación también debe someterse a inspección. El Catálogo es objeto de modificaciones periódicas en las que se añaden o eliminan productos. En el Catálogo revisado que entró en vigor el 15 de octubre de 2021 se añadieron 29 productos, como los abonos y los productos químicos, que quedaron sujetos a inspección.⁸⁰ En el Catálogo revisado que entró en vigor el 1 de

⁷⁷ Se ofrece información detallada a este respecto en el documento [WT/TPR/S/415/Rev.1](#) de la OMC, de 9 de marzo de 2022.

⁷⁸ Si una investigación está relacionada con productos agropecuarios, la investigación y la determinación deben llevarse a cabo conjuntamente con el Ministerio de Agricultura y Asuntos Rurales.

⁷⁹ Documentos [WT/TPR/S/415/Rev.1](#) y [WT/TPR/S/375/Rev.1](#) de la OMC, de 9 de marzo de 2022 y 14 de septiembre de 2018, respectivamente.

⁸⁰ La finalidad de la inspección de los productos de importación y exportación es proteger la salud y la seguridad de las personas, proteger la vida y la salud de los animales o preservar los vegetales, proteger el medio ambiente, impedir el fraude y salvaguardar la seguridad nacional.

octubre de 2022, se suprimieron 87 productos, como los materiales metálicos no peligrosos y el equipo de procesamiento del sector de la electrónica.⁸¹

3.70. Con arreglo al sistema de gestión de riesgos, las empresas siguen clasificándose en distintos grupos en función de un análisis de riesgos. Como sucede con los procedimientos de importación, la inspección y supervisión aduaneras dependen de la calificación de la empresa (sección 3.1.1). Los productos exportados por empresas calificadas como empresas de alto riesgo y otras mercancías de riesgo elevado (en función del análisis de riesgos) son objeto de inspección, mientras que las demás exportaciones se despachan por una vía rápida o mediante un "examen de exportaciones de bajo riesgo".

3.71. Debido a la eliminación del artículo 9 de la Ley de Comercio Exterior en diciembre de 2022, como ocurre en el caso de las importaciones, las autoridades competentes ya no exigen a las empresas y particulares que solicitan licencias de exportación y otros documentos pertinentes (por ejemplo, certificados de registro de contratos de exportación de tecnología, contingentes de exportación y derechos de comercialización del Estado) presentarse ni registrarse como operadores de comercio exterior.⁸²

3.72. En cuanto a las medidas de facilitación del comercio y en materia de cumplimiento establecidas por China con miras, entre otras cosas, a contener la COVID-19, mantener las corrientes comerciales de suministros médicos y reducir al mínimo la perturbación causada por la COVID-19, desde su anterior examen, China ha publicado varios anuncios para ajustar las medidas adoptadas en respuesta a los cambios en la situación de la pandemia de COVID-19.⁸³ Las medidas de control de la exportación de equipos de pruebas de la COVID-19 y otros dispositivos médicos y otras medidas relacionadas con la COVID-19 finalizaron el 18 de agosto de 2023.⁸⁴

3.2.2 Impuestos, cargas y gravámenes

3.73. China aplica derechos de exportación de conformidad con el Reglamento sobre Derechos de Importación y Exportación. Pueden aplicarse tipos arancelarios provisionales a las mercancías de exportación durante un plazo determinado.⁸⁵

3.74. Los derechos de exportación se calculan sobre la base del valor de transacción de las exportaciones más las tasas relacionadas con el transporte y el costo del seguro. En 2023, todos los derechos de exportación eran *ad valorem*. Algunas partidas están sujetas a derechos provisionales de exportación aplicados a un tipo nulo.

⁸⁵ El Consejo de Estado constituirá la Comisión Arancelaria del Consejo de Estado para adoptar una resolución sobre las mercancías sujetas al arancel provisional, los tipos arancelarios y el plazo de aplicación. Las autoridades afirman que el principal objetivo de imponer derechos de exportación es la protección del medio ambiente nacional y la utilización eficaz y la sostenibilidad de los recursos escasos; los tipos arancelarios provisionales de exportación se ajustan según proceda sobre la base de consideraciones de desarrollo económico nacional.

3.75. En diciembre de 2022, la Comisión Arancelaria del Consejo de Estado anunció el Programa de Ajuste Arancelario para 2023.⁸⁶ El Programa contenía un aumento de los derechos de exportación de aluminio y aleaciones de aluminio para promover la transformación y modernización de la rama de producción.⁸⁷ El 1 de agosto de 2021, también se aumentaron al 40% y al 20%, respectivamente, los derechos de exportación de ferrocromo y fundición en bruto de alta pureza.⁸⁸

3.76. El 1 de enero de 2023, 102 líneas arancelarias (al nivel de 8 dígitos del SA) estaban sujetas a derechos de exportación legales, el mismo número que desde 2015, y 67 líneas arancelarias estaban sujetas a derechos provisionales, lo que supuso un descenso frente a las 75 líneas de 2021 (cuadro 3.10). El tipo más alto (del 50%) se aplica a los minerales de estaño y sus concentrados (partida 2609 del SA).⁸⁹

Cuadro 3.10 Derechos de exportación, por tipo y Capítulo del SA, 2024

3.2.3 Prohibiciones, restricciones y licencias de exportación

3.77. Al igual que en el anterior examen, China impone restricciones y prohibiciones a la exportación de determinados productos con miras, entre otras cosas, a proteger la seguridad nacional y el interés público, la salud y seguridad humanas, la vida y salud animal y vegetal y el medio ambiente; preservar los recursos naturales que escasean en el país o pueden agotarse en el futuro; mantener el sistema comercial; proteger determinadas ramas de producción y la balanza de pagos; y cumplir las obligaciones contraídas en virtud de tratados y acuerdos internacionales.⁹⁰

⁹⁰ Oficina de Información del Consejo de Estado, China's Export Controls. Consultado en: http://www.scio.gov.cn/zfbps/ndhf/2021n_2242/202207/t20220704_130729.html.

3.78. Se aplican restricciones a la exportación, con inclusión de prohibiciones y prescripciones en materia de licencias, a diversos productos, según se desprende de la notificación de China a la OMC, de 2022, sobre sus restricciones cuantitativas.⁹¹ La lista contiene productos sujetos a prohibiciones a la exportación (por ejemplo, sustancias tóxicas y productos de animales salvajes, productos químicos y contaminantes peligrosos, arena natural, desechos forestales y céspedes y ractopamina) y sujetos a licencias de exportación (por ejemplo, ganado en pie, trigo, maíz, arroz, carbón, aceite, algodón, tungsteno, tierras raras, motocicletas, sustancias que agotan la capa de ozono, sustancias y tecnologías de doble uso, etc.), algunas de las cuales incluyen contingentes de exportación. Además, varios anuncios del MOFCOM indican restricciones temporales a la exportación (con inclusión de prohibiciones) (cuadro 3.11). Según las autoridades, las licencias de exportación de productos de doble uso no restringen los contingentes ni los volúmenes de exportación.⁹²

3.79. Las autoridades indican que China tiene previsto presentar una nueva notificación antes de la reunión del OEPC que se celebrará en julio de 2024 para examinar las políticas comerciales de China.

3.80. Los productos a los que se aplican restricciones de exportación pueden estar sujetos a contingentes o licencias. Antes del 31 de octubre de cada año, el MOFCOM anuncia el contingente total de exportación de las mercancías. El contingente total más reciente se hizo público mediante el Anuncio de los Contingentes Totales de Exportación de Mercancías del MOFCOM (Anuncio N° 44, 2023).⁹³

3.81. Por lo que respecta a las prescripciones en materia de licencias, el MOFCOM publica anualmente el Catálogo de Mercancías sujetas al Régimen de Licencias de Exportación⁹⁴, en el que se enumeran las mercancías que están sujetas a la obtención de licencias de exportación. El Anuncio de 2023, cuya aplicación está prevista para 2024, contiene 43 categorías (el mismo número que desde 2020). La mayor parte del contenido de estas categorías no ha variado desde 2020, mientras que se han añadido algunos productos de las categorías de regaliz y sus productos, productos químicos, algunos materiales de grafito y sus productos, sustancias que agotan la capa de ozono, algunos vehículos aéreos no tripulados, algunos motores de aviación, algunos artículos de galio y germanio, madera aserrada y algunos automóviles. Se han añadido algunas mercancías a las categorías de fluorita (espato flúor) y titanio. Además, se ha cambiado el nombre de algunas mercancías, pero sus Códigos del SA siguen siendo los mismos.⁹⁵ El Catálogo enumera también las mercancías sujetas a contingentes de exportación, a las que también corresponde un catálogo específico.⁹⁶ En el caso de las exportaciones sujetas a contingentes, el exportador debe obtener el contingente antes de solicitar una licencia.

⁹¹ Documento [G/MA/OR/N/CHN/6](#) de la OMC, de 12 de mayo de 2022.

⁹² Las autoridades afirman que, de conformidad con la Ley de Control de las Exportaciones, los productos de doble uso son bienes, tecnologías o servicios que pueden utilizarse tanto para fines civiles como para fines militares o para otros fines que favorezcan el aumento de la capacidad militar y, en particular, el diseño, el desarrollo, la producción o la utilización de armas de destrucción masiva y sus medios de transporte. En la actualidad, los productos de doble uso sujetos a control incluyen los enumerados en el Reglamento sobre el Control de la Exportación de Productos Nucleares de Doble Uso y Tecnologías Conexas, el Reglamento sobre el Control de la Exportación de Productos Biológicos de Doble Uso y Equipo y Tecnologías Conexas, el Reglamento sobre la Vigilancia de los Productos Químicos, el Reglamento sobre el Control de las Exportaciones de Misiles y Productos y Tecnologías Conexas y las Disposiciones sobre Control de las Exportaciones de Productos Químicos. El Catálogo de Productos de Doble Uso sujetos a Licencias de Importación y Exportación reúne los productos de doble uso y otros productos sujetos a licencias de importación y exportación. También incluye los productos químicos precursores que no están sujetos a la Ley de Control de las Exportaciones, pero se importan o exportan a través de dichas licencias de importación/exportación. Todos los productos del Catálogo deben contar con la aprobación previa de las autoridades competentes para su importación o exportación.

⁹⁴ Anuncios Conjuntos del MOFCOM y la GACC N° 50, 2021; N° 40, 2022; y N° 65, 2023. Consultados en: <http://www.mofcom.gov.cn/article/zcfb/zcdwmy/202112/20211203233746.shtml>, <http://www.mofcom.gov.cn/article/zcfb/zcblqg/202212/20221203376706.shtml>, y <http://www.mofcom.gov.cn/article/zcfb/zcblqg/202312/20231203463828.shtml>.

⁹⁵ Los productos químicos, algunos materiales y productos de grafito, algunos drones y algunos materiales de galio y germanio mencionados en ese Catálogo también se han incluido en el Catálogo para la Administración de Licencias de Importación y Exportación de Productos y Tecnologías de Doble Uso (2024).

⁹⁶ Los contingentes de exportación para 2024 se detallan en el Anuncio N° 44 del MOFCOM, 2023. Consultado en: <http://www.mofcom.gov.cn/article/zcfb/zczxzc/202310/20231003449868.shtml>.

3.82. China aplica un sistema de gestión de licencias para la exportación de determinados productos de doble uso. Durante el período objeto de examen, China impuso un control de las exportaciones de productos relacionados con el perclorato de potasio, los cañones de agua a alta presión, el galio y el germanio y los productos relacionados con drones, y realizó ajustes a las medidas temporales de control aplicables a la exportación de grafito (las autoridades señalan que se trata de prácticas aceptadas a nivel mundial). Las autoridades afirman que estas medidas adoptan un enfoque coordinado de desarrollo y seguridad, tienen en cuenta la necesidad de respetar las obligaciones internacionales, como la no proliferación, y salvaguardan la seguridad y los intereses nacionales. De conformidad con las Disposiciones sobre Administración de Licencias de Importación y Exportación de Productos y Tecnologías de Doble Uso, al final de cada año, el MOFCOM actualizará el Catálogo para la Administración de Licencias de Importación y Exportación de Productos y Tecnologías de Doble Uso, en colaboración con la GACC. Entre los productos sujetos a la administración de licencias de importación y exportación de productos y tecnologías de doble uso incluidos en el Catálogo figuran los productos químicos, misiles, productos nucleares, determinados productos de contraseñas comerciales y productos informáticos. Además, el control de las exportaciones se aplica también a los productos militares y los productos relacionados con la energía nuclear. En diciembre de 2022 se publicó el Catálogo para la Administración de Licencias de Importación y Exportación de Productos y Tecnologías de Doble Uso de 2023, por el que se revisa el Catálogo de 2021.⁹⁷ El Catálogo sobre licencias de exportación contiene 11 tipos de productos, entre otros, productos químicos, misiles, productos nucleares y productos criptográficos.

3.83. Las autoridades afirman que, con miras a promover la facilitación del comercio internacional de semillas agrícolas, a partir del 1 de julio de 2021 se suprimió el requisito de examen a nivel provincial para la importación y exportación de dichas semillas, que ahora aprueba directamente el Ministerio de Agricultura y Asuntos Rurales.

Cuadro 3.11 Productos sujetos a contingentes y licencias de exportación (con inclusión del sistema de gestión de licencias de exportación de productos de doble uso), marzo de 2024

Productos	Observaciones
Productos sujetos a contingentes y licencias de exportación Trigo; maíz; arroz; algodón; carbón; hierbas de efedra para uso medicinal (cultivadas); madera aserrada; pollos vivos (destinados a la exportación a Hong Kong, China); animales vivos de las especies bovina y porcina (destinados a la exportación a Hong Kong, China y Macao, China); petróleo crudo y petróleo refinado (excepto aceite lubricante, grasa, aceite de base lubricante, juncos y sus productos, gránulos medicinales y sus productos); regaliz y sus productos; harina de trigo; harina de maíz; harina de arroz; juncos de estera y sus productos.	
Productos sujetos a licencia Animales vivos de las especies bovina y porcina (destinados a la exportación a mercados distintos de Hong Kong, China y Macao, China); pollos vivos (destinados a la exportación a mercados distintos de Hong Kong, China); carne de bovino, de porcino y de pollo; arena natural (incluida la arena normal); bauxita; fosfato mineral; magnesita; talco en bloques (en polvo); fluorita (espato flúor); tierras raras; estaño y sus productos; tungsteno y sus productos; molibdeno y sus productos; antimonio y sus productos; coque; petróleo refinado (aceite lubricante, grasa y aceite de base lubricante); parafina; metaloides y sus productos; sulfato de disodio; carburo de silicio; sustancias que agotan la capa de ozono; ácido cítrico; plata; platino u oro blanco (exportado en el marco del tráfico de perfeccionamiento); indio y sus productos; motocicletas (incluidas las todoterreno) y motores y cuadros de motocicletas; y automóviles (incluidos los juegos completos de piezas) y chasis de automóviles.	
i) Materiales de grafito artificial de alta pureza (pureza > 99,9%), alta resistencia (resistencia a flexión > 30 MPa) y alta densidad (densidad > 1,73 g/centímetro cúbico) y sus productos (partidas 3801100030, 3801909010 y 6815190020 del SA) ii) Grafito natural en escamas y sus productos (incluidos el grafito esferoidizado, el grafito dilatado, etc.) (partidas 2504101000, 2504109100, 3801901000, 3801909010, 3824999940 y 6815190020 del SA)	Exportaciones prohibidas si no se obtiene un permiso (a partir del 1 de diciembre de 2023)

⁹⁷ MOFCOM. Consultado en: <http://www.mofcom.gov.cn/article/zcfb/zcdwmy/202212/20221203376668.shtml>.

Productos	Observaciones
Vehículos aéreos no tripulados cuyos indicadores de rendimiento no hayan alcanzado los indicadores de control existentes pero hayan alcanzado algunos otros indicadores (partidas 8806100010, 8806221011, 8806229010, 8806231011, 8806239010, 8806241011, 8806249010, 8806291011, 8806299010, 8806921011, 8806929010, 8806931011, 8806939010, 8806941011, 8806949010 y 8806990010 del SA)	Exportaciones prohibidas si no se obtiene un permiso (a partir del 1 de septiembre de 2023)
i) Motores de aviación con una potencia continua de más de 16 kilovatios (kW) especialmente utilizados para vehículos o aeronaves no tripulados específicos (partidas 8501200010, 8501320010, 8501330010, 8501340010, 8501400010, 8501520010, 8501530010, 8407101010, 8407102010, 8408909230, 8408909320, 8411111010, 8411119010, 8411121010, 8411129020, 8411210010, 8411221010, 8411222010, 8411223010 y 8411810002 del SA)	Exportaciones prohibidas si no se obtiene un permiso (a partir del 1 de septiembre de 2023)
ii) Cargas útiles que satisfacen determinadas especificaciones técnicas y se utilizan específicamente para vehículos aéreos o aeronaves no tripulados específicos, con inclusión de equipos de diagnóstico de visualización infrarroja, radares de apertura sintética y láseres para la indicación de blancos	
i) Artículos de galio Galio metálico (elemento) (partidas 8112929010, 8112929090 y 8112999000 del SA); nitruro de galio (incluidos, aunque no exclusivamente, sus obleas, polvos, desechos, etc.) (partidas 2850001901, 3818009001 y 3825690001 del SA); óxido de galio (incluidos, aunque no exclusivamente, el policristalino y monocristalino y sus obleas, obleas epitaxiales, polvos, desechos, etc.) (partidas 2825909001, 3818009002 y 3825690002 del SA); fosfuro de galio (incluidos, aunque no exclusivamente, el policristalino y monocristalino y sus obleas, obleas epitaxiales, etc.) (partidas 2853904030, 3818009003 y 3825690003 del SA); arsenio de galio (incluidos, aunque no exclusivamente, el policristalino y monocristalino y sus obleas, obleas epitaxiales, polvos, desechos, etc.) (partidas 2853909026, 3818009004 y 3825690004 del SA); arsienuro de indio y galio (partidas 2853909028, 3818009005 y 3825690005 del SA); seleniuro de galio (incluidos, aunque no exclusivamente, el policristalino y monocristalino y sus obleas, obleas epitaxiales, polvos, desechos, etc.) (partidas 2842909024, 3818009006 y 3825690006 del SA); antimoniuro de galio (incluidos, aunque no exclusivamente, el policristalino y monocristalino y sus obleas, obleas epitaxiales, polvos, desechos, etc.) (partidas 2853909029, 3818009007 y 3825690007 del SA)	Exportaciones prohibidas si no se obtiene un permiso (a partir del 1 de agosto de 2023)
ii) Artículos de germanio Germanio metálico (elemento) (incluidos, aunque no exclusivamente, sus cristales, polvos, desechos, etc.) (partidas 8112921010, 8112921090 y 8112991000 del SA); lingotes de germanio de fusión por zona (partida 8112921090 del SA); fósforo, germanio y cinc (incluidos, aunque no exclusivamente, sus cristales, polvos, desechos, etc.) (partidas 2853904040, 3818009008 y 3825690008 del SA); sustrato de germanio para crecimiento epitaxial (partida 8112921090 del SA); dióxido de germanio (partidas 2825600002, 3818009009 y 3825690009 del SA); tetracloruro de germanio (partidas 2827399001, 3818009010 y 3825690010 del SA).	

Fuente: Anuncio N° 65 del MOFCOM y la GACC, 2003. Consultado en: <http://www.mofcom.gov.cn/article/zcfb/zcblgg/202312/20231203463828.shtml>; Anuncio N° 44 del MOFCOM, 2023. Consultado en: <http://www.mofcom.gov.cn/article/zcfb/zcblgg/202307/20230703424598.shtml>; y Anuncio N° 23 del MOFCOM, 2023. Consultado en: <http://www.mofcom.gov.cn/article/zcfb/zcblgg/202307/20230703419666.shtml>.

3.84. Además, para "mantener el sistema de comercio exterior", las declaraciones de exportación de algunos productos siguen sujetas a licencias de exportación. Actualmente, según las autoridades, la restricción relativa a los puertos de despacho de aduana es aplicable principalmente en relación con las solicitudes de contingentes de exportación de hierbas de efedra cultivada utilizadas con fines medicinales.⁹⁸ El despacho de las exportaciones del producto debe realizarse en la aduana de Tianjin.

⁹⁸ Anuncio N° 88 del MOFCOM, 2018. Consultado en: <http://www.mofcom.gov.cn/article/b/c/201811/20181102804274.shtml>. Se suspende la gestión de puertos

3.85. En 2021, las exportaciones sujetas a licencias de exportación y contingentes de exportación representaron alrededor del 2,7% del valor de las exportaciones totales de China.⁹⁹ En 2022, representaron alrededor del 3,5% de las exportaciones totales y, en 2023, alrededor del 4,1%.

3.86. Los exportadores deben solicitar una "licencia de exportación de productos sujetos a control" a la autoridad competente para exportar cualquier producto que figure en una lista de control o esté sujeto a controles temporales. De conformidad con el artículo 13 de la Ley de Control de las Exportaciones, la aprobación o desaprobación de las exportaciones se basa en si ponen en peligro la seguridad y los intereses nacionales; pueden utilizarse para el diseño, el desarrollo, la producción o el uso de armas de destrucción masiva y sus vectores; o pueden utilizarse con fines terroristas.¹⁰⁰

3.87. El MOFCOM y el Ministerio de Ciencia y Tecnología (MOST) modificaron el Catálogo de Tecnologías sujetas a Restricciones o Prohibiciones de Exportación en diciembre de 2023.¹⁰¹ Se prohíben las exportaciones de una tecnología, mediante transferencia o concesión de licencias, si esa tecnología se clasifica como prohibida en el Catálogo. En el caso de la transferencia de cualquier tecnología sujeta a restricciones de exportación en el Catálogo, se requiere la aprobación de una autoridad de comercio competente a nivel provincial antes de entablar cualquier negociación sustancial de transferencia con homólogos extranjeros, y también se exigirá una licencia de exportación expedida por la misma autoridad al completar el acuerdo de transferencia de tecnología.

3.88. Según las autoridades, China está redactando el Reglamento sobre el Control de la Exportación de Productos de Doble Uso.

3.2.4 Apoyo y promoción de las exportaciones

3.89. En septiembre de 2022, el MOFCOM publicó el Aviso sobre Diversas Políticas y Medidas para Apoyar el Desarrollo Estable del Comercio Exterior", que contempla el apoyo a la participación en exposiciones relacionadas con las exportaciones, la mejora de las zonas de demostración de la innovación y las zonas experimentales integrales de comercio electrónico transfronterizo, y la mejora de la eficiencia de la recogida, la distribución y el transporte en los puertos.¹⁰²

3.90. La notificación más reciente de China a la OMC relativa a las subvenciones a la exportación se presentó en 2023; China indicó que en 2020, 2021 y 2022 no se concedieron subvenciones a la exportación de productos agropecuarios.¹⁰³

3.91. Los exportadores tienen derecho a desgravaciones del IVA. Salvo en el caso de productos como determinadas especies animales y vegetales amenazadas y determinados productos que consumen gran cantidad de energía o emiten contaminantes sustanciales, que no pueden beneficiarse de desgravaciones fiscales a la exportación, el reintegro de los productos que sí pueden

designados para la exportación de productos como magnesita, tierras raras y antimonio y sus productos; ya no hay puertos de despacho de aduana designados para las exportaciones de estos productos. Anuncio N° 40 del MOFCOM, 2023. Consultado en:

<http://www.mofcom.gov.cn/article/zcfb/zcblgg/202212/20221203376706.shtml>.

⁹⁹ Datos facilitados por las autoridades.

¹⁰⁰ En el caso de las mercancías, tecnologías, y servicios distintos de los enumerados en la lista de control de las exportaciones y en la lista de productos sujetos a control temporal, el exportador deberá solicitar a las autoridades nacionales de control de las exportaciones una licencia de exportación, si tiene o debiera tener constancia de que las mercancías, tecnologías y servicios pertinentes pueden poner en peligro la seguridad y los intereses nacionales, o pueden utilizarse para el diseño, el desarrollo, la producción o el uso de armas de destrucción masiva y sus vectores, o pueden utilizarse para el terrorismo, o si ha recibido de las autoridades nacionales de control de las exportaciones una notificación a tal efecto. MOFCOM. Consultado en: <http://www.mofcom.gov.cn/article/zwgk/zcfb/202010/20201003008925.shtml>.

¹⁰¹ MOFCOM y MOST, Catálogo de 2023, Notificación N° 57/2020, 21 de diciembre de 2023. Consultado en: <http://www.mofcom.gov.cn/article/zcfb/zcqxw/202312/20231203462079.shtml>.

Las autoridades afirman que, de conformidad con el Reglamento sobre la Administración de la Importación y Exportación de Tecnología, en los últimos años, el MOFCOM y el MOST han venido revisando activamente el Catálogo para adaptarse a la evolución de la ciencia y la tecnología y la necesidad de promover los intercambios científicos y tecnológicos internacionales y la cooperación en consonancia con las prácticas internacionales comunes.

¹⁰² Anuncio N° 152 del Departamento de Comercio Exterior del MOFCOM, 2022.

Consultado en: <http://www.mofcom.gov.cn/article/zcfb/zcdwmy/202209/20220903351830.shtml>.

¹⁰³ Documentos [G/AG/N/CHN/58](#), [G/AG/N/CHN/59](#) y [G/AG/N/CHN/68](#) de la OMC, de 16 de noviembre de 2022, 16 de noviembre de 2022 y 20 de septiembre de 2023, respectivamente.

beneficiarse de desgravaciones fiscales a la exportación se realiza sobre la base del tipo impositivo aplicable. El MOF y la Administración Estatal de Impuestos administran el régimen de desgravación del IVA. Durante el período objeto de examen, las tasas de desgravación del IVA sobre las exportaciones fueron objeto de ajustes mediante el Aviso N° 16 de 2021 y el Aviso N° 25 de 2021 del MOF y la Administración Estatal de Impuestos, por los que se eliminó la desgravación del IVA para la exportación de productos de hierro y acero. Según las autoridades, actualmente las tasas vigentes de desgravación fiscal a la exportación ascienden al 13%, el 9%, el 6% y el 0%.¹⁰⁴ Con el fin de ayudar a las empresas de comercio exterior a reducir su presión financiera y promover el desarrollo constante del comercio exterior, en la reunión ejecutiva del Consejo de Estado celebrada el 13 de abril de 2022 se decidió reforzar el apoyo a las políticas de desgravación fiscal a la exportación. A fin de llevar a la práctica la decisión, 10 departamentos del Consejo de Estado publicaron conjuntamente un Aviso sobre el Aumento del Apoyo a la Desgravación Fiscal a la Exportación para Promover el Desarrollo Constante del Comercio Exterior el 20 de abril de 2022.¹⁰⁵ En abril de 2022, la Administración Estatal de Impuestos publicó el Aviso sobre el Fortalecimiento del Apoyo al Reintegro Fiscal Aplicable a las Exportaciones y la Promoción del Desarrollo Estable del Comercio Exterior (Anuncio N° 36 de la Administración Estatal de Impuestos, 2022). El Anuncio tiene por objeto hacer más práctica la tramitación del reintegro fiscal aplicable a las exportaciones en vez de insistir más en ello a nivel de políticas.

3.92. Aparte de su función primordial como terreno de prueba para las reformas de política, las zonas francas experimentales han atraído a empresas exportadoras. Actualmente hay 22 zonas francas experimentales: una más que en 2021, aprobada el 31 de octubre de 2023.¹⁰⁶ En 2022, las 21 zonas francas experimentales utilizaron CNY 222.500 millones de capital extranjero, lo que representaba el 18% del total de la inversión extranjera en el país.¹⁰⁷ Entre los beneficios disponibles para las empresas que operan en zonas francas experimentales figuran un tipo reducido del impuesto sobre la renta de las sociedades del 15% que se aplicará durante cinco años desde su constitución y trámites aduaneros simplificados para las importaciones y exportaciones en esas zonas de las empresas que se dediquen a productos o tecnologías esenciales en esferas clave como los circuitos integrados, la inteligencia artificial, la biomedicina y la aviación civil, y que a su vez realicen actividades sustanciales de producción, investigación o desarrollo en la zona franca experimental de la Zona Especial Lin-Gang de China (Shanghái).

3.93. Desde 2021, se han adoptado diversas medidas con miras a utilizar las zonas francas experimentales como plataforma experimental amplia para la reforma y la liberalización del comercio. El 3 de septiembre de 2021 se publicó el Aviso sobre Diversas Medidas para Promover la Reforma y la Innovación del Comercio y la Facilitación de las Inversiones en las Zonas Francas Experimentales con el objetivo de adoptar 19 medidas de reforma e innovación y otorgar mayor autonomía a las zonas francas experimentales en lo que respecta a la facilitación del comercio y las inversiones.¹⁰⁸ Entre otras medidas figuran las Orientaciones para Reforzar la Protección Ambiental Ecológica y Promover un Desarrollo de Alta Calidad en las Zonas Francas Experimentales (publicadas el 28 de mayo de 2021).¹⁰⁹ Además, a fin de mejorar continuamente el nivel de apertura de las zonas francas experimentales, se publicaron las Medidas Administrativas Especiales relativas al Acceso a la Inversión Extranjera en las Zonas Francas Experimentales (Lista Negativa) (edición de 2021), que tenían menos categorías de actividades que antes.¹¹⁰ China también publicó en julio

¹⁰⁴ Se pueden consultar las tasas más recientes de desgravaciones fiscales a la exportación en el módulo "consulta de tasas de desgravación fiscal a la exportación" de la Plataforma Nacional de Servicios Gubernamentales. ¹¹⁰ Government of China, Anuncio N° 48 de la NDRC y el MOFCOM, 2021. Consultado en:

de 2021 la primera lista negativa en la esfera del comercio transfronterizo de servicios: Medidas Administrativas Especiales relativas al Comercio Transfronterizo de Servicios en el Puerto Franco de Hainan (Lista Negativa) (edición de 2021). Las autoridades han indicado que los proveedores de servicios nacionales y extranjeros no incluidos en la lista negativa recibirán el mismo trato y tendrán el mismo acceso al comercio transfronterizo de servicios. En junio de 2023 se publicó el Aviso sobre Diversas Medidas para la Armonización con las Normas Internacionales de Alto Nivel y la Promoción de la Apertura Institucional en las Zonas Francas Experimentales Calificadas y el Puerto Franco de Hainan, destinado a: i) promover la innovación y el desarrollo del comercio de mercancías; ii) promover el comercio de servicios; iii) facilitar la entrada temporal de personas de negocios; iv) promover el desarrollo del comercio digital; v) aumentar los esfuerzos para optimizar el entorno empresarial; y vi) mejorar el sistema de prevención y control de riesgos.¹¹¹ En diciembre de 2023, China publicó el Plan General para la Promoción de la Apertura Institucional de la Zona Franca Experimental (Shanghái) de China en consonancia con las Normas Económicas y Comerciales Internacionales de Alto Nivel.¹¹²

3.94. En 2022, el valor total del comercio exterior vinculado a las zonas francas experimentales ascendió a CNY 7,5 billones (CNY 4,7 billones en 2020).¹¹³ En 2023, el volumen total de importaciones y exportaciones en las 22 zonas francas experimentales alcanzó los CNY 7,67 billones (con un incremento interanual del 2,7%), lo que representó el 18,4% del comercio total del país.

3.95. En el marco de los programas de apoyo a la exportación, la Oficina de Desarrollo Comercial (TDB) del MOFCOM organiza exposiciones en mercados emergentes y actividades de formación orientadas a la exportación.¹¹⁴ También mantiene el sitio web China Trade Promotion para la promoción del comercio chino y ofrece información general sobre los mercados extranjeros a través de diversas plataformas de servicios. El Servicio para Empresas Chinas de Reclamaciones relativas a Operaciones Comerciales en el Extranjero, creado como ventanilla del MOFCOM en 2006, sigue prestando a los gobiernos locales y a las empresas chinas, entre otros, servicios de tramitación de reclamaciones, información sobre políticas, asesoría, creación de bases de talentos, apoyo a las empresas emergentes y orientación para llevar a cabo actividades comerciales en el extranjero.

3.96. Las autoridades han indicado que, durante el período objeto de examen, se realizaron varias actividades de promoción de las exportaciones y de asistencia a la exportación en el extranjero. Debido a la pandemia, en 2021 y 2022 el Consejo Chino para el Fomento del Comercio Internacional (CCPIT) organizó exposiciones relacionadas con el comercio principalmente en línea. Desde 2021, el CCPIT ha organizado foros de alto nivel, como la Mesa Redonda sobre Derecho Mercantil con ocasión del 70º aniversario del CCPIT. La plataforma de servicios jurídicos en materia de comercio e inversión transfronterizos desarrollada por el CCPIT ha ofrecido servicios de consultoría en más de 315.000 ocasiones desde diciembre de 2020, cuando se puso en marcha el servicio.

3.97. En octubre de 2023, el CCPIT había establecido 393 mecanismos de cooperación industrial y comercial a nivel bilateral y multilateral con homólogos y organizaciones internacionales conexas en más de 152 países y regiones. Desde 2021, el CCPIT ha colaborado con más de 100 interlocutores comerciales en la organización de actividades económicas y comerciales bilaterales y multilaterales, como la Cumbre Empresarial y de Inversiones China-ASEAN, la Cumbre Empresarial China-América Latina, la Conferencia Empresarial y el Seminario sobre Inversiones del Foro de Cooperación entre China y los Estados Árabes, y el Foro Empresarial del grupo BRICS.

<https://www.ccpit.org/a/20230206/2023020668y6.html>.

¹¹⁴ La TDB, establecida en 2003, es una organización centrada en la aplicación de políticas y la promoción del comercio exterior que depende directamente del MOFCOM. Presta servicios públicos para promover los intercambios y la cooperación entre empresas chinas y extranjeras organizando actividades económicas y comerciales, exposiciones a nivel nacional e internacional y sesiones de formación empresarial.

3.2.5 Financiación, seguro y garantías de las exportaciones

3.98. La financiación¹¹⁵, el seguro y las garantías de las exportaciones siguen corriendo a cargo de varias instituciones financieras con el mandato de promover el comercio exterior y las inversiones transfronterizas. Estas incluyen el Banco de Exportación e Importación de China (Banco EXIM), que financia las exportaciones, y la Corporación de Seguros de Crédito y Exportación de China (SINOSURE), de propiedad estatal, que ofrece seguros de crédito a la exportación y garantías conexas. Las empresas de propiedad extranjera también pueden acceder a los servicios del Banco EXIM y SINOSURE. China no participa en el Acuerdo de la OCDE en materia de Créditos a la Exportación con Apoyo Oficial. Las autoridades han indicado que China siempre ha participado activamente en las consultas del Grupo de Trabajo Internacional sobre Créditos a la Exportación, incluido su grupo de trabajo técnico.

3.99. Durante el período objeto de examen no hubo ningún cambio importante en la situación del Banco EXIM, que ofrece principalmente financiación en el extranjero mediante diversas actividades como los créditos a la exportación, ni en sus objetivos y mandatos como banco de propiedad estatal. En 2022, el Banco EXIM realizó operaciones por valor de CNY 1.418,6 millones en concepto de liquidación internacional (CNY 843.600 millones), garantía (CNY 88.800 millones) y financiación del comercio (CNY 486.200 millones); a finales de 2022, el saldo pendiente de los préstamos al comercio exterior del Banco registró un aumento interanual del 20%.¹¹⁶ El Banco EXIM proporciona préstamos en apoyo de la Iniciativa "Cinturón y Ruta" (BRI). A finales de 2022, el saldo de los préstamos en apoyo a la BRI ascendía a CNY 2,2 billones, con una cobertura de más de 130 países.

3.100. Las autoridades afirman que, desde el examen anterior, no ha habido ningún cambio de política en relación con los seguros de crédito a la exportación proporcionados por SINOSURE. En 2022, la cuantía total de los seguros de crédito a la exportación fue de USD 753.000 millones, gran parte de los cuales eran seguros de crédito a la exportación a corto plazo. Según la información facilitada por las autoridades, en 2021 y 2022 los seguros de crédito a la exportación de SINOSURE representaron alrededor del 20,3% y el 21,0%, respectivamente, de las exportaciones totales.

3.3 Medidas que afectan a la producción y al comercio

3.3.1 Incentivos

3.101. Durante el período objeto de examen, China siguió ofreciendo apoyo financiero (con inclusión de incentivos y subvenciones) a nivel del Gobierno central y de los Gobiernos locales, en diversas formas, y a diferentes sectores y ramas de producción, centrándose principalmente en la industria, la ciencia y la tecnología.

3.102. Las políticas e industrias identificadas como esferas de apoyo prioritarias se describen en las Líneas Generales del 14º Plan Quinquenal del Gobierno Central (2021-2025) para el Desarrollo Económico y Social Nacional y los Objetivos a Largo Plazo hasta 2035.¹¹⁷ En el Plan Quinquenal, que persigue a largo plazo el objetivo del "socialismo moderno", se pone de relieve el desarrollo impulsado por la innovación, incluida la digitalización, el desarrollo agrícola y rural, la mejora de las empresas de propiedad estatal (así como de las empresas privadas y las empresas con inversión extranjera), el desarrollo verde, el bienestar de la población y la seguridad económica.¹¹⁸ También se destaca el papel de la economía digital y se incluye la nueva estrategia gubernamental de "doble

¹¹⁵ Las autoridades señalan que esto se refiere únicamente al crédito oficial a la exportación.

¹¹⁶ China Eximbank, *2022 Annual Report*. Consultado en: http://www.eximbank.gov.cn/aboutExim/annals/2021_877/202306/U020230609413828602225.pdf.

circulación".¹¹⁹ El Plan Quinquenal hace hincapié en el apoyo financiero a la ciencia y la tecnología, las empresas de alta tecnología, las patentes y la agricultura.¹²⁰

3.103. Durante el período objeto de examen, China presentó dos notificaciones sobre subvenciones a la OMC. La notificación presentada en agosto de 2021 abarca las subvenciones otorgadas en 2019 y 2020, y la presentada en julio de 2023, las otorgadas en 2021 y 2022.¹²¹ La notificación de 2021 contiene 71 programas a nivel del Gobierno central que se refieren a 53 políticas fiscales preferenciales y 18 asignaciones financieras, y 374 asignaciones financieras proporcionadas por 36 Gobiernos subcentrales. En la notificación de 2023 se informa sobre 69 programas a nivel del Gobierno central que se refieren a 54 políticas fiscales preferenciales y 15 asignaciones financieras. Treinta y seis Gobiernos subcentrales proporcionan 385 asignaciones financieras.

3.104. Los objetivos de las medidas notificadas varían e incluyen la promoción de las industrias de vanguardia y tradicionales, el apoyo a las pymes, la ayuda al desarrollo en las zonas rurales, la atracción de IED, la protección del medio ambiente y la ayuda a las personas con discapacidad. Las subvenciones a los niveles tanto central como subcentral del Gobierno se otorgan en forma de trato fiscal preferencial, donaciones, asignaciones financieras y fondos para objetivos específicos. Concretamente, muchos de los programas notificados tratan de los incentivos financieros para promover la tecnología y la innovación y apoyar la agricultura.

3.105. La principal subvención notificada es un fondo para el desarrollo de la producción agrícola cuyo monto asciende a CNY 232.483 millones. A nivel subcentral, los fondos fiscales para el alivio de la pobreza y la revitalización del medio rural en diversas provincias son los más importantes. En las notificaciones figuran datos sobre las cuantías de casi todas las asignaciones financieras a nivel del Gobierno central. Sin embargo, no se dispone de las cuantías relativas a las asignaciones financieras a nivel subcentral en relación con 54 de 374 programas en las notificaciones de 2021, y 37 de 385 programas en la notificación de 2023; las autoridades afirman que esto se debe a dificultades estadísticas. Las notificaciones no facilitan datos sobre la cuantía de las subvenciones para las políticas fiscales preferenciales, lo que, según las autoridades, se debe a dificultades estadísticas.

3.106. Durante el período objeto de examen, China siguió ofreciendo apoyo financiero a su sector agropecuario (sección 4.1.1.4.3). Las notificaciones de subvenciones correspondientes a 2021 y 2023 presentadas por China contienen además información sobre diversos programas destinados al sector agropecuario. China notificó sus medidas de ayuda interna en diciembre de 2022.¹²² En el sector de la pesca, en 2021 se notificaron ocho programas a nivel del Gobierno central, y en 2023 se notificaron tres programas.¹²³

3.107. En respuesta a la notificación de subvenciones de China correspondiente a 2021, los Miembros presentaron varias comunicaciones (incluidas preguntas).¹²⁴ En esas comunicaciones se piden aclaraciones sobre los fondos gubernamentales de orientación de China, los bancos de propiedad estatal, las subvenciones no notificadas, los fondos para resolver el exceso de capacidad y los criterios de admisibilidad. En sus respuestas, China facilitó más detalles sobre las subvenciones notificadas; en las respuestas no se facilitaba información sobre los fondos gubernamentales de

¹¹⁹ La "doble circulación" es una estrategia gubernamental que se refiere a una pauta de desarrollo que da prioridad al "consumo interno y se mantiene abierta al comercio internacional y a las inversiones". ¹²¹ Documentos de la OMC [G/SCM/N/372/CHN](#), de 27 de agosto de 2021; y [G/SCM/N/401/CHN](#), de 20 de julio de 2023.

¹²² Documentos [G/AG/N/CHN/63-67](#) de la OMC, de 14 de diciembre de 2022.

¹²³ Documentos de la OMC [G/SCM/N/372/CHN](#), de 27 de agosto de 2021; y [G/SCM/N/401/CHN](#), de 20 de julio de 2023.

¹²⁴ Documentos de la OMC [G/SCM/Q2/CHN/105](#), 106, 107, 110, 113, 114, 119, 120, 27 de enero de 2022, 24 de enero de 2023.

orientación, los bancos de propiedad estatal, o la cuantía de los gastos no notificados.¹²⁵ En respuesta a la notificación de subvenciones de China correspondiente a 2023, otros Miembros presentaron varias comunicaciones (incluidas preguntas).¹²⁶

3.108. De manera general, las dos notificaciones presentadas a la OMC durante el período examinado y las respuestas dadas por China no han permitido a la Secretaría tener una visión clara de los programas de ayuda de China. Por ejemplo, las notificaciones no facilitan información sobre los niveles de gasto en sectores en los que es probable que el apoyo gubernamental tenga repercusiones a nivel mundial, como el aluminio, los vehículos eléctricos, los módulos solares, el vidrio, la construcción naval, los semiconductores o el acero. El material informativo puesto a disposición de la Secretaría para este examen solo proporciona información limitada más allá de las dos notificaciones sobre subvenciones de China.

3.109. La información disponible en bases de datos comerciales indica grandes cantidades de ayudas públicas a las empresas de sectores económicos clave. Dos bases de datos, Wind y CSMAR, recopilan información sobre la base de los balances anuales de empresas que cotizan en las tres principales bolsas de valores chinas. Los datos sobre las ayudas indicados en esas bases de datos excluyen los incentivos fiscales, pero incluyen donaciones y activos no monetarios que se otorgan gratuitamente. Las cifras también excluyen la ayuda pagada a las empresas que no cotizan en bolsa. Según la base de datos Wind¹²⁷, la ayuda pública total de China ascendió a más de CNY 250.000 millones en 2022 (cuadro 3.12). Según la base de datos CSMAR¹²⁸, la ayuda total ascendió a más de CNY 245.000 millones en 2022, con una fuerte concentración en el sector manufacturero (cuadro 3.13). Ambas bases de datos reflejan un aumento sustancial de la ayuda desde 2018.

3.110. Hay fondos de inversión que incluyen fondos gubernamentales de inversión (o fondos gubernamentales de orientación); estos comprenden fondos de inversión público-privada que persiguen el doble objetivo de reportar beneficios financieros y promover los objetivos de la política industrial del Gobierno, utilizando recursos públicos para efectuar inversiones de capital en sectores que el Gobierno considera importantes.¹²⁹ Existen 37 fondos gubernamentales de inversión a nivel nacional y, según las estimaciones, 2.100 a nivel subnacional. En el cuadro 3.14 y el cuadro 3.15 se ofrece un panorama general de los principales fondos gubernamentales de inversión a nivel central y subcentral. La mayoría de los fondos a nivel del Gobierno central suelen tener una dotación superior a CNY 10.000 millones. No se han facilitado cifras oficiales. Como ya se ha indicado, por lo general los incentivos proporcionados por esos fondos no se han notificado a la OMC; las autoridades afirman que esos fondos operan con arreglo a los principios del mercado.

Cuadro 3.14 Principales fondos nacionales de inversión en China (incluidos los fondos gubernamentales de inversión/orientación)

Nombre	Año de creación	Dotación inicial (miles de millones de CNY) ^a	Incentivos de política

3.111. A falta de información oficial, existen diferentes estimaciones sobre la dotación acumulativa de todos los fondos gubernamentales de inversión/orientación, que oscilan entre CNY 1,89 billones¹³⁰ y CNY 6,51 billones.¹³¹ Los fondos centrales gubernamentales de inversión/orientación han sido patrocinados por autoridades como el MST, la Comisión de Supervisión y Administración de Activos Estatales (SASAC), el MIIT y la Comisión Nacional de Desarrollo y Reforma (NDRC), con diferentes prioridades en materia de inversión y objetivos de política. En el cuadro 3.16 se enumeran los documentos de política que rigen su gestión de estos fondos.

Cuadro 3.16 Documentos de política sobre la gestión de los Fondos Gubernamentales de Inversión/Orientación

Año	Documento del Gobierno	Ministerio	Observaciones
2008	Orientaciones sobre el Establecimiento y el Funcionamiento Normalizados de los Fondos de Orientación para el Capital de Riesgo ^a	NDRC, MOF, MOFCOM	Guo Ban Fa N° 116 [2008].
2015	Medidas Provisionales para la Administración de los Fondos Gubernamentales de Inversión ^b	MOF	Cai Yu N° 210 [2015].
2016	Medidas Provisionales para la Administración de los Fondos de Inversión Industrial Patrocinados por el Gobierno ^c	NDRC	Guo Fa N° 2800 [2016].
2022	Orientaciones para Seguir Mejorando el Entorno Normativo y Fomentando los Esfuerzos para Apoyar el Desarrollo de la Inversión Privada	NDRC	Guo Fa N° 1652 [2022].

3.112. Dado el predominio de las empresas de propiedad estatal en numerosos sectores, puede ser difícil tener una idea cabal del grado de apoyo gubernamental (sección 3.3.5). Las autoridades estiman que las empresas de propiedad estatal operan con arreglo a los principios del mercado.

3.113. Habida cuenta de la importancia de la economía china y del volumen de la ayuda gubernamental otorgada a determinadas empresas, las medidas de apoyo de China pueden afectar a los mercados mundiales, las ramas de producción de fases ulteriores del proceso productivo y determinadas cadenas de valor. Estos efectos no pueden cuantificarse en cifras totales, ya que no se dispone de los datos pertinentes. No se dispone de estudios oficiales sobre los efectos de la ayuda pública de China en el aumento de la productividad y en la innovación. No obstante, existen varios documentos académicos que examinan la relación entre la ayuda pública, la productividad y la innovación.¹³²

3.3.2 Normas y otras prescripciones técnicas

3.3.2.1 Panorama general y tendencias

3.114. La Ley de Normalización, de 1988, modificada en 2018, y el Reglamento de Aplicación de la Ley de Normalización, de 1990, son los principales instrumentos legislativos de China que regulan las normas. En la Ley de Normalización se establece el proceso de formulación y aplicación de

normas, que tienen por objeto mejorar la calidad de los productos y servicios; promover los avances científicos y tecnológicos; proteger la salud humana, la seguridad y la propiedad; salvaguardar la seguridad nacional y ecoambiental; y elevar el nivel general de desarrollo económico y social.¹³³

3.115. La SAMR, establecida en 2018, se encarga de la normalización y de la observancia de la legislación y la supervisión del mercado en lo relativo a la calidad de los productos, la inocuidad de los alimentos, la medición, la certificación, la acreditación y las normas. La Administración de Normalización de China (SAC), dependiente de la SAMR, se encarga de la supervisión unificada y la coordinación general de las actividades de normalización, y también representa a China en las organizaciones internacionales de normalización. La Administración Nacional de Certificación y Acreditación de China (CNCA) se encarga de la gestión, supervisión y coordinación unificadas de la certificación, la acreditación, la inspección y las pruebas en el ámbito de la evaluación de la conformidad; representa a China en las organizaciones internacionales de evaluación de la conformidad. También se encarga de la aplicación y supervisión del sistema de Certificación Obligatoria de China (CCC).

3.116. Entre la nueva reglamentación sobre normas promulgada por la SAMR durante el período objeto de examen figuran las Medidas relativas a la Administración de las Normas Nacionales (entrada en vigor el 1 de marzo de 2023), las Medidas revisadas relativas a la Administración de las Normas Sectoriales (entrada en vigor prevista para el 1 de junio de 2024) y las Medidas relativas a la Gestión de la Normalización Agrícola y Rural (entrada en vigor prevista para el 1 de julio de 2024).

3.117. En octubre de 2021, el Comité Central del Partido Comunista de China y el Consejo de Estado publicaron las Líneas Generales de Desarrollo Nacional de la Normalización; en julio de 2022 se publicó un plan de acción para su aplicación. En las Líneas Generales se establecen "cuatro transformaciones" relativas a la normalización como objetivo que se ha de alcanzar para 2025: i) equiparación de la importancia atribuida a la administración pública y al mercado; ii) aplicación al conjunto de la economía y la sociedad; iii) normas promovidas mutuamente por las perspectivas de ámbito nacional e internacional; y iv) calidad y eficiencia.¹³⁴

3.118. Sobre la base de las Líneas Generales, la SAC publicó las Directrices Nacionales para Proyectos de Normas en 2022 y 2023, en las que se exigía e instaba al Gobierno central, a los gobiernos subcentrales y a las asociaciones industriales a colaborar en las actividades de normalización.¹³⁵ Los objetivos de las Directrices Nacionales para Proyectos de Normas de 2023 son promover el desarrollo de la normalización; potenciar la transformación de los resultados científicos y tecnológicos; promover la convergencia de las normas a lo largo de la cadena de producción industrial; impulsar la apertura a normas y sistemas internacionales; y fortalecer el suministro efectivo de normas nacionales.¹³⁶ Entre los principales objetivos que se prevé alcanzar para 2025 figuran una proporción del 50% de resultados de investigaciones relacionadas con las normas en tecnologías clave, y una tasa de conversión del 85% de normas internacionales en normas nacionales.

3.119. En el Plan de Normas de China 2035 se exponen las directrices para que el Gobierno y las principales empresas tecnológicas establezcan normas mundiales de tecnologías emergentes como la internet 5G, la internet de las cosas y la inteligencia artificial (IA). El Plan se aplicará de forma concertada con otras políticas industriales de China, a saber, la iniciativa "Made in China 2025", como un instrumento para contribuir a que China llegue a ser un líder mundial en innovación de alta tecnología.

3.120. China es miembro de varias organizaciones internacionales relacionadas con la normalización, como la Organización Internacional de Normalización (ISO), la Comisión Electrotécnica Internacional (CEI) y la Unión Internacional de Telecomunicaciones (UIT).

¹³³ Ley de Normalización, Orden Nº 78, artículo 1.

¹³⁴ SAC, Directrices para Establecer Normas Nacionales en 2023, artículo 1 (2).

¹³⁵ Consejo de Estado, Líneas Generales de Desarrollo Nacional de la Normalización, 10 de octubre de 2021.

¹³⁶ SAC, Directrices para Establecer Normas Nacionales en 2023, artículo 1 (1)-(5).

3.121. Las autoridades indican también que China participa de forma cada vez más activa en el establecimiento de normas mundiales para tecnologías emergentes.¹³⁷ Entre los principales campos de investigación de China en materia de normalización figuran la IA, la información cuántica, la biotecnología, los ferrocarriles de alta velocidad, los vehículos de energías alternativas, los vehículos inteligentes conectados en red y los robots.¹³⁸

3.3.2.2 Normas y reglamentos técnicos

3.122. En la Ley de Normalización se clasifican las normas de China en cinco categorías: nacionales, sectoriales, locales, de asociaciones y empresariales. Las normas nacionales pueden ser voluntarias u obligatorias; las normas sectoriales y locales son voluntarias.

3.123. En enero de 2024 había 44.332 normas nacionales (2.023 obligatorias y 42.309 voluntarias) y 601 documentos técnicos de orientación.¹³⁹ Cada año se adoptan entre 2.000 y 3.000 normas nacionales (cuadro 3.17). Las autoridades indican que más del 80% de las normas nacionales están armonizadas con normas internacionales. En la fabricación de equipos esenciales y en la tecnología de la información de nueva generación, la tasa de conversión de las normas internacionales ha superado el 90%; en el caso de las normas de los productos de consumo más importantes, el nivel de compatibilidad con las normas internacionales ha alcanzado el 95%.

Cuadro 3.17 Normas aprobadas, 2020-2023

	2020	2021	2022	2023
Normas nacionales	2.252	2.815	2.266	2.902
Obligatorias	99	76	82	75
Voluntarias	2.153	2.739	2.184	2.827
Normas sectoriales (voluntarias)	3.474	3.656	2.791	..
Normas locales (voluntarias)	7.383	8.359	8.010	..

.. No disponible.

Fuente: Información facilitada por las autoridades.

3.124. Durante el período objeto de examen, China adoptó una amplia variedad de nuevas normas nacionales sectoriales y basadas en productos. Las nuevas normas obligatorias adoptadas se referían a los aditivos para piensos, los petroleros, el equipo eléctrico médico, el consumo de energía y el control de la contaminación. Se adoptaron nuevas normas voluntarias sobre los formatos de intercambio de datos biométricos, la tecnología de seguridad de la información y los formatos de fabricación aditiva. Durante el período objeto de examen, China ha elaborado cada vez más normas relacionadas con la digitalización y la nueva tecnología. Las autoridades indican que, por ejemplo, China adoptó más de 10 nuevas normas relacionadas con las ciudades inteligentes.

3.125. El Centro de Investigaciones sobre Normas Internacionales de Inspección y Cuarentena y Reglamentos Técnicos, dependiente de la GACC, es el Servicio de Información sobre OTC de China y se encarga de presentar las notificaciones OTC.

3.126. Entre enero de 2021 y febrero de 2024, China presentó 315 notificaciones OTC, la mayoría de ellas en virtud del artículo 2.9 del Acuerdo OTC.¹⁴⁰ La mayoría de los reglamentos técnicos notificados tienen por objeto proteger la salud y la seguridad de las personas, garantizar el cumplimiento de los requisitos de calidad o impedir prácticas que puedan inducir a error a los consumidores.

3.127. Entre enero de 2021 y febrero de 2024, otros Miembros plantearon un total de 21 preocupaciones comerciales específicas (PCE) relativas a OTC contra China; ocho de ellas son PCE nuevas.¹⁴¹

¹³⁷ Consejo de Estado, Líneas Generales de Desarrollo Nacional de la Normalización, 10 de octubre de 2021.

¹⁴¹ PCE 655, 677, 706, 749, 751, 761, 784, 788 y 804.

3.128. Entre enero de 2021 y febrero de 2024, China planteó 65 PCE relativas a OTC contra otros Miembros.

3.3.2.3 Certificación de productos

3.129. No se han producido cambios importantes en la legislación y el marco institucional por los que se rige el sistema de certificación de China. China administra los sistemas de certificación obligatorios y voluntarios, estos últimos relacionados con la gestión, los servicios y los productos orgánicos y ecológicos. El sistema de certificación obligatoria de productos se aplica tanto a los productos nacionales como a las importaciones, sobre la base de las normas nacionales obligatorias. Según la SAMR, hasta marzo de 2024 se habían expedido 3.824 millones de certificados, principalmente en las provincias de Guangdong, Jiangsu y Zhejiang.

3.130. En septiembre de 2022, la SAMR publicó su 14º Plan Quinquenal de Desarrollo de la Certificación, la Acreditación, la Inspección y las Pruebas. El Plan contiene varias tareas relacionadas con la mejora de la capacidad industrial, la promoción de la modernización industrial y de la cadena de suministro, la optimización y modernización del sector manufacturero y la mejora de la cooperación internacional.

3.131. La CNCA se encarga de la certificación de productos. La certificación y la acreditación se rigen por la Ley de Calidad de los Productos, la Ley de Inspección de Mercancías de Importación y Exportación, y el Reglamento de Certificación y Acreditación (modificado en noviembre de 2020), así como por diversas medidas como las Medidas relativas a la Administración de los Órganos de Certificación (modificadas en noviembre de 2020) y las Medidas relativas a la Administración de los Certificados y las Marcas de Certificación. Desde junio de 2022, el Servicio Nacional de Acreditación de China para la Evaluación de la Conformidad (CNAS) ofrece una nueva categoría de servicios de acreditación, con fines de homologación y verificación. La CNCA ha autorizado 34 organismos acreditados, entre ellos 22 organismos de certificación acreditados, 2 organismos de validación y verificación acreditados, 9 laboratorios acreditados y 1 organismo de inspección.¹⁴²

3.132. El Reglamento sobre la Administración de la Certificación Obligatoria de Productos y las Medidas relativas a la Administración de los Organismos de Certificación Obligatoria de Productos, los Organismos de Inspección y los Laboratorios, ambos instrumentos modificados en 2022, regulan el sistema de certificación obligatoria de China y aclaran las funciones de los organismos de reglamentación.¹⁴³ Las modificaciones de 2022 reflejan el traspaso de responsabilidades a la SAMR en 2021, sin ningún cambio sustancial.

3.133. El sistema de certificación obligatoria de China tiene por objeto proteger la seguridad nacional, evitar actos fraudulentos, proteger la salud y la seguridad de las personas, proteger la vida y la salud de los animales y preservar los vegetales y proteger el medio ambiente.¹⁴⁴ En el marco del sistema, los productos nacionales y las importaciones pertinentes deben estar certificados y marcados con la certificación CCC antes de la venta. Los productos sujetos a certificación obligatoria figuran en el Catálogo para la Certificación Obligatoria de Productos (el Catálogo CCC), que se renovó por última vez en 2023.¹⁴⁵ Hay dos tipos de evaluaciones: la evaluación por terceros y la autodeclaración. En el Catálogo CCC figuran 96 productos, entre ellos el equipo electrónico, la maquinaria y los automóviles; la autodeclaración es posible para 19 productos.

3.3.2.4 Etiquetado y envasado

3.134. Varias leyes y reglamentos establecen normas de etiquetado y envasado, principalmente de alimentos, medicamentos, cosméticos e instrumental médico. La Comisión Nacional de Salud se encarga de las normas de etiquetado de alimentos, mientras que la Administración Nacional de Productos Médicos (NMPA), dependiente de la SAMR, se encarga de la reglamentación de los medicamentos, los cosméticos y el instrumental médico.

¹⁴² La lista puede consultarse en: <https://www.cnas.org.cn/cxq/697737.shtml>.

¹⁴³ Anuncio N° 117 de la AQSIQ, 2009; y Anuncio N° 6 de la SAMR, 2022.

¹⁴⁴ Anuncio N° 117 de la AQSIQ, 2009, artículo 2.

¹⁴⁵ Las Normas de Aplicación pueden consultarse en: https://www.cnca.gov.cn/hlwfw/ywzl/qzxcprz/ssgz/art/2021/art_dc8623c0d4bb4c7fb7790e4b064e212a.html.

3.135. La Ley de Inocuidad de los Alimentos exige que los alimentos y aditivos alimentarios preenvasados nacionales e importados vayan provistos de etiquetas en chino que contengan información como la fecha de producción, los ingredientes, el nombre del productor y el origen de los alimentos. No se pueden importar alimentos preenvasados sin etiquetas correctas en chino.¹⁴⁶ En el Reglamento de Aplicación de la Ley de Inocuidad de los Alimentos se reitera esta prescripción.¹⁴⁷ Además, diversas normas proporcionan detalles adicionales sobre etiquetado y envasado de alimentos, a saber: la Norma Nacional sobre Inocuidad de los Alimentos: Disposiciones Generales sobre Etiquetado Nutricional de los Alimentos Preenvasados (GB28050-2011), la Norma Nacional sobre Inocuidad de los Alimentos: Disposiciones Generales sobre Etiquetado de los Alimentos Preenvasados (GB7718-2011) y la Norma Nacional sobre Inocuidad de los Alimentos: Disposiciones Generales sobre Etiquetado de Alimentos Preenvasados para Regímenes Especiales (GB13432-2013).

3.136. Las prescripciones en materia de etiquetado y envasado de medicamentos y cosméticos se establecen en la Ley de Administración de Medicamentos, el Reglamento de Aplicación de la Ley de Administración de Medicamentos, Ley de Administración de Productos Farmacéuticos, la Ley de Calidad de los Productos y el Reglamento de Control de los Cosméticos.

3.137. Durante el período objeto de examen se introdujeron varios cambios y actualizaciones, especialmente en relación con los defectos de la etiqueta. En cuanto al etiquetado de los alimentos, las Medidas de Control, Inspección y Administración de la Producción y Elaboración de Alimentos entraron en vigor en marzo de 2022, aclarando la autoridad y los criterios relativos a los defectos de las etiquetas.¹⁴⁸ Las Medidas Administrativas sobre la Inocuidad de los Alimentos Importados y Exportados, en vigor desde enero de 2022, exigen que la etiqueta china de los alimentos dietéticos y para regímenes especiales importados se imprima en el envase más pequeño.¹⁴⁹

3.138. La Norma Nacional sobre Inocuidad de los Alimentos: Disposiciones Generales sobre Etiquetado de los Alimentos Preenvasados (GB7718-2011) se encuentra actualmente en proceso de revisión, lo que conlleva los siguientes cambios: prescripciones sobre etiquetado digital y cuantitativo, y etiquetado de fechas y de alérgenos en los alimentos.

3.139. En mayo de 2021, la MNPA publicó las Medidas Administrativas para el Etiquetado de Cosméticos, que exige a los productores de cosméticos que actualicen el etiquetado para mayo de 2023.¹⁵⁰ Según la interpretación de la política, su objetivo es unificar los reglamentos y normas anteriores y abordar eficazmente las afirmaciones falsas y exageradas. Sus principales contenidos se refieren a la definición del etiquetado de cosméticos, los requisitos detallados, el contenido prohibido en etiquetas y las circunstancias específicas de los defectos del etiquetado.¹⁵¹ En respuesta, algunos Miembros plantearon una PCE sobre la medida.¹⁵²

3.140. Además, las Disposiciones de Control y Administración de la Fabricación y Comercialización de Cosméticos entraron en vigor en enero de 2022; los artículos 35 a 37 aclaran las circunstancias de los defectos del etiquetado.¹⁵³ Las Disposiciones de Control y Administración de la Venta de Medicamentos en Línea, en vigor desde diciembre de 2022, regulan la venta en línea de medicamentos sujetos a receta médica y prohíben la visualización de la etiqueta y del envase de medicamentos de venta con receta en la página web principal.¹⁵⁴

3.3.3 Prescripciones sanitarias y fitosanitarias

3.3.3.1 Marco general

3.141. El 13^{er} Plan Quinquenal de Inocuidad de los Alimentos (2016-2020) ha servido como principal documento orientativo para las recientes reformas del sistema de inocuidad de los alimentos de China. El Plan consideró que la buena gobernanza de la inocuidad de los alimentos era un elemento crucial para el desarrollo de la industria alimentaria. Como se indicó en el examen anterior, las esferas a las que se orientó la reforma incluían el aumento de las inspecciones y pruebas, la mejora de las normas sobre inocuidad de los alimentos y su integración con las normas internacionales pertinentes, el aumento de la capacidad de investigación y realización de pruebas y el fortalecimiento de la observancia de las leyes y reglamentos en materia de inocuidad de los alimentos. El 14^o Plan Quinquenal para la Modernización de la Regulación de los Mercados adopta el mismo enfoque, y establece, entre otras cosas, varios pilares generales para orientar los esfuerzos de las autoridades por mejorar el sistema de inocuidad de los alimentos y los medicamentos.¹⁵⁵ Durante el período de aplicación del Plan, China tiene el objetivo de seguir mejorando la supervisión de la calidad y la inocuidad en toda la cadena de suministro de alimentos, a través de un enfoque con base científica. Esto supone dar prioridad a la equiparación de las normas generales en materia de inocuidad de los alimentos, en particular las relativas a residuos de plaguicidas, residuos de medicamentos veterinarios, metales pesados, contaminantes alimentarios y microorganismos patógenos. Además, los esfuerzos se centrarán en promover y actualizar normas fundamentales en materia de inocuidad de los alimentos, especificaciones de productos, prescripciones de etiquetado y métodos de inspección esenciales para el desarrollo de la industria, al tiempo que también se racionalizan los mecanismos de observancia. Por otra parte, existe el compromiso de intensificar la supervisión de la inocuidad de los alimentos importados, a fin de mitigar efectivamente los riesgos asociados a los productos importados.

3.142. El marco de medidas sanitarias y fitosanitarias (MSF) de China se regula principalmente a través de la Ley de Inocuidad de los Alimentos (de 2009, revisada por última vez en 2021), la Ley de Calidad e Inocuidad de los Productos Agrícolas (de 2006, revisada por última vez en 2022), la Ley de Prevención de Epizootias (de 1997, revisada por última vez en 2021), la Ley de Cuarentena de Entrada y Salida de Fauna y Flora (de 1992, revisada por última vez en 2009), el Reglamento sobre cuarentena fitosanitaria (promulgado en 1983, revisado por última vez en 2017), la Ley de Inspección de Mercancías de Importación y Exportación (de 1989, revisada por última vez en 2022), y sus medidas y reglamentos de aplicación. En octubre de 2020 se adoptó la Ley de Bioseguridad, que entró en vigor el 15 de abril de 2021. En virtud de la ley se aplican directrices que abarcan varios aspectos, entre ellos la prevención y el control de enfermedades infecciosas, la regulación de investigaciones y aplicaciones biotecnológicas, la garantía de la inocuidad y las prácticas en laboratorios biológicos, la salvaguardia de los recursos genéticos biológicos y humanos, la prevención de la propagación de especies invasoras, la conservación de la biodiversidad y la adopción de medidas de lucha contra el terrorismo biológico.¹⁵⁶ Este conjunto de leyes y reglamentos primarios sigue sirviendo de base para la formulación y la observancia de las normas sanitarias del país para los productos animales, vegetales y alimenticios producidos y comercializados.

3.143. No se han introducido cambios importantes en el marco institucional durante el período objeto de examen. La Comisión Nacional de Salud es responsable de la evaluación del riesgo, la vigilancia del riesgo y el establecimiento de normas nacionales en materia de inocuidad de los alimentos. La principal función de la SAMR en el marco de las MSF sigue incluyendo la formulación de políticas, el sistema de respuesta ante situaciones de urgencia, la investigación de incidentes graves relacionados con la inocuidad de los alimentos y las inspecciones de la inocuidad de los alimentos. El Ministerio de Agricultura y Asuntos Rurales (MARA) se ocupa, entre otras cosas, de la inocuidad y la calidad de los productos agropecuarios; la alerta temprana, en colaboración con los arreglos internacionales pertinentes; y la redacción de medidas de administración de la entrada y salida de animales y plantas, en particular las medidas de cuarentena y prohibición. La GACC es responsable de la redacción de medidas de administración de la entrada y salida de animales y plantas, en particular las medidas de cuarentena y prohibición. Supervisa los procedimientos de

¹⁵⁵ State Council, 14th Five-Year Plan for the Modernization of Market Regulation. Consultado en: https://www.gov.cn/zhengce/zhengceku/2022-01/27/content_5670717.htm.

¹⁵⁶ Ministry of Ecology and Environment (2021), "Biosecurity Law Goes into Effect", 16 de abril de 2021. Consultado en: https://english.mee.gov.cn/News_service/media_news/202104/t20210416_828952.shtml.

cuarentena e inspección sanitaria para la entrada y salida de animales, plantas y sus productos, y colabora con el MARA para determinar y ajustar los catálogos correspondientes.

3.144. Dependiente de la GACC, el Servicio de Información y de Notificación MSF del Centro de Investigaciones sobre Normas Internacionales de Inspección y Cuarentena y Reglamentos Técnicos sigue siendo el servicio de información MSF/OMC de China, y el Centro de Información y Notificaciones relativas a la OMC del MOFCOM es el organismo nacional encargado de la notificación.¹⁵⁷

3.3.3.2 Normas sobre inocuidad de los alimentos, los animales, las plantas y sus productos

3.145. De conformidad con la Ley de Inocuidad de los Alimentos, todos los alimentos, aditivos alimentarios y productos conexos importados deben cumplir las normas de inocuidad de los alimentos de China. Según las autoridades, durante el período objeto de examen adoptaron reglamentos relacionados con las normas de inocuidad de los alimentos en China la Comisión Nacional de Salud, el MARA y la SAMR. Entre ellos figuran el reglamento de 2021 por el que se establecen los Límites máximos de residuos de plaguicidas en los productos alimenticios (GB2763-2021), los Límites máximos de residuos de 41 medicamentos veterinarios en alimentos de 2022 (GB31650.1-2022) y los Límites máximos de residuos de 112 plaguicidas en alimentos de 2022 (GB2763.1-2022). Las autoridades señalan que, de conformidad con la Ley de Inocuidad de los Alimentos, China adopta normas nacionales de inocuidad de los alimentos de conformidad con principios internacionalmente aceptados. En cuanto a las normas de inocuidad de alimentos, animales, plantas y productos pertinentes, el MARA indicó que, a finales de marzo de 2024, China había acumulado 13.755 normas nacionales.

3.146. El 12 de abril de 2021, China adoptó las Medidas administrativas sobre la inocuidad de los alimentos importados y exportados (Anuncio N° 249 de la GACC), que entraron en vigor el 1 de enero de 2022. El reglamento proporciona detalles sobre las normas de la GACC en materia de inspección y evaluación de la inocuidad de los productos alimenticios importados y medidas para mitigar los riesgos en materia de inocuidad de los alimentos. También establece prescripciones sobre el etiquetado de productos alimenticios (sección 3.3.2.4).

3.147. Las Medidas exigen que los importadores obtengan autorización de cuarentena de la GACC antes de la importación, si tienen la intención de exportar un nuevo tipo de alimento a China, o si el alimento es originario de una entidad afectada por un brote notable de epizootia o enfermedad de las plantas. Este principio también es aplicable cuando el territorio exportador experimenta alteraciones sustanciales de sus reglamentos en materia de inocuidad de los alimentos. En esos casos, las Medidas facultan a la GACC para iniciar una evaluación de los reglamentos del territorio en materia de inocuidad de los alimentos.

3.148. En casos de alto riesgo, las autoridades pueden adoptar medidas más drásticas. Por ejemplo, si se producen incidentes relacionados con la inocuidad de los alimentos en la entidad exportadora, la GACC podrá optar, entre otras cosas, por i) intensificar las inspecciones del alimento importado de que se trate, o ii) suspender o prohibir las importaciones cuando la entidad exportadora esté experimentando una epidemia que afecte a plantas y animales, o si hay pruebas de que los alimentos importados están contaminados por patógenos. Las Medidas también describen el procedimiento de terminación y prórroga de tales medidas.

3.149. Las Medidas disponen que todas las empresas extranjeras productoras de alimentos que tengan la intención de exportar alimentos a China deben registrarse ante la GACC. Antes de la adopción de las Medidas, únicamente los fabricantes de productos cárnicos, productos acuáticos, productos lácteos y productos de la apicultura estaban obligados a registrarse ante la GACC. Este sistema fue actualizado por las Medidas, que han derogado las Medidas sobre inocuidad de las importaciones y exportaciones de alimentos adoptadas en 2011, y las medidas específicas sobre la miel, los productos acuáticos, los productos cárnicos y los productos lácteos exportados e importados.¹⁵⁸ Las autoridades indican que el sistema de registro se basa en la ciencia y en la

¹⁵⁷ Plataforma MSF y OTC de la OMC, *Servicios de información/organismos encargados de la notificación*. Consultada en: <https://eping.wto.org/en/EnquiryPoint/sps-nna>.

¹⁵⁸ Medidas para la inspección, cuarentena y administración de la miel exportada, Medidas para la supervisión y administración de la inspección y cuarentena de productos acuáticos importados y exportados,

evaluación del riesgo. También toma en consideración la situación de la gestión de la inocuidad de los alimentos en distintos países/regiones.

3.150. En el contexto del nuevo sistema de registro, El Reglamento sobre el Registro y la Gestión de Fabricantes Extranjeros de Productos Alimenticios Importados de 2021 describe las etapas específicas y la documentación necesaria para este proceso de registro.¹⁵⁹ La GACC dividió el registro en dos modelos. El primer modelo, según el cual los fabricantes pueden registrarse mediante el modo simplificado de "solicitud por la propia empresa" (solicitud directa del fabricante), abarca la mayoría de categorías de alimentos. Además, las empresas que producen determinadas categorías de alimentos están sujetas a prescripciones de registro más estrictas, y solo pueden registrarse si lo recomiendan las autoridades del territorio en el que se encuentran.¹⁶⁰ En este caso de "registro por recomendación oficial", las autoridades competentes inspeccionarán sus empresas recomendadas y presentarán la documentación de inspección pertinente que confirme que esas empresas han cumplido los requisitos. Algunos de los interlocutores comerciales de China han planteado preocupaciones en cuanto a la motivación para imponer estas prescripciones a todos los productos alimenticios, con independencia de su perfil de riesgo. Algunos también han expresado preocupación por las Medidas, por ser, entre otras cosas, "demasiado gravosas" y restringir el comercio más de lo necesario.¹⁶¹ Las autoridades sostienen que la GACC ha publicado sucesivamente la interpretación del Reglamento, las directrices y varios documentos justificantes y formularios para la solicitud del registro. La GACC también ha celebrado sesiones informativas y de formación con los interlocutores comerciales y ha establecido un punto de contacto específico para el Reglamento.

3.151. El marco de protección de la sanidad animal y la salud de los vegetales no sufrió reformas notables. La Ley de Prevención de Epizootias de 1997 trata de administrar, prevenir, contener y erradicar la propagación de epizootias, con el fin de salvaguardar la producción y la seguridad de la industria de cría y proteger la salud humana.

3.152. La Ley de Calidad e Inocuidad de los Productos Agrícolas de 2006 administra las normas de inocuidad y los protocolos de supervisión e inspección que se aplican a los productos agrícolas. Se modificó el 2 de septiembre de 2022 y entró en vigor el 1 de enero de 2023. El objeto de la revisión era armonizar sus disposiciones con las de la Ley de Inocuidad de los Alimentos, en particular en lo relativo a la recientemente adoptada Norma Nacional sobre Inocuidad de los Alimentos: Límites Máximos de Residuos de Plaguicidas en los Alimentos.

3.3.3.3 Medidas sanitarias y fitosanitarias

3.153. Entre abril de 2021 y marzo de 2024, China notificó unas 101 medidas sanitarias y fitosanitarias a la OMC (medidas ordinarias y de emergencia), de las cuales dos eran medidas de emergencia que afectaban a Miembros específicos.¹⁶²

3.154. En enero de 2022 se notificaron medidas de emergencia por las que se establecían prescripciones en materia de cuarentena fitosanitaria para las importaciones de madera de pino (incluidos los troncos para aserrar y la madera aserrada) procedentes de siete entidades (el Canadá, el Japón, la República de Corea, México, Portugal, España y los Estados Unidos) afectadas por *Bursaphelenchus lignicolus*.¹⁶³ Las medidas requieren que las autoridades competentes del país

Medidas para la supervisión y administración de la inspección y cuarentena de productos cárnicos importados y exportados, Medidas para la supervisión y administración de la inspección y cuarentena de productos lácteos importados y exportados, y Disposiciones sobre la administración del registro de empresas que producen alimentos exportados.

¹⁵⁹ GACC, Provisions of the People's Republic of China on the Registration and Administration of Overseas Manufacturers of Imported Food. Consultado en: <http://jckspj.customs.gov.cn/spj/zcfq18/bmqz91/3979122/index.html?ref=chinatrademonitor.com>.

¹⁶⁰ Estos tipos de alimentos incluyen la carne y los productos cárnicos, tripas, productos acuáticos, productos lácteos, nidos de ave y productos de nidos de ave, productos de la apicultura, huevos y sus productos, aceites y grasas comestibles, semillas oleaginosas, productos de pastelería rellenos, cereales comestibles, productos de la molinería y malta, hortalizas frescas y deshidratadas y legumbres secas, condimentos, frutos secos y semillas, frutas secas, café en grano sin tostar y cacao en grano, alimentos para regímenes especiales y alimentos funcionales.

exportador realicen pruebas previas a la exportación, para garantizar que los troncos exportados estén libres de *Bursaphelenchus lignicolus* y se fumiguen posteriormente. La madera aserrada debe someterse a un tratamiento térmico, y la madera de pino debe entrar en China por puertos designados.

3.155. Además, en 2023 se presentó la notificación de emergencia en el Anuncio de la GACC por el que se suspendían las importaciones de todos los productos acuáticos procedentes del Japón.¹⁶⁴ Las autoridades sostienen que se trata de una medida de emergencia provisional, destinada a evitar completamente el riesgo de contaminación radiactiva de los productos alimenticios causada por la descarga de agua nuclear contaminada de Fukushima en el Japón, así como proteger la salud de los consumidores. Mencionaron que habían tratado activamente de obtener información adicional esencial para la evaluación, pero hasta el momento los resultados no habían satisfecho las expectativas.

3.156. Durante el período objeto de examen se plantearon 13 preocupaciones comerciales específicas relativas a medidas chinas en el Comité MSF de la OMC (cuadro 3.18).

Cuadro 3.18 Preocupaciones comerciales específicas relacionadas con las MSF planteadas contra China, abril de 2021 a febrero de 2024

Preocupación	Miembro(s) que plantea(n) la preocupación (Miembros que respaldan la preocupación)	Miembro(s) que responde(n) a la preocupación comercial	Planteada por primera vez/planteada por última vez (número de veces que se ha planteado)
Restricciones a la importación de productos pesqueros	México	China	2021, (1)
Restricciones a las importaciones de carne vacuna	India	China	2021/2022, (3)
Preocupación por la transparencia, los retrasos y las debidas garantías de procedimiento asociadas a los requisitos de China para la importación de productos agrícolas	Australia (Federación de Rusia)	China	2021/2022, (5)
Restricciones generales a la importación a causa de la encefalopatía espongiforme bovina (EEB)	Estados Unidos; Unión Europea (Canadá; Estados Unidos; Suiza; Uruguay)	Reino de la Arabia Saudita; Argentina; Australia; Brasil; China; Colombia; República de Corea; Egipto; Estados Unidos; Filipinas; Japón; Jordania; Malasia; Singapur; Sudáfrica; Tailandia; Taipei Chino; Türkiye; Ucrania; y algunos otros Miembros	2004/2023, (49)
Restricciones a la importación a causa de la peste porcina africana (ID 392)	Unión Europea	China	2015/2023, (19)
Restricciones a la importación a causa de la gripe aviar altamente patógena	Estados Unidos; Unión Europea (Estados Unidos; Unión Europea)	China	2016/2023, (21)
Medidas en relación con la COVID-19 que afectan al comercio de alimentos y productos agropecuarios	Australia; Canadá; Estados Unidos; Federación de Rusia; India; Japón; Taipei Chino; Unión Europea (Australia; Brasil; Federación de Rusia; India; Japón; Kenya; México; Noruega; Nueva Zelanda; Paraguay; Reino Unido; Suiza; Taipei Chino; Unión Europea)	China	2020/2023, (10)

3.3.3.4 Inspección y cuarentena

3.157. Las inspecciones a los efectos de MSF, en particular los procedimientos de cuarentena, permanecieron en general sin cambios durante el período objeto de examen. La GACC se encarga de la inspección de entrada y salida y administra la cuarentena. De conformidad con la Ley de Cuarentena de Entrada y Salida de Fauna y Flora, la Ley de Inspección de Mercancías de Importación y Exportación y su Reglamento de aplicación, el Catálogo de Productos Básicos sujetos a Inspección y Cuarentena de Entrada y Salida establece la lista de animales, plantas y productos conexos sujetos a inspección y cuarentena a la entrada, la salida o el tránsito por China. La revisión más reciente del Catálogo se llevó a cabo mediante el Anuncio N° 79 de la GACC, de 2022. También podrá requerirse la inspección y cuarentena para algunos productos que no figuran en el catálogo, pero que se constata que plantean motivos de preocupación imprevistos.

3.158. Para las importaciones sujetas a cuarentena, los importadores han de presentar su solicitud, junto con los documentos pertinentes, a la GACC. La GACC está obligada a expedir un permiso de cuarentena o notificar la denegación en un plazo de 20 días hábiles contados a partir de la recepción de la solicitud. Por ley, los animales de cría grandes o medianos estarán sujetos a cuarentena en instalaciones de aislamiento animal durante 45 días; los animales acuáticos importados destinados a fines de cría, cultivo y ornamentales se someterán a cuarentena obligatoria durante al menos 14 días en instalaciones de cuarentena designadas; y los demás animales importados estarán sujetos a cuarentena durante 30 días. Si los artículos sujetos a cuarentena no superan la inspección de cuarentena, la GACC expedirá un aviso de régimen de cuarentena e informará al propietario o su representante para que lleven a cabo los tratamientos necesarios, tales como la desinfección.

3.159. Según las autoridades, desde 2021 el 22,74% de los animales grandes y medianos no superó la inspección previa a la llegada. Pueden presentarse apelaciones de conformidad con las leyes y los reglamentos pertinentes.

3.160. Las exportaciones de animales, vegetales y sus productos incluidos en el Catálogo también deben cumplir los reglamentos de cuarentena. Los exportadores están obligados a solicitar aprobación de cuarentena de la GACC en el puerto de exportación designado antes de enviar las mercancías.

3.161. En principio, de conformidad con el Reglamento de Aplicación de la Ley de Inspección de Mercancías de Importación y Exportación, los importadores tienen la opción de solicitar una nueva inspección en un plazo de siete días contados a partir de la recepción del informe de inspección si no están de acuerdo con sus constataciones.

3.162. Los animales, las plantas y sus productos también requieren certificados sanitarios o fitosanitarios de la autoridad competente del país o región de exportación (salvo disposición en contrario).

3.163. En abril de 2023, el MARA publicó Normas Detalladas para el Examen de Plantas Obtenidas por Edición Genética con Fines Agrícolas (edición provisional) para orientar los procedimientos de evaluación de la inocuidad y prestar apoyo a las organizaciones de investigación que realizan actividades de investigación y desarrollo. Las Normas especifican las normas de clasificación y el contenido del examen de plantas obtenidas por edición genética. En el caso de las plantas obtenidas por edición genética que no contengan genes exógenos, si los datos obtenidos de las pruebas indican que las plantas no plantearán un riesgo para la seguridad ambiental, pueden solicitarse directamente los certificados de inocuidad necesarios para la producción de plantas modificadas genéticamente.

3.3.4 Política de competencia y controles de precios

3.3.4.1 Política de competencia

3.3.4.1.1 Marco legislativo e institucional

3.164. La principal legislación relacionada con la competencia, la Ley Antimonopolio, contiene normas relativas a los siguientes tipos de conducta anticompetitiva: i) cárteles; ii) abuso de posición dominante; iii) concentraciones (fusiones y adquisiciones); y iv) abuso de facultades administrativas. La Ley se aplica a las prácticas anticompetitivas llevadas a cabo en China, pero también en el extranjero si esas prácticas "eliminan o restringen la competencia en el mercado interno de China".¹⁶⁵ La Ley no es aplicable a las "actuaciones conjuntas o concertadas de productores agrícolas y organizaciones económicas rurales en sus actividades comerciales, tales como la producción, la elaboración, la venta, el transporte o el almacenamiento de productos agrícolas".¹⁶⁶

3.165. La Ley Antimonopolio establece también un "examen de la competencia leal": los órganos estatales encargados de la adopción de los instrumentos legislativos que regulan las "actividades económicas de las entidades de mercado" llevarán a cabo un proceso de examen de la competencia leal con el fin de asegurarse de que la legislación propuesta no cree obstáculos a la entrada ni perjudique la competencia.

3.166. En 2021 se creó la Administración Antimonopolio, dependiente de la Administración Estatal de Reglamentación del Mercado (SAMR). La Oficina tiene la condición de institución "viceministerial", lo que le confiere una considerable independencia, como la posibilidad de recibir directamente instrucciones del Consejo de Estado, la posibilidad de interactuar directamente con otros organismos estatales y la facultad de redactar leyes relacionadas con la competencia.¹⁶⁷ Los tres departamentos de la Oficina se encargan de la redacción de reglamentos relacionados con la competencia, la

¹⁶⁶ Ley Antimonopolio, artículo 69. Consultada en: <https://www.chinalawtranslate.com/en/anti-monopoly-law-2022/>.

¹⁶⁷ A. Xue y H. Jing (2022), "What Was China's National Anti-Monopoly Administration Created For?", *CPI*, 6 de enero de 2022. Consultado en: https://www.pymnts.com/cpi_posts/what-was-chinas-national-anti-monopoly-administration-created-for/.

aplicación de la legislación contra los cárteles y los abusos de posición dominante, y el control de las fusiones.

3.3.4.1.2 Principales modificaciones legislativas

3.167. Durante el período objeto de examen, la Ley Antimonopolio fue objeto de modificaciones, que entraron en vigor el 1 de agosto de 2022. Se incluyeron normas de "puerto seguro" para abordar las situaciones en las que un acuerdo vertical no tiene el efecto de eliminar la competencia o cuando la cuota de mercado de una empresa es inferior al umbral prescrito por las Disposiciones sobre la Prohibición de los Acuerdos Monopolísticos (inferior al 15%). No se han introducido normas de "puerto seguro" para los acuerdos horizontales.

3.168. También hay nuevas normas que aumentan los umbrales para la notificación de fusiones y adquisiciones. Es necesario notificar la transacción cuando: i) el volumen de negocio mundial agregado de las empresas excede de CNY 12.000 millones y el volumen de negocio individual en China de al menos dos de las empresas asciende a CNY 800 millones; o ii) el volumen de negocio agregado de las empresas en China excede de CNY 4.000 millones y el volumen de negocio individual en China de al menos dos de las empresas asciende a CNY 800 millones. Si no se alcanzan esos umbrales, la fusión o adquisición tiene no obstante que ser notificada si el volumen de negocio en China de una de las empresas excede de CNY 100.000 millones y la otra empresa tiene un valor de mercado igual o superior a CNY 800 millones y genera en China más de una tercera parte de su volumen de negocio global. Aun cuando no se alcancen los umbrales establecidos, la autoridad encargada de la competencia puede exigir a las empresas que declaren la transacción en caso de que tenga o pueda tener un efecto anticompetitivo.¹⁶⁸

3.169. Aunque no se prohíba una fusión o adquisición, para limitar su posible efecto negativo en la competencia en el mercado la autoridad encargada de la competencia puede imponer condiciones restrictivas adicionales, como condiciones estructurales (por ejemplo, cesión de derechos de propiedad intelectual), condiciones de comportamiento (por ejemplo, concesión de licencias para tecnologías clave y de acceso a plataformas), o una combinación de unas y otras.¹⁶⁹ Si las empresas pueden demostrar que una fusión o adquisición no tendrá un efecto anticompetitivo o redundará en beneficio del interés público, se autorizará esa transacción.

3.170. Por lo que se refiere a los procedimientos de examen de las fusiones, las nuevas disposiciones sobre el "reloj detenido" permiten a la autoridad encargada de la competencia dejar en suspenso el período para el examen si: i) las empresas no han presentado los documentos o el material requeridos, imposibilitando así el examen; ii) han tenido lugar nuevos hechos nuevos importantes en relación con la fusión o adquisición; o iii) es necesaria una nueva evaluación de las condiciones restrictivas adicionales impuestas.

3.171. En el marco de un programa piloto, la SAMR puede encomendar a las autoridades provinciales encargadas de la competencia en Beijing, Shanghai, Chongqing, Shaanxi y Guangdong el examen de las notificaciones de fusiones y adquisiciones simplificadas en los casos en que: i) al menos un solicitante tenga su domicilio en la región pertinente; ii) la empresa o empresas adquieran el control de otra u otras empresas con domicilio en las regiones pertinentes; iii) las empresas hayan establecido nuevas empresas conjuntas domiciliadas en las regiones pertinentes; iv) el mercado geográfico relacionado con la concentración de empresas sea un mercado regional entera o principalmente situado en la región pertinente; y v) otros casos en los que la SAMR delegue el examen.¹⁷⁰ Incluso cuando las autoridades provinciales encargadas de la competencia realizan un examen, el SAMR examina los informes y recomendaciones de dichas autoridades y adopta una decisión.

¹⁶⁸ Ley Antimonopolio, artículo 26.

¹⁶⁹ Véanse las Disposiciones sobre el Examen de la Concentración de Empresas (Anuncio Nº 67 de la SAMR, 2023).

¹⁷⁰ Véase el Anuncio de la Administración Estatal de Reglamentación del Mercado sobre el Programa Piloto de Delegación del Examen Antimonopolio de Determinados Casos relacionados con la Concentración de Empresas (Anuncio Nº 23, 2022).

3.172. En lo que respecta al abuso de posición dominante, en la Ley Antimonopolio actual se reconoce explícitamente la función de las herramientas digitales y se prohíbe el uso de "datos o algoritmos, tecnologías y normas sobre plataformas con el fin de abusar de una posición dominante en el mercado".¹⁷¹

3.173. Además, en noviembre de 2022 se publicaron proyectos de modificación de la Ley de Represión de la Competencia Desleal de China.¹⁷² Para evitar superposiciones, la Ley Antimonopolio queda designada como la legislación primaria en materia de conductas anticompetitivas, mientras que la Ley de Represión de la Competencia Desleal aborda las conductas no abarcadas por la Ley Antimonopolio, por ejemplo la conducta de los agentes del mercado que disfrutan de una posición comparativamente ventajosa que no constituye una posición dominante y no está por tanto abarcada por la Ley Antimonopolio.

3.174. En junio de 2022 se publicaron también propuestas de modificación de los seis reglamentos que se indican a continuación para que fueran objeto de consultas públicas. El proyecto de Reglamento sobre los Umbrales para la Notificación de Concentración de Empresas aún no ha sido aprobado, mientras que los siguientes instrumentos legislativos ya están en vigor: i) Disposiciones sobre la Prohibición de los Acuerdos Monopolísticos (Anuncio N° 65 de la SAMR, 2023); ii) Disposiciones sobre la Prohibición del Abuso de Posición Dominante (Anuncio N° 66 de la SAMR, 2023); iii) Disposiciones sobre la Prohibición de la Eliminación y Restricción de la Competencia mediante el Abuso de Derechos de Propiedad Intelectual (Anuncio N° 79 de la SAMR, 2023); iv) Disposiciones sobre la Prohibición de la Eliminación y Restricción de la Competencia mediante el Abuso de Facultades Administrativas (Anuncio N° 64 de la SAMR, 2023); v) Disposiciones sobre la Concentración de Empresas (Anuncio N° 67 de la SAMR, 2023); y vi) Disposiciones sobre los Umbrales para la Notificación Previa de Concentración de Empresas (Anuncio N° 773 del Consejo de Estado, 2024).

3.3.4.1.3 Observancia

3.175. El régimen de observancia de China se ha visto reforzado por las modificaciones de la Ley Antimonopolio. Las partes privadas pueden ahora solicitar ante los tribunales la aplicación de medidas correctivas en caso de infracción de dicha Ley. La Ley Antimonopolio modificada permite asimismo a los fiscales públicos presentar ante los tribunales civiles reclamaciones contra infracciones de la legislación sobre competencia en caso de que esas infracciones perjudiquen el interés público. Actualmente, el Tribunal Supremo del Pueblo de China participa en el proceso de modificación de la Ley Antimonopolio para aclarar el alcance y la jurisdicción de esas alegaciones, dado que, hasta la fecha, los tribunales de China no han entendido en asuntos en materia de competencia relacionados con el interés público.¹⁷³

3.176. Los órganos administrativos también tienen expresamente prohibido abusar de sus facultades y restringir el acceso a los mercados o tratar de manera desigual a las empresas y eliminar de ese modo la competencia. Asimismo, la autoridad encargada de la competencia puede investigar las conductas pertinentes de esos órganos, como el supuesto abuso de facultades, la aplicación de restricciones al acceso a los mercados y la concesión a las empresas de un trato desigual que elimine la competencia. Además, la Ley Antimonopolio ha establecido la responsabilidad personal en caso de infracción de la legislación antimonopolio. Actualmente prescribe sanciones penales para las acciones que entrañen, entre otras cosas, abusos de autoridad, la obstrucción de una investigación o prácticas de licitación colusorias. Tanto las personas físicas como las jurídicas pueden incurrir en responsabilidad penal.

3.177. La Ley Antimonopolio prevé asimismo el aumento de las sanciones por infracción. Las infracciones de la Ley Antimonopolio quedan registradas en el historial crediticio de la empresa o empresas involucradas, lo que puede dar lugar a la suspensión de sus operaciones, a su exclusión respecto de la contratación pública y a la suspensión de programas de incentivos. Sobre la base de la Ley Antimonopolio actual, se aplican las siguientes sanciones: i) por ayudar a otras empresas a crear cárteles, multa de hasta CNY 1 millón; ii) por realizar fusiones que infrinjan la legislación sobre competencia y tengan el efecto de eliminar o restringir la competencia, multa de hasta el 10% de

¹⁷¹ Ley Antimonopolio, artículo 22. Consultada en: <https://www.chinalawtranslate.com/en/anti-monopoly-law-2022/>.

¹⁷² Las modificaciones aún no han entrado en vigor.

¹⁷³ Información facilitada por las autoridades.

las ventas globales de la empresa del año anterior; iii) por realizar fusiones que no hayan sido notificadas pero no tengan efectos anticompetitivos, multa de hasta CNY 5 millones; iv) si la infracción de la Ley Antimonopolio se considera grave, las sanciones pueden desde duplicarse hasta quintuplicarse; v) la falta de cooperación en investigaciones oficiales puede traducirse en una multa de hasta el 1% de las ventas correspondientes a los años anteriores o de hasta CNY 5 millones si no se dispone de datos sobre esas ventas; o vi) si el representante legal, la persona encargada o la persona directamente responsable de la empresa es responsable de la conclusión del acuerdo monopolístico, pueden ser objeto de una multa de hasta CNY 1 millón.

3.178. En la Ley Antimonopolio y en las Directrices de la Comisión Antimonopolio del Consejo de Estado sobre la Aplicación del Sistema de Clemencia en Casos de Acuerdos Monopolísticos Horizontales se prevé una política de clemencia.

3.179. Entre 2021 y 2023, las autoridades se ocuparon de varios centenares de casos referentes a la competencia, la mayoría de ellos relacionados con fusiones y adquisiciones (cuadro 3.19).

Cuadro 3.19 Estadísticas sobre la observancia en la esfera de la competencia, 2021-2023

	2021	2022	2023
1. Iniciación de investigaciones (número)			
a) Investigaciones sobre acuerdos contrarios a la competencia	30	18	15
I) Solicitudes de clemencia	1	0	2
d) Notificaciones de fusiones y adquisiciones	824	867	843
2. Investigaciones finalizadas (número)			
a) Acuerdos contrarios a la competencia	11	16	16
b) Abuso de posición dominante	11	13	11
c) Acuerdos amistosos	0	0	0
d) Fusiones y adquisiciones (número total de decisiones y número de fusiones y adquisiciones no aprobadas)	727 (1 fusión no aprobada, 4 fusiones aprobadas con sujeción a condiciones restrictivas)	794 (5 fusiones aprobadas con sujeción a condiciones restrictivas)	558 (4 fusiones aprobadas con sujeción a condiciones restrictivas)
3. Sanciones por infracción	CNY 25.300 millones	CNY 740 millones	CNY 2.200 millones
4. Apelaciones (número de decisiones de revisión judicial dictadas)	0	0	1

Fuente: Información facilitada por las autoridades.

3.3.4.1.4 Cooperación internacional

3.180. En varios acuerdos de libre comercio (ALC) modificados o firmados por China durante el período objeto de examen, con el Ecuador, Mauricio, Nicaragua, Nueva Zelandia y Serbia, y en el contexto del Acuerdo de Asociación Económica Amplia Regional (RCEP), se incluyen disposiciones sobre política de competencia.

3.181. Actualmente, China está negociando su adhesión al Tratado Integral y Progresista de Asociación Transpacífico (CPTPP) y al Acuerdo de Asociación sobre Economía Digital (DEPA), que contienen ambas disposiciones relacionadas con la competencia. Asimismo, China ha avanzado en las negociaciones con Israel, Noruega, Honduras y el Perú para la conclusión o mejora de ALC en los que figuran disposiciones relacionadas con la competencia.

3.182. China se muestra también activa en la firma de acuerdos de cooperación sobre cuestiones de competencia. Hasta la fecha ha firmado 63 acuerdos con 35 economías, entre ellas los Estados Unidos, la Unión Europea y la Federación de Rusia. En 2021, la SAMR firmó Memorandos de Entendimiento con la Comisión de Competencia y Consumo de Singapur, así como con la Unión Económica Euroasiática. En 2023 se firmó otro Memorandum de Entendimiento con el Organismo de Protección y Fomento de la Competencia de Kazajistán. Además, los jefes de las autoridades encargadas de la competencia de los BRICS firmaron la Declaración Conjunta de Chengdu en 2021 y la Declaración Conjunta de Delhi en 2023.

3.3.4.2 Controles de precios

3.183. La principal legislación por la que se rigen los controles de precios en China, la Ley de Precios de China adoptada en 1997, no se modificó durante el período objeto de examen. Los instrumentos jurídicos que se indican a continuación se refieren a la regulación de los precios:

- Disposiciones sobre Sanciones Administrativas por Infracciones relacionadas con los Precios;
- Disposiciones Provisionales sobre la Prohibición de la Especulación;
- Medidas Provisionales para la Aplicación de Medidas de Intervención en los Precios y Medidas de Emergencia en Tiempos Atípicos;
- Reglamento sobre la Prohibición del Dumping a Precios Bajos;
- Disposiciones sobre el Mercado Claro de los Precios y la Prohibición del Fraude en los Precios; y
- Orientaciones de la Administración Estatal de Reglamentación del Mercado sobre la Investigación y Sanción de los Actos Ilegales de Aumento Excesivo de los Precios.

3.184. En el marco del Plan Quinquenal actual (2021-2025), China ha mejorado la vigilancia de los precios del cobre, el hierro, el petróleo bruto y el gas natural.¹⁷⁴ Además, actualmente se aplica al arroz con cáscara y al trigo una política de precios de compra mínimos en las principales provincias productoras de los dos cultivos. Con respecto al carbón térmico, las autoridades han indicado que no existe un tope de precios.

3.185. En el cuadro 3.20 y el cuadro 3.21 se muestran los productos y servicios sujetos a controles de precios por parte del Gobierno central y los Gobiernos locales de China.

Cuadro 3.20 Productos y servicios sujetos a controles de precios por parte del Gobierno central, 2023

Producto/servicio	Elementos de la fijación de precios		Observaciones
Transmisión y distribución de electricidad	Precio del transporte y la distribución de electricidad a nivel provincial o superior		
Transporte de petróleo y gas por tuberías	Precio del transporte por tuberías interprovincial (región autónoma o municipio bajo el control directo del Gobierno central)		Salvo en el caso de tuberías para consumo interno de las empresas
Transporte básico	Servicios de transporte ferroviario	Tarifas de asientos y camas de trenes ordinarios de pasajeros en líneas ferroviarias que son propiedad exclusiva del Gobierno central o están bajo su control mediante una participación en el capital	No se incluyen en la horquilla de precios los trenes con vagones a motor ni las líneas ferroviarias recién construidas reservadas al transporte de pasajeros y controladas mediante inversión en el capital social
		Precios del transporte de carga a granel y de equipaje por líneas ferroviarias que son propiedad exclusiva del Gobierno central o están bajo su control mediante una participación en el capital	La horquilla de precios abarca los precios del transporte de carbón, petróleo, cereales, abonos y otras cargas de mercancías y equipajes por vagones completos, excepto el transporte de carga por líneas ferroviarias recién construidas y controladas mediante inversión en el capital social

¹⁷⁴ Reuters (2021), "China to Strengthen Commodity Price Controls in Five-Year Plan", 25 de mayo de 2021. Consultado en: <https://www.reuters.com/article/us-china-commodities-idUSKCN2D60A2/>.

Producto/servicio	Elementos de la fijación de precios		Observaciones
	Servicios portuarios	Tarifas de los servicios monopolísticos prestados en los puertos principales a lo largo de la costa y en el curso principal del río Yangtsé, así como en todos los demás puertos abiertos a embarcaciones de pabellón extranjero	La horquilla de precios abarca la entrada y salida de los puertos, el atraque y salida de buques, la seguridad portuaria y otros servicios
	Servicios de aviación civil	Tarifas de transporte de pasajeros en las rutas aéreas nacionales de aviación civil y en la sección interior de las rutas aéreas internacionales de aviación civil que no pueden ser objeto de licitación	Excepto las tarifas de primera clase y clase preferente
		Tarifas de la parte monopolística de los servicios de salvaguardia de la aviación civil	La horquilla de precios abarca las tarifas de los servicios monopolísticos prestados en los aeropuertos civiles y los aeropuertos de doble uso (civil y militar), las tarifas de los servicios de inspección de vuelos de las compañías aéreas civiles y las tarifas de los servicios de gestión del tráfico aéreo civil
Abastecimiento de agua en el marco de los principales proyectos de conservación del agua	Precios del agua suministrada en el marco de proyectos de conservación del agua interprovinciales (región autónoma o municipio bajo el control directo del Gobierno central) directamente dependientes del Gobierno central		Excepto los precios negociados voluntariamente entre proveedores y compradores
Servicios postales importantes	Tarifas de entrega de correo		Excepto en actividades competitivas (como el envío de paquetes cuyo precio se calcula en función del peso y el volumen)
	Tarifas de remesas postales		
	Tarifas de correspondencia clasificada		
	Tarifas de distribución de revistas y periódicos fijadas por el Estado		
	Tarifas de envío de paquetes de peso unitario inferior a 10 kg		
Servicios profesionales importantes	Tasas por servicios básicos de los bancos comerciales y comisiones por transacciones con tarjetas bancarias		La horquilla de precios abarca los servicios básicos de los bancos comerciales, como las transferencias y remesas, los envíos de efectivo y el cobro de facturas, así como los servicios de transacciones con tarjetas bancarias (excepto relaciones competitivas, como las comisiones por adquisición de servicios)
Medicamentos especiales y sangre	Medicamentos especiales	Precios de los estupefacientes y de la primera categoría de sustancias psicotrópicas	
	Sangre	Precios de la sangre para uso clínico de los ciudadanos suministrada por los bancos de sangre	

Fuente: Información facilitada por las autoridades.

Cuadro 3.21 Productos y servicios sujetos a controles de precios por parte de los Gobiernos locales, 2023

Producto/servicio	Tipo de control/justificación	Reglamentación
Tasas de protección ambiental	Las tasas por la utilización por compensación y la comercialización de los derechos de vertido de contaminantes y las tasas de eliminación de desechos peligrosos están reguladas por los Gobiernos locales. Justificación: servicios de utilidad pública	Reglamento sobre Drenaje Urbano y Tratamiento de Aguas Residuales
Tasas de eliminación de basuras domésticas en las zonas urbanas	Las tasas de eliminación de desechos domésticos en las zonas urbanas están reguladas por los Gobiernos locales. Justificación: servicios de utilidad pública	Circular sobre la Imposición de Tasas de Eliminación de Basuras Domésticas en las Zonas Urbanas y la Promoción de la Eliminación de Basuras mediante Tratamientos Industriales
Tasas de eliminación de aguas residuales	Las tasas de eliminación de aguas residuales están reguladas por los Gobiernos locales. Justificación: servicios de utilidad pública	Medidas relativas a la Administración de la Recaudación de las Tasas sobre el Vertido de Contaminantes
Precios de bienes inmuebles y tasas de servicios conexos	Las viviendas económicas y el alquiler de viviendas de bajo precio, así como las tasas por servicios relacionados con bienes inmuebles, están sujetos a la orientación de precios de los Gobiernos locales. Justificación: servicios de utilidad pública	Medidas Administrativas relativas a las Viviendas Económicas Medidas Administrativas relativas al Alquiler de Viviendas de Bajo Precio
Entrada a lugares de interés turístico propiedad del Estado	Los precios están sujetos a fijación u orientación por los Gobiernos locales. Justificación: servicios de utilidad pública	Ley de Turismo

Fuente: Información facilitada por las autoridades.

3.3.5 Comercio de Estado y empresas públicas

3.186. China presentó su última notificación completa sobre las empresas comerciales del Estado en 2021. La legislación y la reglamentación no han variado durante el período objeto de examen. Según las autoridades, los fines del comercio de Estado son los siguientes: asegurar la estabilidad del suministro y de los precios de los productos abarcados, garantizar la seguridad alimentaria, proteger los recursos naturales agotables y no reciclables y el medio ambiente, y lograr el objetivo de desarrollo sostenible.

3.187. Las empresas comerciales del Estado de China tienen el derecho exclusivo de importar o exportar los siguientes productos: tabaco, petróleo crudo y elaborado, carbón refinado, abonos químicos, tungsteno y sus productos, antimonio y sus productos, y plata. Según la notificación presentada, las empresas no comerciales del Estado con derechos registrados pueden gestionar parte del contingente de importación de determinados productos, como el trigo, el maíz, el arroz, el azúcar y el algodón, en las condiciones establecidas en los anuncios anuales. Además, algunas de estas empresas están autorizadas a importar o exportar abonos químicos, petróleo crudo y petróleo elaborado.

3.188. Las autoridades han señalado, entre las empresas comerciales del Estado cuyo funcionamiento se rige por el mecanismo del mercado, las siguientes sociedades: COFCO Corporation, China National Sugar and Alcohol Group Corporation Ltd, China Commercial Foreign Trade Corporation, China Tobacco International Inc., Sinochem Group, China International Petroleum and Chemicals Co. Ltd, China National United Oil Corporation, Zhu Hai Zhen Rong Company, China Aviation Oil Imp. & Exp. Co. Ltd, China National Offshore Oil Corporation, China National Agricultural Means of Production Group Co., Chinatex Corporation Ltd, Beijing Jiu Da Textiles Group Cooperation, Tianjin Textiles Industry Supply and Sales Co. Ltd, Shanghai Textiles Raw Materials Co. Ltd, China National Cotton Reserves Corporation, Xinjiang Yin Long International Agricultural Cooperation Co. Ltd, China National Cotton Group Corporation, Xinjiang Jintianlu Agricultural Products Logistics Co. Ltd, Jilin Grain Group Imp. & Exp. Co. Ltd, Beidahuang Group. Co. Ltd, y Beijing Oriental Desheng Grain Import & Export Co. Ltd.

3.189. En la economía china, la propiedad estatal de las empresas coexiste con diversas modalidades de propiedad privada, por lo que hay desde empresas de capital totalmente estatal hasta estructuras de propiedad mixta. Las autoridades consideran que la economía estatal es la fuerza principal de la economía nacional, y que la economía no pública es un componente importante de la economía socialista de mercado. El Gobierno promueve una economía mixta en un contexto de preponderancia de la propiedad pública, que las autoridades señalan como el núcleo de la "economía socialista de mercado"; la propiedad mixta pretende fomentar la integración entre el capital estatal, el capital colectivo, el capital privado y otras formas de capital. El sector privado es dominante en industrias tales como la del vestido, los alimentos y el montaje para la exportación, mientras que las empresas públicas predominan en sectores como la energía, los servicios públicos, el transporte y los servicios financieros y de telecomunicaciones. Las empresas públicas pueden ser entidades comerciales o entidades de protección social.

3.190. Aunque no está previsto privatizar las empresas públicas, se han logrado avances en la "reforma de la propiedad mixta". Según las autoridades, el plan de acción trienal (2020-2022) para la reforma de las empresas públicas chinas se tradujo en general en una mayor eficiencia y orientación hacia el mercado de las empresas públicas. En julio de 2023 se inició una nueva ronda de reforma de las empresas públicas centrada en la reorganización institucional e industrial y en la innovación tecnológica.

3.191. Durante el período examinado creció el número de empresas públicas, tanto en el sector industrial como en el de la construcción. El porcentaje de empresas públicas en el sector industrial aumentó ligeramente, a diferencia de lo ocurrido en el sector de la construcción (cuadro 3.22). Los beneficios de las empresas públicas del sector industrial también han aumentado, registrando un máximo en 2021. El valor bruto de la producción de las empresas públicas en el sector de la construcción aumentó de manera constante, mientras que su cuota de mercado fluctuó en torno al 12%. En los últimos años, la participación de las empresas públicas en los beneficios totales del sector de la construcción ha aumentado.

Cuadro 3.22 Las empresas públicas en la economía de China, 2017-2022

Sector	2017	2018	2019	2020	2021	2022
Sector industrial^a						
Número total de empresas	372.729	378.440	377.815	399.375	441.517	472.009

Valor de la producción bruta de las empresas públicas (en miles de millones de CNY)	2.641	2.626	3.066	3.488	3.763	4.409
Porcentaje de empresas públicas	12,3	11,2	12,3	13,2	12,8	14,3

a Con inclusión de la minería, las manufacturas, y la producción y el suministro de electricidad, gas y agua.

b Las cifras se refieren a las empresas públicas, incluidas las empresas con participación del Estado.

Fuente: Oficina Nacional de Estadística de China, *China Statistical Yearbook* (varios números).

3.192. La Comisión de Supervisión y Administración de Activos Estatales (SASAC), de propiedad estatal, supervisa la creación de valor y el incremento del capital estatal, nombra y evalúa a los directivos de las empresas con arreglo a la ley, los recompensa o sanciona en función de los resultados obtenidos, y establece las directrices para la reforma de las empresas públicas y las fusiones y adquisiciones. La SASAC actúa como representante del Gobierno central y como inversor,

y depende directamente del Consejo de Estado. Las autoridades han señalado que la supervisión de las empresas públicas centrales por parte de la SASAC está sujeta a los derechos de los inversores, no a las facultades administrativas. En marzo de 2024, la SASAC tenía a su cargo 97 empresas públicas (el mismo número de empresas que en enero de 2021). La administración de las empresas públicas del sector financiero o empresas financieras centrales (26 en total) depende directamente del MOF.

3.193. En 2022 había 1.351 empresas públicas que cotizaban en bolsa (441 de ellas participadas por el Estado y 910 participadas por las administraciones locales), lo que representa el 26,6% de todas las empresas que cotizaban en bolsa. Entre las principales empresas que cotizan en bolsa y tienen un alto valor de mercado, el porcentaje de empresas participadas por el Estado es particularmente alto. Muchas grandes empresas formalmente privadas, incluso aquellas que cotizan en el mercado de valores, tienen al Estado como accionista importante o mayoritario, ya sea en virtud de la titularidad directa de participaciones o mediante instrumentos de inversión estatal.

3.194. La SASAC supervisa en la actualidad a 7 de las 10 mayores empresas públicas de China (Cuadro 3.23), frente a 3 en 2021. A finales de 2023, el número de trabajadores empleados en empresas supervisadas por la SASAC ascendía a unos 29,3 millones.

Cuadro 3.23 Las 10 mayores empresas públicas de China, 2023

(Miles de millones de USD)

Empresa	Ingresos
Red Eléctrica Estatal	530,0
China National Petroleum ^a	483,0
Grupo SINOPEC ^a	471,2
China State Construction Engineering ^a	305,9
Banco Industrial y Comercial de China	214,8
Banco de la Construcción de China	202,8
Banco Agrícola de China	187,1

3.195. Las empresas públicas son un elemento esencial de la economía china. Aunque hay quien las considera instrumentos clave para aplicar las políticas públicas, prestar apoyo a los objetivos industriales nacionales y mantener el control estatal sobre sectores esenciales, fomentando así la estabilidad económica e influyendo en la competitividad mundial, las autoridades afirman que las empresas públicas de China operan de manera sistemática sobre la base de criterios comerciales y realizan actividades empresariales de acuerdo con principios orientados al mercado y basados en el Estado de derecho. Según el FMI, la productividad de las empresas públicas que cotizan en bolsa en China es por lo general baja, en comparación con la de las empresas privadas que cotizan; las reformas podrían cerrar esta brecha provocada por una deficiente asignación de los recursos. Se estima que cerrar la brecha de productividad entre las empresas públicas y las empresas privadas aumentaría la productividad en torno a un 6%.¹⁷⁵

3.196. El Fondo para la Reforma Estructural de China, creado en 2016 con una dotación inicial de CNY 131.000 millones, tiene por objeto optimizar la gestión y el desarrollo de las empresas públicas a través de la financiación de la reestructuración de estas empresas y de las fusiones y adquisiciones en el extranjero, con miras a incrementar la integración industrial y mejorar la eficiencia en general. La segunda fase del Fondo se puso en marcha en 2021, con un capital desembolsado de CNY 737.500 millones, y su finalidad es invertir en industrias emergentes estratégicas y en esferas clave que afectan a la seguridad nacional. Las autoridades afirman que el Fondo está constituido, invierte y opera en un régimen de mercado.

3.197. Existen diversos mecanismos de financiación respaldados por el Gobierno para cubrir las deudas y déficits de las empresas públicas. En julio de 2020, China constituyó un fondo de protección

¹⁷⁵ FMI (2021), *People's Republic of China: Selected Issues*, IMF Country Report N° 21/12. Consultado en: [https://www.elibrary.imf.org/view/journals/002/2021/012/article-A002-en.xml#:~:text=A%20Brief%20Overview%20of%20SOEs,country%20\(IMF%20Fiscal%20Monitor\)](https://www.elibrary.imf.org/view/journals/002/2021/012/article-A002-en.xml#:~:text=A%20Brief%20Overview%20of%20SOEs,country%20(IMF%20Fiscal%20Monitor).).

del crédito para las empresas públicas centrales con la finalidad de recaudar CNY 100.000 millones y una dotación inicial de CNY 10.000 millones destinados a proporcionar financiación de emergencia a las empresas públicas para evitar posibles impagos. Desde entonces, 11 Gobiernos provinciales o municipales también han creado fondos de protección del crédito para cubrir los riesgos de impago de los bonos emitidos por empresas públicas. No se dispone de información sobre la tasa de utilización o los desembolsos del fondo.

3.198. La importancia global de las empresas públicas en la economía de China puede afectar al funcionamiento de las políticas y prácticas de mercado y tener repercusiones mundiales. Según el FMI, las empresas públicas de China pueden beneficiarse de créditos concedidos por bancos estatales u otras formas de financiación, de garantías implícitas, de inyecciones de capital y de un acceso preferencial a los insumos. Las autoridades rechazan esta afirmación e indican que las empresas públicas de China operan en condiciones de mercado, sin privilegios otorgados por el Gobierno. Además, las autoridades afirman que "no hay datos empíricos que respalden la afirmación de que se están ofreciendo [a las empresas públicas] garantías implícitas o un acceso preferencial al crédito".¹⁷⁶

3.3.6 Contratación pública

3.3.6.1 Panorama general

3.199. Según las autoridades, el valor total de la contratación pública en China ascendió a CNY 3,5 billones en 2022 (último año sobre el que se dispone de datos), lo que equivale al 2,9% del PIB (cuadro 3.24). Como en los años precedentes, la mayor parte de la contratación pública tiene lugar a nivel de los Gobiernos subcentrales.

Cuadro 3.24 Valor de la contratación pública y proporción del PIB, 2020-2022

(Miles de millones de CNY y %)

Año	Nivel	Valor total de la contratación	Proporción del PIB (%)	Bienes	Servicios de construcción e ingeniería	Otros servicios
2020	Gobierno central	285,3	..	149,4	74,5	61,3
	Gobiernos subcentrales	3.411,8	..	768,2	1.674,7	968,9
	Otros (empresas públicas, servicios públicos, etc.)	..	..	..	..	..
	Total	3.697,1	3,6	917,6	1.749,2	1.030,2
2021	Gobierno central	296,2	..	156,6	80,2	59,3

	Otros (empresas públicas, servicios públicos, etc.)	..	..	..	..	..
	Total	3.499,3	2,9	902,8	1.566,4	1.030,1

.. No disponible.

Fuente: Información facilitada por las autoridades.

3.3.6.2 Marco jurídico e institucional

3.3.6.2.1 Marco vigente y evolución reciente

3.200. Desde el anterior examen no se han producido cambios importantes en el marco institucional por el que se rige la contratación pública en China.¹⁷⁷ La Ley de Contratación Pública (promulgada en 2002 y revisada en 2014) y su reglamento de aplicación siguen siendo las disposiciones legislativas básicas que regulan las actividades de contratación pública en China. Se aplica a todas

¹⁷⁶ FMI (2024), *China: Staff Report for the Article IV Consultation and Statement by Zhengxin Zhang, Executive Director for People's Republic of China*, IMF Country Report N° 24/38, página 8.

¹⁷⁷ Para más información sobre el marco jurídico e institucional de China en materia de contratación pública, véanse los documentos de la OMC [WT/TPR/S/415/Rev.1](#), de 9 de marzo de 2022 (sección 3.3.6.2), y [WT/TPR/S/375/Rev.1](#), de 14 de septiembre de 2018 (sección 3.3.6.2).

las actividades de contratación realizadas por órganos estatales de todos los niveles, instituciones públicas y organizaciones sociales financiadas con cargo a fondos fiscales ordinarios, pero no a la contratación llevada a cabo por las empresas públicas. Además, la Ley de Licitaciones (promulgada en 1999 y revisada en 2017) regula la contratación de los grandes proyectos de construcción (incluidos los proyectos de grandes obras de infraestructura y de servicios públicos). Es, de hecho, el instrumento legislativo que regula el régimen de contratación de las empresas públicas.

3.201. Por lo que se refiere al principio de no discriminación, el artículo 16 de la Ley de Inversión Extranjera dispone que las empresas con inversión extranjera establecidas en China "pueden participar en las actividades de contratación pública en condiciones de competencia leal" y que "los productos fabricados y los servicios prestados por empresas con inversión extranjera en el territorio de China recibirán un trato igualitario en la contratación pública". En la actualidad, las leyes y los reglamentos de contratación pública de China no contienen disposiciones específicas en materia de no discriminación de las empresas extranjeras. Sin embargo, el artículo 18 de la Ley dispone que no se excluirá a los licitadores potenciales mediante la imposición de condiciones no razonables, y que en la contratación no se discriminará a ningún licitador potencial. Sigue existiendo la posibilidad de otorgar a los proveedores, mercancías y servicios nacionales un trato más favorable que el otorgado a los proveedores, las mercancías y los servicios extranjeros. A título de ejemplo:

- El artículo 10 de la Ley de Contratación Pública dispone que las entidades contratantes deben contratar bienes, servicios de construcción y otros servicios, con las excepciones siguientes: i) cuando los bienes, servicios de construcción u otros servicios requeridos no están disponibles en el territorio de China o, si lo están, no puedan adquirirse en condiciones comerciales razonables; ii) cuando los bienes, los servicios de construcción y otros servicios se adquieren para su uso en el extranjero; y iii) cuando otras leyes y reglamentos administrativos dispongan otra cosa. Además, las Medidas relativas a la Administración de la Contratación Pública de Productos Importados (Cai Ku Nº 119, 2007) disponen que las autoridades financieras han de verificar, en cada caso específico, las condiciones que permiten la contratación de productos importados.
- El artículo 9 de la Ley de Contratación Pública establece que la contratación pública se llevará a cabo de manera que facilite el logro de los objetivos marcados por las políticas estatales de desarrollo económico y social, entre los que figuran la protección del medio ambiente, la asistencia a zonas poco desarrolladas o con minorías étnicas, y la promoción del crecimiento de las pequeñas y medianas empresas. Además, otras medidas obligan a las autoridades chinas a conceder un trato preferencial a las pymes nacionales, a las empresas del sector penitenciario y a las empresas de personas discapacitadas y de zonas afectadas por la pobreza. En lo que respecta a las pymes, y con el fin de aplicar los requisitos pertinentes de la Circular del Consejo de Estado sobre la adopción de un paquete de medidas de política para estabilizar la economía (Guo Fa [2022] Nº 12)¹⁷⁸, el Ministerio de Hacienda publicó un Anuncio sobre la intensificación del apoyo a las pymes en la contratación pública (Anuncio Nº 19 de 2022).¹⁷⁹ Este Anuncio dispone que las entidades contratantes pertinentes deben i) aplicar de manera rigurosa las políticas de contratación pública para apoyar a las pymes (por ejemplo, el Anuncio del MOF Cai Ku [2020] Nº 46, que contiene información sobre la política de contratos reservados a las pymes); ii) incrementar las preferencias de precios para las pymes; y iii) aumentar la proporción de contratos reservados a las pymes. Según las autoridades, la participación de las pymes en la contratación asciende a cerca del 75%.¹⁸⁰

¹⁷⁸ Véase la Circular Nº 12 del Consejo de Estado, de 2022, sobre la adopción de un conjunto de medidas de política sólido para estabilizar la economía. Consultado en: https://www.gov.cn/zhengce/content/2022-05/31/content_5693159.htm.

¹⁷⁹ Véase el Anuncio Nº 19 del Ministerio de Hacienda, de 2022, sobre la intensificación del apoyo a las pymes en la contratación pública. Consultado en: https://gks.mof.gov.cn/quizhangzhidu/202205/t20220531_3814923.htm.

¹⁸⁰ Para poder acogerse a las políticas destinadas a las pymes, las empresas deben presentar la Carta de Declaración para las Pequeñas y Medianas Empresas, de conformidad con las Medidas administrativas para promover el desarrollo de las pequeñas y medianas empresas por medio de la contratación pública.

3.202. Durante el período objeto de examen se adoptaron diversas medidas relacionadas con la contratación para aplicar la Ley de Contratación Pública y la Ley de Licitaciones. En el cuadro 3.5 se ofrece un panorama general de las principales medidas relacionadas con la contratación adoptadas durante el período examinado.

Cuadro 3.25 Lista de medidas relacionadas con la contratación pública adoptadas durante el período examinado

Ley/reglamento/medida	Año de promulgación
Medidas administrativas en materia de contratación pública de servicios	Anuncio Nº 102 del MOF (2020)
Medidas administrativas en materia de prescripciones sobre la contratación pública	Anuncio Nº 21 del MOF Cai Ku [2021]

3.203. En agosto de 2023, el Consejo de Estado emitió un dictamen¹⁸¹ encaminado a optimizar el entorno empresarial para la inversión extranjera en China. Este dictamen hace referencia a la contratación pública y aclara que las empresas con capital extranjero establecidas en China deben poder participar en las actividades de contratación pública de manera no discriminatoria, de conformidad con la legislación aplicable. En él también se indica que i) se introducirán lo antes posible políticas y medidas complementarias para aclarar mejor los criterios específicos sobre la "producción en China"; ii) se llevarán a cabo inspecciones especiales para garantizar la participación equitativa de los proveedores en las actividades de contratación pública; y iii) se investigarán y tratarán las infracciones de la ley, como el trato diferenciado de las empresas con capital extranjero.

¹⁸¹ Véase Consejo de Estado, Dictamen Nº 11 de 2023 sobre la optimización del entorno de inversión extranjera y la intensificación de los esfuerzos para atraer inversiones extranjeras. Consultado en:
https://www.gov.cn/zhengce/content/202308/content_6898048.htm.

3.3.6.2.2 Revisiones en curso de la Ley de Contratación Pública y la Ley de Licitaciones

3.204. Durante el período objeto de examen prosiguió el proceso de revisión de la Ley de Contratación Pública y la Ley de Licitaciones.

- El proyecto de Ley de Licitaciones modificada se publicó en línea para que pudieran formularse alegaciones públicas en diciembre de 2019.¹⁸² En julio de 2020, la Comisión Nacional de Desarrollo y Reforma presentó al Consejo de Estado un nuevo proyecto revisado que reflejaba las observaciones recibidas; en abril de 2024, la revisión seguía en curso.
- El proyecto de Ley de Contratación Pública modificada se publicó en línea para que pudieran formularse alegaciones públicas en dos ocasiones (diciembre de 2020 y julio de 2022).¹⁸³ Según las autoridades, el poder legislativo de China aún está examinando la versión más reciente del proyecto.

3.205. Según las autoridades, se espera que la revisión de ambas leyes adapte en mayor medida el marco de contratación pública de China a los instrumentos internacionales en el ámbito de la contratación pública, incluido el Acuerdo sobre Contratación Pública (ACP de 2012) y la Ley Modelo de la CNUDMI sobre la Contratación Pública, y armonice la aplicación de las dos leyes.

3.3.6.3 Métodos de contratación y utilización de la contratación electrónica

3.206. Durante el período examinado se introdujeron pocos cambios en los principales métodos y procedimientos de contratación.¹⁸⁴ En particular, el MOF adoptó medidas provisionales (Anuncio N° 110 del MOF¹⁸⁵) para introducir la posibilidad de utilizar acuerdos marco en las contrataciones frecuentes y de valor reducido.

3.207. Según las autoridades, en 2022 la contratación mediante licitación pública representó el 77,2% de la contratación pública total, la licitación selectiva el 0,8%, la petición de precios el 0,9%, la negociación competitiva el 2,2% y la contratación de proveedor único el 3,3%. El valor de la contratación de proveedor único disminuyó de CNY 1,596 billones en 2020 a CNY 1,153 billones en 2022 (cuadro 3.26).

3.208. Según las autoridades, durante el período examinado China siguió trabajando en la creación de un sistema nacional único de contratación electrónica y en la elaboración de las normas técnicas y especificaciones de datos necesarias para todo el proceso de contratación electrónica. Además, los organismos de contratación centralizada, el Gobierno central y los Gobiernos locales han creado plataformas electrónicas para apoyar la contratación basada en acuerdos marco.

Cuadro 3.26 Valor de los contratos adjudicados a nivel del Gobierno central y de los Gobiernos locales, por método de contratación (2020-2022)

(Miles de millones de CNY y %)

Método de contratación		2020	2021	2022
Licitación pública	Valor	2.931,3	2.825,2	2.702,6
	Porcentaje	79,3%	77,6%	77,2%
Licitación selectiva	Valor	40,3	37,3	27,3
	Porcentaje	1,1%	1,0%	0,8%
Petición de precios	Valor	40,4	36,7	30,7
	Porcentaje	1,1%	1,0%	0,9%

¹⁸² Para más información sobre la naturaleza y el contenido de las enmiendas propuestas, véase el documento de la OMC [WT/TPR/S/415/Rev.1](#), de 9 de marzo de 2022, párrafo 3.3.

¹⁸³ Para más información sobre la naturaleza y el contenido de las enmiendas propuestas, véase el documento de la OMC [WT/TPR/S/415/Rev.1](#), de 9 de marzo de 2022, párrafo 3.4.

¹⁸⁴ La Ley de Contratación Pública, su reglamento de aplicación y las Medidas administrativas pertinentes establecen seis métodos de contratación: i) licitación pública; ii) licitación selectiva; iii) petición de precios; iv) negociación competitiva; v) consultas competitivas; y vi) contratación de proveedor único. Para ampliar la información sobre los métodos y procedimientos de contratación, véase el documento [WT/TPR/S/375/Rev.1](#) de la OMC, de 14 de septiembre de 2018, párrafos 3.197 a 3.207.

¹⁸⁵ Véanse las Medidas administrativas provisionales sobre la utilización de acuerdos marco en la contratación pública (Anuncio N° 110 del MOF). Consultado en: <https://lawinfochina.com/display.aspx?id=38586&lib=law>.

Método de contratación		2020	2021	2022
Negociación competitiva	Valor	119,3	103,3	77,4
	Porcentaje	3,2%	2,8%	2,2%
Consultas competitivas	Valor	283,5	352,7	384,1
	Porcentaje	7,7%	9,7%	11,0%
Contratación de proveedor único	Valor	159,6	137,5	115,3
	Porcentaje	4,3%	3,8%	3,3%
Total	Valor	3.574,3	3.492,7	3.337,3
	Porcentaje	96,7%	96,0%	95,4%

Fuente: Información facilitada por las autoridades.

3.3.6.4 Procedimientos internos de revisión

3.209. Los procedimientos administrativos y judiciales de revisión de China apenas han variado durante el período examinado.¹⁸⁶ La Ley de Contratación Pública y las Medidas relativas a la Gestión de Impugnaciones y Reclamaciones contra los Procesos de Contratación Pública (Anuncio N° 94 del MOF, de 2017) exige que las autoridades financieras en los diferentes niveles del Gobierno examinen las reclamaciones de los proveedores en relación con las actividades de contratación pública en sus respectivos niveles. En 2022, último año sobre el que se dispone de cifras, se presentaron unas 11.000 reclamaciones administrativas (cuadro 3.27). Según las autoridades, los proveedores extranjeros tienen por lo general la posibilidad de plantear objeciones y presentar recursos de conformidad con la reglamentación pertinente.

Cuadro 3.27 Reclamaciones relacionadas con la contratación pública a nivel del Gobierno central y de los Gobiernos locales, 2020-2022

	2020	2021	2022
Número total de reclamaciones administrativas	10.371	12.307	11.008

Fuente: Información facilitada por las autoridades.

3.3.6.5 Adhesión al ACP de 2012 y otra cooperación internacional

3.210. China solicitó la adhesión al ACP de 2012 en diciembre de 2007, cumpliendo así el compromiso de iniciar las negociaciones de adhesión al Acuerdo que había asumido en el momento de su adhesión a la OMC en 2001. La oferta más reciente de acceso a los mercados presentada por China, su sexta oferta revisada, se distribuyó en octubre de 2019, y sus respuestas actualizadas a la lista recapitulativa de preguntas se distribuyeron en junio de 2020. Durante el período examinado se ha avanzado poco. En su informe anual de 2023, el Comité de Contratación Pública de la OMC alentó a China a que siguiera trabajando y a que distribuyera una nueva oferta revisada de acceso a los mercados tan pronto como fuera posible.¹⁸⁷

3.211. Según las autoridades, hay seis zonas francas experimentales en las que se están aplicando normas económicas y comerciales internacionales de alto nivel, incluso en el ámbito de la contratación pública (por ejemplo, disciplinas similares a las previstas en el ACP), con el fin de adquirir experiencia e ideas para la adhesión al ACP. Las entidades contratantes de estas zonas están obligadas a justificar la contratación con un único proveedor.

3.212. China no ha incluido ningún compromiso de acceso a los mercados en la esfera de la contratación pública en ninguno de sus ALC. Algunos de los ALC firmados por China (por ejemplo, el Acuerdo de Asociación Económica Amplia Regional y el ALC actualizado con Nueva Zelandia) contienen disposiciones sobre contratación pública destinadas principalmente a promover la transparencia y la cooperación entre los signatarios.

¹⁸⁶ Para ampliar la información sobre el mecanismo de reclamación por los proveedores, véase el documento [WT/TPR/S/375/Rev.1](#) de la OMC, de 14 de septiembre de 2018, párrafos 3.215 y 3.216.

¹⁸⁷ Documento [GPA/AR/6](#) de la OMC, de 6 de diciembre de 2023, sección 3.1.2.2.

3.3.7 Derechos de propiedad intelectual

3.3.7.1 Panorama general

3.213. Durante el período objeto de examen, China siguió incorporando la propiedad intelectual (PI) a su economía y adaptó su sistema nacional para dar respuesta a la evolución tecnológica y mejorar su eficacia y el cumplimiento de los compromisos internacionales.

3.214. En 2023, China ocupaba el puesto 12º entre las 132 economías incluidas en el Índice Mundial de Innovación.¹⁸⁸ Este puesto elevado se debió a la evolución positiva del régimen de PI de China, que registró el mayor número de patentes en vigor, 4,2 millones, en 2022.¹⁸⁹

3.215. La participación de China en el comercio de PI ha experimentado un aumento, como demuestra el incremento de los ingresos totales percibidos por concepto de derechos de PI, que pasaron de USD 20.000 millones en 2013 a casi USD 45.000 millones en 2022 (gráfico 3.4).

Gráfico 3.4 Derechos relacionados con las exportaciones y las importaciones de PI, 2013-2022

(En miles de millones de USD)

Fuente: Portal de Datos de la OMC. Consultado en: <https://data.wto.org/>.

3.3.7.2 Reformas institucionales y políticas relacionadas con la PI

3.216. Durante el período objeto de examen, China siguió reformando su régimen de propiedad intelectual, entre otras cosas: se promulgó una Ley de Derecho de Autor revisada, se modificaron la Ley de Patentes y una nueva Ley de Semillas, y se revisó la Ley de Marcas de Fábrica o de Comercio. Se está preparando una modificación de la Ley de Represión de la Competencia Desleal para reforzar la regulación de la competencia desleal relacionada con los derechos de PI. Esta modificación incluirá prohibiciones respecto de la venta de mercancías que causen confusión deliberadamente, y las sanciones correspondientes.

3.217. En 2023, el Comité Central del Partido Comunista de China y el Consejo de Estado publicaron el Programa para la Reforma de las Instituciones del Partido y del Estado, en el que se establece expresamente que se mejorará la administración de los derechos de PI. En concreto, el Programa prevé acelerar el proceso de conversión de China en un país donde la PI sea competitiva mejorando de manera integral la creación, el uso, la protección, la administración y los servicios en materia de PI. La Administración Nacional de la Propiedad Intelectual de China (CNIPA) fue reestructurada y pasó de ser una oficina nacional dependiente de la SAMR a un organismo dependiente directamente del Consejo de Estado. La observancia de la legislación sobre marcas de fábrica o de comercio y

¹⁸⁸ OMPI (2023), *Global Innovation Index 2023*. Consultado en: wipo.int/edocs/pubdocs/en/wipo-pub-2000-2023-en-main-report-global-innovation-index-2023-16th-edition.pdf.

patentes sigue estando a cargo del equipo responsable de la supervisión del mercado y admite la orientación profesional de la CNIPA.

3.218. El MIIT y la CNIPA publicaron conjuntamente el Plan de Acción relativo a la Propiedad Intelectual para la Innovación y el Desarrollo en la Industria (2023-2027)¹⁹⁰, que fijó el objetivo de mejorar la capacidad para crear patentes de alto valor para las principales industrias fabriles. El 27 de julio de 2023, la CNIPA publicó las Orientaciones¹⁹¹ de 2023 para la Construcción de un País Pujante en materia de Propiedad Intelectual y el Plan de Fomento de la Aplicación del 14º Plan Quinquenal. El Plan tiene por objeto fomentar la modernización mediante la innovación y los avances tecnológicos, así como fomentar la producción de alta gama, inteligente y ecológica. Además, incluye la mejora de la eficiencia de los servicios públicos de propiedad intelectual, el fortalecimiento del uso integral de los derechos de PI y su protección judicial.

3.3.7.3 Contexto internacional

3.219. China es uno de los Estados miembros de la Organización Mundial de la Propiedad Intelectual (OMPI) y participa en diversos convenios y tratados internacionales relacionados con los derechos de propiedad intelectual (cuadro 3.28). Durante el período objeto de examen, China se adhirió al Tratado de Marrakech para facilitar el acceso a las obras publicadas a las personas ciegas, con discapacidad visual o con otras dificultades para acceder al texto impreso y al Arreglo de La Haya relativo al Registro internacional de dibujos y modelos industriales (Acta de Ginebra de 1999), que entraron en vigor el 5 de mayo de 2022.¹⁹²

3.220. China es parte en 23 acuerdos comerciales bilaterales; también es parte en 13 ACR que tienen un capítulo sobre PI. En particular, en enero de 2022 entró en vigor para China el Acuerdo de Asociación Económica Amplia Regional (RCEP). Su capítulo sobre PI abarca una amplia variedad de temas, como el derecho de autor, las marcas de fábrica o de comercio, las indicaciones geográficas, las patentes, los dibujos y modelos industriales, los recursos genéticos, los conocimientos tradicionales y el folclore, la protección contra la competencia desleal, la observancia, la cooperación, la transparencia y la asistencia técnica.

3.221. La CNIPA ha desarrollado una amplia red de Programas de Tramitación Acelerada de Patentes (PPH). Entre 2023 y 2024, se firmaron acuerdos de cooperación de PPH con las oficinas de propiedad intelectual de Alemania, Chile, Dinamarca, la Federación de Rusia, el Japón, Noruega, el Reino de la Arabia Saudita, la República Checa y la Oficina Euroasiática de Patentes.¹⁹³

3.3.7.4 Derecho de autor y derechos conexos

3.222. Durante el período objeto de examen, China revisó su Ley de Derecho de Autor, que entró en vigor en junio de 2021. La Ley contiene actualizaciones que responden al rápido desarrollo de nuevas tecnologías y los respectivos mecanismos de exigencia del cumplimiento. Asimismo, aplica el Tratado de Marrakech y amplió el alcance del uso razonable de "transcribir en braille las obras publicadas y publicar la transcripción" a "distribuir obras publicadas a las personas con trastornos de lectura en un formato accesible y que puedan percibir".¹⁹⁴

3.223. Las Disposiciones Provisionales sobre la Distribución de Obras para las Personas con Discapacidad Visual en un Formato Accesible son unas directrices concretas relativas a la producción y distribución de formatos accesibles, y hacen cumplir la protección prevista en la Ley de Derecho de Autor y el Tratado de Marrakech.¹⁹⁵

3.224. El régimen de derecho de autor incluye asimismo el Reglamento de Aplicación de la Ley de Derecho de Autor, el Reglamento sobre la Protección de los Programas Informáticos, el Reglamento sobre la Administración Colectiva del Derecho de Autor, el Reglamento sobre la Protección del Derecho de Divulgación de Información a través de las Redes, y las Medidas Provisionales sobre el Pago por las Estaciones de Radio y de Televisión de una Remuneración por la Radiodifusión de Grabaciones de Sonido.

3.225. Desde el punto de vista institucional, la Administración Nacional del Derecho de Autor administra el registro del derecho de autor. En el caso de los programas informáticos, el registro de las obras amparadas por el derecho de autor está a cargo del Centro para la Protección del Derecho de Autor.

3.226. En abril de 2021, la Administración Nacional del Derecho de Autor de China y el Ministerio de Cultura y Turismo distribuyeron conjuntamente un Anuncio sobre el Mantenimiento del Buen Funcionamiento del Mercado de los Derechos de Autor en el Sector del Karaoke para mejorar la gestión colectiva de los derechos de autor; crear un mecanismo sólido, científico y razonable de protección del derecho de autor en el sector del karaoke; proteger los derechos e intereses legítimos de los titulares y usuarios del derecho de autor; y promover un desarrollo regulado del sector de los derechos de autor.¹⁹⁶

3.227. El procedimiento de registro previsto en la Ley de Derecho de Autor no ha variado desde el anterior examen. El registro es voluntario y no es necesario para que el derecho de autor esté protegido.¹⁹⁷ La nueva Ley de Derecho de Autor prevé la concesión de licencias de derechos de autor y la transferencia de derechos. La infracción del derecho de autor puede sancionarse con multas.

¹⁹³ CNIPA, *PPH News*. Consultado en: <https://english.cnipa.gov.cn/col/col1356/index.html>.

¹⁹⁴ Información facilitada por las autoridades.

¹⁹⁵ Información facilitada por las autoridades, (Guo Ban Fa [2022] Nº 1).

¹⁹⁶ Información facilitada por las autoridades (Guo Ban Fa [2021] Nº 1).

¹⁹⁷ Los ciudadanos chinos y las personas jurídicas u otras organizaciones chinas gozan automáticamente de protección del derecho de autor sobre sus obras; esto también se aplica a los extranjeros cuyas obras se publiquen por primera vez en China. La protección del derecho de autor de las obras publicadas en el extranjero no ha variado desde el anterior examen.

3.228. La duración de la protección del derecho de autor para las personas físicas, y para determinadas obras¹⁹⁸, abarca la vida del autor más 50 años.¹⁹⁹ La protección de los programas informáticos se concede a partir de la fecha en que se terminó su elaboración. La duración de la protección de los dibujos y modelos tipográficos es de 10 años. La duración de la protección de las obras fotográficas es la vida del autor más 50 años; y las obras audiovisuales están protegidas durante 50 años.

3.229. Hay cinco organizaciones de administración colectiva del derecho de autor en China: la Sociedad de Derechos de Autor de Obras Musicales de China; la Asociación de Derechos de Autor de Obras Audiovisuales de China; la Sociedad de Derechos de Autor de Obras Escritas de China; la Sociedad China del Derecho de Autor sobre las Imágenes; y la Asociación China del Derecho de Autor sobre Películas Cinematográficas (cuadro 3.29).

Cuadro 3.29 Organizaciones de administración colectiva del derecho de autor - Derechos y composición

Organización	Derechos percibidos (en millones de CNY, 2023)	Nº de miembros (2023)
Sociedad de Derechos de Autor de Obras Musicales de China	417	12.079
Asociación de Derechos de Autor de Obras Audiovisuales de China	454	553 (con inclusión de entidades miembros y miembros particulares)
Sociedad de Derechos de Autor de Obras Escritas de China	20,7	10.520
Sociedad China del Derecho de Autor sobre las Imágenes	7,2	22.000
Asociación China del Derecho de Autor sobre Películas Cinematográficas	0,0388	104

Fuente: Información facilitada por las autoridades.

3.3.7.5 Propiedad industrial

3.3.7.5.1 Marcas de fábrica o de comercio

3.230. Durante el período objeto de examen, China estaba revisando la Ley de Marcas de Fábrica o de Comercio y sus reglamentos para abordar el registro abusivo y los actos que afectan negativamente al registro de marcas de fábrica o de comercio y coartan los derechos de marcas de fábrica o de comercio. Además, la revisión tiene por objeto optimizar los procedimientos para otorgar y verificar derechos sobre marcas de fábrica o de comercio; mejorar la protección de las marcas de fábrica o de comercio notoriamente conocidas no registradas; crear un mecanismo de solución de diferencias; reforzar la observancia; y fomentar la colaboración entre los distintos sectores para mejorar los servicios públicos. Los proyectos de modificación de la Ley de Marcas de Fábrica o de Comercio estuvieron a disposición del público para que se formularan observaciones del 13 de enero al 27 de febrero de 2023.

3.231. Desde la reforma del régimen de marcas de fábrica o de comercio en 2018, el examen de las solicitudes y el registro y la administración de las marcas de fábrica o de comercio están a cargo de la CNIPA. El registro sigue siendo un requisito previo para la protección, y la propiedad se determina en función de quién es el primer solicitante. Conforme al artículo 18 de la Ley de Marcas de Fábrica o de Comercio, las empresas extranjeras deben designar un agente de marcas chino. La duración de la protección es de 10 años. Según las autoridades, la solicitud de renovación del registro debe presentarse 12 meses antes de la fecha de expiración.

¹⁹⁸ Entre ellas figuran las obras de una persona jurídica u otra organización; las obras creadas en el marco de la actividad profesional y cuyos derechos de autor correspondan a una persona jurídica u otra organización; y las obras cinematográficas y fotográficas. Las producciones audiovisuales, las emisiones de radiodifusión y las interpretaciones o ejecuciones en público gozan también de protección durante 50 años a partir del primer día de producción, radiodifusión o interpretación.

¹⁹⁹ En caso de haber más de un titular del derecho de autor, la protección se otorga hasta 50 años después de la muerte del último titular del derecho superviviente.

3.232. En diciembre de 2022, la SAMR publicó el reglamento sectorial denominado Disposiciones sobre la Supervisión y Administración de las Agencias de Marcas de Fábrica o de Comercio para mejorar la calidad de los servicios prestados por los agentes de marcas de fábrica o de comercio y promover la buena salud del mercado.²⁰⁰

3.233. Durante el período objeto de examen, el número de solicitudes y registros de marcas de fábrica o de comercio siguió aumentando. En 2022, el 97% de las solicitudes y el 97% de los registros de marcas de fábrica o de comercio correspondían a residentes (cuadro 3.30).

Cuadro 3.30 Solicitudes y registros de marcas de fábrica o de comercio, 2020-2022

(Número)

Marcas de fábrica o de comercio		2020	2021	2022
Solicitudes	Residentes	9.116.454	9.192.675	7.304.007
	No residentes	231.114	257.832	211.954
	Solicitudes presentadas en el marco del Sistema de Madrid por solicitantes chinos	6.721	5.296	5.074
Registro	Residentes	5.576.545	7.545.358	6.001.698
	No residentes	184.107	193.589	175.472

Fuente: Información facilitada por las autoridades; y datos del Sistema de Madrid obtenidos del Centro de Datos Estadísticos sobre Propiedad Intelectual de la OMPI (consultado el 27 de junio de 2023).

3.3.7.5.2 Indicaciones geográficas

3.234. Las indicaciones geográficas pueden obtener protección en forma de marcas de certificación o de marcas colectivas, con arreglo a la Ley de Marcas de Fábrica o de Comercio, o mediante un sistema *sui generis* previsto en las Disposiciones sobre la Protección de las Indicaciones Geográficas de Productos y administrado por la CNIPA. El régimen de indicaciones geográficas tiene por objeto promover el desarrollo de industrias especializadas, contribuyendo a la revitalización del medio rural. Las indicaciones geográficas que no hayan sido registradas oficialmente siguen estando protegidas por las leyes pertinentes, por ejemplo, la Ley de Marcas de Fábrica o de Comercio, la Ley de Represión de la Competencia Desleal, la Ley de Inocuidad de los Alimentos y la Ley de Calidad e Inocuidad de los Productos Agrícolas.

3.235. El 1 de marzo de 2021 entró en vigor el acuerdo bilateral entre la UE y China para proteger las indicaciones geográficas. El Acuerdo protege 200 denominaciones de productos agroalimentarios europeos y chinos contra la imitación y la usurpación. Durante un período de cuatro años a partir de su entrada en vigor, el alcance del acuerdo se ampliará para abarcar otras 350 indicaciones geográficas de ambas partes. Estas indicaciones geográficas tendrán que seguir el mismo procedimiento de aprobación (es decir, la evaluación y la publicación para la formulación de observaciones) que los 200 nombres inicialmente abarcados por el acuerdo.²⁰¹

3.236. En junio de 2022, China había aprobado 2.493 productos protegidos por indicaciones geográficas, había certificado 6.927 indicaciones geográficas para su registro como marcas colectivas y marcas de certificación, y había autorizado a unas 19.400 entidades mercantiles a utilizar símbolos especiales de indicaciones geográficas.²⁰²

3.3.7.5.3 Patentes

3.237. El 17 de octubre de 2020, el 13^{er} Comité Permanente del Congreso Nacional del Pueblo en su 22^o período de sesiones adoptó una modificación de la Ley de Patentes. La Ley de Patentes revisada entró en vigor el 1 de junio de 2021. La nueva Ley establece muchas medidas concretas destinadas a proteger los derechos e intereses de los titulares de patentes, a promover la aplicación de patentes y a mejorar el sistema de concesión de patentes. Entre esas medidas figuran el establecimiento de sistemas de indemnización punitiva, el aumento del límite máximo de la indemnización legal y el establecimiento de una licencia abierta y una prórroga de la duración de las

²⁰⁰ Información facilitada por las autoridades; y Anuncio N° 63 de la SAMR.

²⁰¹ MOFCOM. Consultado en: <http://tfs.mofcom.gov.cn/article/zscq/202009/20200903002354.shtml>.

Consultado en: https://english.cnipa.gov.cn/art/2022/8/17/art_2829_177354.html.

patentes, lo que pone de relieve la orientación hacia la mejora de la protección de la propiedad intelectual y el fomento de la innovación.

3.238. Durante el período objeto de examen, se modificaron varios reglamentos. El 21 de diciembre de 2023, la CNIPA publicó la versión final del Reglamento de Aplicación de la Ley de Patentes y de las Directrices para el Examen de Patentes revisados, que entraron en vigor el 20 de enero de 2024. Estos instrumentos revisados completan los esfuerzos legislativos por introducir cambios en el sistema de patentes de China mediante la modificación de la Ley de Patentes promulgada en junio de 2021. Uno de esos cambios es la prórroga de la duración de las patentes introducida en virtud el artículo 41.3 de la Ley de Patentes para compensar la pérdida de la duración real de la patente como consecuencia del tiempo dedicado a la aprobación de la comercialización de nuevos medicamentos.

3.239. En una reunión ejecutiva del Consejo de Estado celebrada en octubre de 2023 se aprobó el Plan de Acción Especial para la Comercialización y Utilización de Patentes (2023-2025). El objetivo del Plan es potenciar la comercialización de patentes de universidades e institutos de investigación que, en conjunto, representan el 25,3% de todas las patentes de invención válidas cuya titularidad pertenece a usuarios chinos.²⁰³

3.240. Las autoridades están revisando las disposiciones detalladas del Reglamento de Aplicación de la Ley de Patentes y de las Directrices para el Examen de Patentes, a fin de mejorar el sistema de examen de patentes, fortalecer la protección de las patentes y promover la conversión y aplicación de patentes con arreglo a la nueva Ley de Patentes.

3.241. La CNIPA es el organismo encargado de recibir y tramitar las solicitudes de patentes y de otorgar las patentes. El período de protección de las patentes es de 20 años. Las personas físicas y jurídicas interesadas pueden recurrir a un tribunal popular o a la autoridad administrativa para la solución de diferencias relativas a las patentes.

3.242. Conforme a lo dispuesto en el artículo 75 de la Ley de Patentes, se permiten las importaciones paralelas de productos patentados. Los artículos 53 a 63 contienen disposiciones sobre licencias obligatorias. Se pueden conceder licencias obligatorias de patentes por razones de interés público o en caso de emergencia nacional o en circunstancias extraordinarias. Hasta la fecha no se han concedido licencias obligatorias en China.

3.243. Según los informes de la Oficina Nacional de Estadística, en 2022 los sectores con un uso intensivo de patentes alcanzaron un valor añadido de CNY 15,32 billones. La fabricación de nuevos equipos generó un valor añadido de CNY 4,17 billones, lo que representa el 27,2% del valor añadido global de los sectores con un uso intensivo de patentes. Le sigue el sector de los servicios de tecnologías de la información y las comunicaciones, que contribuye con CNY 3,39 billones y representa el 22,1% del total. La industria manufacturera de las tecnologías de la información y las comunicaciones generó un valor añadido de CNY 3,18 billones, que representa el 20,8% del total.²⁰⁴

3.244. En 2022, la CNIPA se clasificó como la principal oficina de propiedad intelectual del mundo, al alcanzar el 46,8% del total mundial de solicitudes de patentes, lo que equivale a 1,6 millones de solicitudes de patentes en 2022 (gráfico 3.5). El número de patentes solicitadas en China aumentó un 2,1% en 2022, tras un aumento del 5,9% en 2021 y del 6,9% en 2020. Desde 2015, la CNIPA ha recibido más de un millón de solicitudes anuales. En 2022, China tenía el mayor número de patentes en vigor, a saber, 4,2 millones.²⁰⁵

3.3.7.5.6 Esquemas de trazado (topografías) de los circuitos integrados

3.249. Los esquemas de trazado (topografías) de los circuitos integrados están protegidos por el Reglamento sobre la Protección de los Esquemas de Trazado de los Circuitos Integrados y sus Normas de Aplicación.

3.250. La CNIPA se encarga del registro de los esquemas de trazado de los circuitos integrados. Las autoridades afirman que un esquema de trazado dejará de estar protegido 15 años después de la fecha de finalización de su creación, con independencia de su registro o explotación comercial.

3.3.7.5.7 Obtenciones vegetales

3.251. El 24 de diciembre de 2021, el Comité Permanente del 13^{er} Congreso Nacional del Pueblo, en su 32^o período de sesiones, adoptó la decisión de revisar la Ley de Semillas, cuyo texto revisado entró en vigor el 1 de marzo de 2022. El objetivo principal de esta revisión es fortalecer la protección de los derechos de propiedad intelectual en la industria de las semillas mediante la ampliación del alcance de los mecanismos de protección de los derechos sobre obtenciones vegetales, el establecimiento del sistema de variedades esencialmente derivadas, la mejora del sistema de compensación por infracción de derechos y la promoción del establecimiento de sistemas que fomenten y apoyen la innovación en la reproducción.²⁰⁹

3.252. En noviembre de 2021, China publicó un Catálogo de Obtenciones Vegetales Protegidas (Recursos Forestales y Herbáceos) (octavo lote), en el que incluyó nueve nuevos géneros (especies).²¹⁰

3.253. El plazo de protección de las obtenciones vegetales es de 20 años a partir de la fecha de autorización en el caso de las vides, los árboles forestales, los árboles frutales y los árboles ornamentales, y de 15 años en el de las demás plantas.

3.254. El MARA y la Administración Nacional de Silvicultura y Pastizales (NFGA) son responsables conjuntamente de la protección de las obtenciones vegetales. Entre 2021 y 2023, China recibió un total de 35.198 solicitudes de obtenciones vegetales (de las cuales 1.294 eran solicitudes extranjeras) y se autorizaron 14.978 solicitudes (964 de ellas extranjeras).

3.3.7.5.8 Información no divulgada y secretos comerciales

3.255. El régimen por el que se rige la protección de la información no divulgada y los secretos comerciales se compone de la Ley de Represión de la Competencia Desleal (modificada por última vez en 2019), la Ley de Licencias Administrativas (modificada por última vez en 2019), el

²¹⁰ Información facilitada por las autoridades.

Código Penal (modificado por última vez en 2020), la Ley del Trabajo, el Reglamento de Aplicación de la Ley de Administración de Productos Farmacéuticos, y el Reglamento sobre la Administración de Productos Químicos Agrícolas.

3.256. En marzo de 2022, la SAMR publicó el Anuncio de Publicación del Plan de Trabajo para el Programa Piloto de Protección Innovadora de Secretos Comerciales en todo el País, y llevó a cabo proyectos piloto nacionales de innovación para la protección de los secretos comerciales. En julio de 2022 se anunció el primer lote de 20 regiones piloto innovadoras, que puso en marcha oficialmente el proyecto piloto de innovación. En abril de 2023, la SAMR publicó un aviso para iniciar el proceso de solicitud para el segundo lote.

3.257. Varias regiones han estudiado formas de abordar las dificultades que entraña la protección de los secretos comerciales. Se han puesto en marcha iniciativas como el establecimiento de oficinas de orientación para la protección de secretos comerciales (servicio de información), empresas de demostración y bases de demostración, que han mejorado eficazmente los conocimientos de las empresas sobre sus derechos y los niveles de servicios gubernamentales. Hasta la fecha, los departamentos de supervisión de mercados a todos los niveles en el conjunto del país han establecido 8.634 bases de demostración, servicios de información sobre protección de derechos, empresas de demostración, etc.

3.3.7.6 Observancia

3.3.7.6.1 Panorama general

3.258. El régimen de observancia de los derechos de la propiedad intelectual en China sigue evolucionando. Ha surgido un sistema judicial especializado, encabezado por la División de DPI del Tribunal Supremo del Pueblo y administrado por cuatro tribunales de DPI. Los asuntos se someten principalmente a los 27 tribunales locales del pueblo de nivel intermedio, con el apoyo de los tribunales de DPI de los tribunales locales del pueblo en todos los niveles (cuadro 3.33). El 20 de abril de 2022, el Tribunal Supremo del Pueblo publicó el Aviso sobre Diversas Disposiciones relativas a la Jurisdicción de Primera Instancia en Asuntos Civiles y Administrativos en Materia de Propiedad Intelectual, y las correspondientes medidas de apoyo. El número de tribunales del pueblo de nivel inferior con jurisdicción sobre los asuntos civiles de DPI en China, incluidos los tribunales de internet, asciende a 558.

3.3.7.6.2 Procedimientos administrativos

3.259. En 2021 y 2022, la SAMR utilizó sus funciones de coordinación y organizó reuniones nacionales periódicas sobre la lucha contra las infracciones y la falsificación, publicó los puntos clave anuales de los esfuerzos nacionales para combatir la infracción y la falsificación, y aclaró las principales tareas y responsabilidades de diversas regiones y departamentos. También ha aplicado orientaciones sobre el fortalecimiento de la protección de los derechos de propiedad intelectual de empresas con financiación extranjera.

3.260. Con la intención de abordar las infracciones relacionadas con marcas de fábrica o de comercio y patentes, la SAMR organizó medidas de observancia e investigó las actividades ilegales. La SAMR también publicó el Programa de Acción "Puño de Hierro" para la Investigación y Tramitación de Asuntos en el Ámbito de los Medios de Subsistencia del Pueblo, 2021 y 2023, dirigido especialmente a combatir la infracción de las marcas de fábrica o de comercio. Con el fin de hacer frente a los registros de marcas de fábrica o de comercio maliciosos, la SAMR reforzó el intercambio de información con la CNIPA y organizó departamentos de supervisión de los mercados locales para aplicar medidas más rigurosas de observancia de la legislación.

3.261. En 2021 y 2022, la SAMR organizó en todo el país acciones destinadas a destruir las mercancías infractoras, falsificadas y de calidad inferior para impedir la circulación de esos productos. En noviembre de 2022, 18 provincias (regiones autónomas y municipios) destruyeron simultáneamente más de 30 categorías y más de 100 variedades de productos infractores, falsificados y de calidad inferior, por un valor total de CNY 500 millones, protegiendo eficazmente los derechos e intereses legítimos de empresas nacionales y con financiación extranjera.

3.262. La CNIPA publica anualmente el Plan de Trabajo de Protección Administrativa Nacional de la Propiedad Intelectual, que se centra en áreas clave y en regiones de alta incidencia en las que el público tiene grandes intereses y preocupaciones, y despliega más de 20 tareas específicas de rectificación especial. También formula un plan anual de evaluación de resultados, que incluye una rápida protección coordinada, inspecciones organizadas y la mejora del nivel de observancia de la legislación y de la capacidad de tramitación de asuntos. La CNIPA ha promovido también la construcción de sistemas de apoyo técnico para casos de solución de diferencias por infracción de la propiedad intelectual, y ha publicado Disposiciones Provisionales sobre la Participación de Investigadores Técnicos en la Resolución Administrativa de Diferencias relacionadas con la Infracción de Patentes y Esquemas de Trazado de Circuitos Integrados y las Orientaciones sobre el Fortalecimiento de la Evaluación de la Propiedad Intelectual.

3.263. En un esfuerzo conjunto con el Tribunal Supremo del Pueblo, la Fiscalía Suprema del Pueblo, el Ministerio de Seguridad Pública y la SAMR, la CNIPA formuló los Dictámenes sobre el Fortalecimiento de la Armonización entre Autoridades en la Evaluación de los Derechos de Propiedad Intelectual, promoviendo el desarrollo profesional de las instituciones de evaluación de la propiedad intelectual. Además, la CNIPA organiza cursos anuales de formación para la resolución administrativa de diferencias relacionadas con la infracción de patentes y cursos de formación para mejorar la capacidad de protección de la propiedad intelectual de casi 900 directivos. También apoya y orienta a las autoridades locales con más de 40 cursos de formación sobre la protección administrativa de la propiedad intelectual, enviando a 46 conferenciantes y formando a 3.500 empleados de empresas y funcionarios de base encargados de hacer cumplir la ley a nivel provincial, municipal, de condado y de aldea.

3.264. Desde 2021, la Administración Nacional del Derecho de Autor ha emprendido sistemáticamente medidas especiales para combatir las infracciones del derecho de autor y la piratería en línea, medidas estacionales para proteger los derechos de autor de los jóvenes, campañas especiales para combatir la piratería de libros y campañas especiales para combatir la grabación y difusión no autorizadas de películas cinematográficas. Ha reforzado las principales normas que regulan el derecho de autor en línea y ha adoptado medidas enérgicas contra la infracción del derecho de autor y la piratería en ámbitos clave en línea, redoblando continuamente los esfuerzos de protección del derecho de autor, optimizando el entorno empresarial y promoviendo el desarrollo de alta calidad.

3.3.7.6.3 Medidas judiciales

3.265. El Tribunal Supremo del Pueblo promulgó Disposiciones sobre Varias Cuestiones relativas a la Aplicación de la Ley en Litigios Civiles de Patentes relacionados con Medicamentos cuyo Registro se Solicita, el Aviso sobre Diversas Disposiciones relativas a la Aplicación Específica de la Ley en el Enjuiciamiento por Infracciones de Derechos sobre Obtenciones Vegetales, y Disposiciones sobre Varias Cuestiones relativas a la Aplicación de la Ley en Litigios Civiles de Monopolio. También ha formulado la Interpretación de Varias Cuestiones relativas a la Aplicación de la Ley de Represión de la Competencia Desleal de la República Popular China, para dar respuesta a las necesidades judiciales en nuevos ámbitos y promover la formación de una competencia leal y un mercado nacional abierto y unificado; la Interpretación sobre la Aplicación de Indemnizaciones Punitivas en Litigios Civiles de Infracción de la Propiedad Intelectual, para garantizar unas normas uniformes en materia de indemnizaciones punitivas; y la Respuesta Oficial del Tribunal Supremo del Pueblo sobre las Cuestiones relativas a la Reclamación por el Demandado de una Indemnización por Gastos Razonables Alegando que el Demandante Abusa de sus Derechos en una Acción por Infracción de los Derechos de Propiedad Intelectual, a fin de apoyar las reclamaciones de gastos razonables a litigantes abusivos, y orientar a las partes para que ejerzan sus derechos procesales de buena fe.

3.266. El Tribunal Supremo del Pueblo también lleva a cabo una amplia labor de mediación en línea en diferencias sobre propiedad intelectual, y tramita más de 20.000 asuntos de solución de diferencias en materia de propiedad intelectual.

3.3.7.6.4 Medidas aduaneras

3.267. El marco jurídico para la observancia de los derechos de PI en la frontera lo conforman la Ley de Aduanas, el Reglamento sobre la Protección en Aduana de los Derechos de Propiedad Intelectual y las Normas de la Administración de Aduanas de Aplicación del Reglamento sobre la Protección en Aduana de los Derechos de Propiedad Intelectual.

3.268. En 2022, la Administración de Aduanas de China incautó 60.900 lotes y 77,9 millones de unidades de mercancías sospechosas de infringir los DPI, frente a 79.200 lotes y 71,8 millones de unidades de mercancías en 2021.

3.269. La Administración de Aduanas de China ha organizado campañas especiales como la "Acción Dragón Volador" para el fortalecimiento integral de la protección de la propiedad intelectual, la "Acción Red Azul" dirigida a los canales postales, y la "Acción Limpieza de Redes" centrada en las mercancías que transitan por un tercero. La Administración de Aduanas de China también ha mejorado la observancia de la legislación fomentando la aplicación de equipos de alta tecnología en la protección aduanera. Ha hecho un amplio despliegue de tecnología de reconocimiento de marcas de fábrica o de comercio mediante terminales móviles, con el fin de ayudar a los funcionarios de aduanas a identificar en línea las marcas falsificadas infractoras y acelerar la verificación de la situación de los DPI de las mercancías importadas y exportadas. La Administración de Aduanas de China también ha proporcionado a los funcionarios cursos, plataformas de intercambio laboral y formación en el empleo para mejorar las capacidades de observancia de la legislación en primera línea. En 2021 y 2022 se impartieron un total de 1.260 sesiones de formación en materia de observancia a más de 70.000 participantes.

3.270. En 2020 se incautaron 61.900 envíos, que contenían 56,2 millones de unidades de mercancías sospechosas. En 2021 y 2022 estas cifras ascendieron a 79.200 envíos y 60.900 envíos, con 71,8 millones y 77,9 millones de unidades de mercancías sospechosas, respectivamente. Aún no se dispone de las cifras correspondientes a 2023.

3.3.7.6.5 Procedimientos penales

3.271. Desde 2021, el Ministerio de Seguridad Pública ha facultado a los organismos nacionales de seguridad pública para desempeñar plenamente sus funciones de observancia penal, reprimir diversas infracciones de la propiedad intelectual conforme a lo dispuesto en la legislación, proteger los derechos e intereses legítimos de los titulares de DPI y contribuir a la creación de un entorno empresarial de primera clase. De 2021 a 2022 se tramitaron un total de 48.000 asuntos relacionados con la infracción de la propiedad intelectual y la fabricación y venta de mercancías falsificadas; los asuntos más importantes se sometieron a una supervisión especial.

3.272. El Ministerio de Seguridad Pública coordina con los organismos de seguridad de diversas regiones la adhesión a un principio básico de equidad en la protección de la propiedad intelectual, otorgando idéntica protección a las diversas entidades del mercado, incluidas las empresas de propiedad estatal, las empresas privadas, las empresas nacionales y extranjeras, y las grandes, medianas, pequeñas empresas y microempresas. Apoyándose en diversos mecanismos de cooperación internacional a nivel bilateral y multilateral para la observancia de la legislación, el Ministerio colaboró en asuntos transnacionales y transfronterizos. Por invitación de INTERPOL, los organismos de seguridad pública chinos siguen participando activamente en la "Operación Opso" contra los delitos alimentarios, la "Operación Pangea" contra los delitos relacionados con medicamentos y la "Operación Falcon" contra los delitos relacionados con la propiedad intelectual en internet.

4 POLÍTICAS COMERCIALES, POR SECTORES

4.1 Agricultura, silvicultura y pesca

4.1. La agricultura, la ganadería, la silvicultura y la pesca aportaron el 5,9% del PIB corriente en 2023, frente al 6,4% en 2021. La tasa de crecimiento real y el empleo fluctuaron de año en año (cuadro 4.1).

Cuadro 4.1 Principales indicadores de la agricultura, la ganadería, la silvicultura y la pesca, 2018-2023

	2018	2019	2020	2021	2022	2023
Contribución proporcional al crecimiento del PIB (%) ^a	4,1	3,9	10,4	6,4	10,8	5,9
Proporción del PIB corriente (%)	7,3	7,5	8,0	7,6	7,7	7,5
Tasa de crecimiento real (%)	3,6	3,2	3,3	7,1	4,4	4,2
Empleo (porcentaje del empleo total)	25,7	24,7	23,6	22,9	24,1	22,8
Proporción del valor de la producción bruta (%)						
Agricultura	54,1	53,3	52,1	53,3	54,1	..
Ganadería	25,3	26,7	29,2	27,1	26,0	..

4.1.1 Agricultura

4.1.1.1 Características del comercio en la agricultura

4.2. China sigue siendo un país importador neto de productos agropecuarios; en 2023 las importaciones de esos productos representaron el 8,4% de las importaciones totales de mercancías. Las principales exportaciones agropecuarias de China, por líneas arancelarias (a nivel de 4 dígitos del SA), siguen siendo las frutas y las hortalizas. Las importaciones de productos agropecuarios siguen consistiendo predominantemente en habas de soja (soya) (cuadro 4.2).

4.3. Las tierras cultivables pertenecen a las colectividades de campesinos, situación que no ha variado desde el anterior examen.¹ Las autoridades afirman que se alienta a los agricultores y a las organizaciones económicas colectivas rurales a que, de manera voluntaria, recauden fondos para programas destinados al bien público y aporten mano de obra para esos programas, así como a que participen en la roturación, explotación y gestión de las tierras agrícolas. También afirman que se mejorará el sistema de tenencia de las tierras rurales y se garantizarán los derechos e intereses sobre la tierra reconocidos por la ley correspondientes a los agricultores que se han afincado en ciudades. Las autoridades están estudiando el establecimiento de un mecanismo de vigilancia del

¹ Ley de Contratación de Tierras en Zonas Rurales. Consultada en: http://www.npc.gov.cn/zgrdw/npc/xinwen/2019-01/07/content_2070250.htm.

uso de las tierras cultivables. Según las autoridades, en el marco del Programa Piloto para la Profundización de la Reforma del Sistema de Fincas Rurales, publicado en 2020, la reforma piloto del sistema en 104 condados, ciudades y distritos y 3 ciudades de nivel de prefectura ha abarcado 1.719 municipios y 25.590 aldeas administrativas. Las autoridades afirman que la reforma afectó, entre otras cosas a la asignación, transferencia, aprobación y supervisión de fincas rurales y a la garantía de una vivienda para los agricultores.

4.1.1.2 Marco jurídico e institucional

4.4. El Ministerio de Agricultura y Asuntos Rurales (MARA) sigue siendo el principal ministerio competente, encargado, entre otras cosas, de las políticas relativas a las tierras cultivables, del desarrollo agrícola y rural y de la ejecución de la estrategia de revitalización del medio rural. La Administración Nacional de Reservas Alimentarias y Estratégicas (NAFRA), que depende de la Comisión Nacional de Desarrollo y Reforma (NDRC), sigue a cargo de: i) la organización y aplicación del sistema de compra, almacenamiento, rotación y administración cotidiana de las reservas de emergencia de conformidad con el plan general de desarrollo y el catálogo del sistema nacional de reservas; ii) la construcción y gestión de la infraestructura conexa; y iii) la supervisión e inspección de las reservas del Gobierno y de las empresas administradas por la NAFRA y la aplicación de las políticas de constitución de reservas; y iv) la supervisión de las orientaciones para el sector en materia de distribución de los cereales y gestión administrativa de las reservas centrales de cereales y de algodón (Recuadro 4.1). El Ministerio de Ciencia y Tecnología (MOST) administra la Fundación Nacional de Ciencias Naturales de China (NSFC), un organismo público de financiación de las actividades científicas. El MARA, junto con la NDRC, el Ministerio de Hacienda y el Ministerio de Comercio (MOFCOM), entre otras instituciones, está a cargo de la aplicación de la política agrícola.

Recuadro 4.1 La producción de algodón en China

Según datos facilitados por las autoridades, en 2023 la superficie dedicada al cultivo de algodón en el conjunto de China era de 41,82 millones de *mu* (1/15 de hectárea), lo que supone un disminución interanual del 7,1%. La pauta de distribución de las zonas de cultivo que ha cobrado forma consiste en "una zona principal y dos zonas secundarias" (la zona algodонера del interior noroccidental es la zona principal y las zonas algodoneiras de la cuenca del río Amarillo y la cuenca del río Yangtsé son las zonas secundarias). En 2023 la zona algodонера de Xinjiang tenía una superficie de 35,54 millones de *mu*, que representaban el 85% de la superficie total de cultivo en China. En los últimos años el rendimiento unitario de la producción de algodón ha aumentado sustancialmente a raíz de la promoción e introducción de nuevas especies y tecnologías. En 2023 el rendimiento unitario de la producción de algodón fue de 134,3 kg/*mu*, lo que supone un aumento interanual de 1,5 kg/*mu* y un aumento de casi el 30% respecto de 2015. En 2023 el volumen total de la producción de algodón fue de 5,62 millones de toneladas, de las que 5,11 millones de toneladas (el 91% del volumen total de producción) correspondían a Xinjiang. La tasa de autosuficiencia de China sigue rondando el 70%.

Fuente: Información facilitada por las autoridades.

4.5. Entre las empresas de propiedad estatal dependientes del Gobierno central y sus filiales supervisadas por la Comisión de Supervisión y Administración de Activos Estatales (SASAC) que operan en el sector agropecuario y sectores conexos, como los de elaboración de alimentos y producción de semillas, abonos y plaguicidas, cabe mencionar las siguientes: el Grupo de Desarrollo Agrícola de China, la Corporación Nacional de Cereales, Aceites y Productos Alimenticios de China (COFCO), el Grupo de Reservas de Grano de China, el Grupo de la Industria de la Sal de China, Sinochem, el Grupo Químico Nacional de China y el Grupo Nacional de Semillas de China.

4.6. En el Cuadro 4.3 se indican las principales leyes relativas al sector agropecuario. El 29 de abril de 2021 se promulgó la Ley de Fomento de la Revitalización del Medio Rural, que establece los objetivos, principios y prescripciones generales en materia de revitalización del medio rural. Con la estrategia de revitalización del medio rural las autoridades pretenden impulsar el crecimiento económico a través del desarrollo industrial, el apoyo al talento, la prosperidad cultural, la protección ecológica, la protección de las organizaciones y la integración de los medios urbano y rural.² Entre las medidas de apoyo pertinentes figurarán establecer y mejorar un sistema de garantía de las inversiones financieras, establecer un mecanismo de apoyo y asistencia a largo plazo para la población rural de ingresos bajos y las zonas subdesarrolladas, mejorar el mercado de capitales, y

² Government of China, Rural Revitalization Strategy. Consultado en: https://www.gov.cn/gongbao/content/2018/content_5331958.htm.

establecer y mejorar el servicio financiero rural y el sistema de seguros agrícolas, con el objetivo de reforzar el apoyo a la revitalización del medio rural.

4.7. La Ley de Semillas se revisó el 24 de diciembre de 2021, y la norma revisada, cuyo objetivo es reforzar la protección de los derechos de propiedad intelectual en la industria semillera, entró en vigor el 1 de marzo de 2022. La revisión amplió el alcance de la protección de los derechos sobre nuevas obtenciones vegetales, estableció el sistema de variedades esencialmente derivadas, mejoró el sistema de compensación por infracción de derechos, y mejoró los sistemas que alientan y apoyan la innovación en la reproducción (sección 3.3.7).³ Además, el 24 de junio de 2022 se adoptó la Ley de Protección de la Tierra Negra, que entró en vigor el 1 de agosto de 2022, con el fin de proteger los recursos de tierra negra y restablecer y aumentar la fertilidad básica de la tierra negra.⁴ La Ley de Protección de la Fauna y Flora Silvestres se revisó el 30 de diciembre de 2022, y la norma revisada, que tiene, entre otros, los objetivos de reforzar la protección de los hábitats de la fauna y flora silvestres, perfeccionar las medidas control de las poblaciones de fauna y flora silvestres, y reforzar la prevención y el control de la invasión por especies exóticas, entró en vigor el 1 de mayo de 2023. La Ley de Protección del Río Yangtsé, que se adoptó el 26 de diciembre de 2020 y entró en vigor el 1 de marzo de 2021, tiene el objetivo de alcanzar determinadas prioridades ecológicas y el desarrollo verde, y la Ley de Protección del Río Amarillo se adoptó el 30 de octubre de 2022 y entrará en vigor el 1 de abril de 2024.⁵ Ley de Ganadería se revisó el 30 de octubre de 2022, y la norma revisada, que tiene, entre otros, los objetivos de garantizar el suministro de productos para la ganadería y la avicultura, fomentar la cría y promoción de razas excelentes de ganado y aves de corral, revitalizar las industrias de cría ganadera y avícola, prevenir los riesgos para la salud pública y promover un desarrollo de alta calidad de la industria ganadera, entró en vigor el 1 de marzo de 2023. Ley de Prevención de Epizootias se revisó el 22 de enero de 2021, y la norma revisada, cuyo objetivo es reforzar la prevención de las epizootias, entró en vigor el 1 de enero de 2023. La Ley de Calidad e Inocuidad de los Productos Agrícolas se revisó en septiembre de 2022 y la norma revisada entró en vigor el 1 de enero de 2023.⁶

4.8. La Ley de Administración de Tierras, la Ley de Organización de Comités Rurales, la Ley de Cuarentena de Entrada y Salida de Fauna y Flora y la Ley de Promoción de la Mecanización Agrícola no han variado desde el anterior examen.

4.9. Las restricciones a la IED en la agricultura no han variado desde el anterior examen de China.

Cuadro 4.3 Principales leyes relacionadas con la agricultura, abril de 2024

Ley (fecha de la última modificación)	Ámbito de aplicación
Ley de Agricultura, 1993 (2012)	Principios para el desarrollo, gestión y protección de la agricultura. La agricultura comprende la plantación de cultivos, la silvicultura, la ganadería y la pesca.
Ley de Ganadería, 2005 (2022)	Disposiciones sobre la estandarización de la producción ganadera y avícola, la garantía del suministro, calidad e inocuidad de los productos para la ganadería y la avicultura, la protección y la utilización razonable de los recursos genéticos en la ganadería y la avicultura, la obtención y promoción de razas excelentes de ganado y aves de corral, la revitalización de las industrias de cría ganadera y avícola, la salvaguardia de los derechos e intereses legítimos en la producción y explotación ganaderas y avícolas, la prevención de los riesgos para la salud pública y la promoción de un desarrollo de alta calidad de la industria ganadera.
Ley de Cooperativas Especializadas de Agricultores, 2006 (2017)	Reglamentación sobre las normas aplicables a las cooperativas especializadas de agricultores y sobre el ejercicio de su actividad.

⁴ Gobierno de China. Consultado en: https://www.gov.cn/xinwen/2022-06/25/content_5697698.htm.

⁵ La Ley establece, entre otras cosas, medidas de ahorro de agua y mejora de la eficiencia en la agricultura, ahorro de agua y reducción de emisiones en la industria, y ahorro de agua y reducción de pérdidas en las ciudades.

⁶ Gobierno de China. Consultado en: https://www.gov.cn/xinwen/2022-09/03/content_5708127.htm.

Ley (fecha de la última modificación)	Ámbito de aplicación
Ley de Prevención de Epizootias, 1997 (2021)	Disposiciones sobre el refuerzo de la gestión de las actividades de prevención de epizootias, la prevención, control, eliminación y erradicación de enfermedades de los animales, la promoción del desarrollo de la ganadería, la prevención y control de las enfermedades infecciosas zoonóticas y la garantía de la salud pública y la salud humana.
Ley de Promoción de la Mecanización Agrícola, 2004 (2018)	Disposiciones para alentar y apoyar a los agricultores y las entidades de producción y explotación agrícolas en el uso de maquinaria agrícola avanzada y adecuada, y promover la mecanización agrícola.
Ley de Contratación de Tierras en Zonas Rurales, 2002 (2018)	Disposiciones para estabilizar y perfeccionar el sistema de explotación de dos niveles, que consiste en el sistema de responsabilidad contractual de las unidades familiares complementado por una gestión unificada, y confiere a los habitantes de las poblaciones rurales un derecho de uso de la tierra duradero y garantizado.
Ley de Extensión de Ingeniería Agrícola, 1993 (2012)	Disposiciones para reforzar la extensión de ingeniería agrícola y promover la investigación científica agronómica y las nuevas tecnologías agrícolas con el fin de asegurar el desarrollo y la modernización del sector agropecuario.
Ley de Administración de Tierras, 1986 (2019)	Disposiciones sobre los derechos de propiedad y uso de la tierra, la planificación de la utilización de la tierra, la protección de las tierras cultivadas, los terrenos edificables y la supervisión e inspección.
Ley de Calidad e Inocuidad de los Productos Agrícolas, 2006 (2022)	Disposiciones sobre las normas de calidad e inocuidad, el origen, la producción, el envasado y etiquetado, y la supervisión e inspección de los productos agropecuarios.
Ley de Organización de Comités Rurales, 1998 (2018)	Disposiciones sobre la composición y las funciones de los comités rurales, la elección de los comités, su reuniones y la supervisión y gestión democráticas.
Ley sobre las Empresas Establecidas en los Municipios, 1996	Disposiciones sobre el apoyo a las empresas establecidas en los municipios y la orientación de su desarrollo sostenible y adecuado, la protección de los derechos e intereses de esas empresas reconocidos por la ley y la regulación del ejercicio de su actividad.
Ley de Fomento de la Revitalización del Medio Rural, 2021	Disposiciones sobre la ejecución integral de la estrategia de revitalización del medio rural y la promoción de la revitalización de la industria, el talento, la cultura, la ecología y las organizaciones rurales.
Ley de Mediación y Arbitraje en Diferencias sobre Contratos Agrarios, 2009	Disposiciones sobre la resolución justa y oportuna de diferencias relativas a los contratos agrarios y a la gestión de las tierras rurales, y sobre la protección de los derechos e intereses legítimos de las partes.
Ley de Cuarentena de Entrada y Salida de Fauna y Flora, 1991 (2009)	Disposiciones sobre la prevención de la entrada o salida del país de enfermedades infecciosas, enfermedades parasitarias, enfermedades peligrosas de las plantas, insectos, malas hierbas y otros organismos nocivos, y sobre la protección de la agricultura, la silvicultura, la ganadería, la producción pesquera y la salud humana.
Ley de Protección de la Tierra Negra, 2022	Disposiciones sobre la protección de los recursos de tierra negra y el restablecimiento y la mejora de la fertilidad básica de la tierra negra.
Ley de Semillas, 2000 (2021)	Disposiciones sobre la protección y la utilización racional de los recursos de germoplasma, la normalización de la obtención de variedades, la producción de semillas, las prácticas de explotación y gestión, la promoción de la investigación científica y tecnológica en la industria semillera, el fomento de la innovación en la obtención de variedades, la protección de los derechos sobre las obtenciones vegetales, la salvaguardia de los derechos e intereses legítimos de los productores y usuarios de semillas, la mejora de la calidad de las semillas y el desarrollo de una industria semillera moderna.

4.10. Las autoridades consideran que el comercio electrónico ha acercado a los agricultores al mercado. Al final de 2023 la penetración de internet en las zonas rurales alcanzaba el 66,5%, y la brecha entre el campo y la ciudad sigue reduciéndose. En 2023 el volumen nacional de ventas al por

menor en línea rurales alcanzó la cifra de CNY 2,49 billones, con un aumento interanual del 12,9%. En 2023 el volumen nacional de ventas al por menor en línea de productos agropecuarios alcanzó la cifra de CNY 587.030 millones, con un aumento interanual del 12,5%. Al final de 2023 el número de comerciantes (comercios) rurales en línea en el conjunto del país ascendía a 18,4 millones, con un aumento interanual del 6,3%. Al final de 2023 se habían establecido en el conjunto del país más de 2.900 centros de servicio público de comercio electrónico y centros de distribución logística urgente a nivel de condado. La tasa nacional de cobertura del servicio urgente en las aldeas administrativas ha alcanzado el 95%, y en más de un tercio de los condados los paquetes pueden entregarse en cualquier aldea del condado en el mismo día de su expedición. Más de 100 millones de paquetes entran y salen de las zonas rurales cada día. En 2023 había 6,69 millones de empresas rurales de comercio electrónico en tiempo real, que representaban el 36,4% de las empresas rurales de comercio electrónico. La venta al por menor instantánea a nivel condado se ha desarrollado rápidamente, con una tasa de crecimiento anual de más del 50%, según estimaciones del sector.

4.1.1.3 Objetivos de política y reformas

4.11. Las autoridades indican que, durante el período objeto de examen, China se centró, entre otras cosas, en: i) reforzar la preparación de tierras agrícolas de alta calidad, ejecutar medidas para aumentar la capacidad de producción de cereales en 50 millones de toneladas, y estudiar el establecimiento de un mecanismo de vigilancia de la utilización de la tierra cultivable; ii) modernizar las instalaciones y la infraestructura agrícolas, con especial atención a una renovación y mejora integrales de las instalaciones anticuadas de cultivo y transformación de hortalizas y verduras; iii) establecer un sistema de suministro de alimentos diversificado para coordinar los cultivos de cereales, los cultivos económicos y los cultivos alimentarios; integrar la agricultura, la silvicultura, la ganadería y la pesca; y cultivar plantas y microorganismos y criar animales; iv) reforzar la supervisión de la inocuidad de los alimentos y la calidad de la producción agropecuaria; v) mejorar el sistema de tierras rurales; y vi) mejorar el entorno vital rural, intensificar la construcción de infraestructuras rurales, y mejorar los servicios públicos básicos para promover la planificación y construcción de poblaciones rurales.

4.12. La estrategia agrícola de China se refleja principalmente el Documento Central Nº 1 sobre el Desarrollo Agrícola y Rural, que se publica cada año. El principal objetivo del Documento Central Nº 1 publicado en 2023 es acelerar el desarrollo de una agricultura robusta; el objetivo se articula en 33 puntos, entre los que cabe destacar la promoción de la revitalización del medio rural y el refuerzo del apoyo conexo.

4.13. Los objetivos de política en materia de agricultura se reseñaron también en las Líneas Generales del 14º Plan Quinquenal (2021-2025) de Desarrollo Económico y Social Nacional y los Objetivos a Largo Plazo hasta 2035, anunciados en marzo de 2021. En noviembre de 2021 el Gobierno publicó el Aviso sobre la Planificación de la Modernización Agrícola y Rural, con el objetivo de promover el 14º Plan Quinquenal.⁷ En respuesta a diversas cuestiones relacionadas con la agricultura, los agricultores y las zonas rurales, se establecen los siguientes objetivos: garantizar eficazmente el suministro de cereales y otros productos agropecuarios importantes; mejorar continuamente la calidad, eficiencia y competitividad de la agricultura; hacer progresos en la construcción de infraestructuras rurales; mejorar el entorno ecológico rural; seguir mejorando la capacidad de gobernanza rural; aumentar los ingresos de los residentes en zonas rurales; y consolidar y ampliar los logros en materia de reducción de la pobreza.⁸

⁷ Government of China, Guo Fa Nº 25 [2021]. Consultado en: https://www.gov.cn/zhengce/content/2022-02/11/content_5673082.htm.

⁸ Guo Fa Nº 25 [2021], artículo V.

4.14. Otras estrategias son el Plan de Desarrollo Digital Agrícola y Rural (2019-2025)⁹, el Libro Blanco sobre la Seguridad Alimentaria en China, el Plan de Acción Quinquenal (2021-2025) para la Mejora del Hábitat Rural, y el Plan de Acción sobre la Construcción Rural.¹⁰

4.15. El Plan Nacional para el Desarrollo de Industrias Rurales 2020-2025, publicado por el MARA en julio de 2020, sigue en vigor¹¹; en el período objeto de examen las provincias introdujeron sus respectivos planes de desarrollo industrial rural, en consonancia con el Plan Nacional.¹²

4.16. Las autoridades también se proponen construir parques agroindustriales, ciudades industriales y conglomerados industriales modernos, así como introducir nuevos tipos de actividad industrial (por ejemplo, agricultura recreativa, turismo rural y comercio electrónico rural). Se ha apoyado el establecimiento de parques y municipios agroindustriales y conglomerados industriales modernos, así como el desarrollo de nuevos modelos empresariales (a saber, agricultura recreativa, turismo rural y comercio electrónico rural); desde 2021 se han establecido 150 parques agroindustriales modernos, 180 conglomerados industriales 698 centros urbanos agroindustriales.

4.17. En los últimos años, el MOFCOM, junto con los departamentos pertinentes, ha promovido el desarrollo del comercio electrónico rural en respuesta a la tendencia al desarrollo de internet y de la urbanización, con el fin de promover la transformación y mejora de la agricultura, impulsar los mercados de consumo rurales y aumentar los ingresos de los agricultores.

4.1.1.4 Instrumentos de política

4.1.1.4.1 Medidas en frontera

4.18. Los productos agropecuarios (definición de la OMC) están sujetos a tipos aplicados *ad valorem*, con la excepción de algunos productos de origen animal.¹³ En 2024, el arancel NMF medio aplicado a los productos agropecuarios era del 12,6% (12,7% en 2021). Entre los grupos de productos que se benefician de una protección arancelaria superior a la media figuran los azúcares y artículos de confitería (30,6%); los cereales y las preparaciones alimenticias (20,2%); las bebidas y el tabaco (15,8%); el algodón, la seda y la lana (14,2%); y el café, el té, el cacao y las especias (12,7%). El promedio aritmético de los aranceles aplicados a los productos lácteos fue el más bajo (11,1%) entre los correspondientes a los productos agropecuarios. Además, la variabilidad de los aranceles es mayor en el caso de los productos agropecuarios (desviación típica de 11,0) que en el de los productos no agrícolas (desviación típica de 4,5), y especialmente alta en el caso de los cereales y las preparaciones alimenticias (desviación típica de 22,0) y las bebidas y el tabaco (desviación típica de 16,9), seguidos por el azúcar y los artículos de confitería (desviación típica de 16,2) y el algodón, la seda y la lana (desviación típica de 12,3) (cuadro A3. 1).

4.19. China sigue utilizando contingentes arancelarios.¹⁴ La NDRC y el MOFCOM anuncian públicamente cada año los reglamentos de aplicación para la administración de los contingentes arancelarios de importación. Salvo en el caso del algodón sin peinar, los tipos arancelarios aplicables dentro y fuera de los contingentes son *ad valorem*. China aplica a una determinada cantidad de algodón sin peinar (SA 5201.00.00) importado fuera del contingente un tipo provisional en forma de derecho móvil que no puede exceder del 40% (es decir, del tipo consolidado para el algodón). Desde 2020, la tasa de utilización de los contingentes arancelarios ha fluctuado en el caso de algunos productos, entre ellos el trigo, el arroz, la lana y el algodón (cuadro 4.4). Las autoridades han

⁹ Gobierno de China. Consultado en: https://www.gov.cn/zhengce/zhengceku/2020-01/20/content_5470944.htm.

¹¹ Gobierno de China. Consultado en: https://www.gov.cn/zhengce/zhengceku/2020-07/17/content_5527720.htm.

¹² En el Plan se establecen los objetivos y las metas de ingresos para el desarrollo de industrias rurales, con prioridades como la modernización de las industrias de elaboración de productos agropecuarios, la expansión de las industrias rurales especializadas, la mejora del turismo agrícola, el desarrollo de nuevos tipos de industrias de servicios rurales, la promoción de sinergias entre la integración vertical de la agricultura y el desarrollo de industrias rurales, y el fomento del espíritu empresarial y de la innovación en las zonas rurales.

¹³ Esos productos corresponden a cuatro líneas arancelarias de la partida 0207 del SA, carne y despojos comestibles de aves, congelados, de la especie *Gallus domesticus*. Tres líneas arancelarias de la partida 4001 del SA (caucho natural) están sujetas a tipos alternativos o mixtos; esos tres tipos alternativos son derechos provisionales.

¹⁴ Documento [G/LIC/N/3/CHN/18](#) de la OMC, de 30 de enero de 2020.

indicado que las fluctuaciones de las tasas de utilización se deben a los cambios en las condiciones de los mercados interno e internacional.

Cuadro 4.4 Contingentes arancelarios para productos agropecuarios y su utilización, 2020-2022

Productos	Tipos fuera del contingente	Tipos dentro del contingente	Cuantía del contingente arancelario	Importaciones dentro del contingente		
				2020	2021	2022
	(%)		(toneladas)			
Trigo (7 líneas)			9.636.000	8.151.565	9.502.113	9.636.000

.. No disponible.

a La cantidad del contingente arancelario es de 2.660.000 toneladas para el arroz de grano corto y el arroz de grano medio combinados y de 2.660.000 toneladas para el arroz de grano largo.

Nota: El número de líneas arancelarias indicado entre paréntesis (al nivel de 8 dígitos del SA) se refiere al Arancel de 2024.

Fuente: Documentos de la OMC [G/AG/N/CHN/56](#), de 29 de junio de 2021; [G/AG/N/CHN/57](#), de 13 de septiembre de 2022; [G/AG/N/CHN/70](#), de 21 de septiembre de 2023; [G/LIC/N/3/CHN/18](#), de 30 de enero de 2020; [G/LIC/N/3/CHN/18/Corr.1](#), de 5 de febrero de 2020; y cálculos de la Secretaría de la OMC basados en datos facilitados por las autoridades.

4.20. La NDRC está encargada de asignar los contingentes de cereales y algodón, y el MOFCOM adjudica el resto. Algunos productos sujetos a contingentes arancelarios (por ejemplo, los cereales, el algodón y el azúcar) también son objeto de comercio de Estado. En esos casos, una parte del contingente se asigna a empresas comerciales del Estado y el resto a otras empresas. Los métodos de administración de los contingentes arancelarios descritos por China en su notificación a la OMC

no han variado.¹⁵ La importación de cereales (trigo, maíz y arroz), azúcar, tabaco y algodón es objeto de comercio de Estado (sección 3.3.5).

4.21. De conformidad con el Aviso del Consejo de Estado relativo a la Profundización de la Reforma para Separar los Permisos de las Licencias Comerciales y Aumentar la Vitalidad del Desarrollo de los Participantes en el Mercado (Guo Fa [2021] Nº 7), publicado el 19 de mayo de 2021, el 1 de julio de 2021 el MARA eliminó el requisito de examen de la importación y exportación de semillas por el Departamento de Agricultura y Asuntos Rurales de los Gobiernos provinciales. En cambio, el MARA comenzó a aceptar y aprobar directamente esas importaciones y exportaciones (sección 3.2). Desde el 1 de diciembre de 2021, el proceso de aprobación está plenamente digitalizado y las solicitudes en línea no precisan materiales impresos.

4.22. En 2023, el tipo del IVA aplicable a los productos agropecuarios de producción nacional e importados se mantuvo en el 9% (sin cambios desde el examen anterior). Los productos agropecuarios de producción propia vendidos por los productores están exentos del IVA. La hoja de tabaco (es decir, el tabaco en hoja secado al sol y el tabaco en hoja tostado) comprada en China está sujeta al impuesto aplicable a la hoja de tabaco, del 20%.¹⁶ Según las autoridades, ese impuesto no se aplica a la hoja de tabaco importada.

4.1.1.4.2 Medidas que afectan a las exportaciones

4.23. China ha notificado a la OMC que en los años civiles 2020 y 2022 no se concedieron subvenciones a la exportación de productos agropecuarios.¹⁷ China aplica programas de financiación de las exportaciones (es decir, créditos a la exportación, garantías de créditos a la exportación y programas de seguro) que abarcan los productos agropecuarios. China ha indicado, en sus respuestas al cuestionario sobre la competencia de las exportaciones distribuido el 17 de enero de 2020, que aplica programas de financiación de las exportaciones (por ejemplo, apoyo a corto plazo a la financiación del comercio para la exportación de productos agropecuarios sobre la base de facturas, recibos o cartas de crédito, etc.; préstamos de capital de explotación para proveedores; seguros de crédito a la exportación a medio y largo plazo, seguros de inversión en el extranjero y seguros de crédito a la exportación a corto plazo) que abarcan, entre otras cosas, los productos agropecuarios.¹⁸

4.24. Las autoridades indican que, desde que en 2009 se estableció el Fondo Fiduciario para la Cooperación Sur-Sur con la Organización de las Naciones Unidas para la Alimentación y la Agricultura (FAO), China ha donado un total de USD 130 millones y ha enviado al extranjero a numerosos expertos y técnicos. En el marco del Fondo para el Desarrollo Mundial y la Cooperación Sur-Sur, China ha cooperado con la FAO y el Programa Mundial de Alimentos en la aplicación de unos 50 proyectos de cooperación Sur-Sur.

4.25. Se aplican impuestos de exportación a cuatro líneas arancelarias (al nivel de 8 dígitos del SA) relativas a productos de origen animal, y a dos líneas arancelarias correspondientes a los cueros y pieles en bruto (cuadro 3.11).¹⁹

4.26. Según las autoridades, durante el período objeto de examen no se han modificado las leyes y reglamentos relativos a las licencias de importación o exportación. Las exportaciones de arroz, maíz, tabaco y algodón son objeto de comercio de Estado.²⁰ Las autoridades indican que, durante el período objeto de examen, se han añadido dos nuevas empresas comerciales del Estado exportadoras de algodón (Xinjiang Xintianlu Agricultural Products Co. Ltd y China National Cotton Group Corporation). Esos productos, excepto el tabaco, están además sujetos a contingentes de

exportación, que son administrados por la NDRC y el MOFCOM y solo se asignan a empresas comerciales del Estado. El trigo también está sujeto a contingentes de exportación (cuadro 4.5).

Cuadro 4.5 Productos agropecuarios sujetos a contingentes y licencias de exportación, marzo de 2024

Productos	Tipo de licencia	Observaciones
Productos sujetos a contingentes y licencias		
Arroz, maíz, trigo y algodón	Licencia para contingentes de exportación	La NDRC y el MOFCOM asignan el contingente y el MOFCOM expide la licencia.
Animales vivos de las especies bovina y porcina (exportación a Hong Kong, China, y Macao, China); pollos vivos (exportación a Hong Kong, China); y harina de maíz, arroz y trigo, madera aserrada, juncos y regaliz	Licencia para contingentes de exportación	El MOFCOM asigna el contingente.
Productos sujetos a licencia		
Animales vivos de las especies bovina y porcina (destinados a mercados distintos de Hong Kong, China, y Macao, China); y pollos (destinados a mercados distintos de Hong Kong, China) y carnes de bovino, de porcino y de pollo congeladas o refrigeradas	Licencia de exportación	La licencia se concede si el exportador tiene el correspondiente contrato de exportación.

Fuente: Información facilitada por las autoridades.

4.27. Los contingentes de exportación para la harina de maíz y la harina de arroz disminuyeron entre 2020 y 2022; los contingentes de exportación para la harina de trigo disminuyeron en 2021, pero aumentaron en 2022 (cuadro 4.6).

Cuadro 4.6 Contingentes de exportación de harina de maíz, harina de arroz y harina de trigo, 2020-2022

(Toneladas)

Producto	2020	2021	2022
Harina de maíz	803	913	412
Harina de arroz	76	55	18
Harina de trigo	181.312	79.553	140.543

Fuente: Información facilitada por las autoridades.

4.1.1.4.3 Medidas internas

4.1.1.4.3.1 Medidas de ayuda

4.28. La ayuda que presta el Gobierno central a los agricultores adopta la forma de incentivos fiscales (cuadro 4.7) o de asignaciones presupuestarias (cuadro 4.8). En 2022, China notificó al Comité de Agricultura de la OMC la ayuda otorgada al sector agropecuario para el año 2017.²¹ China notificó los programas de ayuda correspondientes al período 2021-2022 en el marco del Acuerdo sobre Subvenciones y Medidas Compensatorias (Acuerdo SMC).²² Según las autoridades, durante el período objeto de examen, las medidas de ayuda de China para los principales productos agropecuarios fueron principalmente precios mínimos de compra para el arroz con cáscara y el trigo, subvenciones para el arroz con cáscara, subvenciones a los productores de maíz, subvenciones a los productores de soja y subvenciones basadas en los precios de referencia del algodón.

²¹ Documento [G/AG/N/CHN/62](#) de la OMC, de 14 de diciembre de 2022.

²² Documento [G/SCM/N/401/CHN](#) de la OMC, de 20 de julio de 2023.

Cuadro 4.7 Incentivos fiscales otorgados por el Gobierno central al sector agropecuario, 2023

Título <i>Fundamento jurídico</i>	Objetivo	Subvención	Fecha de inicio
Políticas fiscales preferenciales para productos de la agricultura, la silvicultura, la ganadería y la pesca <i>Ley del Impuesto sobre la Renta de las Sociedades, 2007;</i> <i>Reglamento de Aplicación de la Ley del Impuesto sobre la Renta de las Sociedades, 2007;</i> <i>Circular del MOF, Cai Shui Nº 149 [2008]; Circular del MOF, Cai Shui Nº 26 [2011]</i>	Apoyar el desarrollo de la agricultura	Trato fiscal preferencial. En el caso de los ingresos obtenidos de proyectos de agricultura, silvicultura, ganadería y pesca, las empresas pueden beneficiarse de la exención o reducción del impuesto sobre la renta de las sociedades.	2008
Trato fiscal preferencial para los productos importados con objeto de sustituir las plantaciones de adormidera <i>Circular del MOF, Cai Shui Nº 63 [2000]</i>	Apoyar la sustitución de las plantaciones de adormidera en las zonas fronterizas de la provincia de Yunnan	Exención del IVA y los aranceles	2000
Políticas fiscales preferenciales para las importaciones de semillas y especies <i>Circular del MOF, Cai Guan Shui Nº 29 [2021]</i>	Introducir y promover especies mejoradas, reforzar la protección de las especies existentes y desarrollar ramas de producción agrícolas y forestales de alta calidad, productivas y eficaces	Exención del IVA	2016
Trato fiscal preferencial otorgado al té vendido en las zonas fronterizas <i>Anuncio Nº 83 del MOF y la SAT, 2019; Anuncio Nº 4 del MOF y la SAT, 2021; Anuncio Nº 59 del MOF y la SAT sobre la Continuación de la Aplicación de la Política en materia del IVA a la Venta de Té en Zonas Fronterizas, 2023</i>	Reducir los costos de los grupos étnicos minoritarios que residen en zonas fronterizas para comprar té vendido en zonas fronterizas, y garantizar el suministro del té vendido en zonas fronterizas donde residen grupos étnicos minoritarios	Exención del IVA	1994

Cuadro 4.8 Asignaciones presupuestarias del Gobierno central al sector agropecuario, 2023

Título <i>Fundamento jurídico</i>	Objetivo(s)	Subvención	Fecha de inicio	Asignaciones presupuestarias (millones de CNY)
Fondo para el Desarrollo de la Producción Agrícola <i>Circulares del MOF, Cai Nong Nº 10 [2020], y Cai Nong Nº 25 [2022]</i>	Impulsar la producción agrícola, optimizar la estructura industrial, promover la integración agrícola, mejorar la eficiencia agrícola, etc.	Se concede principalmente a agricultores, nuevos tipos de entidades agrícolas y explotaciones y personas que desempeñan tareas en el marco de proyectos	2017	2021: 210.303 2022: 232.483
Fondo de Subvenciones para la Protección de los Recursos Agrícolas y el Medio Ambiente <i>Circular del MOF, Cai Nong Nº 10 [2020]; Circular del MOF, Cai Nong Nº 25 [2022]</i>	Conservación de los recursos agrícolas, protección del medio ambiente, compensación de los pagos de intereses, etc.	Se concede principalmente a agricultores, ganaderos, pescadores, nuevos tipos de entidades agrícolas y explotaciones y personas que desempeñan tareas en el marco de proyectos	2021	2021: 37.189 2022: 44.849
Fondo para la Conservación de los Recursos Hídricos <i>Circular del MOF, Cai Nong Nº 54 [2019]</i>	Apoyar el desarrollo de proyectos de conservación de los recursos hídricos y el suelo y prevenir y controlar la erosión del suelo	Se concede a los Gobiernos provinciales para proyectos de conservación de los recursos hídricos y el suelo en tierras de cultivo	1983	2021: 4.500 2022: 5.029
Fondo para la Prevención de Catástrofes y el Socorro en el Sector de la Producción Agrícola <i>Circular del MOF, Cai Nong Nº 117 [2019]</i>	Respaldar la respuesta a las catástrofes, las inundaciones y las sequías que afectan a la agricultura	Se asigna a los beneficiarios que se determinen según la situación de emergencia	2019	2021: 7.400 2022: 16.273,5

Título <i>Fundamento jurídico</i>	Objetivo(s)	Subvención	Fecha de inicio	Asignaciones presupuestarias (millones de CNY)
Fondo de Subvenciones para una Nueva Serie de Iniciativas de Reconversión de Tierras de Cultivo en Bosques y en Pastizales (incluida una donación para actividades de divulgación) <i>Zi Ran Zi Fa</i> Nº 191 [2022]; <i>Circular del MOF, Cai Zi Huan</i> Nº 171 [2022]	Promover la construcción de una civilización ecológica y el desarrollo sostenible	Se concede a los Gobiernos provinciales con miras a su distribución a los agricultores para que reconviertan tierras de cultivo en bosques y en pastizales	2014	2021: 13.557 2022: 10.730

Nota: En este cuadro no se incluyen las subvenciones relacionadas con la silvicultura, a excepción de las destinadas a la reconversión de tierras de cultivo en bosques.

Fuente: Documento [G/SCM/N/401/CHN](#) de la OMC, de 20 de julio de 2023.

4.29. También se han notificado a la OMC algunos programas de subvenciones destinados a apoyar a los agricultores a nivel de los Gobiernos subcentrales.²³

4.1.1.4.3.2 Controles de precios y sistemas de sostenimiento de los precios del mercado

4.30. China sigue aplicando una política de precios de compra mínimos para el arroz y el trigo en las principales zonas productoras. Los precios mínimos de compra se ajustan en función de factores como los costos de producción, la oferta y la demanda del mercado, los precios de los mercados interno y externo y el desarrollo industrial. Según las autoridades, durante el período objeto de examen aumentaron los precios mínimos de compra en un contexto de incremento de los precios de producción. Los precios mínimos de compra del trigo, el arroz indica con cáscara temprano, el arroz indica con cáscara semitardío y tardío y el arroz japónica con cáscara fueron más elevados en 2023 que en 2021 (cuadro 4.9).²⁴

Cuadro 4.9 Precios de compra mínimos, 2020-2023

(CNY/tonelada)

	2020	2021	2022	2023
Trigo	2.240	2.260	2.300	2.340
Arroz indica con cáscara temprano	2.420	2.440	2.480	2.520
Arroz indica con cáscara semitardío y tardío	2.540	2.560	2.580	2.580
Arroz japónica con cáscara	2.600	2.600	2.620	2.620

Fuente: Información facilitada por las autoridades.

²³ Documento [G/SCM/N/401/CHN](#) de la OMC, de 20 de julio de 2023. Se trata de los siguientes programas: i) asistencia del Fondo de Subvención Fiscal para promover la revitalización del medio rural (municipio de Xinzhou, provincia de Shanxi); ii) subvenciones para el reconocimiento de "los alimentos ecológicos, los alimentos orgánicos y las indicaciones geográficas" de la producción agropecuaria (Liga de Alxa, región autónoma de Mongolia Interior); iii) Fondo de Subvenciones para el Desarrollo de la Industria Tabacalera (distrito de Fuling, municipio de Chongqing); iv) Fondo Especial para la Construcción de Instalaciones para la Conservación del Agua a Nivel Provincial (provincia de Guangdong); v) donación financiera de la provincia para promover la revitalización del medio rural, Fondo de Subvención Fiscal para Ayudar a Promover la Revitalización del Medio Rural, Fondo para la Conservación de los Recursos Hídricos (provincia de Guizhou); vi) subvención de las primas del seguro de cultivo de tabaco (provincia de Yunnan); vii) Fondo de Subvenciones para Ayudar a Promover la Revitalización del Medio Rural, Fondo para la Conservación de los Recursos Hídricos (región autónoma del Tíbet); viii) Fondo de Subvenciones para la Política de Reconversión de Tierras de Cultivo en Bosques (región autónoma de Ningxia Hui); ix) Fondo de Subvenciones para Ayudar a Promover la Revitalización del Medio Rural (región autónoma de Xinjiang Uygur); x) Fondo para la Conservación de los Recursos Hídricos, Fondo de Subvenciones para la Creación de Tierras de Cultivo (ciudad de Dalian, provincia de Liaoning); y xi) Fondo de Subvención Fiscal para Ayudar a Promover la Revitalización del Medio Rural (ciudad de Qingdao, provincia de Shandong).

²⁴ Las autoridades afirman que, en general, los agricultores venden los cereales a precios de mercado. Los agricultores solo pueden vender a las empresas designadas el arroz y el trigo que cumplen los requisitos de calidad cuando los precios de esos productos caen por debajo de los precios de compra mínimos, a fin de reducir las pérdidas causadas por el descenso de los precios de los cereales. Esos precios, así como la limitación de los volúmenes totales de compra, los fija anualmente la NDRC en consulta con el MARA y con otros organismos gubernamentales.

4.31. Durante el período objeto de examen no se modificó el sistema de reservas de cereales para el maíz, el arroz, las habas de soja y el trigo que mantienen el Gobierno central y los Gobiernos locales.

4.1.1.4.3.3 Otras medidas

4.32. Durante el período objeto de examen, el Banco Popular de China (PBOC) ha dado orientaciones a las instituciones financieras para que aumenten la concesión de créditos al sector agropecuario. Entre los documentos de política pertinentes figuran los Dictámenes sobre la Ayuda Financiera para la Consolidación y Ampliación de los Logros en la Reducción de la Pobreza y el Avance Integral de la Revitalización del Medio Rural (Yin Fa Nº 171 [2021]), los Dictámenes sobre la Conclusión Efectiva de la Labor Fundamental para la Promoción Integral de la Revitalización del Medio Rural en 2022 (Yin Fa Nº 74 [2022]) y las Orientaciones sobre la Ayuda Financiera para la Promoción Integral de la Revitalización del Medio Rural y la Aceleración de la Creación de una Potencia Agrícola (Yin Fa Nº 97 [2023]). La finalidad de esos documentos es orientar a las instituciones financieras para que sigan aumentando la concesión de créditos al sector agropecuario. A finales de 2023, el saldo de los préstamos en moneda nacional y en divisas era de CNY 56,6 billones, lo que supone un incremento interanual del 14,9%. El saldo de los préstamos rurales (condados y entidades de menor tamaño) era de CNY 47,26 billones, el saldo de los préstamos a los hogares rurales era de CNY 16,86 billones y el saldo de los préstamos a la agricultura, la ganadería, la silvicultura y la pesca era de CNY 5,83 billones.

4.33. China también ha realizado esfuerzos por ampliar los canales de financiación directa en el sector agrícola. Se ha alentado a los bancos y las instituciones financieras a que emitan bonos especiales destinados a la agricultura y la microfinanciación, movilicen fondos para conceder préstamos para la agricultura y las microempresas, aumenten la capacidad de préstamo y amplíen las fuentes de fondos disponibles. En 2021, la Asociación Nacional de Inversores Institucionales del Mercado Financiero (NAFMII) publicó notas sobre la revitalización del medio rural basadas en las experiencias adquiridas en la reducción de la pobreza, apoyando a las empresas admisibles para que emitieran bonos para la revitalización del medio rural y otros instrumentos de financiación de la deuda con el fin de promover el desarrollo rural. A finales de 2023, 157 empresas habían recibido apoyo para la emisión de bonos para la revitalización del medio rural por un valor total de CNY 198.770 millones, y los bancos de todo el país habían emitido bonos especiales destinados a la agricultura y la microfinanciación por un total acumulado de CNY 2,37634 billones.

4.34. El Gobierno central y los Gobiernos locales apoyan la participación de los agricultores en programas de seguro; el plan de seguros cubre desastres naturales como lluvias torrenciales, inundaciones y sequías. La distribución de la financiación entre el Gobierno central y los Gobiernos locales varía según el cultivo (cuadro 4.10). No se dispone de datos sobre los gastos totales. El 31 de diciembre de 2021, China revisó las Medidas relativas a la Administración de las Subvenciones para Primas de Seguros Agropecuarios por el Gobierno Central.²⁵ En consecuencia, se ha ampliado a todos los principales condados productores de cereales de China el costo total del seguro para el trigo, el arroz y el maíz. Las autoridades indican que, en 2021 y 2022, las primas de los seguros agrícolas ascendieron a CNY 96.500 millones y CNY 119.200 millones, respectivamente.

Cuadro 4.10 Distribución de la financiación del programa de seguros agrícolas entre las autoridades centrales y locales

	Cultivos	Cría de ganado	Silvicultura no comercial	Silvicultura comercial	Variedades tibetanas y caucho natural
Gobierno central	45% en las regiones central, occidental y nororiental; 35% en la región oriental	50% en las regiones central y occidental; 40% en la región oriental	50%	30%	40%
Gobiernos locales	25%	25%	25%	25%	25%

Fuente: Información facilitada por las autoridades.

²⁵ Gobierno de China. Consultado en: https://www.gov.cn/gongbao/content/2022/content_5683856.htm.

4.35. Según las autoridades, todos los bancos pueden proporcionar financiación para proyectos agrícolas en condiciones comerciales.

4.36. En los últimos años, el PBOC ha aplicado las decisiones del Comité Central del Partido Comunista de China y del Consejo de Estado para fortalecer la orientación sobre las políticas monetarias y crediticias; orientar a las instituciones financieras para que observen los principios de orientación al mercado y legalización; aumentar los recursos asignados a la revitalización del medio rural y la mejora de la agricultura; y mejorar la capacidad y el nivel de los servicios financieros con respecto a la agricultura, las zonas rurales y los agricultores. Junto con la Administración Nacional de Reglamentación Financiera, la Comisión de Reglamentación de Valores de China, el MOF y el MARA, el PBOC publicó las Orientaciones sobre la Ayuda Financiera para la Promoción Integral de la Revitalización del Medio Rural y la Aceleración de la Creación de una Potencia Agrícola y aplicó varias políticas para fortalecer el apoyo financiero al sector. Las autoridades han indicado que, a finales de septiembre de 2023, el saldo de los préstamos agrícolas ascendía a CNY 55,8 billones, lo que supone un aumento interanual del 15,1%. El PBOC también fomentó la ampliación del alcance de las garantías y los avales con arreglo a las necesidades de financiación de las entidades agrícolas y la revitalización de los activos rurales para desarrollar las operaciones agrícolas y aumentar los ingresos y la riqueza de los agricultores. A finales de septiembre de 2023, el saldo de los préstamos a los agricultores era de CNY 16,7 billones, lo que representa un aumento interanual del 12,6%, y el saldo de los préstamos agrícolas era de CNY 5,8 billones, lo que supone un aumento interanual del 14,6%. El PBOC también ha apoyado la emisión de letras de revitalización del medio rural en el mercado interbancario por las empresas admisibles con el fin de recaudar fondos para ámbitos fundamentales como el empleo y el aumento de los ingresos de los agricultores, la modernización de la agricultura y la construcción de infraestructuras. También ha alentado a los bancos a emitir bonos financieros especiales para "la agricultura, las zonas rurales y los agricultores" con el fin de obtener fondos destinados específicamente a la concesión de préstamos agrícolas. A finales de septiembre de 2023, había prestado apoyo a 147 empresas para la emisión de letras de revitalización del medio rural por valor de CNY 188.400 millones, y se habían emitido bonos financieros especiales para la agricultura, las zonas rurales y los agricultores por valor de CNY 136.700 millones. La Comisión de Reglamentación de Valores de China presta apoyo a las empresas admisibles para la emisión de letras de revitalización del medio rural en el mercado cambiario. Los fondos recaudados se utilizan para consolidar los logros en la reducción de la pobreza, fomentar el desarrollo de zonas en las que se ha erradicado la pobreza y revitalizar el medio rural. A finales de 2023, se había prestado apoyo a 86 empresas para la emisión de letras corporativas de revitalización del medio rural por un total de CNY 73.600 millones.

4.37. La Administración Nacional de Reglamentación Financiera (NFRA) ha publicado avisos de orientación para que los sectores de la banca y los seguros se ocupen adecuadamente de la labor financiera relativa a la revitalización del medio rural y aclaren sus objetivos y tareas fundamentales cada año. A finales de 2023, el saldo de los préstamos agrícolas en todo el país ascendía a CNY 56,6 billones, un 15,11% más que a comienzos del año. El saldo de los préstamos agrícolas inclusivos ascendía a CNY 12,59 billones, un 20,34% más que a comienzos del año, y 10,2 puntos porcentuales más que la tasa media de crecimiento de los diversos préstamos. El saldo de los préstamos concedidos en las principales zonas productoras de cereales del país ascendía a CNY 3,71 billones, un 21,77% más que a comienzos del año. La NFRA también alentó el establecimiento de sucursales de bancos e instituciones financieras en zonas en las que en la actualidad no están presentes. A finales de 2023, la tasa de cobertura de los bancos e instituciones financieras en zonas rurales era del 97,93%. El Banco de Desarrollo, el Banco de Desarrollo Agrícola de China y seis grandes bancos han establecido instituciones internas dedicadas a la revitalización del medio rural que prestan apoyo en materia de políticas en relación con los precios internos de transferencia, la asignación de personal y la evaluación de los incentivos para los préstamos agrícolas.

4.1.1.4.4 Niveles de ayuda

4.38. En diciembre de 2022, China notificó sus compromisos en materia de ayuda interna correspondientes al año civil 2020.²⁶ La notificación muestra que la ayuda del compartimento azul (programas de limitación de la producción) ascendió a CNY 89.800 millones en 2020, frente a CNY 38.400 millones en 2019. La ayuda notificada en el marco del compartimento verde ascendió

²⁶ Documento [G/AG/N/CHN/65](#) de la OMC, de 14 de diciembre de 2022.

a CNY 1,2561 billones en 2020, frente a CNY 1,2199 billones en 2019. La ayuda del compartimento ámbar (incluida la ayuda *de minimis*) fue nula en 2020 (frente a CNY 205.400 millones en 2019).

4.39. La OCDE sigue calculando estimaciones de la ayuda a la agricultura en China que ofrecen indicadores relativos al período objeto de examen (datos disponibles hasta 2022). Según la OCDE, la estimación de la ayuda total en 2022 fue de alrededor de CNY 2,0555 billones (el 1,69% del PIB), frente a CNY 2,0750 billones en 2021 (el 1,81% del PIB).²⁷ Las estimaciones de la ayuda a los productores y el sostenimiento de los precios del mercado también disminuyeron durante el período objeto de examen.

4.1.2 Silvicultura

4.40. La principal legislación por la que se rige el sector forestal comprende la Ley Forestal, la Ley de Pastizales, la Ley de Protección de los Humedales, la Ley de Conservación de la Fauna y Flora Silvestres, la Ley de Semillas y la Ley de Prevención y Control de la Desertificación. Durante el período objeto de examen, con miras a reforzar la protección de los humedales, mantener las funciones ecológicas y la biodiversidad de estas zonas y garantizar la seguridad ecológica, el 24 de diciembre de 2021 se adoptó la Ley de Protección de los Humedales, que entró en vigor el 1 de junio de 2022. En virtud de la Ley, se adoptó una definición de humedales, se instauró el sistema de gestión de estas zonas y las responsabilidades departamentales conexas, y se estableció, entre otras cosas, la gestión de la clasificación de los humedales y la regulación de la utilización, el uso racional y el restablecimiento de estas zonas, proporcionando garantías jurídicas más sólidas para su protección y gestión. Además, la Ley de Protección de la Fauna y Flora Silvestres se modificó el 30 de diciembre de 2022 y entró en vigor el 1 de mayo de 2023. Según las autoridades, la Administración Nacional de Silvicultura y Pastizales está tratando de promover la revisión de la legislación pertinente, incluida la Ley de Parques Nacionales, el Reglamento sobre Reservas Naturales, el Reglamento sobre Enclaves Pintorescos y Lugares Históricos, el Reglamento de Aplicación de la Ley Forestal y el Reglamento sobre la Protección de las Obtenciones Vegetales.

4.41. El promedio de los aranceles aplicados a la madera y las manufacturas de madera (Capítulo 44 del SA) fue del 0,3% en 2024 (1,0% en 2021). La madera en bruto (SA 4403) gozó de franquicia arancelaria en 2021 y 2024.

4.42. Las restricciones en materia de IED en el sector de la silvicultura no se han modificado desde el examen anterior.

4.1.3 Pesca

4.1.3.1 Características y evolución del mercado

4.43. China es uno de los principales productores de pescado del mundo. Desde 2021, la producción acuícola se mantuvo relativamente estable (cuadro 4.11). En el mismo período, las exportaciones de pescado (definición de la OMC) representaron aproximadamente el 0,6% del valor de las exportaciones totales de China. Las importaciones de pescado aumentaron gradualmente del 0,6% al 0,9% de las importaciones totales durante el mismo período (cuadro 4.12). En 2024, el promedio aritmético de los aranceles aplicados al pescado y los productos de pescado (definición de la OMC) fue del 6,8%, con aranceles que oscilan entre el 0% y el 15% (cuadro A3. 1). Se aplican derechos de exportación a una línea arancelaria correspondiente al pescado y los crustáceos, a saber, anguilas, alevines, vivos (subpartida 0301.92.10 del SA) (cuadro 3.11).

²⁷ OCDE (2023), *Agricultural Policy Monitoring and Evaluation 2023*. Consultado en: <https://www.oecd.org/publications/agricultural-policy-monitoring-and-evaluation-22217371.htm>. Los informes anuales de la OCDE de seguimiento y evaluación de las políticas agropecuarias utilizan una metodología para calcular el valor de la ayuda que se expresa en varios indicadores, entre ellos los siguientes: i) la Estimación de la Ayuda a los Productores (EAP) en el caso de las transferencias brutas de los consumidores y contribuyentes a los productores del sector agropecuario; ii) la Estimación de la Ayuda Total (EAT) en el de las transferencias al sector agropecuario en general; y iii) las Transferencias para un Solo Producto (TSP) en el de las transferencias para productos específicos. La EAP representa el valor de las transferencias a los productores. Por consiguiente, el valor de la ayuda que se notifica a la OMC no es compatible ni comparable con los valores calculados por la OCDE.

Cuadro 4.11 Indicadores del sector pesquero, 2020-2022

	2020	2021	2022
Empleo	12.395.858	11.846.287	11.779.185
Embarcaciones pesqueras (embarcaciones de pesca motorizadas)	563.262 (374.757)	520.845 (356.994)	511.046 (342.418)
Capturas marinas (en miles de t) (algas)	11.790,7 (21,7)	11.761,1 (20,3)	11.838,3 (19,4)
Producción acuícola (en miles de t) (algas)	52.242,0 (2.621,4)	53.944,1 (2.722,9)	55.654,6 (2.723,9)

Notas: Los datos sobre el empleo se basan en los indicadores de los empleados del sector pesquero que figuran en el Anuario Estadístico de la Pesca de China.

Salvo en el caso de la medusa, que se mide por peso después de desalar, y diversos tipos de algas, que se miden por peso en estado seco, todos los demás productos acuáticos se miden por peso efectivo en el momento de la captura. Los datos sobre la producción pesquera comunicados por China pueden diferir de los datos publicados por la FAO porque el Gobierno informa sobre el peso de las algas en estado seco, mientras que la FAO informa sobre el peso de las algas en estado húmedo. La FAO obtiene y publica datos sobre la producción basados en pesos calculados científicamente aportados por el Gobierno.

Cuadro 4.12 Comercio de pescado y productos del pescado, 2018-2023

	2018	2019	2020	2021	2022	2023
Exportaciones (en millones de USD)	21.738,8	20.160,8	18.587,2	21.338,4	22.431,7	19.877,3
% de las exportaciones totales	0,9	0,8	0,7	0,6	0,6	0,6
Tasa de crecimiento (%)	5,5	-7,3	-7,8	14,8	5,1	-11,4
Cinco principales productos de exportación al nivel de 4 dígitos del SA (% del total):						
1605 Crustáceos, moluscos, etc., preparados o en conserva	21,3	18,4	18,7	23,1	23,4	23,8
1604 Preparaciones y conservas de pescado; caviar y sus sucedáneos	16,9	18,6	22,4	23,9	20,7	21,1
0304 Filetes y demás carne de pescado, frescos, refrigerados o congelados	20,6	21,3	18,0	14,8	18,2	16,7
0307 Moluscos vivos, frescos, refrigerados, congelados, salados o en salmuera	15,1	14,6	14,6	14,6	15,1	12,7
0303 Pescado congelado, excepto los filetes y demás carne de pescado de la partida 0304	13,2	14,1	12,8	11,1	10,1	11,4
Importaciones (en millones de USD)	14.371,2	18.001,9	14.916,1	17.255,5	22.560,6	22.622,1
% de las importaciones totales	0,7	0,9	0,7	0,6	0,8	0,9
Tasa de crecimiento (%)	34,2	25,3	-17,1	15,7	30,7	0,3
Cinco principales productos de importación al nivel de 4 dígitos del SA (% del total):						
0306 Crustáceos vivos, frescos, refrigerados, congelados, salados o en salmuera	30,4	39,1	39,6	40,4	42,4	42,3
0303 Pescado congelado, excepto los filetes y demás carne de pescado de la partida 0304	31,7	27,4	26,3	20,3	22,6	21,2
230120 ^a Harina, polvo y "pellets", de pescado o de crustáceos, moluscos, etc.	15,5	11,0	13,1	15,9	13,3	12,9
0307 Moluscos vivos, frescos, refrigerados, congelados, salados o en salmuera	8,7	8,7	7,9	10,3	8,1	8,7
0302 Pescado fresco o refrigerado, excepto los filetes y demás carne de pescado de la partida 0304	5,1	4,4	2,8	4,1	3,8	5,2

	2018	2019	2020	2021	2022	2023
0304 Filetes y demás carne de pescado, frescos, refrigerados o congelados	3,1	3,6	3,5	2,3	3,3	5,2

a Desglosado al nivel de 6 dígitos del SA ya que solo la subpartida de 6 dígitos 230120 de la partida 2301 es un producto de pescado.

Nota: Definición de la OMC de pescado y productos de pescado: Capítulo 3 del SA y algunos productos seleccionados (SA 03, 0508, 0511.91, 1504.10, 1504.20, 1603-1605, y 2301.20). La clasificación de los cinco principales productos pesqueros de exportación y de importación al nivel de 4 dígitos del SA corresponde al año 2023.

Fuente: Cálculos de la Secretaría de la OMC basados en cifras comerciales procedentes de la base de datos UN Comtrade.

4.1.3.2 Marco jurídico, institucional y normativo

4.44. El Ministerio de Agricultura y Asuntos Rurales (MARA) dirige la revisión de los proyectos de leyes y reglamentos relacionados con la pesca, elabora normas y reglamentos departamentales y orienta el desarrollo de la legislación pesquera. Los Gobiernos locales se encargan de los asuntos pesqueros en sus respectivas divisiones administrativas, con inclusión de la pesca marina en las zonas marítimas contiguas (a menos que el Consejo de Estado determine lo contrario).

4.45. Según las autoridades, hay 11 empresas de pesca de altura estatales.

4.46. La principal legislación por la que se rige el sector pesquero es la Ley de Pesca, de 2005, que no se ha modificado desde el anterior examen (la última modificación data de 2013). El Reglamento de Aplicación de la Ley de Pesca tampoco se ha modificado (la última modificación data de 2020).²⁸ Las Disposiciones sobre la Administración de las Licencias de Pesca (Decreto N° 1 del MARA, 2018²⁹) y determinados artículos de esas Disposiciones (modificados por última vez en 2022) se mantuvieron sin cambios.³⁰

4.47. En 2021, el MARA publicó el 14º Plan Quinquenal para el Desarrollo de la Pesca Nacional, en el que se especificaba que la producción nacional de pesca marítima se limitaría a 10 millones de toneladas para 2025. En 2021 y 2022, la producción nacional total de pesca marítima fue de 9,52 millones de toneladas y 9,51 millones de toneladas, respectivamente, y ninguna provincia superó el objetivo fijado para 2020. El Plan también tiene por objeto promover el desarrollo de alta calidad y la modernización del sector pesquero, y plantea 12 objetivos en cuatro esferas - el desarrollo del sector pesquero, la ecología, la innovación científica y tecnológica y la capacidad de gestión - con miras a 2035.

4.48. Con arreglo a la Ley de Pesca, los extranjeros y las embarcaciones pesqueras extranjeras que se dedican a la producción pesquera en aguas bajo la jurisdicción de China deben obtener la aprobación del MARA. Si las embarcaciones pertenecen a interlocutores comerciales de China que han firmado tratados o acuerdos pertinentes con este país, las cuestiones se tratan de conformidad con esos tratados.³¹ El régimen de inversión extranjera para la pesca no ha sido objeto de modificaciones. Las Medidas Administrativas Especiales relativas al Acceso de la Inversión Extranjera en las Zonas Francas Experimentales (Lista Negativa, edición de 2021) prohíben la inversión en la pesca de productos acuáticos en los mares y las aguas interiores bajo la jurisdicción de China. Las autoridades siguen previendo revisar la Ley de Pesca.

4.49. El MARA, en coordinación con el Ministerio de Transporte, el Ministerio de Relaciones Exteriores y otros departamentos competentes, está en proceso de adherirse al Acuerdo sobre Medidas del Estado Rector del Puerto.

²⁸ Reglamento de Aplicación de la Ley de Pesca (2020), modificado por el Decreto N° 726 del Consejo de Estado. Consultado en: http://www.gov.cn/zhengce/2020-12/25/content_5574001.htm.

³⁰ Decreto N° 5 de 2020 del MARA. Consultado en: http://www.moa.gov.cn/nybg/2020/202008/202010/t20201020_6354689.htm.

³¹ Ley de Pesca, artículo 8.

4.50. China es parte contratante en diversos convenios y tratados internacionales sobre la pesca, incluida la Comisión Internacional para la Conservación del Atún Atlántico (CICAA), la Comisión del Atún para el Océano Índico (IOTC), la Comisión de Pesca del Pacífico Occidental y Central (WCPFC), la Comisión Interamericana del Atún Tropical (CIAT), la Comisión de Pesca del Pacífico Norte (NPFC), la Organización Regional de Ordenación Pesquera del Pacífico Sur (SPRFMO), el Acuerdo de Pesca para el Océano Índico Meridional (SIOFA) y la Comisión para la Conservación de los Recursos Vivos Marinos Antárticos (CCAMLR).

4.51. En cuanto a los acuerdos bilaterales relacionados con la pesca, China ha firmado acuerdos como el Acuerdo de Pesca con la República de Corea, que entró en vigor en 2001; el Acuerdo de Pesca con el Japón, que entró en vigor en 2000; y el Protocolo de Cooperación en las Aguas Fronterizas de los Ríos Heilongjiang y Ussuri para la Protección, el Ajuste y la Mejora de los Recursos Pesqueros, que entró en vigor en 1994.

4.52. China presentó su aceptación del Protocolo del Acuerdo sobre Subvenciones a la Pesca a la OMC el 27 de junio de 2023.

4.1.3.3 Ayuda del Gobierno al sector pesquero

4.53. La ayuda al sector la prestan tanto el Gobierno central como los Gobiernos locales y provinciales. La última notificación presentada por China a la OMC abarca el período 2021-2022 y contiene tres programas de incentivos o de apoyo aplicados a nivel del Gobierno central; estos se refieren a un fondo de subvenciones para el desarrollo del sector pesquero y al pago de transferencias para fines generales (cuadro A4. 1). De los programas relativos al sector pesquero adoptados por los Gobiernos locales durante el período 2021-2022, 22 también se notificaron a la OMC (cuadro A4. 2).

4.54. Desde 2015, China ha puesto fin a las subvenciones a la construcción de barcos. En 2021, el Gobierno eliminó las subvenciones a los combustibles. Ese mismo año, el Ministerio de Hacienda y el MARA publicaron el Aviso sobre la Aplicación de Políticas de Apoyo al Desarrollo de la Pesca para Promover el Desarrollo de Alta Calidad de la Pesca (Cai Nong [2021] N° 41), que propone optimizar la estructura del sector pesquero de conformidad con la tendencia general de las negociaciones internacionales sobre subvenciones a la pesca. El Aviso también tiene por objeto promover el desarrollo de alta calidad de la pesca, aplicar un nuevo conjunto de políticas para apoyar el desarrollo de la pesca durante el período abarcado por el 14º Plan Quinquenal, eliminar las subvenciones a los costos directos, modificar el método de subvención y centrarse en promover la aplicación de las principales políticas y proyectos introducidos y previstos por el país mediante fondos de subvenciones para el desarrollo de la pesca. Entre las principales medidas figuran las siguientes: i) apoyo a la construcción de zonas marinas de cría a nivel nacional; y apoyo a la construcción de equipos e instalaciones de acuicultura modernos; ii) construcción de instalaciones pesqueras públicas básicas³², incluida la eliminación de las subvenciones a los costos directos, el apoyo a los cambios en las modalidades de subvención y la prestación de ayuda específica a la aplicación de las principales políticas y proyectos introducidos y previstos por China en el marco de las subvenciones para el desarrollo de la pesca; iii) apoyo a la construcción de instalaciones pesqueras públicas básicas, como las zonas económicas de los puertos de pesca costera y las zonas de pesca de altura; iv) apoyo al desarrollo verde y circular de la pesca, como la transformación normalizada de los estanques de acuicultura continental concentrados y el tratamiento normalizado del agua de cola de la industria de la acuicultura, así como el suministro de sistemas inteligentes de vigilancia de la calidad del agua y de control ambiental; y v) apoyo al estudio y la conservación de los recursos pesqueros y la mejora de la capacidad de cumplimiento de las normas internacionales. Estas medidas entrañan, entre otras cosas, la concesión de subvenciones para la conservación de los recursos pesqueros a los buques de pesca de altura que cumplan la normativa sobre la conservación de los recursos pesqueros con sujeción a un control estricto de la intensidad de la subvención. Los pescadores de altura destinan estas subvenciones principalmente a la reducción de su número de

³² Esto incluye la prestación de apoyo para la mejora y la transformación de las embarcaciones de pesca de altura y de pesca en aguas distantes, así como de las instalaciones y equipos, como sistemas anticontaminantes y contra incendios, dispositivos de salvamento y sistemas de navegación, y las instalaciones destinadas a la producción y la vivienda. Se prestará apoyo a la construcción de instalaciones y equipos de cría en aguas profundas y aguas distantes, como las jaulas de red para aguas profundas y los equipos inteligentes de cría de peces en gran escala, así como la construcción de instalaciones y equipos de elaboración primaria y almacenamiento refrigerado y conservación de los productos acuáticos.

buques y la transición hacia la producción; el desarrollo verde de la acuicultura; el equipamiento, funcionamiento y mantenimiento de los buques y muelles encargados de velar por la observancia de la legislación pesquera; la informatización del sector pesquero; el tratamiento y distribución de productos acuáticos; la modernización y reconstrucción de los buques de pesca de altura y de las instalaciones a bordo; y la conservación de los recursos pesqueros.

4.55. China aceptó formalmente el Protocolo del Acuerdo sobre Subvenciones a la Pesca depositando su instrumento de aceptación ante la OMC el 27 de junio de 2023. Según las autoridades, China ha tenido en cuenta la orientación general de las negociaciones sobre las subvenciones a la pesca al formular su actual política de subvenciones en esta esfera; respecto de una pequeña cantidad de subvenciones a la pesca en aguas distantes que no cumplen las disposiciones de los artículos 4.1 o 5.1 del Acuerdo sobre Subvenciones a la Pesca, China acatará el Acuerdo y eliminará las subvenciones pertinentes una vez que entre en vigor.

4.56. La participación de los pescadores en los seguros de pesca es voluntaria; los seguros de pesca se centran en servicios de asistencia mutua.

4.57. Según las autoridades, desde 2021, el Gobierno Central ha prestado apoyo al desarrollo de la pesca mediante el pago de transferencias pertinentes: i) se ha prestado apoyo para el establecimiento de zonas marinas de cría experimentales a nivel nacional con el fin de promover la conservación y mejora de los recursos pesqueros y mejorar el medio ambiente en las zonas marítimas; ii) se ha ampliado la ayuda para la construcción de zonas económicas en los puertos de pesca costera a nivel nacional en el marco de proyectos piloto para promover la pesca de alta calidad y eficiente, las zonas de pesca rentables que ofrezcan condiciones de vida adecuadas, y la prosperidad de los pescadores; iii) se ha otorgado ayuda para proyectos piloto de desarrollo verde y circular en el sector de la pesca, en el marco de los cuales se alienta a las provincias a que tomen los condados como unidades piloto, promuevan la renovación normalizada de los estanques de acuicultura continental y velen por el tratamiento normalizado del agua de cola de la industria de la acuicultura; iv) se ha prestado apoyo al desarrollo de equipos e instalaciones de pesca modernos con el objetivo de promover la modernización de las instalaciones y el equipo de pesca y mejorar la capacidad de producción de productos pesqueros mediante la renovación y mejora de las embarcaciones pesqueras y el equipo a bordo para reducir el consumo de energía y las emisiones contaminantes, mejorar la seguridad de las embarcaciones pesqueras y aumentar su nivel de automatización, inteligencia y modernización; y v) se han realizado esfuerzos para mejorar la capacidad de cumplimiento de las normas internacionales mediante la prestación de apoyo a las empresas de pesca en aguas distantes que cumplen los convenios internacionales destinados a conservar los recursos pesqueros internacionales, orientando a las embarcaciones de pesca en aguas distantes para que participen en la pesca responsable y en la conservación de los recursos pesqueros marinos internacionales.

4.1.3.4 Medidas de conservación de la pesca

4.58. China sigue desempeñando un papel importante en el segmento de la pesca en aguas distantes. Según ha indicado la FAO, en 2020 China notificó unos 2,3 millones de toneladas de su "pesca en aguas distantes".³³ Según las autoridades, el número se mantuvo al mismo nivel en 2021 y 2022.

4.59. Según las autoridades, China ha venido aplicando una política de "tolerancia cero" contra la pesca INDNR desde 2021, llevando a cabo investigaciones en relación con las embarcaciones de pesca sospechosas de infringir la normativa según lo denunciado por las organizaciones o embajadas pertinentes, y ha impuesto sanciones a las empresas y embarcaciones de pesca en aguas distantes identificadas como infractoras. Desde 2021, China ha cancelado el certificado de calificación de una empresa autorizada a pescar en aguas distantes y ha suspendido los certificados de calificación de otras cuatro. Se ha sancionado a más de 70 embarcaciones pesqueras identificadas como infractoras con penas por un valor total de más de CNY 80 millones.

³³ FAO (2022), *El estado mundial de la pesca y la acuicultura 2022*. Consultado en: <https://openknowledge.fao.org/items/92319005-6232-450f-8c75-4d4fcf24720d>.

4.2 Minería y energía

4.2.1 Minería

4.60. La industria minera sigue siendo un importante motor del crecimiento económico. Al proporcionar materias primas, el sector ha contribuido de manera importante al desarrollo de la infraestructura del país y su industrialización. No obstante, las actividades mineras pueden tener efectos perjudiciales en el medio ambiente. Según las autoridades, en el marco de las iniciativas destinadas a promover el uso de prácticas mineras inocuas para el medio ambiente, China se ha centrado en elaborar directrices normalizadas y en establecer prescripciones estrictas respecto de los métodos y tecnologías utilizados para la extracción y la prevención de la contaminación.

4.61. A finales de 2021, se habían descubierto en China 173 tipos de recursos minerales, que incluían minerales energéticos, minerales metálicos y minerales no metálicos (cuadro 4.13).³⁴ El país ocupa una posición destacada en la producción de varios metales y minerales importantes. Por ejemplo, domina la producción mundial de tierras raras (alrededor del 60%)³⁵, que son cruciales para muchas aplicaciones de alta tecnología, como las tecnologías electrónicas y las relacionadas con energías renovables. También es uno de los principales productores de cobre, cobalto, litio, grafito, magnesio, manganeso, estaño, volframio (tungsteno) y cinc, que se utilizan de manera significativa en varias ramas de producción fundamentales.

Cuadro 4.13 Principales minerales de China, 2021

Nº	Minerales	Unidad	Reservas
Minerales energéticos			
1	Carbón	Millones de toneladas	207.890
2	Petróleo	Millones de toneladas	3.690
3	Gas natural	Billones de m ³	6,33927
4	Metano de yacimientos carboníferos	Millones de m ³	365.970
5	Gas de esquisto	Millones de m ³	544.060
Minerales metálicos			
1	Mineral de hierro	Millones de toneladas	16.120
2	Mineral de manganeso	Millones de toneladas	281,69
3	Cromita	Millones de toneladas	3,09
4	Vanadio	Millones de toneladas de V ₂ O ₅	7,87
5	Titanio	Millones de toneladas de TiO ₂	223,83
6	Cobre	Millones de toneladas de metal	34,95
7	Plomo	Millones de toneladas de metal	20,41
8	Cinc	Millones de toneladas de metal	44,23
9	Bauxita	Millones de toneladas de mineral	711,14
10	Níquel	Millones de toneladas de metal	4,22
11	Cobalto	Millones de toneladas de metal	0,14
12	Volframio (tungsteno)	Millones de toneladas de WO ₃	2,95
13	Estaño	Millones de toneladas de metal	1,13
14	Molibdeno	Millones de toneladas de metal	5,85
15	Antimonio	Millones de toneladas de metal	0,64
16	Oro	Toneladas de metal	2.964,37
17	Plata	Toneladas de metal	71.783,66
18	Metales del grupo del platino	Toneladas de metal	87,69
19	Estroncio	Millones de toneladas de celestita	24,64
20	De litio	Millones de toneladas de Li ₂ O	4,05
Minerales no metálicos			
1	Magnesita	Millones de toneladas de mineral	579,91
2	Espato flúor	Millones de toneladas de minerales	67,25
3	Arcilla refractaria	Millones de toneladas de mineral	284,89
4	Pirita	Millones de toneladas de mineral	1.318,71
5	Fosforita	Millones de toneladas de mineral	3.760
6	Potasa	Millones de toneladas de KCl	284,25
7	Boro	Millones de toneladas de B ₂ O ₃	11,19
8	Sal sódica	Millones de toneladas de NaCl	20.630

Nº	Minerales	Unidad	Reservas
9	Mirabilita	Millones de Na ₂ SO ₄	37.800
10	Barita	Millones de toneladas de mineral	91,55
11	Piedra caliza para cemento	Millones de toneladas de mineral	42.110
12	Roca silícea para la fabricación de vidrio	Millones de toneladas de mineral	1.650
13	Yeso natural	Millones de toneladas de mineral	2.130
14	Caolín	Millones de toneladas de mineral	752,40
15	Bentonita	Millones de toneladas de mineral	332,72
16	Diatomita	Millones de toneladas de mineral	170,62
17	Chapado de granito	Millones de m ³	1.700
18	Chapado de mármol	Millones de m ³	530
19	Diamantes	Kilogramos de minerales	183,19
20	Grafito cristalino	Millones de toneladas de minerales	78,26
21	Amianto (asbesto)	Millones de toneladas de minerales	17,90
22	Talco	Millones de toneladas de mineral	71,75
23	Wollastonita	Millones de toneladas de mineral	64,39

Nota: Los datos relativos a las reservas de petróleo y gas (petróleo, gas natural, metano de yacimientos carboníferos y gas de esquisto) representan las reservas técnicamente accesibles comprobadas restantes según la Clasificación de Recursos y Reservas de Petróleo (GB/T 19492-2020) y los relativos a otros minerales representan el total de reservas comprobadas y reservas probables con arreglo a la Clasificación de Recursos Minerales y Reservas Minerales (GB/T 17766-2020).

Fuente: Ministerio de Recursos Naturales, *China Mineral Report*, 2022.

4.62. Entre 2018 y 2023, el comercio de productos minerales de China experimentó una tendencia al alza, aunque en 2020 se registró una disminución tanto de las importaciones como de las exportaciones. Las exportaciones de productos minerales representaron entre un 2,1% y un 1,4% de las exportaciones totales (cuadro A1. 3). Las importaciones de minerales representan una proporción mucho más importante de las importaciones totales (más del 25% en promedio) y también han presentado una tendencia al alza desde 2018, con excepción de la disminución registrada en 2020 (22,6%), y siguieron aumentando en 2021 y los años siguientes (cuadro A1. 4). Entre los productos minerales importados en grandes cantidades figuran el petróleo crudo, el mineral de hierro, el mineral de manganeso y el mineral de cobre. El plomo, el cinc, el volframio (tungsteno), el estaño, el antimonio, las tierras raras, el magnesita, el espato flúor, la barita y el grafito figuran entre los principales minerales exportados (cuadro 4.14).

4.63. Las medidas que adoptan las autoridades respecto del sector se ajustan a lo previsto en el Plan Nacional de Recursos Minerales (2016-2020). En el Plan se define la visión estratégica de China para la prospección, utilización y protección de los recursos minerales durante el período 2016-2020.³⁶ Su propósito era obrar como documento de referencia para las reformas que emprendiera China con miras a lograr un desarrollo económico ordenado de la industria minera. El Plan apunta a i) promover la prospección de minerales respecto de los cuales se cuenta con una disponibilidad limitada; ii) reglamentar la cantidad de minerales con ventajas tradicionales; iii) reducir la producción de minerales que registran un exceso de capacidad; y iv) garantizar el suministro de minerales en las industrias emergentes estratégicas. En el Plan no se enumeran los minerales clasificados en función de su disponibilidad limitada, sus ventajas tradicionales o el exceso de capacidad, y las autoridades no han publicado listas a estos efectos.

³⁶ Agencia Internacional de la Energía, *National Plan for Mineral Resources (2016-2020)*. Consultado en: <https://www.iea.org/policies/15519-national-plan-for-mineral-resources-2016-2020>.

4.64. Aunque el Plan se refiere a determinados minerales energéticos³⁷, minerales ferrosos³⁸ y minerales no ferrosos³⁹ como minerales estratégicos, también hace hincapié en la importancia de las tierras raras y promueve un estricto control estatal de su explotación, teniendo en cuenta los niveles de explotación y consumo de este tipo de minerales y las nuevas reservas. Las fuentes oficiales indican que en 2020 China producía 146.600 toneladas de minerales de tierras raras. En el marco del Plan, China también atribuye gran importancia a la diversificación de sus fuentes de suministro de minerales, en particular mediante un aprovechamiento de los recursos naturales de las entidades que participan en la Iniciativa "Cinturón y Ruta".

4.65. Durante el período objeto de examen no se introdujeron cambios sustanciales en el marco jurídico e institucional del sector. La Ley de Recursos Minerales de 1986 (modificada por última vez en 2009) y su reglamento de aplicación⁴⁰ siguen siendo los principales instrumentos legislativos por los que se rige el sector de la minería. En los últimos años las autoridades han iniciado un proceso para modificar la Ley con miras a racionalizar aún más las actividades mineras. La economía y la sociedad de China se siguen desarrollando, y las autoridades consideran que han surgido nuevos desafíos y oportunidades en el sector de los recursos minerales. En consecuencia, la actual Ley de Recursos Minerales ya no alcanza para responder a las nuevas necesidades que se van planteando, y se ha de revisarla para regular mejor la prospección y extracción de minerales, mejorar la restauración ecológica de las zonas mineras y promover iniciativas nacionales de prospección y extracción de recursos minerales.

4.66. El Ministerio de Recursos Naturales es el organismo gubernamental encargado de administrar la industria minera. El Ministerio de Ecología y Medio Ambiente (encargado de la protección del medio ambiente) y el MOFCOM (responsable de regular las importaciones y exportaciones de productos minerales) también desempeñan funciones importantes en el sector.

4.67. El 31 de diciembre de 2021, el MOFCOM y la Administración General de Aduanas publicaron el Catálogo de Productos Básicos sujetos a la Administración de Licencias de Exportación correspondiente a 2022. El Catálogo se renovó en 2023, sin cambios importantes. Por lo que se refiere a los recursos minerales, en el Catálogo se prevé que deberán solicitar una licencia de exportación los exportadores de queroseno, petróleo bruto, petróleo refinado (excluidos los aceites de engrase, las grasas y los aceites de base lubricantes), arena natural (incluida la arena normal), bauxita, fosfato mineral, arena de magnesio, talco (en polvo); fluorita (espato flúor), tierras raras, estaño y sus productos y volframio (tungsteno) y sus productos (sección 3.2).

4.68. Los exportadores de cerio y determinadas aleaciones de cerio (de partículas de tamaño inferior a 500 micrones), volframio (tungsteno) y aleaciones de volframio (tungsteno) (de partículas de tamaño inferior a 500 micrones), circonio y berilio deben solicitar una licencia de exportación de productos y tecnologías de doble uso.

4.69. Además, en virtud del Anuncio sobre la aplicación de un control de las exportaciones de determinados artículos relacionados con el galio y el germanio, desde el 3 de julio de 2023 los exportadores deben solicitar al MOFCOM un permiso de exportación para determinados artículos de doble uso (militar o civil) si desean exportar productos relacionados con el galio y el germanio.

4.70. En general, los individuos o empresas del extranjero pueden poseer derechos de extracción en China. Sin embargo, de conformidad con las Medidas Administrativas Especiales relativas al Acceso de la Inversión Extranjera (Lista Negativa) (edición 2021), los inversores extranjeros no pueden invertir, de manera directa o indirecta, en la prospección o explotación de volframio (tungsteno), tierras raras y minerales radiactivos. Las Medidas Administrativas Especiales relativas al Acceso de la Inversión Extranjera en el Puerto Franco de Hainan (Lista Negativa para las zonas

³⁷ Petróleo, gas, gas de esquisto, carbón, metano de yacimientos carboníferos y uranio.

³⁸ Hierro, cromo, cobre, aluminio, oro, níquel, volframio (tungsteno), estaño, molibdeno, antimonio, cobalto, litio, tierras raras y circonio.

³⁹ Fósforo, potasa, grafito cristalino y fluorita.

⁴⁰ Reglamento de Aplicación de la Ley de Recursos Minerales (Decreto Nº 152 del Consejo de Estado, de 1994); Reglamento sobre el Registro para Explorar Recursos Mineros mediante el Sistema de Bloques (Decreto Nº 240 del Consejo de Estado, de 1998, modificado el 29 de julio de 2014); Procedimiento para la Administración del Registro de las Actividades de Extracción de Recursos Minerales (Decreto Nº 241 del Consejo de Estado, de 1998, modificado el 29 de julio de 2014); y Medidas relativas a la Administración de la Transferencia de Derechos de Prospección de Minerales y Derechos Mineros (Decreto Nº 242 del Consejo de Estado, de 1998, modificado el 29 de julio de 2014).

francas experimentales) (edición de 2020) suprimieron las restricciones a la inversión extranjera y nacional en las actividades de prospección y extracción de tierras raras, minerales radiactivos y volframio (tungsteno).

4.71. De conformidad con el Catálogo de Sectores en los que se Incentiva la Inversión Extranjera (edición de 2022), China alienta la inversión extranjera en la prospección, el desarrollo y la extracción de petróleo y gas natural (incluido el gas de esquisto y el metano de yacimientos carboníferos); el desarrollo y el uso de nuevas tecnologías para mejorar la tasa de utilización de residuos de la extracción minera y el uso integral de tecnologías de restauración ecológica en zonas mineras; y la prospección, extracción y preparación de minerales preciosos (como potasa y cromita) (sección 2.4.3).

4.72. En 2023, el promedio de los aranceles aplicados a los productos minerales distintos del petróleo no había variado de manera significativa y se situaba en el 6% (6,1% en 2021). Los tipos NMF aplicados oscilaban entre el 0% y el 21% (cuadro A3. 1). Los productos no metálicos estaban sujetos a los tipos arancelarios más altos.

4.2.2 Energía

4.2.2.1 Panorama general y cesta energética

4.73. China es uno de los principales productores y consumidores de energía del mundo.⁴¹ La producción y el consumo de energía han seguido creciendo de manera constante en los últimos años (cuadro 4.15). En 2023, la producción total de energía primaria ascendió a 4.830 millones de toneladas equivalentes en carbón y la tasa de autosuficiencia energética se situó en el 84,4%.

Cuadro 4.15 Producción y consumo de energía de China, 2018-2023

	2018	2019	2020	2021	2022	2023
Producción (miles de millones de toneladas de equivalente en carbón)	3,79	3,97	4,07	4,27	4,64	4,83
Consumo	4,64	4,86	4,98	5,26	5,41	5,72

Fuente: Ministry of Natural Resources, *China Mineral Resources Report* (varias ediciones).

4.74. Durante el período objeto de examen, para hacer frente al déficit energético del país, se incrementaron las importaciones de petróleo y gas, que en 2023 representaron aproximadamente el 20% de las importaciones totales de mercancías (cuadro A1. 4).

4.75. Según la Agencia Internacional de la Energía (IEA), en 2021, la producción interna de petróleo representó el 27,5% del suministro total de petróleo crudo de China.⁴² La diferencia se importa principalmente del Reino de la Arabia Saudita, la Federación de Rusia y el Iraq (cuadro 4.16). En marzo de 2022, se adoptó el 14º Plan Quinquenal para un Sistema Energético Moderno, que prevé, entre otras cosas, mantener una producción petrolera constante al nivel de 200 millones de toneladas al año registrado en 2021.

Fuente: Recopilación realizada por la Secretaría de la OMC a partir de información de la base de datos UN Comtrade.

4.76. En 2020, China anunció sus Contribuciones Determinadas a Nivel Nacional (CDN) actualizadas, en las que se comprometía a alcanzar el punto máximo de sus emisiones de dióxido de carbono antes de 2030 y lograr la neutralidad en emisiones de carbono antes de 2060. Además, China tiene previsto reducir sus emisiones de dióxido de carbono por unidad del PIB en más de un 65% con respecto al nivel de 2005, aumentar la proporción de combustibles no fósiles en el consumo de energía primaria hasta alrededor del 25% para 2030 y elevar su capacidad instalada total de energía eólica y solar a más de 1.200 millones de kW para 2030. En este contexto, en 2021, China publicó dos documentos de política, "Logros, Nuevos Objetivos y Nuevas Medidas de China para las Contribuciones Determinadas a Nivel Nacional" y "Estrategia a Largo Plazo de China para un Desarrollo con Bajas Emisiones de Gases de Efecto Invernadero para Mediados de Siglo"⁴³, que representan el plan del país para cumplir el Acuerdo de París.

4.77. Aunque el consumo de energía sigue dependiendo principalmente del carbón, China tiene previsto apartarse de esta fuente. El país es un importador neto de carbón y en 2021 sus importaciones representaron el 7,7% del suministro total de carbón. En consonancia con los objetivos enunciados tanto en las CDN como en el 14º Plan Quinquenal para el Desarrollo de Energías Renovables (2021-2025)⁴⁴, está previsto que el carbón deje su actual posición dominante en el sistema energético para pasar a desempeñar una función suplementaria. Se espera que esta transición dé lugar a una disminución del consumo de carbón en 2026-2030. En el Plan no se exige el abandono del carbón, y las autoridades reconocen la importancia de este para salvaguardar la seguridad energética de China, especialmente para atender las necesidades energéticas básicas en momentos de menor disponibilidad de energía.⁴⁵ La importancia relativa del consumo de carbón ha ido disminuyendo en los últimos años. Las autoridades indican que se ha reducido, y en 2022 representó el 56,2% del consumo total de energía.

4.78. En los últimos años, China ha seguido mejorando su cesta energética favoreciendo las fuentes de energía no fósiles, como la energía hidroeléctrica, la nuclear, la eólica y la fotovoltaica. Las partes correspondientes a estas fuentes de energía aumentaron notablemente entre 2018 y 2022 (gráfico 4.1). En marzo de 2022, se adoptó el 14º Plan Quinquenal para un Sistema Energético Moderno. Su objetivo es aumentar en alrededor de un 20% la participación de la energía no fósil en el consumo total de energía para el período 2021-2025. En el Plan también se estableció el objetivo de reducir las emisiones de carbono por unidad del PIB en un 18% y el consumo de energía por unidad de PIB en un 13,5%. Se han adoptado diversas medidas concretas para hacer frente a las cuestiones relacionadas con la intensidad de carbono y energética, en particular el refuerzo de la aplicación de las leyes y reglamentos existentes, como la Ley de Conservación de Energía. En marzo de 2024, China también había publicado 364 normas nacionales de conservación de energía, destinadas a reforzar la supervisión de la conservación de energía, el etiquetado sobre eficiencia

Consultado en: <https://unfccc.int/sites/default/files/NDC/2022-06/China%E2%80%99s%20Achievements%2C%20New%20Goals%20and%20New%20Measures%20for%20Nationally%20Determined%20Contributions.pdf>.

⁴⁴ El 14º Plan Quinquenal para el Desarrollo de Energías Renovables (2021-2025) es uno de los principales documentos de política del sector energético. Se publicó en junio de 2022.

⁴⁵ IEA (2023), *Electricity Market Report 2023*. Consultado en: <https://iea.blob.core.windows.net/assets/255e9c8a-da84-4681-8c1f-458ca1a3d9ca/ElectricityMarketReport2023.pdf>.

energética y la gestión de la conservación de energía de las principales unidades consumidoras de energía. Las autoridades señalan que, entre 2019 y 2022, la intensidad de carbono de China se redujo un 4,1%, 1,0%, 3,8% y 0,8%, respectivamente, con respecto al año anterior; en 2023 no varió. Durante el mismo período, el consumo energético de China por cada CNY 10.000 del PIB ascendió a 0,55, 0,49, 0,48 y 0,48 toneladas equivalentes en carbón por CNY 10.000, respectivamente.

Gráfico 4.1 Consumo total de energía y su desglose, 2018 y 2022

TCE: Toneladas equivalentes en carbón.

4.79. Con arreglo al Catálogo de Sectores con Incentivos a la IED, existen políticas preferenciales para los inversores extranjeros que invierten en determinadas tecnologías de energías limpias, incluidos el reciclado y la elaboración de palas de turbinas eólicas y módulos fotovoltaicos descartados, la construcción y explotación de determinados proyectos de generación de energía a partir de carbón limpio, y la mejora con bajas emisiones de carbono de materias primas petroquímicas y químicas.

4.80. El marco institucional del sector energético de China apenas ha cambiado. La Comisión Nacional de Energía (NEC) es el organismo de coordinación y consulta. La Administración Nacional de la Energía (NEA), dependiente de la NDRC, se encarga de formular y aplicar estrategias, planes y políticas de desarrollo de la energía; formular recomendaciones sobre las reformas institucionales en el sector de la energía; y desempeñar funciones ejecutivas como organismo de reglamentación y como oficina general de la NEC.

4.2.2.2 Electricidad

4.81. La Ley de Electricidad de 1995 (modificada por última vez en 2018) sigue siendo el principal instrumento legislativo por el que se rige el sector de la energía eléctrica de China. En el sector de la energía renovable, la Ley de Energía Renovable tiene por objeto promover el desarrollo y la utilización de energías renovables y establece un marco jurídico para las políticas preferenciales conexas de China. La capacidad de generación de electricidad de China siguió creciendo de manera constante durante el período objeto de examen. Según las autoridades, a finales de 2022, la capacidad instalada total era de 2.564,05 GW, frente a 2.376,92 GW en 2021. Ese mismo año, la energía eólica y la energía solar aportaron 365,44 GW y 392,61 GW, respectivamente.

4.82. La energía térmica, que en 2021 representó el 68% de la producción total de electricidad (71,1% en 2018), sigue dominando el sistema eléctrico de China; las fuentes renovables representaron alrededor del 32% en 2021 (29% en 2018). El sector industrial es el mayor consumidor de electricidad (gráfico 4.2).

Gráfico 4.2 Estructura de la producción y el consumo de electricidad, 2021

a Por energía térmica se entiende la electricidad generada mediante carbón, petróleo, gas, calor residual, incineración de residuos, y biomasa.

b Por comercio se entiende el comercio al por mayor y al por menor, y los servicios de hoteles y suministro de comidas.

Fuente: National Bureau of Statistics, National Data. Consultado en: <https://data.stats.gov.cn/english/easyquery.htm?cn=C01>.

4.83. El sector de la electricidad de China es la mayor fuente de emisiones de carbono, lo cual lo convierte en un factor decisivo de los esfuerzos de las autoridades para hacer frente al cambio climático.⁴⁶

4.84. El 14º Plan Quinquenal para el Desarrollo de Energías Renovables (2021-2025) prevé acelerar la adopción de energías renovables por China estableciendo el objetivo, entre otros, de lograr una participación del 33% de electricidad renovable en el consumo. También tiene por objeto conseguir que las energías renovables constituyan el 50% del consumo adicional de electricidad entre 2021 y 2025. No obstante, China mantiene restricciones al suministro de energía nuclear. De hecho, con arreglo a la Lista Negativa Nacional relativa a la Inversión Extranjera, los extranjeros solo pueden invertir en la construcción y explotación de centrales nucleares mediante una asociación con una parte china en la que esta tendrá la participación mayoritaria.

4.85. China aplica un conjunto de mecanismos que apoyan la inversión en energías limpias (sección 3.3.1). Las subvenciones a las tarifas reguladas, que permiten a los productores de energías renovables recibir un precio superior al del mercado eléctrico (con las centrales de carbón como referencia), han sido el principal instrumento de política utilizado en el último decenio.

4.86. El programa de tarifas reguladas de China funciona con un modelo basado en el costo. La NDRC, organismo regulador de los precios de la energía, establece distintas tarifas reguladas para diferentes proyectos de energías renovables que se ajustan a sus costos de producción. En los últimos años, la NDRC ha ido reduciendo gradualmente las tasas de subvención para tener en cuenta los avances en la tecnología de producción y la disminución de los costos de producción del sector.

4.87. El importe de la ayuda equivale a la diferencia entre las tarifas reguladas de las energías renovables y los precios de referencia de las centrales de carbón, y su pago se efectúa con cargo al Fondo para el Desarrollo de la Energía Renovable, que se financia con los ingresos derivados del recargo de las tarifas de energía renovable. Sin embargo, debido al crecimiento desenfrenado del número de proyectos de energía renovable, varias fuentes han indicado una acumulación de retrasos en los pagos. Así pues, parece que varios de los proyectos admisibles no han recibido la ayuda

⁴⁶ IEA (2020), *China's Net-Zero Ambitions: The Next Five-Year Plan Will Be Critical for an Accelerated Energy Transition*. Consultado en: <https://www.iea.org/commentaries/china-s-net-zero-ambitions-the-next-five-year-plan-will-be-critical-for-an-accelerated-energy-transition>.

durante varios años o han sufrido retrasos en los pagos.⁴⁷ Las autoridades señalan que la NDRC, el MOF y la NEA están trabajando intensamente con los departamentos pertinentes para subsanar los atrasos en las subvenciones a las energías renovables.

4.88. En 2021, las autoridades determinaron que las tarifas reguladas de las energías fotovoltaica y eólica fundamentalmente habían alcanzado los niveles necesarios para eliminar progresivamente las subvenciones y lograr la paridad con respecto a la energía térmica. Por consiguiente, los nuevos proyectos dejaron de financiarse y se aplicó una política de paridad que ajusta las tarifas reguladas a las de la energía térmica, ya que se considera que los costos de producción de ambas tecnologías se han igualado.⁴⁸ Las autoridades provinciales competentes en materia de precios establecen categorías específicas, como las de los proyectos de energía eólica marina y de energía solar de concentración, y aquellos que cumplen las condiciones requeridas pueden mantener tarifas reguladas.

4.89. Con arreglo a la ley, el Fondo para el Desarrollo de la Energía Renovable se empleará principalmente para apoyar las siguientes actividades de desarrollo y utilización de energías renovables: i) investigación científica y tecnológica, formulación de normas y proyectos de demostración para el desarrollo y la utilización de energías renovables; ii) proyectos de utilización de energías renovables para uso doméstico en zonas rurales y de pastoreo; iii) construcción de sistemas de energías renovables independientes en zonas remotas e islas; iv) exploración y evaluación de recursos y creación de un sistema de información conexo sobre energías renovables; y v) promoción de la producción localizada de energías renovables.⁴⁹ China ha mantenido la mayor capacidad instalada del mundo de energía eólica, solar e hidroeléctrica, y el papel de su amplia base manufacturera de energía eólica y solar ha sido fundamental para la viabilidad económica de estas tecnologías.

4.90. Las ayudas a las tarifas reguladas se están sustituyendo por una gama de políticas y de mecanismos orientados al mercado que aprovechan el juego de la oferta y la demanda para fomentar el crecimiento del mercado de la energía verde. Estos mecanismos tienen por objeto reducir la carga fiscal de las subvenciones a las tarifas reguladas y el incentivo del exceso de inversiones en las energías renovables.

4.91. En septiembre de 2021, China aplicó también su sistema nacional experimental de comercio de energía verde, con arreglo al cual se expiden certificados de electricidad verde únicamente para la energía eólica y la energía solar.⁵⁰ Los generadores de energía eólica y solar que no reciben subvenciones del Gobierno tienen prioridad en la venta de su energía en el mercado de la energía verde. El 3 de agosto de 2023, la NDRC, el MOF y la NEA publicaron un aviso sobre la ampliación del alcance de los certificados de electricidad verde para su uso como prueba a efectos de la prima ambiental de la electricidad generada mediante energía renovable.⁵¹ Actualmente, esos certificados pueden ser objeto de comercio en la Bolsa de la Electricidad de Beijing y la Bolsa de la Electricidad de Guangzhou. En su mayor parte, son solicitados por empresas con requisitos de consumo de energía verde (cuotas en forma de proporción de su consumo energético total).

4.92. En julio de 2021, China puso oficialmente en funcionamiento su mercado nacional de carbono, que abarca unas 2.162 centrales de energía térmica. Anteriormente, el Reglamento del Comercio de Emisiones de Carbono (aplicación provisional) y el Plan de Aplicación para la Determinación y Distribución de Contingentes Nacionales de Comercio de Emisiones de Carbono para 2019-2020 (Sector de Generación de Electricidad) contenían una lista de las principales unidades de emisión del sector de generación de electricidad incluidas en la gestión de los contingentes, así como los requisitos específicos para la asignación y observancia de los contingentes. Los contingentes de

⁵⁰ NDRC (2021), "The Green Power Trading Plan Is Poised to Be Introduced - The Interpretation of the 'Green Power Trading Pilot Work Plan'", 28 de septiembre de 2021. Consultado en: https://www.ndrc.gov.cn/fqgz/fqzy/xmtjd/202109/t20210928_1298058.html?code=&state=123.

⁵¹ NDRC, Notification to Promote the Consumption of Electricity from Renewable Sources. Consultado en: https://gbdy.ndrc.gov.cn/gbdyczjd/202308/t20230803_1359095.html.

emisión se asignan de manera gratuita, teniendo en cuenta la producción histórica de la entidad y el tipo y origen de energía generada. Según las autoridades, en 2022, en el caso de las empresas participantes en el mercado nacional de emisiones de carbono, la intensidad de carbono por unidad de generación de energía térmica disminuyó un 2% con respecto a 2018.

4.93. Según las autoridades, el 18 de marzo de 2024, el volumen de comercio acumulado de contingentes de emisiones de carbono ascendió a 449 millones de toneladas y el volumen total de negocio se cifró en CNY 25.512 millones.

4.94. Está previsto que las industrias del hierro y el acero, los metales no ferrosos, el cemento, el vidrio plano, la cerámica, el papel, la construcción y el refinado de petróleo sean las próximas industrias intensivas en carbono que se incorporen al sistema nacional de comercio de carbono.⁵²

4.95. En 2022, China aprobó 106 gigavatios de nuevos proyectos de centrales de carbón y reactivó los proyectos suspendidos.⁵³

4.3 Manufacturas

4.3.1 Principales características y evolución reciente

4.96. En los últimos decenios, China se ha convertido en un importante centro manufacturero a nivel mundial. En la actualidad, la producción bruta de manufacturas de China es superior a la de los nueve siguientes mayores fabricantes en conjunto.⁵⁴ El sector manufacturero es el segundo principal sector económico del país, después de los servicios. Durante el período objeto de examen aportó entre un 26% y un 28% al PIB, representó alrededor del 28% del empleo total⁵⁵ y recibió aproximadamente el 25% de la inversión extranjera directa (IED) total. La inversión privada en el sector manufacturero de China ha sido tradicionalmente un motor importante del crecimiento económico.

4.97. Las autoridades consideran que los resultados de China en el sector manufacturero pueden deberse a su creciente integración en las cadenas de valor mundiales, impulsada por factores como la liberalización del comercio y las inversiones, la abundancia y la productividad de la mano de obra, el vasto mercado interno, la alta calidad de la infraestructura y la innovación. Sin embargo, la sostenibilidad a largo plazo del sector podría verse comprometida por los problemas ambientales, la disminución del crecimiento de la productividad, el aumento de los costos de mano de obra y el exceso de capacidad.

4.98. El comercio de productos manufacturados de China se ha mantenido resiliente frente a las perturbaciones recientes (cuadro 4.17). A pesar de la pandemia de COVID-19, las exportaciones de esos productos registraron una tendencia al alza. Las exportaciones de componentes de productos manufacturados han aumentado, debido también a la creciente demanda mundial de aparatos que posibilitan el teletrabajo, mientras que las de textiles han disminuido. Las importaciones de productos manufacturados se redujeron ligeramente en 2019 y 2020, pero experimentaron un acusado incremento en 2021, para luego descender en 2022 y 2023. Las exportaciones de productos manufacturados consisten principalmente en maquinaria y equipo de transporte, automóviles, productos químicos y productos conexos, textiles y prendas de vestir, hierro y acero. En 2023, los productos manufacturados representaron el 95,1% de las exportaciones de China (porcentaje ligeramente inferior al 95,4% registrado en 2019) y el 57,5% de sus importaciones (frente al 66,5% en 2019).

⁵² NDRC, Notice on the Issuance of the "Implementation Guide for Energy Conservation and Carbon Reduction Transformation and Upgrading in Key Areas of High Energy-Consuming Industries (edición de 2022)". Consultado en: https://www.ndrc.gov.cn/xwdt/tzqg/202202/t20220211_1315447.html.

⁵³ Centre for Research on Energy and Clean Air, *China Permits Two New Coal Power Plants per Week in 2022*. Consultado en: <https://energyandcleanair.org/publication/china-permits-two-new-coal-power-plants-per-week-in-2022/>.

⁵⁴ R. Baldwin (2024), "China Is the World's Sole Manufacturing Superpower: A Line Sketch of the Rise", 17 de enero de 2024, VoxEU. Consultado en: <https://cepr.org/voxeu/columns/china-worlds-sole-manufacturing-superpower-line-sketch-rise>.

⁵⁵ Según las autoridades, el sector secundario representa aproximadamente entre el 28% y el 29% del empleo total.

Cuadro 4.17 Comercio de manufacturas, 2018-2023

(En miles de millones de USD, salvo que se indique otra cosa)

	2018	2019	2020	2021	2022	2023
Exportaciones de manufacturas (CUCI Rev. 3)	2.352,0	2.360,0	2.475,2	3.223,9	3.424,0	3.215,9
% de las exportaciones totales	94,6	94,4	95,5	95,8	95,3	95,1
Productos químicos y productos conexos	167,5	161,8	169,2	264,3	313,3	260,0
Productos medicinales y farmacéuticos	17,4	17,3	22,1	48,7	35,1	22,3
Hierro y acero	62,6	55,1	46,5	84,5	100,9	88,7
Metales no ferrosos	27,5	26,3	23,8	37,4	45,3	36,9
Maquinaria	1.092,0	1.085,6	1.150,0	1.446,7	1.508,6	1.409,3
Máquinas de oficina y máquinas de procesamiento automático de datos	219,2	199,7	217,4	259,3	242,1	194,8
Equipo de transporte	116,1	109,9	108,3	171,6	196,2	238,2
Importaciones de manufacturas (CUCI Rev. 3)	1.434,0	1.343,5	1.378,5	1.710,5	1.626,3	1.471,4
% de las importaciones totales	67,1	64,7	67,1	63,6	59,9	57,5
Productos químicos y productos conexos	223,7	218,8	213,3	264,0	266,4	239,0
Productos medicinales y farmacéuticos	29,6	35,7	37,0	44,4	47,6	51,4
Hierro y acero	24,2	25,4	39,1	45,6	45,5	38,4
Metales no ferrosos	55,9	48,6	66,2	87,1	84,4	72,4
Maquinaria	724,7	689,3	742,3	902,3	848,3	747,8
Máquinas de oficina y máquinas de procesamiento automático de datos	57,2	56,7	59,4	73,9	62,7	55,1
Equipo de transporte	114,8	97,2	86,3	103,6	93,8	82,9

Fuente: Administración General de Aduanas de la República Popular China (GACC).

4.99. El promedio de los aranceles NMF aplicados en el sector manufacturero fue del 6,8% en 2023, frente al 7% en 2021 y el 9,5% en 2017. Debido a la amplia red de acuerdos comerciales preferenciales de China, el comercio de productos manufacturados con numerosas economías se beneficia de aranceles mucho más bajos.

4.100. El sector manufacturero de China está en general abierto a la inversión extranjera. Durante el período objeto de examen se suprimieron diversas restricciones a la IED en la producción de vehículos y satélites (sección 2.4). En marzo de 2024, China anunció la supresión de todas las restricciones a la inversión extranjera que quedaban en el sector manufacturero.⁵⁶ El número de sectores en los que se incentiva la IED ha aumentado con el tiempo, como se observa en las actualizaciones recientes del Catálogo de Sectores con Incentivos a la IED. Esto puede ser reflejo del interés de China en sus cadenas de producción en esferas como las de los semiconductores y el sector de las energías limpias. Según las autoridades, no existen disposiciones que obliguen a las empresas extranjeras a transferir tecnología en el sector manufacturero.

4.101. El principal organismo encargado de la formulación de políticas relativas al sector manufacturero es el Ministerio de Industria y Tecnología de la Información (MIIT), que determina la planificación y las políticas industriales de China y supervisa el sector. La Comisión Nacional de Desarrollo y Reforma (NDRC) se ocupa de coordinar el desarrollo del sector industrial y de elaborar estrategias de modernización industrial. Entre los objetivos de política de China para el sector manufacturero figura el desarrollo de las actividades de mayor valor añadido y basadas en el conocimiento a través de la innovación, pero también desempeñan un papel importante las consideraciones ambientales, como la reducción del consumo de energía y de la contaminación.

4.102. La iniciativa "Made in China 2025" (o China Manufacturing 2025), puesta en marcha en 2015, sigue siendo la principal iniciativa estratégica nacional para promover la modernización del sector manufacturero.⁵⁷ Su finalidad es ayudar a China i) a convertirse en una de las sólidas potencias

⁵⁶ Gobierno de China. Consultado en: https://www.gov.cn/yaowen/liebiao/202403/content_6939153.htm.

⁵⁷ Según las autoridades, Made in China 2025 es una iniciativa estratégica en materia de desarrollo industrial de naturaleza similar a la de otras iniciativas estratégicas publicadas por algunos Miembros desarrollados.

manufactureras para 2025; ii) a alcanzar el nivel medio de las potencias manufactureras mundiales para 2035; y iii) a situarse en la vanguardia de los líderes mundiales en la industria manufacturera para 2050. En el marco de la iniciativa se han identificado industrias estratégicas, entre ellas las siguientes: equipo aeroespacial; biotecnología; tecnología de la información; sistemas de fabricación inteligentes; ingeniería marítima; equipo ferroviario avanzado; vehículos eléctricos; equipo eléctrico; nuevos materiales; biomedicina; maquinaria y equipo agrícolas; productos farmacéuticos; y robótica. Las autoridades han indicado que no se dispone de datos sobre la cuantía de la financiación pública, en su caso, destinada a apoyar a la industria en el marco de esas iniciativas, ni de estudios de impacto relativos a la iniciativa "Made in China 2025".

4.103. En el marco del 14º Plan Quinquenal, China ha publicado desde 2021 diversos planes relacionados con el desarrollo industrial, como el Plan de Desarrollo de Sistemas de Fabricación Inteligentes, el Plan de Desarrollo de la Industria Robótica y el Plan de Desarrollo de la Industria de Vehículos Propulsados por Energías Alternativas. El objetivo general de los Planes es promover el desarrollo de la industria manufacturera o de un sector específico. En los Planes se proponían varios objetivos de desarrollo específicos; por ejemplo, el Plan de Desarrollo de Sistemas de Fabricación Inteligentes tiene por objeto lograr la digitalización y la creación de redes de cooperación en el 70% de las empresas manufactureras por encima de un determinado tamaño designado, y fomentar el establecimiento de más de 150 proveedores profesionales de soluciones de fabricación inteligentes.

4.104. Otras medidas adoptadas durante el período objeto de examen incluyen las siguientes: Aviso sobre Diversas Políticas para Promover el Crecimiento Constante de la Economía Industrial⁵⁸; Plan de Aplicación para la Revitalización de la Actividad Económica Industrial y la Promoción del Desarrollo Industrial de Alta Calidad⁵⁹; Dictámenes de Ejecución del Programa Piloto de Desarrollo de la Innovación en el Sector Manufacturero⁶⁰; Plan de Aplicación para la Promoción de la Renovación del Equipo en el Sector Industrial⁶¹; Aviso sobre la Ejecución del Proyecto Piloto de la Nueva Transformación Tecnológica del Sector Manufacturero⁶²; Dictámenes de Ejecución sobre la Promoción de la Innovación y el Desarrollo Industriales en el Futuro⁶³; y Diversos Reglamentos sobre la Producción y Gestión de Aeronaves Civiles no Tripuladas.⁶⁴

4.105. Los fondos gubernamentales de orientación desempeñan un papel fundamental en la consecución de los objetivos de la política industrial de China (sección 3.3.1). Varios de esos fondos se centran específicamente en el sector manufacturero. Algunos de ellos están relacionados con la iniciativa "Made in China 2025" (cuadro 3.14); según las autoridades, se trata de fondos de inversión orientados al mercado y no reciben subvenciones ni tienen funciones de política industrial. Otros fondos gubernamentales de orientación que apoyan a las empresas de propiedad estatal, las pymes, la innovación o el desarrollo regional también tienen importantes consecuencias para el sector manufacturero.

4.106. El sector manufacturero de China es un importante receptor de donaciones, financiación para investigación y concesiones fiscales (sección 3.3.1). Las notificaciones de subvenciones presentadas por China en 2021 y 2023 se refieren a numerosas medidas de política destinadas a apoyar al sector manufacturero y el desarrollo tecnológico en general.⁶⁵ Según la base de datos CSMAR, en 2022 las subvenciones concedidas a empresas chinas del sector manufacturero

⁶³ Gobierno de China. Consultado en: https://www.gov.cn/zhengce/zhengceku/202401/content_6929021.htm.

⁶⁴ MIIT. Consultado en: https://www.miit.gov.cn/gyhxxhb/jgsj/cyzcyfgs/bmgz/jdcjxl/art/2024/art_60819d411ad149d58ac3b0a03fd05fcb.html.

⁶⁵ Documentos [G/SCM/N/372/CHN](#) y [G/SCM/N/401/CHN](#) de la OMC, de 27 de agosto de 2021 y 20 de julio de 2023, respectivamente.

ascendieron a CNY 160.000 millones (sección 3.3.1). En la mayoría de los subsectores del sector manufacturero abundan las empresas de propiedad estatal.

4.107. Conforme a la reglamentación vigente, los productos remanufacturados (productos mecánicos y eléctricos) se consideran productos usados y están sujetos a las disposiciones relativas a las restricciones o prohibiciones a la importación de mercancías usadas. En julio de 2023, el Consejo de Estado de China publicó el Aviso sobre Diversas Medidas relativas a la Promoción de la Apertura Institucional de las Zonas Francas Experimentales y los Puertos Francos Calificados para su Armonización con las Normas Internacionales de Alto Nivel, con miras a promover el programa piloto sobre las importaciones de productos remanufacturados derivados fundamentales en algunas zonas francas.

4.3.2 Subsectores seleccionados

4.3.2.1 Automóviles, aeronaves, y sus partes y componentes

4.108. China es el mayor mercado mundial de automóviles, tanto en términos de demanda como de producción. En 2023, la producción local de vehículos fue por primera vez superior a 30 millones de unidades, frente a 25,3 millones en 2020.⁶⁶ Las exportaciones de vehículos automóviles ascendieron a más de USD 44.000 millones en 2022, frente a menos de USD 10.000 millones en 2020 (cuadro 4.18).

4.109. El MIIT supervisa cuestiones tales como las licencias de producción, las normas sobre la eficiencia del consumo de combustibles y la reglamentación sobre emisiones. De conformidad con la Política Comercial sobre el Sector del Automóvil publicada en 2005, la importación de vehículos usados y sus partes y componentes está prohibida. Las empresas de propiedad estatal desempeñan una importante función en el sector del automóvil.

4.110. Una de las prioridades de la política industrial del país es la producción de automóviles propulsados por energías alternativas. China tiene actualmente uno de los mercados de vehículos eléctricos de más rápido crecimiento del mundo.⁶⁷ Las exportaciones de vehículos eléctricos han aumentado considerablemente en los últimos años, y en 2022 superaron la cifra de USD 20.000 millones, mientras que el nivel de las importaciones se mantuvo constante entre 2017 y 2022 (cuadro 4.18). En noviembre de 2023, la producción mensual de vehículos eléctricos de China excedió por primera vez de 1 millón de unidades.

Cuadro 4.18 Comercio de vehículos automóviles, 2017-2022

(En millones de USD)

	2017	2018	2019	2020	2021	2022
Exportaciones	7.176,9	8.627,7	8.633,0	9.927,7	24.389,1	44.687,9
Vehículos eléctricos únicamente	110,0	129,8	438,1	1.578,9	8.596,3	20.088,9
Importaciones	49.946,1	49.596,4	47.056,8	44.924,0	52.852,7	52.273,9
Vehículos eléctricos únicamente	1.468,9	1.198,5	2.466,8	949,6	797,1	1.445,0

Fuente: Información recopilada por la Secretaría de la OMC a partir de información de la base de datos UN Comtrade.

4.111. En el contexto del presente examen no se ha facilitado información sobre las subvenciones a la producción de vehículos eléctricos más allá de la contenida en las notificaciones de subvenciones de China. Las autoridades han indicado que las políticas aplicadas a nivel subcentral para fomentar la compra de vehículos eléctricos no se utilizan directamente para subvencionar a las empresas, y que este tipo de política no es específico y no está sujeto a prescripciones en materia de notificación.

4.112. La industria aeronáutica de China es todavía relativamente joven. En mayo de 2023 comenzó a realizar vuelos comerciales una aeronave de fuselaje estrecho, con capacidad para unos 160 pasajeros, construida por la empresa de propiedad estatal COMAC. Actualmente, esa aeronave solo

⁶⁶ China Association of Automobile Manufacturers. Consultado en: <http://en.caam.org.cn/Index/lists/catid/69.html>.

⁶⁷ Agencia Internacional de la Energía, *Trends in Electric Cars*. Consultado en: <https://www.iea.org/reports/global-ev-outlook-2024/trends-in-electric-cars>.

está certificada por China. En la notificación de subvenciones presentada por China en 2023 se indica que existe un tipo preferencial del IVA para grandes aeronaves de pasajeros y aeronaves de transporte regional nuevas, así como políticas relativas al impuesto de propiedad de la vivienda y al impuesto sobre el uso de terreno urbano para las empresas dedicadas al diseño y fabricación de grandes aeronaves de pasajeros y sus motores.⁶⁸

4.3.2.2 Maquinaria, equipo, electrónica e industrias conexas

4.113. Las exportaciones de maquinaria de China ascendieron a más de USD 1,4 billones en 2023, frente a menos de USD 1,1 billones en 2019. Las importaciones se situaron en unos USD 750.000 millones en 2023, frente a USD 690.000 millones en 2019.

4.114. Las autoridades han indicado que la política industrial del subsector de la maquinaria tiene por objeto fomentar el desarrollo a través de la innovación; promover la transformación para lograr un sector inteligente, ecológico y orientado a los servicios; promover la optimización de las estructuras industriales; mejorar la calidad de los productos; aumentar las tasas de utilización de los recursos y la energía; y reducir las emisiones contaminantes.

4.115. En 2023, el MIIT y otros organismos gubernamentales adoptaron un plan para el desarrollo de una industria robótica cuyo objetivo es convertir a China en un centro mundial de excelencia en innovación en tecnología robótica, fabricación avanzada y aplicaciones integradas para 2025. En 2021, el Ministerio de Industria y Tecnología de la Información, junto con otros órganos gubernamentales, formuló el 14º Plan Quinquenal relativo al Plan de Desarrollo de la Industria Robótica. En el Plan se proponía convertir a China para 2025 en una fuente mundial de innovación en tecnología robótica, en un clúster de fabricación de productos de alta gama y en un lugar propicio para crear aplicaciones integradas.

4.116. Las autoridades consideran que el sector de los circuitos integrados es un sector estratégico que favorece el desarrollo y la seguridad nacionales. En la iniciativa "Made in China 2025" se insistía en la atención prestada por China a la tecnología de la información de nueva generación, en particular a los semiconductores.

4.117. China depende en gran medida de las importaciones de circuitos integrados de alta gama. La importancia de la demanda de semiconductores es un reflejo de la especialización del país en el montaje de productos electrónicos, ya que la mayoría de las microplaquetas semiconductoras (chips) no están destinadas a su consumo efectivo en China, sino que se reexportan a otros países en forma de equipo electrónico (por ejemplo, teléfonos, televisores y tabletas). Durante el período objeto de examen, importantes interlocutores comerciales impusieron controles a la exportación de determinados semiconductores y productos conexos a China.

4.118. El Fondo Nacional de Inversiones para el Sector de los Circuitos Integrados y los fondos conexos a nivel provincial y municipal se encargan de inyectar capital en el sector de los semiconductores de China (cuadro 3.14). Se aplica un régimen fiscal especial a las empresas que producen semiconductores específicos.⁶⁹ Esas medidas no se han notificado a la OMC. En agosto de 2020, el Consejo de Estado publicó el Aviso sobre Diversas Políticas para Promover el Desarrollo de Alta Calidad del Sector de los Circuitos Integrados y el Sector de los Programas Informáticos en la Nueva Era (Guo Fa [2020] Nº 8), en las que se prevé la prestación de apoyo al sector de los semiconductores en términos de finanzas y tributación, inversión y financiación, investigación y desarrollo, importación y exportación, y talento.

4.3.2.3 Hierro, acero y construcción naval

4.119. Según las autoridades, en 2022 la capacidad de producción de acero en bruto de China era de 1.102 millones de toneladas, y la producción de acero en bruto ascendió a 1.018 millones de

⁶⁸ Documento [G/SCM/N/401/CHN](#) de la OMC, de 20 de julio de 2023.

⁶⁹ China ofrece exenciones totales del impuesto sobre la renta de las sociedades a las empresas que produzcan circuitos integrados con un nodo de 28 nanómetros o menos durante un período de 10 años. Las empresas admisibles que producen circuitos integrados con un nodo de 65 nanómetros o menos pueden beneficiarse de una exención fiscal total durante cinco años, seguida de una reducción del 50% de los tipos impositivos en los cinco años siguientes. Consultado en: <https://www.chinatax.gov.cn/eng/c101269/c5160133/content.html>.

toneladas; en 2023, la producción de acero en bruto de las empresas privadas productoras de acero representó alrededor del 60% del total nacional, mientras que la de las empresas de propiedad estatal representó en torno al 40%, y la de las 10 principales empresas productoras de acero representó el 41% de la producción nacional de acero en bruto. El sector cuenta con varios grandes grupos estatales que son propiedad de las autoridades locales, los Gobiernos provinciales y el Gobierno central mediante participación en el capital.⁷⁰

4.120. El Gobierno es consciente del exceso de capacidad en el sector del acero. Los esfuerzos por eliminar el exceso de capacidad de producción se siguen rigiendo por los Dictámenes sobre la Reducción del Exceso de Capacidad en el Sector del Acero para Impulsar el Desarrollo mediante la Solución de Dificultades (Guo Fa [2016] Nº 66), que prohíben la creación de nueva capacidad de producción de acero. En abril de 2021 se publicaron las Medidas de Aplicación para la Sustitución de la Capacidad en la Industria Siderúrgica (Gong Xin Bu Yuan [2021] Nº 46) con miras a seguir reduciendo el exceso de capacidad de producción de hierro y acero. El objetivo de una de las medidas incluidas en la última notificación de subvenciones de China es reducir el exceso de capacidad.⁷¹ En enero de 2022, el MIIT, conjuntamente con la NDRC y el Ministerio de Ecología y Medio Ambiente, publicó las Orientaciones sobre la Promoción del Desarrollo de Alta Calidad del Sector Siderúrgico, que tienen por objeto, entre otros, limitar estrictamente la instalación de nueva capacidad de producción de hierro y acero.

4.121. Otras políticas de apoyo al desarrollo de la industria siderúrgica incluyen las Medidas de Aplicación para la Sustitución de la Capacidad en la Industria Siderúrgica (Gong Xin Bu Yuan [2021] Nº 46) y las Orientaciones sobre la Promoción del Desarrollo de Alta Calidad del Sector Siderúrgico (Gong Xin Bu Yuan [2022] Nº 6).

4.122. En el marco de la iniciativa "Made in China 2025", la construcción naval se considera uno de los 10 sectores prioritarios. En los últimos años, el nivel del diseño y la construcción de buques ha mejorado rápidamente, y el sector de la construcción naval civil de China se ha caracterizado por una tendencia a la construcción de más tipos de buques "de alta gama", como grandes trasatlánticos y buques de transporte de gas natural licuado (GNL).

4.123. La última notificación de subvenciones de China no contiene cifras específicas sobre las subvenciones asignadas al sector de la construcción naval. Sin embargo, se indica que las empresas navieras pueden beneficiarse de la amortización acelerada de los activos fijos.⁷²

4.124. En agosto de 2021 se completó la fusión de las dos principales empresas públicas de construcción naval del país —China State Shipbuilding Corp. (CSSC) y China Shipbuilding Industry Co. (CSIC)—, de la que surgió la mayor empresa de construcción naval del mundo.

4.4 Servicios

4.4.1 Servicios de telecomunicaciones

4.4.1.1 Panorama general

4.125. China es uno de los mercados de telecomunicaciones de mayor tamaño del mundo, como prueba su número de abonados a los servicios de telefonía (recuadro 4.2). En 2023, la transmisión de información, los programas informáticos y la tecnología de la información representaron el 4,4% del PIB, frente a un 3,1% en 2019 (sección 1.1).

4.126. Según se desprende de los datos oficiales, el valor añadido del sector de las telecomunicaciones de China aumentó un 5,1% en 2022 gracias al notable crecimiento de nuevos sectores de actividad y al rápido desarrollo de nuevas infraestructuras. Durante el mismo período, los ingresos generados por las empresas del sector superaron los 1,58 billones de CNY, lo que equivale a un incremento del 8% con respecto al año anterior. Los ingresos combinados de los

⁷⁰ Según las autoridades, las empresas privadas productoras de acero representan más del 60% de la producción de acero en bruto.

⁷¹ Fondo Especial de Incentivos y Subvenciones para la Reestructuración de Empresas Industriales en la Región Autónoma de Guangxi Zhuang; en 2021, su presupuesto notificado fue de CNY 161 millones. Documento [G/SCM/N/401/CHN](#) de la OMC, de 20 de julio de 2023.

⁷² Documento [G/SCM/N/401/CHN](#) de la OMC, de 20 de julio de 2023.

nuevos sectores de actividad, como los centros de datos de Internet, la computación en la nube y la Internet de las cosas, aumentaron un 32,4%. Durante el mismo período, la inversión en el sector de las telecomunicaciones también registró un crecimiento importante (del 3,3% en términos interanuales) hasta alcanzar CNY 419.300 millones en 2022.⁷³

4.127. El comercio de servicios de telecomunicaciones ha seguido creciendo en los últimos años (gráfico 4.3), a pesar de que las importaciones disminuyeron considerablemente entre 2021 y 2022 debido a las repercusiones de la pandemia COVID-19 y las restricciones asociadas a ella. Según las autoridades, la innovación permanente en el campo digital y el aumento de la demanda de servicios digitales se han convertido en importantes fuerzas impulsoras del comercio de servicios de telecomunicaciones de China. Las autoridades han señalado asimismo que las empresas chinas que participan en la externalización de tecnologías de la información a nivel internacional han registrado un crecimiento interanual del 7,9% en 2023, con un valor total de USD 60.570 millones. En 2023, los tres principales mercados destinatarios de la externalización de las tecnologías de la información fueron los Estados Unidos; Hong Kong, China; y la Unión Europea.

Gráfico 4.3 Comercio en los sectores de las telecomunicaciones y los servicios de informática e información, 2016-2022

(Miles de millones de USD)

Fuente: Administración Estatal de Divisas. Consultado en: <http://www.safe.gov.cn/>.

4.128. Los principales operadores que prestan servicios de telecomunicaciones fijos y móviles son tres empresas públicas (China Telecom, China mobile y China Unicom). La participación del Estado en estas tres empresas de telecomunicaciones ha disminuido entre 2020 y 2022.⁷⁴ En 2020, China Broadnet, otra empresa pública, se convirtió en la única empresa autorizada por el Gobierno para prestar servicios móviles, fijos, de banda ancha y de televisión por cable en China. En 2022, el operador se sumó a sus tres homólogos y comenzó a ofrecer servicios 5G. China ha seguido registrando un rápido crecimiento de sus redes 5G. Según las autoridades, en 2023 había más de 2,73 millones de estaciones de base 5G (frente a 400.000 en 2020, como se indicó en el examen anterior). Solo en 2022 se construyeron cerca de 887.000 estaciones de base 5G. En 2022 había 561 millones de usuarios de redes móviles 5G, lo que equivale a un tercio de los usuarios de los servicios de telefonía móvil de China.⁷⁵

4.129. La explotación de nuevos sectores de actividad en el campo de las telecomunicaciones, como los centros de datos de Internet, la computación en la nube o la Internet de las cosas, corre fundamentalmente a cargo de empresas privadas.

4.130. Según las autoridades, las tarifas de telecomunicaciones están determinadas por el mercado y son las empresas de telecomunicaciones quienes las fijan. Los precios de los servicios de

https://english.www.gov.cn/archive/statistics/202301/19/content_WS63c93615c6d0a757729e5e02.html.

⁷⁴ La proporción de acciones de propiedad estatal de China Telecom, China Mobile y China Unicom era del 82,85%, el 72,72% y el 52,10%, respectivamente.

⁷⁵ State Council (2023), "China's Telecom Industry Reports Steady Expansion in 2022", 19 de enero. Consultado en:

https://english.www.gov.cn/archive/statistics/202301/19/content_WS63c93615c6d0a757729e5e02.html.

telecomunicaciones, en porcentaje del ingreso nacional bruto (INB) per cápita, son significativamente inferiores a los precios medio de Asia y del resto del mundo (cuadro 4.19).

Recuadro 4.2 Indicadores seleccionados del sector de las telecomunicaciones, 2022

Datos económicos

Número total de abonados a líneas telefónicas: 1,776 billones (en 2020)

Tasas de penetración (2022):

Total de abonados a servicios de telefonía (por cada 100 habitantes): 131,95%

Abonados a servicios de telefonía móvil (% del total de abonados a servicios de telefonía): 90,4%

Usuarios de Internet (por cada 100 habitantes): 75,6%

Abonados a servicios de Internet de banda ancha (por cada 100 habitantes): 41,8%

Principales operadores:

Número de empresas que prestan servicios de telecomunicaciones de valor añadido: 147.000 empresas (abril de 2023).

Nombres y cuotas de mercado de los principales proveedores de servicios de telecomunicaciones (fijos y móviles) (2022): China Telecom (28%), China Mobile (52%) y China Unicom (20%).

Nombres y cuotas de mercado de los principales proveedores de servicios de Internet de banda ancha (2022): China Telecom (37,5%), China Mobile (43,5%) y China Unicom (19%).

Participación extranjera en el capital de las empresas de telecomunicaciones:

En abril de 2023, un total de 1.426 empresas extranjeras habían invertido en empresas de telecomunicaciones chinas.

Propiedad estatal:

En 2022, la proporción de acciones de propiedad estatal de China Telecom, China Mobile, China Unicom y China Broadnet era del 75,15%, el 70,42%, el 51,7% y el 100,00%, respectivamente.

4.4.1.2 Marco de políticas y reglamentario

4.131. Según las autoridades, los objetivos de China en el sector de las telecomunicaciones no han variado durante el período objeto de examen. Uno de ellos es orientar y facilitar un desarrollo sólido y de calidad del sector mediante una asignación de recursos más eficaz y la mejora de la accesibilidad y asequibilidad de los servicios de comunicaciones. Entre las medidas desplegadas para mejorar la competencia y la eficacia, las autoridades mantienen programa de portabilidad de números que permite a los usuarios de telefonía móvil cambiar de proveedor sin perder su actual número de teléfono.

4.132. Según las autoridades, la implantación en todo el país del servicio de portabilidad numérica finalizó a finales de 2019. A finales de febrero de 2024 habían recurrido a este servicio unos 100 millones de abonados.

4.133. El marco institucional y jurídico no ha experimentado grandes cambios. El MIIT sigue siendo el organismo encargado de la reglamentación del sector. Supervisa la concesión de licencias, establece las normas sectoriales y administra las tarifas de acceso. En el plano provincial y local, esta responsabilidad corresponde a los departamentos administrativos encargados de los servicios de telecomunicaciones. El Reglamento de Telecomunicaciones de 2000 (modificado por última vez en 2016) sigue siendo el principal fundamento jurídico en el que se basa el sector. Se complementa con un amplio conjunto de reglamentos de aplicación que abarcan muy diversas cuestiones, entre ellas la concesión de licencias, la recaudación de derechos, la interconectividad y la participación extranjera. El proceso de concesión de licencias se basa en el Catálogo de Servicios de Telecomunicaciones de 2015 (que no ha sido modificado durante el período examinado). Este

documento distingue entre los servicios de telecomunicaciones básicos y los servicios de telecomunicaciones de valor añadido. Los titulares de licencias solo están autorizados a realizar las actividades que se especifican en sus licencias respectivas.

4.134. La participación extranjera en el sector de las telecomunicaciones sigue estando sujeta a algunas restricciones. Estas restricciones se enuncian en los compromisos de apertura de los mercados suscritos en el Protocolo de adhesión de China a la OMC, en la Lista Negativa Nacional y en la Lista Negativa para las Zonas Francas Experimentales (sección 2.4.1). Según se especifica en estos compromisos, la participación extranjera en los servicios de telecomunicaciones de valor añadido (salvo en el caso del comercio electrónico, las comunicaciones nacionales entre múltiples partes, el almacenamiento y retransmisión y los centros de llamadas) no debe superar el 50%. Con arreglo al Reglamento de Telecomunicaciones, la participación o acciones del Estado en las empresas dedicadas a la prestación de servicios de telecomunicaciones básicas no debe ser inferior al 51%. En el caso de las inversiones en servicios de redes privadas virtuales (VPN) nacionales, la participación extranjera no puede superar el 50%. Al igual que en el examen anterior, los servicios en la nube no están abiertos a la inversión extranjera.

4.135. Las autoridades han indicado que, en 2022, China publicó la Decisión sobre la Modificación y Derogación de determinados Reglamentos Administrativos y revisó las Disposiciones sobre la Administración de las Empresas de Telecomunicaciones con Financiación Extranjera. La reforma ha suprimido las prescripciones que obligaban a los posibles inversores extranjeros a demostrar unos resultados sólidos y experiencia operativa en empresas de telecomunicaciones. También ha establecido una base jurídica que permite a las autoridades flexibilizar o eliminar en determinados casos las restricciones relativas al porcentaje de participación extranjera en el sector de las telecomunicaciones, y ha reducido de 90 a 60 días el plazo de tramitación de las solicitudes de autorización para los servicios de telecomunicaciones de valor añadido.

4.136. Según las autoridades, en abril de 2023 un total de 1.426 empresas extranjeras habían invertido en empresas de telecomunicaciones chinas (recuadro 4.2). Esta cifra representa un incremento notable con respecto a finales de 2020, fecha en la que 395 empresas de capital extranjero habían penetrado en el mercado de telecomunicaciones de China.

4.137. El MIIT sigue alentando la construcción conjunta y el uso compartido de las infraestructuras de telecomunicaciones a fin de limitar el desarrollo de instalaciones de telecomunicaciones superfluas. Por ejemplo, en mayo de 2023, el MIIT y otros 14 departamentos publicaron conjuntamente los Dictámenes de Ejecución relativos a la Intensificación de la Construcción Conjunta y el Uso Compartido de Infraestructuras de Telecomunicaciones y a la Promoción de un Desarrollo de Calidad de las Redes de "Doble Gigabit" (Gong Xin Bu Lian Tong Xin [2023] Nº 59). Los Dictámenes de Ejecución definen diversas tareas que deben llevarse a cabo para, entre otras cosas, construir y compartir las infraestructuras de telecomunicaciones, y promover la construcción de redes de "doble gigabit", en particular mediante el apoyo a la construcción conjunta y el uso compartido a las redes de acceso 5G.⁷⁶ Según las autoridades, desde la introducción de la política de uso compartido de las instalaciones de telecomunicaciones, la tasa de uso compartido de las torres de nueva construcción ha pasado de un 14,3% en 2014 a un 83% en 2023. Esto significa que se han construido conjuntamente y se están compartiendo más de 2,51 millones de estaciones de base 5G. Las autoridades han señalado asimismo que este incremento se ha traducido en un importante aumento de la eficacia y ha supuesto la eliminación de 980.000 torres potenciales, un ahorro superior a CNY 176.000 millones y una reducción de las emisiones de carbono de 26 millones de toneladas.

4.4.1.3 Evolución de la economía digital

4.138. Según la Academia China de Tecnologías de la Información y las Comunicaciones (CAICT), entre 2016 y 2022 la economía digital china ha más que duplicado su tamaño, pasando de

⁷⁶ Dictámenes de Ejecución relativos a la Intensificación de la Construcción Conjunta y el Uso Compartido de Infraestructuras de Telecomunicaciones y a la Promoción de un Desarrollo de Calidad de las Redes de "Doble Gigabit", publicados conjuntamente por el Consejo de Estado, el Ministerio de Industria y Tecnología de la Información y otros 14 departamentos. Consultado en: https://www.gov.cn/lianbo/bumen/202305/content_6876197.htm.

CNY 22,6 billones a más de CNY 50 billones (más del 41% del PIB).⁷⁷ Las infraestructuras de telecomunicaciones avanzadas, incluido el creciente número de estaciones de base 5G y la cadena industrial de macrodatos, han contribuido de manera crucial al crecimiento de la economía digital en el país.

4.139. Las grandes inversiones en I+D han contribuido a la transformación digital de China. En el Índice Mundial de Innovación de 2023 elaborado por la OMPI, China ocupaba el puesto 12º de las 132 economías incluidas. En cuanto al gasto realizado en I+D, China ocupaba el segundo puesto en la clasificación mundial.⁷⁸ Además, entre los principales centros de innovación científica y tecnológica del mundo, el de Shenzhen-Hong Kong, China-Guangzhou ocupaba el segundo lugar y el de Beijing el cuarto lugar.⁷⁹ China es uno de los países con mayor número de titulares de patentes de invención en el ámbito digital. A finales de 2023, los tres principales sectores que contribuían al crecimiento de las patentes de invención en China eran los métodos de gestión de la tecnología informática, la tecnología informática y los programas de comunicaciones básicos. Además, según se desprende de la información oficial del Consejo de Estado, a finales de 2022 había en China 1,6 millones de patentes de invención en los sectores esenciales de la economía digital, de las cuales cerca del 80% correspondían a entidades chinas.⁸⁰

4.140. La rápida digitalización de la economía china debería impulsar la productividad, sobre todo en el sector financiero, donde las herramientas de la inteligencia artificial (IA) pueden, por ejemplo, reducir las asimetrías de información y permitir así a las empresas y los particulares adoptar mejores decisiones financieras y reducir potencialmente sus costos.⁸¹

4.141. Según las autoridades, el auge de la economía digital en China ha creado importantes oportunidades de empleo en el sector de los servicios. En el sector del comercio electrónico, por ejemplo, han surgido numerosas pymes gracias a las grandes plataformas tecnológicas chinas. También ha aumentado el empleo en el sector de las TIC.

4.142. Por otro lado, en los últimos años la creciente automatización en el sector manufacturero se ha visto acompañado de la pérdida de puestos de trabajo. No obstante, parece que la incidencia neta de la digitalización sobre el empleo es positiva.⁸²

4.143. Con el fin de desarrollar la economía digital china en un entorno competitivo, las autoridades han adoptado recientemente medidas para regular la competencia en el mercado de los sectores económicos en que operan esas plataformas. Por ejemplo, en 2021, la antigua Comisión Antimonopolio del Consejo de Estado publicó las Directrices de la Comisión Antimonopolio del Consejo de Estado sobre la Lucha contra el Monopolio en la Esfera de la Economía de las Plataformas de Internet. China ha diseñado diversas políticas y estrategias para fomentar el crecimiento sostenible de la economía digital. Las autoridades han señalado que, en los últimos años, el país ha puesto en marcha su estrategia nacional sobre la economía digital y los macrodatos, ha acelerado la mejora de las infraestructuras digitales, ha promovido nuevas formas y modelos empresariales y ha maximizado el potencial de los elementos de datos, con objeto de fomentar "la industrialización digital y la digitalización industrial".

4.144. Se han puesto en marcha varias estrategias para facilitar el crecimiento de la industria digital y potenciar un desarrollo de calidad de la economía digital. Entre ellas, cabe citar el 14º Plan Quinquenal de Desarrollo de la Economía Digital⁸³, el Plan General para la Construcción de una China

⁷⁷ CAICT (2022), *White Paper on Global Digital Economy*. Consultado en: http://www.caict.ac.cn/english/research/whitepapers/202303/t20230316_416850.html.

⁸³ Consejo de Estado, Aviso del Consejo de Estado sobre la Publicación y Distribución del 14º Plan Quinquenal de Desarrollo de la Economía Digital. Consultado en: https://www.gov.cn/zhengce/content/2022-01/12/content_5667817.htm.

Digital⁸⁴, el 14º Plan Quinquenal de Desarrollo de la Industria de los Macrodatos⁸⁵ y el 14º Plan Quinquenal de Desarrollo de la Informatización y la Integración Industrial.⁸⁶

4.145. Otro de los objetivos de los actuales esfuerzos de China por mejorar su política digital es reforzar el marco reglamentario de la economía digital. Un ejemplo es la adopción del Dictamen relativo al Desarrollo de un Sistema de Datos Básicos⁸⁷, cuya finalidad es optimizar la utilización de los elementos de datos. Para aumentar el grado de alfabetización digital en la sociedad e impulsar el crecimiento socioeconómico digital, varios ministerios y comisiones han colaborado para adoptar directivas como los Elementos Esenciales para Mejorar la Alfabetización y las Competencias Digitales, de 2023, y los Elementos Esenciales para el Desarrollo de Aldeas Digitales, también de 2023.

4.4.1.4 Evolución en el ámbito de la ciberseguridad

4.146. Los problemas de seguridad que plantea la transformación digital de la economía china siguen siendo motivo de preocupación. Las autoridades han señalado que China ha presentado la Iniciativa Mundial para la Gobernanza de la IA a fin de promover un enfoque equilibrado del desarrollo y la seguridad en el ámbito de la IA. También han expresado su disposición a intensificar los intercambios y el diálogo mundial para reforzar la gobernanza mundial de la IA.

4.147. A medida que el ritmo de la digitalización continúa cobrando impulso y mejorando la eficiencia en diversas ramas de producción, surgen también una serie de nuevos riesgos cibernéticos de rápida evolución. Las autoridades han adoptado recientemente un conjunto de medidas en materia de ciberseguridad que incluyen políticas, leyes, reglamentos y directrices para mitigar esos riesgos. Por ejemplo, en 2021, la Administración del Ciberespacio de China (CAC) elaboró el Reglamento de Protección de la Seguridad de las Infraestructuras Críticas de Información para i) proteger las infraestructuras de información claves (relacionadas, entre otras cosas, con los servicios financieros y los servicios públicos) contra ataques, intrusiones, interferencias e intentos de destrucción, ii) preservar la seguridad de las infraestructuras críticas de información y iii) garantizar la ciberseguridad.

4.148. Como se indicó en el examen anterior, China ha promulgado la Ley de Ciberseguridad, la Ley de Seguridad de los Datos y la Ley de Protección de la Información Personal, el Reglamento de Protección de la Seguridad de las Infraestructuras Críticas de Información, las Medidas para el Examen de la Ciberseguridad, el Aviso sobre Diversas Disposiciones relativas a la Administración de la Seguridad de los Datos relativos a los Automóviles (versión de prueba) y las Medidas relativas a la Evaluación de la Seguridad de la Transferencia de Datos de Salida. Según las autoridades, estas disposiciones sirven de base para evaluar la ciberseguridad, gestionar la seguridad de los datos, proteger la información personal y evaluar la seguridad de las transferencias transfronterizas de datos a fin de preservar la seguridad del ciberespacio de China.

4.149. Las normas de China sobre las transferencias transfronterizas de datos, enunciadas en la Ley de Ciberseguridad, disponen que la información personal y los datos importantes recopilados y generados por los operadores de infraestructuras críticas de información en el marco de las actividades que llevan a cabo en China deben someterse a una evaluación de la seguridad siempre que sea necesario comunicar esos datos fuera del país por razones comerciales.⁸⁸ La Ley de Seguridad de los Datos y las Medidas relativas a la Evaluación de la Seguridad de los Datos

⁸⁴ Comité Central del Partido Comunista de China y Consejo de Estado, Plan General para la Construcción de una China Digital. Consultado en: https://www.gov.cn/zhengce/2023-02/27/content_5743484.htm.

⁸⁶ MIIT, Aviso del Ministerio de Industria y Tecnología de la Información sobre la Publicación y Distribución del "14º Plan Quinquenal" de Desarrollo de la Informatización y la Integración Industrial. Consultado en: https://www.gov.cn/zhengce/zhengceku/2021-12/01/content_5655208.htm.

⁸⁷ Consejo de Estado, Dictamen del Comité Central del Partido Comunista de China y el Consejo de Estado relativo al Desarrollo de un Sistema de Datos Básicos para Mejorar la Utilización de los Elementos de Datos. Consultado en: https://www.gov.cn/zhengce/2022-12/19/content_5732695.htm?eqid=fa4ca900000012d100000004647899c9.

⁸⁸ Según las autoridades, la expresión "datos importantes" hace referencia a aquellos datos que son importantes desde la perspectiva nacional.

Exportados disponen asimismo que las empresas encargadas del tratamiento de datos que comunican datos importantes al extranjero, los operadores de infraestructuras críticas de información y las empresas encargadas del tratamiento de datos que gestionan información que concierne a un elevado número de personas deben evaluar la seguridad siempre que faciliten información personal fuera de China.

4.150. La Ley de Protección de la Información Personal establece procedimientos específicos para las empresas dedicadas a la transferencia transfronteriza de datos. En concreto, dispone que, cuando una empresa que se ocupa del tratamiento de información personal debe enviar datos fuera de China por razones legítimas de carácter comercial o de otro tipo, puede hacerlo empleando diferentes métodos. Estos métodos consisten, entre otros, en llevar a cabo una evaluación de la seguridad de la transferencia de datos, obtener un certificado relativo a la protección de la información personal, o firmar un contrato normalizado sobre la transferencia con el destinatario situado fuera de China. Además, en el supuesto de que un tratado o acuerdo internacional en el que China sea parte prevea condiciones para la transferencia de información personal fuera de China, deben respetarse esas condiciones. Al parecer, las prescripciones de China sobre la transferencia transfronteriza de datos han suscitado preocupación en algunas empresas extranjeras que operan en China, debido a los posibles costos de cumplimiento y a la incertidumbre.⁸⁹

4.151. En agosto de 2023, el Consejo de Estado instó a establecer "canales verdes" para que las empresas extranjeras que cumplieran los requisitos previstos pudieran exportar datos, así como programas piloto para crear una lista de los datos que pueden transferirse libremente a través de las fronteras en zonas designadas, como Beijing, Tianjin y Shanghai.⁹⁰ El 22 de marzo de 2024, la CAC promulgó y comenzó a aplicar el Reglamento de Promoción y Regulación de los Flujos Transfronterizos de Datos. El Reglamento, entre otras cosas, flexibiliza las condiciones aplicables a los flujos transfronterizos de datos y reduce el alcance de la evaluación de la seguridad de los datos de salida. Se han adoptado exenciones de la obligación de informar sobre las evaluaciones de la seguridad para las siguientes actividades de transferencia de datos: comercio y actividades internacionales (por ejemplo, compras transfronterizas, remesas transfronterizas, reservas de billetes de avión y hoteleras, y solicitudes de visado); información personal recopilada y gestionada en el extranjero sin que se hayan añadido datos personales nacionales o datos importantes en el curso del tratamiento; casos en los que es necesario facilitar información personal al extranjero para concluir y ejecutar contratos entre particulares; gestión transfronteriza de recursos humanos; situaciones de emergencia; e intercambio de volúmenes de datos limitados (para determinadas empresas que procesen información referente a menos de 100.000 personas).

4.152. Además, el Reglamento establece un sistema de lista negativa en las zonas francas experimentales que permite a las empresas de estas zonas que se ocupan del tratamiento de datos comunicar al extranjero datos que no figuren en la lista negativa, sin necesidad de respetar determinadas prescripciones en materia de declaración y certificación.

4.153. Hay varias medidas legislativas y tecnologías de Internet que restringen el acceso a un gran número de sitios web que difunden información o documentación contrarias a la legislación china. Además, está prohibido o limitado utilizar redes privadas virtuales (VPN) para navegar por Internet.⁹¹ Aunque las autoridades han señalado que la finalidad de estas medidas es permitir que los ciudadanos y las organizaciones accedan legalmente a Internet, se ha observado que las medidas podrían en algunos casos resultar perjudiciales para la libre circulación de la información y la productividad laboral (sección 2.4.1).

4.154. Durante el período objeto de examen se adoptaron varias medidas con repercusiones en el sector tecnológico a fin de seguir regulando los servicios de Internet y garantizar la seguridad del ciberespacio. Por ejemplo, el 31 de diciembre de 2021, la CAC, el MIIT, el Ministerio de Seguridad Pública y la Administración Estatal de Reglamentación del Mercado (SAMR) publicaron las Disposiciones relativas a la Administración de las Recomendaciones generadas por Algoritmos para

⁸⁹ Véase, por ejemplo, Cámara de Comercio de la Unión Europea en China (2023), *Flash Survey: The Impact of China's Data Regulations on European Business*. Consultado en: <https://www.europeanchamber.com.cn/en/flash-survey-on-impact-of-china-s-data-regulations>.

⁹⁰ Consejo de Estado, Dictamen sobre la Intensificación de los Esfuerzos para atraer Inversiones Extranjeras. Consultado en: https://www.gov.cn/zhengce/content/202308/content_6898048.htm.

⁹¹ Véase, por ejemplo, la Circular relativa al Saneamiento y Reglamentación del Mercado de Servicios de Acceso a Internet.

los Servicios de Información en Internet, que entraron en vigor el 1 de marzo de 2022. Estas Disposiciones tienen por objeto, entre otras cosas, reforzar la transparencia del funcionamiento de los algoritmos y dar a los usuarios una mayor control sobre los datos que utilizan las empresas para alimentar esos algoritmos.

4.155. El 27 de junio de 2022, la CAC anunció las Disposiciones relativas a la Administración de la Información sobre las Cuentas de los Usuarios de Internet. Las Disposiciones, que entraron en vigor el 1 de agosto de 2022, tienen por finalidad mejorar la administración de la información sobre las cuentas de los usuarios de Internet para, entre otras cosas, promover el buen desarrollo de los servicios de información en Internet.

4.156. El 25 de noviembre de 2022, la CAC, el MIIT y el MSP anunciaron conjuntamente las Disposiciones relativas a la Administración de la IA Generativa en los Servicios de Información en Internet, que entraron en vigor el 10 de enero de 2023. Estas Disposiciones establecen obligaciones amplias para los proveedores de servicios de IA generativa y apoyo técnico en materia de seguridad de los datos, protección de la información personal, transparencia, gestión del contenido, etiquetado y seguridad técnica.

4.4.2 Servicios financieros

4.4.2.1 Resultados sectoriales y objetivos de política

4.4.2.1.1 Resultados sectoriales

4.157. En 2022, los servicios financieros representaban el 8,0% del PIB (frente al 7,9% en 2021) y daban empleo a 7,4 millones de personas (un descenso con respecto a los 8,59 millones de 2020 y los 8,19 millones de 2021). En los últimos años, el comercio de servicios financieros de China ha experimentado un crecimiento notable (gráfico 4.4). El aumento de las importaciones fue particularmente perceptible hasta 2021. Esta tendencia pone de relieve que China ha seguido abriendo su sector de servicios financieros, por ejemplo permitiendo que empresas con participación de capital extranjero presten servicios de calificación crediticia, gestión de activos, administración de fondos de pensiones y corretaje, y eliminando los límites a la participación extranjera en sociedades de valores, empresas de futuros y sociedades de gestión de fondos.⁹² Durante el período objeto de examen, China siguió siendo un exportador neto de servicios financieros.

Gráfico 4.4 Comercio de servicios financieros, 2016-2023

(En miles de millones de USD)

Fuente: Administración Estatal de Divisas. Consultada en: <http://www.safe.gov.cn/>.

4.158. La financiación social⁹³ alcanzó un total de CNY 32 billones en 2022, frente a CNY 31,3 billones en 2021. Sin embargo, la tasa de crecimiento fue inferior a la tendencia debido a los efectos económicos de la pandemia de COVID-19. La proporción de préstamos bancarios en el crédito total a la economía disminuyó del 64,2% al 63,7% en el mismo período. A principios de 2023 se produjo una fuerte reactivación de los nuevos préstamos bancarios a raíz de las medidas gubernamentales de apoyo a la economía. Las autoridades han señalado que, a finales de 2023, el

⁹² Documento [WT/TPR/S/415/Rev.1](#) de la OMC, de 9 de marzo de 2022.

⁹³ Medida del crédito total a la economía que incluye préstamos bancarios, bonos corporativos, préstamos encomendados y préstamos fiduciarios.

saldo de los préstamos en moneda nacional y en divisas era de CNY 242,24 billones, lo que supone un incremento interanual del 10,1%.

4.159. La estructura del sector financiero sigue estando marcada por un fuerte predominio de los bancos con respecto a otros tipos de instituciones financieras (Cuadro 4.20). Los datos facilitados por las autoridades indican que el sector bancario sigue estando muy concentrado. A finales del tercer trimestre de 2023 (el período más reciente sobre el que se disponía de datos), los activos de las instituciones bancarias de China en el país y en el extranjero alcanzaban CNY 409,8 billones, lo que representa un aumento interanual del 9,5%.⁹⁴ De esos activos, CNY 173,3 billones correspondían a los principales bancos comerciales (los seis grandes bancos de propiedad estatal), una cuantía equivalente al 40,8% del total.⁹⁵ Los activos de los bancos comerciales por acciones ascendían a CNY 69,6 billones y representaban el 17% de los activos totales de las instituciones financieras en China. Los activos del sector bancario chino aumentaron durante el período objeto de examen en respuesta al reiterado llamamiento de los organismos de reglamentación en favor de un mayor apoyo al crédito a las empresas.⁹⁶

Cuadro 4.20 Activos de las instituciones financieras en China, 2020-2023

(En billones de CNY)

Período	Activos totales de las instituciones financieras	De los cuales: instituciones bancarias	De los cuales: instituciones de seguros
T1 de 2020	332,94	302,39	21,72
T2 de 2020	340,43	309,41	21,98
T3 de 2020	347,32	315,18	22,44

Nota: Los activos totales, los pasivos totales y el patrimonio de las instituciones financieras son la suma de los correspondientes indicadores de las instituciones bancarias, las sociedades de valores y las instituciones de seguros. Las instituciones bancarias son las entidades jurídicas (incluidas las sucursales en el extranjero), con exclusión del PBOC. Las instituciones de seguros son los grupos de seguros (holdings), las compañías de seguros y las sociedades de gestión de activos de seguros.

Fuente: Información facilitada por las autoridades.

4.160. La evolución del sector bancario se caracterizó por importantes riesgos para la estabilidad financiera, derivados de una desaceleración del crecimiento económico, vulnerabilidades en los balances de algunos Gobiernos locales y tensiones en el mercado inmobiliario (aunque a escala limitada, según las autoridades).⁹⁷ La calidad de los activos de los bancos comerciales se mantuvo bastante estable en el tercer trimestre de 2023. En comparación con el mismo período de 2022, las cifras oficiales muestran una disminución de 0,01 puntos porcentuales en la proporción de préstamos dudosos, que se situó en el 1,61%. Sin embargo, en términos absolutos, el saldo pendiente de préstamos dudosos de los bancos comerciales era de CNY 3,2 billones, lo que supone un aumento de CNY 24.400 millones.

⁹⁴ National Financial Regulatory Administration (NFRA), *Supervisory Statistics of the Banking and Insurance Sectors – 2023 Q3*. Consultado en: <https://www.cbirc.gov.cn/en/view/pages/ItemDetail.html?docId=1142474>.

⁹⁵ El Banco Postal de Ahorros de China, el Banco Industrial y Comercial de China, el Banco Agrícola de China, el Banco de China, el Banco de la Construcción de China y el Banco de Comunicaciones siguen siendo los grandes bancos estatales de China, los más importantes del sistema financiero nacional.

⁹⁶ PBOC, Declaración oficial. Consultada en: <http://www.pbc.gov.cn/goutongjiaoliu/113456/113469/5033430/index.html>.

⁹⁷ Las autoridades señalan que el 80% del saldo de CNY 53 billones de préstamos inmobiliarios corresponde a préstamos personales para vivienda, cuya repercusión en el sector bancario es limitada.

4.161. A finales de 2023, el saldo de préstamos dudosos de las instituciones financieras del sector bancario era de CNY 3,95 billones, lo que representa un incremento interanual del 3,9%, muy por debajo de la tasa de crecimiento de diversos préstamos. La proporción de préstamos dudosos se situó en el 1,62%, es decir, una disminución interanual del 0,1%. En esa misma fecha, el coeficiente de capital de los bancos comerciales de China era del 15% y el coeficiente de aprovisionamiento del 205%. Las autoridades consideraron que el sector bancario presentaba un nivel de resultados satisfactorio y que los riesgos financieros eran en general controlables. Señalan que se dispone de recursos y condiciones adecuados para hacer frente a los riesgos, como los más de CNY 50 billones de capital y provisiones de los sectores de la banca y los seguros de China, el fondo de garantía de estabilidad financiera del país y diversos fondos de garantía sectoriales.

4.162. El incremento de los préstamos dudosos en todos los bancos estatales parece deberse principalmente al sector de la construcción/inmobiliario.⁹⁸ En 2023 disminuyó el total de préstamos del sector bancario al sector inmobiliario (suma de préstamos hipotecarios y préstamos a promotores inmobiliarios). En cambio, los bancos siguieron aumentando los préstamos a proyectos verdes, incluidas las energías renovables, en respuesta a la iniciativa de neutralidad en emisiones de carbono, considerada de prioridad nacional (cuadro 4.21).

Cuadro 4.21 Datos sobre préstamos bancarios al sector inmobiliario y préstamos verdes, 2021-2023

(En billones de CNY)

Año	Préstamos al sector inmobiliario	Préstamos a promotores inmobiliarios	Préstamos personales para vivienda	Préstamos verdes
2021	52,17	12,01	38,32	15,9
2022	53,16	12,69	38,8	22,03
2023	52,63	12,88	38,17	30,08

Fuente: Información facilitada por las autoridades.

4.163. En cuanto al sector de los seguros, en el tercer trimestre de 2023 los activos acumulados de las compañías de seguros alcanzaron CNY 29,6 billones, lo que supone un aumento de CNY 2,4 billones y del 9% desde el comienzo del año. Entre 2020 y 2023, el porcentaje anual de activos totales correspondiente al conjunto de las cinco principales compañías de seguros fue del 47,5%, el 49,2%, el 49,1% y el 49,5%, respectivamente.⁹⁹

4.164. A finales del tercer trimestre de 2023, el coeficiente de solvencia global del sector de los seguros era del 194% y el coeficiente de solvencia básico del 126%.

4.165. En el sector de las pensiones, las autoridades han indicado que en el primer trimestre de 2023 el total de las primas de seguros de pensiones privados ascendía a CNY 5.080 millones y había 429.000 pólizas emitidas (frente a 339.000 en 2022 por valor de CNY 3.840 millones).

4.166. El mercado de valores de China es el segundo más importante del mundo. Según las autoridades, a finales de julio de 2023 cotizaban en las bolsas chinas (Shanghái, Beijing y Shenzhen) 5.251 empresas (frente a 4.697 en 2021 y 5.079 en 2022) y la capitalización bursátil total era de unos CNY 85 billones (CNY 92 billones en 2021 y CNY 79 billones en 2022).

4.4.2.1.2 Objetivos de política

4.167. La finalidad esbozada en el 14º Plan Quinquenal de Desarrollo Económico y Social y en los Objetivos a Largo Plazo es establecer un sistema financiero fuerte que se caracterice por una alta competitividad e inclusividad y tenga solidez suficiente para apoyar la economía real.

⁹⁹ China Life Insurance Company Ltd; Ping An Life Insurance Company of China; China Pacific Life Insurance Co. Ltd; Taikang Life Insurance Co. Ltd; y New China Life Insurance Co. Ltd.

4.168. En octubre de 2023 se celebró en China la última conferencia central sobre cuestiones financieras. Esta reunión de alto nivel proporcionó orientaciones para configurar la trayectoria del sector a largo plazo.¹⁰⁰ En esa conferencia, el Gobierno hizo hincapié en su determinación de fomentar la estabilidad y el desarrollo económicos y financieros con "características chinas" distintivas. Otra de las grandes prioridades es el imperativo de atraer más instituciones financieras extranjeras y capital a largo plazo para las operaciones e inversiones en China. El Gobierno también destacó la importancia de mantener una supervisión centralizada del sector financiero, como queda plasmado en la reciente reestructuración del marco de supervisión de la nación (sección 4.4.2.2).

4.169. Según las autoridades, China está decidida a aplicar una serie de medidas para mitigar y abordar con eficacia los riesgos financieros. Esas medidas se centran principalmente en la gestión de los riesgos asociados a la deuda de los Gobiernos locales, el fomento de las instituciones financieras pequeñas y medianas, la lucha contra las actividades financieras ilegales, y el mantenimiento del tipo de cambio del CNY básicamente estable en un nivel razonable y equilibrado gracias a la mejora de la gestión macroprudencial de los flujos transfronterizos de capital. Una prioridad fundamental es mejorar la gestión macroprudencial en el ámbito de la financiación inmobiliaria.

4.170. En consonancia con su visión estratégica, las autoridades se proponen optimizar la estructura financiera de la economía china. Esto implica potenciar el papel central del mercado de capitales, promover el sistema de oferta pública inicial basado en el registro, fomentar la diversificación de la financiación mediante fondos propios, elevar los criterios de calidad de las empresas cotizadas, desarrollar los bancos e instituciones de inversión más importantes y promover un desarrollo de alta calidad del mercado de bonos.

4.171. En cuanto a la participación del Estado en el sector financiero, las autoridades han manifestado su intención de perfeccionar el posicionamiento institucional de las grandes entidades financieras estatales, lo que conlleva potenciar su función al servicio de la economía real y como piedra angular de la estabilidad financiera. Al mismo tiempo, las autoridades se proponen reforzar el papel esencial del sector de los seguros como amortiguador y estabilizador frente a perturbaciones económicas.

4.4.2.2 Reforma del marco de supervisión financiera

4.172. La rápida evolución del sector financiero de China ha estado marcada recientemente por la aparición de nuevos tipos de riesgos, en particular el sistema bancario paralelo. Durante el período objeto de examen, las autoridades respondieron reforzando las respectivas funciones de supervisión de los organismos de reglamentación para aumentar su eficacia, entre otras medidas.

4.173. La reforma de la estructura de supervisión financiera llevada a cabo en 2019 tenía por objeto aumentar la coordinación entre los organismos de reglamentación para contener los crecientes riesgos inherentes al sistema bancario paralelo. Esa reforma consolidó la supervisión reglamentaria de la banca y los seguros en el marco de la Comisión de Reglamentación Bancaria y de Seguros de China (CBIRC). También facultó al PBOC para desempeñar un papel más importante en la supervisión del sector financiero.¹⁰¹ El sistema de reglamentación financiera de China comprendía en total cuatro órganos principales: el Comité de Estabilidad y Desarrollo Financieros (FSDC), encargado de coordinar la supervisión financiera; el PBOC; la CBIRC; y la Comisión de Reglamentación de Valores de China (CSRC) (gráfico 4.5).

¹⁰⁰ State Council (2023), "Central Financial Work Conference Is Held", 2 de noviembre de 2023. Consultado en: https://english.www.gov.cn/news/202311/02/content_WS65430bb8c6d0868f4e8e0e33.html.

¹⁰¹ Documento WT/TPR/S/415 de la OMC, de 20 de octubre de 2021.

Gráfico 4.5 Antiguo marco de supervisión financiera de China

Fuente: Información facilitada por las autoridades.

4.174. El 7 de marzo de 2023 se anunció una nueva reforma que consolida esas instituciones en "un comité, un banco, una administración y una comisión" (gráfico 4.6). Bajo la supervisión directa del Comité Central del Partido Comunista de China, la recién creada Comisión Financiera Central (CFC) asume ahora las funciones que antes desempeñaba el antiguo FSDC¹⁰², por lo que pasa a ser la principal entidad encargada de la adopción de decisiones y la coordinación en materia financiera. Asimismo, está previsto crear una Comisión de Trabajo Central Financiera.

Gráfico 4.6 Marco actual de supervisión financiera de China

Fuente: Información facilitada por las autoridades.

4.175. En el nuevo marco, la Administración Nacional de Regulación Financiera (NFRA) ha sustituido a la CBIRC y asume ahora una gama más amplia de responsabilidades, incluida la supervisión de las sociedades financieras de cartera, que antes era competencia del PBOC. Además, se ha encomendado al NFRA el mandato de reglamentar la protección de los consumidores e inversores en el sector financiero.

4.176. El papel del PBOC en la política monetaria y la supervisión macroprudencial se ha reorientado y ya no tiene autoridad sobre las sociedades financieras de cartera. La función de la CSRC como organismo de reglamentación del mercado de capitales se ha reforzado al añadir a sus competencias la supervisión de la emisión de bonos de empresas, que antes era responsabilidad de la NDRC. Esta consolidación establece un marco reglamentario unificado para la emisión de bonos de empresas y corporativos bajo los auspicios de la CSRC. La reforma refleja la intención de las autoridades de

¹⁰² El FSDC actuaba bajo la supervisión del Consejo de Estado.

ampliar el mercado de financiación directa de las empresas, y los bonos de empresas y corporativos son los instrumentos financieros que el Gobierno desea reforzar.

4.177. Aunque, por un lado, la reforma puede mejorar la coordinación entre los órganos de supervisión para gestionar mejor los riesgos financieros, por otro puede resentirse la eficacia de la estructura de supervisión financiera como consecuencia de una mayor presencia del Estado en el sistema financiero. De hecho, el sistema financiero de China está dominado por unas pocas grandes instituciones de propiedad estatal (sección 4.4.2.1.1) y las principales actividades financieras del país se encuentran ahora bajo la supervisión directa del Partido. Este aspecto choca con las funciones habituales de la reglamentación financiera y también tiende a fomentar la aparición de problemas de riesgo moral, que llevan a las entidades financieras públicas a asumir riesgos financieros excesivos. No obstante, las autoridades señalan que China está decidida a fomentar la innovación financiera y el desarrollo del sector en un entorno orientado al mercado y regido por un marco jurídico sólido.

4.4.2.3 Otros cambios en la reglamentación

4.4.2.3.1 Evolución del sector bancario

4.178. Durante el período objeto de examen se adoptaron algunas medidas para seguir promoviendo la participación extranjera en el sector bancario de China. Por ejemplo, el 2 de septiembre de 2022, la CBIRC publicó la Decisión sobre la Modificación de Determinadas Normas para la Concesión de Licencias Administrativas. Esa Decisión levanta las restricciones sobre la proporción de participación de los bancos extranjeros que invierten en bancos comerciales chinos. En ella también se prevé un plazo de aprobación de cuatro meses para el establecimiento en China de sucursales de bancos financiados con capital extranjero.

4.179. Se aplican diversas prescripciones para regular la participación extranjera en el sector financiero de China. Por ejemplo, una entidad extranjera que invierta en un banco comercial chino deberá ser una institución financiera extranjera, y una entidad extranjera que invierta en un banco rural de pequeño o mediano tamaño deberá ser un banco extranjero. En el caso de un banco de propiedad exclusivamente extranjera, los accionistas extranjeros deberán ser instituciones financieras, cuyo accionista único o mayoritario también deberá ser un banco comercial; en el caso de un banco conjunto chino-extranjero, los accionistas extranjeros deberán ser instituciones financieras, cuyo accionista único o mayoritario deberá ser un banco comercial.

4.180. En cuanto a la reglamentación cautelar, el 1 de noviembre de 2023, la NFRA revisó las Normas sobre la Gestión del Capital de los Bancos Comerciales, con el fin de fortalecer el enfoque de gestión del riesgo de los bancos y mejorar su capacidad para prestar un mayor apoyo a la economía interna.¹⁰³ Las Normas revisadas entraron en vigor en enero de 2024 y se aplican a todos los bancos comerciales.

4.181. Las normas establecen un sistema de supervisión del capital diferenciado, con prescripciones en materia de capital más estrictas para los grandes bancos (en términos de volumen de activos y proporción de actividades en el extranjero). Por medio del enfoque de supervisión por niveles, las autoridades se proponen alcanzar un equilibrio entre la mejora de la resiliencia de la deuda del sector bancario y la limitación del costo del cumplimiento de la reglamentación en los bancos pequeños para que puedan prestar un mejor servicio a la economía real.

4.182. Las autoridades consideran que las normas para los grandes bancos (aquellos con activos totales por valor de CNY 500.000 millones o más, o con créditos y deudas en el extranjero que superen los CNY 30.000 millones, o bancos comerciales de Nivel 1) están muy armonizadas con el marco regulatorio de Basilea III, a excepción de unas ponderaciones por riesgo más rigurosas para determinados activos. Esa especificación estaba concebida para aumentar la sensibilidad al riesgo en las prácticas de gestión del capital de los bancos y poder comparar sus coeficientes de capital y su divulgación pública a escala mundial.

4.183. Las normas en materia de capital para los bancos comerciales de Nivel 2 (aquellos con activos totales por valor de CNY 10.000 millones o más, o con créditos y deudas en el extranjero

¹⁰³ Consultado en: <https://www.cbirc.gov.cn/cn/view/pages/rulesDetail.html?docId=1134197>.

inferiores a CNY 30.000 millones) se han simplificado, si bien conservan en lo esencial las prescripciones existentes. Los bancos más pequeños (con menos de CNY 10.000 millones y sin créditos en el extranjero, o bancos comerciales de Nivel 3) están sujetos a las normas sobre capital y divulgación más simplificadas, con miras a facilitar las actividades de financiación de las microempresas y pequeñas empresas.

4.184. Las nuevas normas también exigen que los bancos comerciales evalúen y clasifiquen el riesgo de crédito con mayor rapidez y prudencia y den prioridad a la capacidad de los deudores para cumplir sus obligaciones sobre los valores de las garantías subyacentes (cuadro 4.22).

Cuadro 4.22 Criterios de clasificación de los riesgos en cinco categorías

Categoría	Directrices para la clasificación
Normal	Se prevé que el prestatario podrá reembolsar sus obligaciones según las condiciones existentes.
En vigilancia especial	i) Impago en el capital o los intereses pagaderos (se excluyen los descubiertos operativos o técnicos en un plazo de siete días); o ii) Cambio de finalidad de los fondos sin el acuerdo previo de los bancos; o iii) Reembolso mediante renegociación o refinanciación (salvo en el caso de los bonos y los préstamos a microempresas y pequeñas empresas admisibles); o iv) Si un deudor no minorista tiene exposición a un crédito improductivo en el banco en cuestión o en otros bancos
Subestándar	i) Impago en el capital o los intereses pagaderos durante más de 90 días; o ii) Deterioro real de los activos financieros; o iii) Rebajas significativas de la calificación de la deuda externa, que conlleva un deterioro material de la capacidad de reembolso del prestatario; o iv) Si un prestatario tiene impagados más del 20% de sus pasivos totales en todos los bancos durante más de 90 días
Dudoso	i) Impago en el capital o los intereses pagaderos durante más de 270 días; o ii) El prestatario decide no efectuar el reembolso; o iii) Deterioro real de los activos financieros, con pérdidas previstas superiores al 50% del valor nominal del instrumento
Fallido	i) Impago en el capital o los intereses pagaderos durante más de 360 días; o ii) El prestatario está en quiebra/en fase de liquidación; o iii) Deterioro real de los activos financieros, con pérdidas previstas superiores al 90% del valor nominal del instrumento

Nota: Las categorías Subestándar, Dudoso y Fallido se refieren a activos improductivos.

Los cambios más destacados en comparación con las normas existentes figuran en negrita.

4.185. En lo que respecta a las medidas para prevenir y resolver los principales riesgos financieros, la CBIRC publicó en junio de 2021 las Medidas Provisionales relativas a la Aplicación de los Planes de Reestructuración y Resolución para las Instituciones Bancarias y de Seguros. Con arreglo a esas Medidas, los bancos comerciales y las compañías de seguros con determinadas cantidades de activos están obligados a elaborar sus propios planes de reestructuración y resolución para hacer frente a los riesgos de manera oportuna en caso de que se presenten situaciones de riesgo importante.¹⁰⁴

4.186. Según las autoridades, se está preparando un Proyecto de Ley de Estabilidad Financiera y modificaciones de la Ley de Bancos Comerciales y de la Ley de Reglamentación Bancaria para establecer y mejorar los mecanismos de eliminación ordenada de los riesgos financieros. La finalidad del Proyecto de Ley es, entre otras cosas, crear un fondo de garantía de estabilidad financiera que proporcione financiación de emergencia a los bancos débiles, con miras a preservar la estabilidad financiera del país.

¹⁰⁴ Instituciones financieras de depósito, sociedades de gestión de activos financieros y empresas de arrendamiento financiero con activos por valor de CNY 300.000 millones o más; y compañías de seguros con activos por valor de CNY 200.000 millones o más.

4.187. Se adoptaron algunas medidas para seguir consolidando la resiliencia de los bancos de importancia sistémica de China, entre ellas planes de reestructuración y resolución y normas para garantizar que esos bancos tengan suficiente capacidad para absorber pérdidas y reestructurar el capital en caso de entrar en fase de resolución.¹⁰⁵ El 22 de septiembre de 2023, las autoridades publicaron la versión más reciente de la lista de bancos de importancia sistémica del país, en la que figuran 19 bancos, según las Medidas relativas a la Evaluación de los Bancos de Importancia Sistémica.¹⁰⁶

4.4.2.3.2 Evolución del sector de los seguros

4.188. Durante el período objeto de examen, China adoptó algunas medidas con el fin de dotar de mayor claridad a las condiciones para la participación extranjera en el sector de los seguros. A ese respecto, en marzo de 2021 se modificaron las Normas Detalladas de Aplicación del Reglamento de la República Popular China sobre la Administración de las Compañías de Seguros con Financiación Extranjera. La nueva modificación elimina las disposiciones que restringen la proporción de acciones extranjeras en las compañías de seguros.

4.189. Además, China aclara que, con arreglo a las Medidas relativas a la Administración de la Participación de las Instituciones Financieras Extranjeras en el Capital de las Compañías de Seguros, de 2018, las instituciones financieras que no sean compañías de seguros o grupos de compañías de seguros no serán los accionistas principales de las compañías de seguros extranjeras ni los únicos accionistas extranjeros de las compañías de seguros extranjeras.

4.190. Se aplicaron varias medidas más para aumentar la eficiencia del sector de los seguros. En particular, se introdujeron reformas en el sistema de seguros de automóviles, a fin de incorporar los vehículos eléctricos a todos los efectos. Asimismo, se elaboraron las Medidas de Reglamentación de las Actividades de Seguros de Accidentes, que se publicaron el 13 de octubre de 2021, como orientación para un mayor desarrollo de dichas actividades.

4.191. En diciembre de 2021 se publicó el Aviso sobre Normalización y Promoción del Desarrollo de Actividades Comerciales de Financiación de Pensiones, al que le siguió el Aviso sobre Cuestiones relativas a las Actividades de Pensiones Privadas Realizadas por Compañías de Seguros, de noviembre de 2022. Con esas medidas se trata de mejorar el sistema de seguros de pensiones de varios pilares por medio del desarrollo de las actividades comerciales de financiación de pensiones y las actividades de pensiones personales, y de dar respuesta a las diferentes necesidades de la población. El objetivo es abordar la prevalencia de elevados niveles de ahorro preventivo y el escaso consumo en la economía china.

4.192. El escaso consumo, especialmente entre la población rural, es uno de los principales riesgos para el crecimiento sostenible de la economía china. Si bien hay diversos factores que restringen las pautas de consumo de los residentes en zonas rurales, existe la opinión de que la falta de una red de seguridad social eficiente ha propiciado el aumento del ahorro preventivo.¹⁰⁷ En la misma línea, la literatura económica indica que una mayor expansión y el fortalecimiento del seguro de salud, en especial la cobertura de problemas de salud específicos (enfermedades graves) en las zonas rurales, promueven significativamente el consumo diario de los residentes en dichas zonas.¹⁰⁸ A ese respecto, durante el período objeto de examen, la NFRA procedió a la reforma estructural de la oferta de seguros de salud, con la aplicación de políticas en materia de seguros de salud que ofrecen ventajas fiscales a fin de promover la innovación en los productos de seguros de salud.

¹⁰⁵ Reglamento sobre la Supervisión Adicional de Bancos de Importancia Sistémica (aplicación provisional) y Reglamento sobre la Gestión de la Capacidad Total de Absorción de Pérdidas de los Bancos de Importancia Sistémica.

¹⁰⁸ Véase, por ejemplo, W. Zhao (2019), "Does Health Insurance Promote People's Consumption? New Evidence from China", *China Economic Review*, volumen 53, páginas 65-86.

4.193. En cuanto a la reglamentación cautelar, el organismo de reglamentación revisó y publicó en 2021 el Proyecto de Reglamento sobre la Gestión de la Solvencia de las Compañías de Seguros, en el que se indica que las compañías de seguros que cumplen los tres indicadores siguientes también cumplen las normas de solvencia: el coeficiente de solvencia básico no debe ser inferior al 50%; el coeficiente de solvencia global no debe ser inferior al 100%; y la calificación integral de riesgos, que mide el riesgo global de solvencia de las compañías de seguros (incluidos los riesgos capitalizados y no capitalizados), no debe ser inferior a la Clase B.

4.4.2.3.3 Evolución de los fondos de pensiones

4.194. Las iniciativas para establecer un sistema de pensiones eficaz en China pueden ser una forma creíble de optimizar el ahorro preventivo, impulsar el consumo y estimular el crecimiento económico.¹⁰⁹ Concretamente, en la literatura económica, Zheng *et al.* (2021) examinaron un amplio conjunto de datos sobre el período 2011-2018 y llegaron a la conclusión de que la participación en las pensiones y las expectativas a ese respecto podían impulsar el consumo interno.¹¹⁰ En abril de 2022, China puso oficialmente en marcha, con carácter experimental, su régimen de pensiones privadas (el tercer pilar del sistema de pensiones). Dicho régimen tiene por objeto complementar la pensión básica junto con las pensiones vitalicias de empresas (laborales). Varios bancos, fondos de gestión de patrimonios y compañías de seguros han recibido autorización oficial para participar en el sistema de pensiones privadas en 36 ciudades de China.¹¹¹

4.195. En el período objeto de examen se publicaron reglamentos para aclarar los tipos de productos que pueden ofrecerse, y las normas y prescripciones a ese respecto.¹¹² En noviembre de 2022 se adoptó un conjunto de incentivos fiscales para impulsar el desarrollo del nuevo sistema. Se trata de deducciones antes de impuestos de hasta CNY 12.000 de los ingresos imposables anuales de los participantes en regímenes de pensiones privadas y una reducción de la carga fiscal sobre las prestaciones por jubilación de entre el 7,5% y el 3% (en el momento del retiro). Además, los rendimientos generados por las inversiones realizadas en el marco de cuentas de pensiones están exentos del impuesto sobre la renta de las personas físicas.

4.4.2.3.4 Evolución del sector de los valores

4.4.2.3.4.1 Mercados de valores

4.196. En el sector de los valores, las autoridades tratan fundamentalmente de seguir desarrollando un mercado de capitales bien regulado, transparente, abierto, dinámico y resiliente que pueda apoyar los objetivos generales de desarrollo de China.

4.197. Entre las medidas adoptadas durante el período objeto de examen figura la puesta en marcha de la Bolsa de Beijing (BSE) el 15 de noviembre de 2021. Desde su creación, la BSE se ha erigido en una importante plataforma para que China impulse su reforma de los mercados de capitales, a fin de atender las necesidades financieras y el crecimiento de las pymes innovadoras. En torno a 200 empresas cotizan en la BSE, que también facilita las actividades de préstamo de valores y creación de mercado. Los inversores extranjeros pueden participar en la negociación de acciones cotizadas en la BSE mediante programas como los relativos a los inversores institucionales

¹¹¹ En la Circular de la CBIRC sobre la Adopción de Medidas Provisionales relativas a la Administración de las Actividades de Pensiones Personales de los Bancos Comerciales y las Empresas de Gestión de Patrimonios y la Circular de la CBIRC sobre Cuestiones relativas a la Puesta en Marcha de Actividades de Pensiones Personales por las Compañías de Seguros se especifican las condiciones que deben cumplir las instituciones que participan en el sistema de pensiones privadas.

¹¹² El 4 de noviembre de 2022 se publicaron las Medidas relativas a la Puesta en Marcha de las Pensiones Personales y las Medidas Provisionales relativas a la Gestión de la Inversión de las Pensiones Personales en los Fondos de Inversión en Valores de Oferta Pública.

extranjeros calificados QFII o los inversores institucionales extranjeros calificados en yuan (RQFII).¹¹³

4.198. Las autoridades siguen facilitando la participación extranjera en los mercados de capitales de China. Como se indicó en el anterior examen, en 2020 se eliminaron las restricciones a las inversiones en acciones de empresas chinas de valores, fondos o futuros por parte de los inversores extranjeros. Las autoridades señalan que se adoptaron medidas durante el actual período objeto de examen para garantizar la plena aplicación de esas medidas de liberalización. Por ejemplo, a finales de agosto de 2023, 24 empresas de valores, fondos o futuros de propiedad extranjera en parte o en su totalidad podían operar en los mercados de capitales de China; tres filiales de bancos extranjeros radicadas en China estaban autorizadas a realizar actividades de custodia de fondos; y 35 gestores de fondos de inversión de capital privados, que eran propiedad de inversores extranjeros en su totalidad o empresas conjuntas chino-extranjeras, estaban inscritas en la Asociación de Gestión de Activos de China.

4.199. Las autoridades indican que la gama de productos específicos de futuros y opciones siguió ampliándose, con 24 productos de futuros, entre ellos el petróleo crudo, el ácido tereftálico purificado y el hierro, abiertos a los inversores extranjeros. El 4 de enero de 2023 se permitió a los bancos extranjeros participar en el mercado de futuros sobre el Tesoro de China, y 46 productos de futuros y opciones, entre ellos futuros de productos básicos, opciones de productos básicos, futuros sobre índices bursátiles y opciones sobre índices bursátiles, estaban abiertos a los inversores titulares de licencias QFII y RQFII.

4.200. Entre otras medidas adoptadas por China para desarrollar su sector de los valores figuran las destinadas a facilitar las inversiones y la financiación transfronterizas de las empresas chinas. En particular, se mejoró el funcionamiento del mecanismo de conexión bursátil entre Shanghai, Shenzhen y Hong Kong, el canal de inversión transfronterizo. También se amplió la gama de productos internacionales a disposición de los inversores chinos.

4.4.2.3.4.2 Mercados de bonos

4.201. Durante el período objeto de examen, China adoptó una serie de medidas para promover la participación extranjera en los mercados interbancarios y los mercados bursátiles de bonos. Por ejemplo, en mayo de 2022, el PBOC, la CSRC y la SAFE publicaron conjuntamente el Anuncio sobre Cuestiones relativas a una Mayor Facilitación de las Inversiones en el Mercado de Bonos Chino por Inversores Institucionales Extranjeros, que establece un marco unificado para la apertura de los mercados de bonos, y unifica y mejora las prescripciones de política pertinentes para la inversión en los mercados de bonos de China por parte de los inversores extranjeros.

4.202. En la misma línea, en enero de 2024, el PBOC y la Autoridad Monetaria de Hong Kong (HKMA) incluyeron los bonos del programa de conexión "Bond Connect" entre las garantías admisibles en el marco del acuerdo de liquidez del yuan de la HKMA con el fin de promover las actividades de recompra de bonos por instituciones extranjeras a través del acceso directo al mercado y al programa "Bond Connect".¹¹⁴ A finales de enero de 2024, habían entrado en los mercados de bonos de China un total de 1.129 inversores extranjeros, con un total de CNY 3,9 billones en bonos.

4.203. Las autoridades indican que la participación extranjera en el mercado de bonos ha seguido mejorando en los últimos años. Ocho bancos extranjeros actúan en la actualidad como agentes de liquidación en el mercado de bonos interbancario de China. Además, desde 2021, el número de instituciones financieras extranjeras que actúan como agencias de cotización para "Bond Connect" se ha elevado a 15, tras sumarse cuatro instituciones nuevas. Se han adoptado medidas concretas para racionalizar los procesos de inversión de las instituciones extranjeras. En noviembre de 2021, por ejemplo, el Ministerio de Hacienda y la Administración Estatal de Impuestos publicaron el Anuncio sobre la Prórroga del Plazo de las Políticas de Exención del Impuesto sobre la Renta de las

¹¹³ Los programas QFII y RQFII son el sistema de certificación que permite a los inversores extranjeros profesionales autorizados que cumplen determinadas condiciones invertir directamente en una gama de productos financieros en el mercado de capitales de China.

¹¹⁴ "Bond Connect" es un programa de acceso mutuo a los mercados, que promueve las oportunidades comerciales para los inversores chinos y extranjeros. Establece una conexión entre las instituciones de infraestructura financiera de China y Hong Kong, China.

Sociedades y del Impuesto sobre el Valor Añadido para las Instituciones Extranjeras que Invierten en el Mercado Interno de Bonos. Ese anuncio prorroga hasta finales de 2025 la política de China por la cual las instituciones extranjeras que invierten en los mercados de bonos de China quedan exentas temporalmente del impuesto sobre la renta de las sociedades y del impuesto sobre el valor añadido que se aplican a los ingresos procedentes de los intereses obtenidos con las obligaciones.

4.4.2.3.5 Evolución en el ámbito de la tecnología financiera

4.204. En China, el desarrollo de tecnología financiera se halla en una fase avanzada. Además de aprovechar la tecnología de internet, el sector financiero está integrando cada vez en mayor medida tecnologías emergentes como los macrodatos, la computación en la nube, la inteligencia artificial y la cadena de bloques. Esas tecnologías siguen remodelando la innovación de los productos y servicios financieros.

4.205. En 2022, el PBOC publicó el segundo Plan de Desarrollo de la Tecnología Financiera, que abarca el período 2022-2025.¹¹⁵ El plan tiene por objeto seguir desarrollando el sector de la tecnología financiera de China e impulsar la transformación digital de las finanzas para 2025. En el plan figuran recomendaciones para el fomento de la tecnología financiera y se describe el concepto general, los objetivos de desarrollo, las tareas esenciales y los medios para garantizar la puesta en marcha con éxito de la transformación digital en el sector.¹¹⁶

4.206. Como se señaló en el examen anterior, no existe un único reglamento general por el que se rijan las actividades de tecnología financiera. En cuanto al marco de supervisión de la tecnología financiera, las empresas pertinentes están sujetas a la supervisión de las autoridades financieras tradicionales, según las características de los servicios prestados. En el Plan de Desarrollo de la Tecnología Financiera para 2022-2025, la mejora de la supervisión reglamentaria del sector de la tecnología financiera se considera una de las tareas más importantes.

4.207. El Plan también tiene como finalidad la protección de la privacidad y los datos. Asimismo, prevé la integración de la tecnología financiera y la financiación verde, y propone la creación de centros y sistemas de datos verdes basados en tecnologías avanzadas. A ese respecto, las autoridades introdujeron el plan de acción trienal (2024-2026) para los "elementos de datos X", destinado a alentar a las instituciones financieras a incrementar al máximo el uso de herramientas de tecnología financiera. Además, en 2023, el PBOC publicó las Directrices para la Creación de Capacidad en los Centros de Datos Financieros, una norma industrial que establece prescripciones para la adopción de nuevas tecnologías y promueve las prácticas respetuosas con el medio ambiente. Esa iniciativa alienta a las instituciones financieras a impulsar la construcción y la gestión de centros de datos verdes e inteligentes.

4.208. En un estudio reciente se indica que, con la adopción de soluciones de tecnología financiera por parte de los bancos, se fomenta la innovación financiera y se logra un modelo empresarial mejorado gracias a la reducción de los gastos de explotación de los bancos.¹¹⁷ Al mismo tiempo, el crecimiento no regulado del sector puede plantear riesgos significativos, como la incertidumbre en materia de reglamentación, las transacciones ilícitas y la posibilidad de abuso de los monopolios de datos. Además, la gran exposición de las actividades de tecnología financiera a las amenazas contra la ciberseguridad puede plantear importantes riesgos sistémicos para la estabilidad financiera.¹¹⁸

4.209. En ese contexto, la esfera de la tecnología financiera estuvo marcada por una serie de medidas reglamentarias destinadas a ofrecer mayor protección al sector. En 2020, China comenzó a vigilar de cerca al sector financiero en internet, y suspendió la oferta pública inicial de Ant Group. Además, en 2021, China puso en marcha medidas antimonopolio en el sector tecnológico y reforzó la supervisión de la recopilación de datos y la protección de la privacidad en el sector de la tecnología

¹¹⁵ El primer plan, el Plan de Desarrollo de la Tecnología Financiera para 2019-2021, se publicó en 2019.

financiera. Los principales agentes (como Ant Group, Tencent y Didi) fueron objeto de investigaciones y, en consecuencia, fueron sometidos a una vigilancia reglamentaria más rigurosa.

4.210. Las autoridades indican que, en julio de 2023, los organismos de reglamentación financiera de China publicaron un anuncio conjunto en el que declaraban que se habían logrado progresos sustanciales para solucionar problemas importantes en las operaciones financieras que se realizaban en las plataformas de las empresas del sector.

4.211. Las actividades relacionadas con las criptomonedas se consideran actividades financieras ilícitas en China. Esa prohibición abarca los servicios que las bolsas de criptomonedas extranjeras ofrecen a los ciudadanos chinos a través de plataformas en línea. Las autoridades sostienen que la minería de criptomonedas tiene un elevado consumo de energía y una huella de carbono considerable, pero solo aporta una contribución mínima a la economía real. Además, señalan que las criptomonedas se han explotado con fines ilícitos, como el blanqueo de dinero, planteando grandes riesgos para la lucha contra el blanqueo de dinero y contra la financiación del terrorismo, así como para la integridad financiera en general. En septiembre de 2021, la NDRC, junto con otras 10 entidades gubernamentales, publicó un aviso sobre las actividades de minería de criptomonedas. Posteriormente, el PBOC, junto con otros nueve organismos públicos, publicó un aviso con el fin de anticipar y gestionar los riesgos asociados al comercio de criptomonedas y la especulación en ese ámbito.

4.4.2.3.6 Financiación verde

4.212. En los últimos años, varias iniciativas de política han convertido a China en el segundo sistema de financiación verde más importante del mundo, en el que predominan los préstamos verdes concedidos por los bancos.¹¹⁹ El respaldo político, el apoyo del PBOC, el establecimiento de taxonomías verdes y la aplicación de diversos incentivos han contribuido colectivamente al logro de este avance. Según las autoridades, a finales de 2022, China había emitido bonos verdes por un valor total de USD 352.400 millones, de los cuales USD 65.500 millones habían sido emitidos por instituciones financieras bancarias. El FMI indica que los préstamos verdes de los bancos se utilizan principalmente para financiar la infraestructura y la energía limpia (71%), mientras que el ahorro de energía y la protección del medio ambiente absorben el 14%. En el contexto de un marco de política favorable, el FMI señala también que el sector de la financiación verde tiende a generar mayores rendimientos de las inversiones en China.¹²⁰ Ese fenómeno se debe principalmente al aumento de la demanda de activos verdes, complementado por la percepción de los inversores de que esos activos presentan menos riesgos subyacentes.

4.213. El sector público de China, integrado principalmente por empresas de propiedad estatal, bancos estatales y otros grandes bancos de propiedad estatal, domina las actividades de financiación verde; la contribución del sector privado es marginal y sigue estando concentrada en el sector de la energía solar.¹²¹ Las autoridades señalan que la contribución de los fondos basados en el mercado de las instituciones financieras y otros sectores privados al desarrollo ecológico y con bajas emisiones de carbono también está aumentando gradualmente. El Banco Mundial considera que un panorama reglamentario más estable, unido a mejores oportunidades financieras y de acceso a los mercados, es esencial para que el sector privado pueda ofrecer soluciones basadas en el mercado. Ello permitiría reducir los costos y favorecer la innovación tecnológica, lo que en última instancia aliviaría el déficit de financiación de la acción climática.¹²²

4.214. En algunos casos, las normas de China sobre los bonos verdes tienden a desviarse de las normas internacionales comúnmente aceptadas. Las autoridades tratan de mejorar esas normas, lo que contribuirá, entre otras cosas, a garantizar que los beneficios se destinen a proyectos admisibles de adaptación al cambio climático y mitigación de sus efectos. En julio de 2022 se publicó un nuevo documento sobre los principios relativos a los bonos verdes de China. En él se exige que los emisores

¹¹⁹ FMI (2023), *People's Republic of China: Selected Issues*, IMF Country Report N° 23/81. Consultado en: <https://www.imf.org/en/Publications/CR/Issues/2023/02/09/Peoples-Republic-of-China-Selected-Issues-529473>.

¹²² Banco Mundial (2022), *China Country Climate and Development Report*. Consultado en: <https://openknowledge.worldbank.org/server/api/core/bitstreams/35ea9337-dfcf-5d60-9806-65913459d928/content>.

destinen el 100% de los beneficios a proyectos de protección del medio ambiente, frente al 70% exigido anteriormente.

4.215. Según las autoridades, China se propone alcanzar el punto máximo de emisiones de carbono y la neutralidad en emisiones de carbono, para lo cual se necesita una inversión importante, de una cuantía estimada de entre CNY 150 billones y CNY 300 billones.¹²³ Los fondos fiscales por sí solos no satisfacen esta exigencia, y se hace necesaria la participación de fondos basados en el mercado. Para incentivar a las instituciones financieras y los sectores privados a destinar más fondos a los sectores verdes y con bajas emisiones de carbono, China ha aplicado varias políticas, entre ellas instrumentos de política monetaria estructural y pruebas de resistencia relativas a los riesgos climáticos, a fin de orientar a las instituciones financieras para que gestionen con eficacia los riesgos financieros relacionados con el clima. China también está aplicando, con carácter experimental, diversas estrategias para la financiación verde en nueve ciudades de distintas provincias (cuadro 4.23), por medio de "zonas experimentales de financiación verde", que presentan contextos económicos y de desarrollo distintos. Esas iniciativas se están poniendo a prueba antes de ejecutarlas de manera más amplia. Se prevé que reducirán de manera significativa el consumo de energía industrial.

Cuadro 4.23 Zonas experimentales de financiación verde de China

Provincia/ región	Municipio	Prioridades
Guangdong	Guangzhou	– Innovación de productos y servicios financieros verdes – Tecnología financiera verde – Desarrollo del mercado de capitales de financiación verde y cooperación a ese respecto en el Área de la Gran Bahía
Zhejiang	Huzhou Quzhou	– Modernización y transformación de las ramas de producción tradicionales – Financiación verde para las mipymes
Guizhou	Nuevo distrito de Gui'an	– Optimización de los recursos ecológicos locales en el desarrollo de la financiación verde para impulsar un crecimiento económico limpio y sostenible – Reducción de la pobreza – Construcción de infraestructuras compartidas para los macrodatos
Jiangxi	Nuevo distrito de Ganjiang	– Optimización de los recursos ecológicos locales en el desarrollo de la financiación verde para impulsar el crecimiento económico – Modernización de las ramas de producción tradicionales
Xinjiang	Ciudad de Hami, prefectura de Changji, ciudad de Karamay	– Demostración de la función que se cumple en la iniciativa verde "Cinturón y Ruta" – Movilización de financiación verde para apoyar la modernización de la agricultura, la energía limpia y la fabricación de productos de alta gama relacionados con las energías renovables
Gansu	Nuevo distrito de Lanzhou	– Desarrollo de un sistema local de financiación verde – Promoción de los sectores de los vehículos eléctricos y los macrodatos
Chongqing	Chongqing	– Establecimiento de un sistema de servicios de inversión y financiación que pueda responder al desarrollo verde y con bajas emisiones de carbono de los sectores más importantes, como los de la energía, la construcción, el transporte, la manufactura, la agricultura y la silvicultura, y apoyo a la reducción constante de la intensidad de las emisiones de carbono en Chongqing

4.4.3 Servicios de transporte

4.4.3.1 Transporte aéreo

4.216. El marco jurídico e institucional de los servicios de transporte aéreo se ha mantenido en gran medida inalterado durante el período objeto de examen. La Ley de Aviación Civil (modificada por última vez en 2021) sigue siendo la principal legislación que rige el sector de la aviación. La Administración de Aviación Civil de China (CAAC) es la autoridad nacional en materia de aviación. Supervisa la seguridad de las operaciones aéreas y de escala realizadas en el marco de la aviación civil. Esta función incluye tareas tales como la certificación, supervisión e inspección de los operadores de aviación civil, los productos de la industria aeronáutica y los servicios de mantenimiento. Además, se ocupa del registro de aeronaves nacionales, evalúa los resultados operativos y realiza exámenes para las aeronaves civiles. Asimismo, la CAAC desempeña un papel fundamental en la elaboración de planes estratégicos de desarrollo para el sector de la aviación civil y la gestión del tráfico aéreo, incluida la planificación del espacio aéreo y el establecimiento de rutas aéreas. En 2022, la CAAC concedió una aprobación a Commercial Aircraft Corp of China (COMAC), en la que indicaba que el avión C919, de fabricación nacional, había concluido con éxito todos los vuelos de prueba necesarios para obtener un certificado de aeronavegabilidad.

4.217. Según la IATA, antes del azote de la pandemia de COVID-19 en 2019, China representaba una parte importante de la demanda mundial de transporte aéreo de pasajeros. Daba cuenta del 9% de los viajes internacionales y del 25% de los viajes nacionales, que descendieron a aproximadamente el 1% durante la pandemia. Tras la reapertura producida en diciembre de 2022, China experimentó una sólida recuperación del tráfico de entrada de vuelos internacionales. Sin embargo, los resultados variaban según los distintos mercados. Entre enero y abril de 2023, la mayor parte de los 20 principales mercados internacionales de China, que contribuían al 90% de sus vuelos internacionales en 2019, registró un aumento sustancial de sus vuelos semanales a China.¹²⁴

4.218. Sobre la base de las cifras oficiales, a finales de 2022, había 254 aeropuertos en China, 60 de los cuales prestaban servicios de comidas a vuelos internacionales. Entre ellos, 18 aeropuertos tenían un movimiento anual de pasajeros superior a 10 millones, y representaban, en conjunto, el 52,8% de los centros de transporte aéreo de China. Los aeropuertos de Beijing, Shanghai y Guangzhou, las tres ciudades principales, aportaban el 15% del número total de pasajeros nacionales. Además, 51 aeropuertos manipulaban un volumen anual de carga y correo de más de 10.000 toneladas y abarcaban el 98,5% de todos los servicios aeroportuarios nacionales. Entre ellos, los aeropuertos de Beijing, Shanghai y Guangzhou daban cuenta del 43,4% del movimiento de carga y correo de la red aeroportuaria nacional.

4.219. El 14º Plan Quinquenal de Desarrollo de la Aviación Civil de China es la principal visión estratégica que orienta la labor de las autoridades del sector durante el período 2021-2025.¹²⁵ El objetivo de las autoridades es, entre otras cosas, fomentar el desarrollo de un sector de la aviación civil que lleve a cabo su actividad de conformidad con normas favorables para el medio ambiente y estén también orientadas a lograr un alto nivel de resultados. El 14º Plan Quinquenal Especializado para el Desarrollo Ecológico de la Aviación Civil, el Plan de Acción para una Aviación Civil Inteligente de Nueva Generación, el Plan de Acción para la Construcción de Aeropuertos Seguros, Verdes, Inteligentes y Humanitarios (2020-2035) y las Directrices para una Mayor Promoción del Desarrollo Verde de la Aviación Civil son ejemplos de los documentos de política de China destinados a garantizar el desarrollo sostenible de la aviación civil.¹²⁶ Concretamente, hay medidas en vigor para aumentar la adopción de tecnologías aeroportuarias verdes, promover sistemas de ahorro de energía de las líneas aéreas y favorecer el control de la contaminación producida por plásticos. Por ejemplo, en mayo de 2021, las autoridades adoptaron un Plan de Trabajo para el Control de la Contaminación por Plásticos en el Sector de la Aviación Civil (2021-2025), cuya finalidad es prohibir el uso de

¹²⁴ IATA (2023), Air Passenger Outlook: China Reopening. Consultado en: <https://www.iata.org/en/iata-repository/publications/economic-reports/air-passenger-outlook-china-reopening/>.

¹²⁵ CAAC, Circular de la Administración de Aviación Civil de China, la Comisión Nacional de Desarrollo y Reforma y el Ministerio de Transporte sobre la Publicación del 14º Plan Quinquenal de Desarrollo de la Aviación Civil. Consultada en: http://www.caac.gov.cn/XXGK/XXGK/FZGH/202201/t20220107_210798.html.

¹²⁶ CAAC (2022), China Civil Aviation Green Development Policy and Action. Consultado en: <http://www.caac.gov.cn/English/News/TPXW/202305/P020230515369357225251.pdf>.

plásticos desechables y no degradables en los aeropuertos con un movimiento anual de 2 millones de pasajeros o más y en los servicios nacionales de pasajeros.¹²⁷

4.220. Las medidas de China relativas a la participación extranjera en el sector de la aviación no fueron objeto de cambios significativos durante el período examinado. El país mantiene restricciones a la inversión extranjera en la propiedad de los aeropuertos. De conformidad con las Medidas Administrativas Especiales relativas al Acceso a la Inversión Extranjera (Lista Negativa) (edición de 2021), la construcción y explotación de los aeropuertos civiles deben estar bajo el control de partes chinas.

4.221. La participación de los transportistas extranjeros en los servicios de aviación se rige por las Disposiciones sobre la Concesión de Licencias de Explotación de Rutas Aéreas a Empresas Extranjeras de Transporte Aéreo. De conformidad con las normas, cuando una compañía aérea extranjera solicita explotar una ruta de vuelo especificada que conecta un destino extranjero con un lugar de China, debe adherirse al acuerdo bilateral sobre transporte aéreo civil. También deben observarse las especificaciones técnicas descritas en las directrices de la CAAC. Por lo general, se prohíbe a las líneas aéreas extranjeras realizar vuelos regulares o no regulares entre dos lugares de China, salvo en circunstancias especiales, como las misiones de rescate y socorro, previa aprobación de la CAAC.

4.222. En octubre de 2022, China celebró un acuerdo bilateral de transporte aéreo con Guyana.

4.4.3.2 Transporte marítimo

4.223. El sector del transporte marítimo, incluidas las actividades portuarias, es fundamental para la estrategia de desarrollo económico impulsado por las exportaciones de China. Las autoridades señalan que China se propone forjar un sector de transporte marítimo de alta calidad para 2035, haciendo especial hincapié en sistemas de gobernanza modernos, ahorro de energía y procesos inteligentes, con el fin de seguir consolidando la competitividad del sector.

4.224. Las actividades de transporte marítimo han aumentado de manera sostenida en los últimos años. En 2022, el volumen de carga por vía acuática fue de 8.550 millones de toneladas (frente a 7.470 millones de toneladas en 2019, 7.620 millones de toneladas en 2020 y 8.240 millones de toneladas en 2021) y el volumen de la carga transportada fue de 11,56 billones de t/km (frente a 10,4 billones de t/km en 2019, 10,58 billones de t/km en 2020 y 12,10 billones de t/km en 2021). Las autoridades indican que, a finales de 2022, los 10 principales puertos en cuanto a movimiento de mercancías se encontraban en la ciudad de Ningbo-Zhoushan (1.260 millones de toneladas), Tangshan (769 millones de toneladas), Shanghai (728 millones de toneladas), Qingdao (658 millones de toneladas), Guangzhou (629 millones de toneladas), Suzhou (573 millones de toneladas), Rizhao (571 millones de toneladas), Tianjin (549 millones de toneladas), Yantai (463 millones de toneladas) y el Golfo de Beibu (371 millones de toneladas). En 2022, se enviaron 15.700 millones de toneladas de carga y 296 millones de TEU de contenedores desde puertos chinos, lo que muestra un aumento interanual del 0,9% y del 4,7%, respectivamente. La estructura de la propiedad de los diversos puertos está relativamente diversificada entre la participación estatal y del sector privado nacional y extranjero.

4.225. Con el fin de racionalizar la circulación de mercancías hacia y desde el país, China ha posicionado estratégicamente su sector marítimo como uno de los más avanzados a nivel mundial, y cuenta con algunos de los puertos más grandes y con mayor nivel de actividad del mundo. Según las autoridades, en 2022, China era propietaria de 8.839 buques autopropulsados para la navegación marítima de hasta 1.000 toneladas o más (frente a 6.896 en 2020), lo que representaba una capacidad total de 301.997.355 toneladas de peso muerto (TPM) (frente a 228.376.872 en 2020). Estas cifras convierten a China en el segundo país del mundo con mayor número de embarcaciones en cuanto a la capacidad de transporte de carga (13.4% de la capacidad mundial medida en TPM).¹²⁸ En su flota total, China tiene unas 2.800 embarcaciones registradas fuera de China, lo que representa una número considerable (el 59,5% del total en TPM).

¹²⁷ CAAC (2021), The Work Plan for Control of Plastic Pollution in the Civil Aviation Industry (2021-2025) Officially Issued. Consultado en: http://www.caac.gov.cn/English/News/202305/t20230515_219528.html.

¹²⁸ UNCTAD (2023), Informe sobre el Transporte Marítimo 2023. Consultado en: https://unctad.org/system/files/official-document/rmt2023_es.pdf.

4.226. El Informe sobre el Transporte Marítimo 2023 de la UNCTAD también indica que siete puertos chinos figuraban entre los 25 principales puertos a nivel mundial en lo que respecta al rendimiento portuario en las operaciones de manipulación de la carga, teniendo en cuenta indicadores como el promedio del tiempo de los buques en puerto.¹²⁹ Además, el índice de conectividad del transporte marítimo de línea (LSCI) de la UNCTAD pone de relieve sistemáticamente la posición de China como la economía más conectada del mundo. Esto se mide a través de diversos factores, entre ellos, la multitud de empresas que ofrecen servicios a los puertos de China y desde estos puertos, así como el tamaño de los mayores buques utilizados para prestar servicios en estos puertos.¹³⁰

4.227. En los estudios realizados sobre el comercio, se reconoce ampliamente que una mayor conectividad portuaria tiende a reducir los costos del comercio, crear oportunidades comerciales y aumentar el volumen del comercio. Esa evolución es posible debido a la mayor previsibilidad que ofrece la regularidad del transporte, así como al mayor acceso a una gama más amplia de mercados de exportación. Por ejemplo, Del Rosal (2024) constató que, independientemente del nivel de desarrollo de un país, y en un contexto en que el comercio de productos agropecuarios se realiza crecientemente en contenedores, la conectividad del transporte marítimo de línea tiene el potencial de impulsar el comercio agropecuario.¹³¹ Además, Fugazza y Hoffmann (2017) constataron que la mejora de la conectividad del transporte puede vincularse positivamente con las corrientes comerciales bilaterales.¹³²

4.228. El marco institucional no se ha modificado. El Ministerio de Transporte (MOT) se encarga de formular las políticas de transporte marítimo y portuarias; la Administración de Seguridad Marítima, en la órbita del MOT, está a cargo de la seguridad marítima y la protección del medio marino. De conformidad con el Reglamento para el Registro de Embarcaciones, las Administraciones de la Superintendencia Portuaria que se encuentran en distintos puertos son los organismos encargados del registro de buques.

4.229. El sector del transporte marítimo de China se rige por un amplio conjunto de leyes y reglamentos, en particular, la Ley Marítima, la Ley de Puertos, el Reglamento sobre la Administración del Transporte por Vías de Navegación Interior, las Disposiciones sobre la Administración de las Operaciones Portuarias, las Normas de Aplicación del Reglamento sobre el Transporte Marítimo Internacional (modificadas en 2023) y las Disposiciones sobre la Administración del Transporte por Vías de Navegación Interior.

4.230. El 1 de septiembre de 2021 se revisó la Ley de Seguridad del Tráfico Marítimo, la principal legislación que rige la seguridad del tráfico marítimo en China, y se introdujeron algunas prescripciones de notificación aplicables a distintos buques extranjeros, entre otros, los sumergibles y las embarcaciones que transportan materiales radiactivos, petróleo a granel, productos químicos, gas licuado y otras sustancias tóxicas y nocivas. Las autoridades indican que la Ley tiene por objeto garantizar la seguridad y otorgar protección al medio marino, de conformidad con los convenios internacionales pertinentes.

4.231. Las autoridades permiten operaciones específicas de embarcaciones que naveguen bajo "pabellón de conveniencia" y cumplan determinadas condiciones en China. De conformidad con un reglamento publicado por la GACC en enero de 2022 y un anuncio publicado por el MOT en diciembre de 2021, las embarcaciones extranjeras que sean de propiedad exclusiva o estén bajo el control de compañías navieras de capital chino también pueden prestar servicios de relevo de carga siempre que obtengan la autorización pertinente del MOT y cumplan las formalidades de registro de buques ante la Administración de Aduanas de China.¹³³

¹²⁹ UNCTAD (2023), Informe sobre el Transporte Marítimo 2023.

¹³⁰ UNCTAD, Índice de conectividad del transporte marítimo de línea, trimestral. Consultado en: <https://unctadstat.unctad.org/datacentre/dataviewer/US.LSCI>.

¹³¹ I. Del Rosal (2024), "Maritime Connectivity and Agricultural Trade", *Journal of Agricultural Economics*, volumen 75, páginas 153-168. Consultado en: <https://doi.org/10.1111/1477-9552.12548>.

¹³² M. Fugazza y J. Hoffmann (2017), "Liner Shipping Connectivity as Determinant of Trade", *Journal of Shipping and Trade*, volumen 2. Consultado en: <https://doi.org/10.1186/s41072-017-0019-5>.

¹³³ Anuncio sobre la Revisión de las Disposiciones relativas al Transporte de Contenedores para el Comercio Nacional y Extranjero en los Mismos Buques y las Actividades de Relevo de Carga de Embarcaciones de Navegación Internacional (Anuncio Nº 12, 2022); y Anuncio del Ministerio de Transporte sobre el Programa Piloto para que Empresas Extranjeras de Transporte Marítimo Internacional de Contenedores Realicen

4.232. El 20 de julio de 2023, una modificación del Reglamento sobre Transporte Marítimo Internacional suprimió, con efecto inmediato, la necesidad de que los operadores chinos de transporte internacional de contenedores, los operadores chinos de transporte internacional de carga común y las empresa de transporte marítimo que no explotan buques soliciten una aprobación antes de llevar a cabo sus operaciones. En lugar de ello, la modificación estipula que estos operadores solo deben presentar los registros exigidos a la autoridad competente.

4.233. En general, los extranjeros pueden invertir en actividades de transporte marítimo. Sin embargo, de conformidad con la Lista Negativa Nacional relativa a las inversiones extranjeras, la participación mayoritaria de las empresas nacionales de transporte por vía acuática debe estar en manos de una persona u organización china. El Catálogo de Sectores en los que se Incentiva la Inversión Extranjera alienta a los inversores extranjeros a invertir en la construcción y explotación de instalaciones de muelles públicos en los puertos.

4.234. China sigue percibiendo un impuesto sobre el tonelaje de buques que entran en puertos nacionales. El impuesto es proporcional al tonelaje neto del buque y al plazo de vigencia de la licencia correspondiente (cuadro 4.24). Se aplican tipos preferenciales para los buques sujetos a impuestos, sean chinos o de un país de matrícula que haya firmado tratados o acuerdos que contengan cláusulas sobre la concesión mutua de trato NMF en materia de impuestos y derechos sobre los buques. Según las autoridades, en enero de 2024, más de 60 países habían concertado acuerdos con China, en los que se preveía el trato NMF recíproco.

Cuadro 4.24 Tipos del impuesto sobre el tonelaje de las embarcaciones, 2024

	Tipo impositivo ordinario en función del plazo de vigencia de la licencia			Tipo impositivo preferencial en función del plazo de vigencia de la licencia		
	Licencia de un año	Licencia de 90 días	Licencia de 30 días	Licencia de un año	Licencia de 90 días	Licencia de 30 días
2.000 t netas como máximo	12,6	4,2	2,1	9,0	3,0	1,5
2.000-10.000 t netas	24,0	8,0	4,0	17,4	5,8	2,9
10.000-50.000 t netas	27,6	9,2	4,6	19,8	6,6	3,3

Cuadro A3. 2 Medidas aplicadas a las importaciones originarias de interlocutores comerciales específicos sobre la base de los anuncios/decretos de la GACC y otros ministerios y organismos competentes, marzo de 2024

Fecha	Anuncio/decreto	Interlocutores comerciales	Productos	Categoría de medidas	Motivo de la aplicación/anulación
10 de enero de 2023	Anuncio sobre la Prevención de la Propagación de la Peste Equina Africana de Nigeria a China (Anuncio Nº 4 de la GACC)	Nigeria	Equinos y productos conexos	Prohibición de importación	El 23 de diciembre de 2022, se registró un brote de peste equina africana en Nigeria. A efectos de proteger la seguridad de la ganadería en China y prevenir la introducción de la epidemia, se impusieron restricciones al comercio de equinos y productos conexos procedentes de Nigeria. Todavía no se ha levantado esa prohibición.
25 de enero de 2021	Anuncio sobre la Suspensión de las Importaciones de Aves de Corral y Productos Conexos procedentes de Lituania (Anuncio Nº 10 de la GACC)	Lituania	Aves de corral	Prohibición de importación	El 25 de enero de 2021, se informó a la Organización Mundial de Sanidad Animal de que se había registrado un brote de gripe aviar de alta patogenicidad (subtipo H5N8) en aves de corral nacionales. A efectos de prevenir la introducción de la epidemia, se impusieron restricciones al comercio de aves de corral y productos conexos procedentes de Lituania. Todavía no se ha levantado esa prohibición.
9 de febrero de 2023	Anuncio sobre la Prevención de la Propagación de la Fiebre Aftosa del Iraq a China (Anuncio Nº 9 de la GACC)	Iraq	Animales de pezuña hendida y productos conexos	Prohibición de importación	El 26 de enero de 2023, se registró un brote de fiebre aftosa en el Iraq. A efectos de prevenir la introducción de la epidemia, se impusieron restricciones al comercio de animales de pezuña hendida y productos conexos procedentes del Iraq. Todavía no se ha levantado esa prohibición.
6 de julio de 2023	Anuncio sobre la Prevención de la Propagación de la Peste Porcina Africana de Croacia a China (Anuncio Nº 84 de la GACC)	Croacia	Cerdos, jabalíes y productos conexos	Prohibición de importación	El 27 de junio de 2023, se registró un brote de peste porcina africana en Croacia. A efectos de proteger la seguridad de la ganadería en China y prevenir la introducción de la epidemia, se impusieron restricciones al comercio de cerdos, jabalíes y productos conexos procedentes de Croacia. Todavía no se ha levantado esa prohibición.
6 de julio de 2023	Anuncio sobre la Prevención de la Introducción de la Peste Porcina Africana de Bosnia y Herzegovina en China (Anuncio Nº 85 de la GACC)	Bosnia y Herzegovina	Cerdos, jabalíes y productos conexos	Prohibición de importación	El 22 de junio de 2023, se registró un brote de peste porcina africana en Bosnia y Herzegovina. A efectos de proteger la seguridad de la ganadería en China y prevenir la introducción de la epidemia, se impusieron restricciones al comercio de cerdos, jabalíes y productos conexos procedentes de Bosnia y Herzegovina. Todavía no se ha levantado esa prohibición.

Fecha	Anuncio/decreto	Interlocutores comerciales	Productos	Categoría de medidas	Motivo de la aplicación/anulación
4 de agosto de 2023	Anuncio del Examen y la Resolución sobre la Aplicación de Medidas Antidumping y Medidas Compensatorias a la Importación de Cebada procedente de Australia (Anuncio Nº 29 del MOFCOM)	Australia	Cebada	Derechos antidumping	El 18 de mayo de 2020, el MOFCOM emitió los Anuncios Nº 14 y Nº 15, 2020, por los que se decidió imponer derechos antidumping y compensatorios a las importaciones de cebada procedente de Australia por un período de cinco años a partir del 19 de mayo de 2020. El 14 de abril de 2023, a petición de la Asociación China de Bebidas Alcohólicas, el MOFCOM emitió el Anuncio Nº 12, 2023, y decidió estudiar la necesidad de seguir imponiendo derechos antidumping y derechos compensatorios a las importaciones de cebada procedentes de Australia. Tras completar la investigación, el MOFCOM dictaminó el 4 de agosto de 2023 que, a la luz de los cambios producidos en el mercado de la cebada en China, no era necesario seguir imponiendo derechos antidumping ni derechos compensatorios a las importaciones de cebada procedente de Australia en virtud del artículo 49 del Reglamento Antidumping y el artículo 48 del Reglamento sobre Medidas Compensatorias. Los derechos antidumping y los derechos compensatorios impuestos a las importaciones de cebada procedente de Australia se suprimieron el 5 de agosto de 2023.
24 de agosto de 2023	Anuncio de la Administración General de Aduanas sobre la Suspensión de la Importación de todos los Productos Acuáticos procedentes del Japón (Anuncio Nº 103 de la GACC)	Japón	Productos acuáticos	Prohibición de importación	Se trata de una medida de prevención en caso de emergencia, que cumple las normas de la OMC en materia de MSF. Su objetivo es evitar el riesgo de contaminación radiactiva de la inocuidad de los alimentos causada por la descarga de agua nuclear contaminada de Fukushima en el Japón, a fin de proteger la salud de los consumidores chinos y garantizar la inocuidad de los alimentos importados.
9 de febrero de 2022	Aviso del Departamento de Cuarentena Animal y Vegetal de la GACC por el que se Suspende la Importación de Troncos de Lituania en China (Aviso Nº 12 del DAPQ, 2022)	Lituania	Carne de bovino, productos lácteos, productos alcohólicos	Prohibición de importación	El grupo de expertos chinos no pudo evaluar y confirmar la eficacia continuada del sistema de gestión de la inocuidad de la carne y los productos lácteos de Lituania (carne de bovino, productos lácteos). Hubo sospechas de fraude y de riesgo relativo a la inocuidad de los alimentos destinados a los consumidores (productos alcohólicos). Todavía no se ha levantado esa prohibición.
2 de septiembre de 2023	Anuncio sobre la Prevención de la Introducción de la Fiebre Aftosa de Omán en China (Anuncio Nº 113 de la GACC)	Omán	Animales de pezuña hendida y productos conexos	Prohibición de importación	Se registró un brote de fiebre aftosa en Omán. A efectos de proteger la seguridad de la ganadería en China y prevenir la introducción de la epidemia, se impusieron restricciones al comercio de animales de pezuña hendida y productos conexos procedentes de Omán. Todavía no se ha levantado esa prohibición.
20 de septiembre de 2023	Anuncio sobre la Prevención de la Propagación de la Peste Porcina Africana de Suecia a China (Anuncio Nº 121 de la GACC)	Suecia	Cerdos, jabalíes y productos conexos	Prohibición de importación	El 7 de septiembre de 2023, se registró un brote de peste porcina africana en Suecia. A efectos de proteger la seguridad de la ganadería en China y prevenir la introducción de la epidemia, se impusieron restricciones al comercio de cerdos, jabalíes y productos conexos procedentes de Suecia. Todavía no se ha levantado esa prohibición.

Fecha	Anuncio/decreto	Interlocutores comerciales	Productos	Categoría de medidas	Motivo de la aplicación/anulación
27 de septiembre de 2023	Anuncio sobre la Prevención de la Propagación de la Viruela Ovina y la Viruela Caprina de Bulgaria a China (Anuncio N° 124 de la GACC)	Bulgaria	Pequeños rumiantes	Prohibición de importación	El 16 de septiembre de 2023 se registró un brote de viruela ovina y viruela caprina en Bulgaria. A efectos de proteger la seguridad de la ganadería en China y prevenir la introducción de la epidemia, se impusieron restricciones al comercio de ovejas, cabras y productos conexos procedentes de Bulgaria. Todavía no se ha levantado esa prohibición.
23 de octubre de 2023	Anuncio sobre la Prevención de la Propagación de la Enfermedad de la Lengua Azul de Bélgica a China (Anuncio N° 139 de la GACC)	Bélgica	Rumiantes y productos conexos	Prohibición de importación	El 10 de octubre de 2023 se registró un brote de la enfermedad de la lengua azul en Bélgica. A efectos de proteger la seguridad de la ganadería en China y prevenir la introducción de la epidemia, se impusieron restricciones al comercio de rumiantes y productos conexos procedentes de Bélgica. Todavía no se ha levantado esa prohibición.
23 de octubre de 2023	Anuncio sobre la Prevención de la Propagación de la Enfermedad de la Lengua Azul de los Países Bajos a China (Anuncio N° 140 de la GACC)	Países Bajos	Rumiantes y productos conexos	Prohibición de importación	Se registró un brote de la enfermedad de la lengua azul en Bélgica. A efectos de proteger la seguridad de la ganadería en China y prevenir la introducción de la epidemia, se impusieron restricciones al comercio de rumiantes y productos conexos procedentes de los Países Bajos. Todavía no se ha levantado esa prohibición.
23 de octubre de 2023	Anuncio sobre la Prevención de la Introducción de la Peste de los Pequeños Rumiantes de Rwanda en China (Anuncio N° 141 de la GACC)	Rwanda	Pequeños rumiantes	Prohibición de importación	El 2 de octubre de 2023 se registró un brote de peste de los pequeños rumiantes en Rwanda. A efectos de proteger la seguridad de la ganadería en China y prevenir la introducción de la epidemia, se impusieron restricciones al comercio de ovejas, cabras y productos conexos procedentes de Rwanda. Todavía no se ha levantado esa prohibición.
20 de noviembre de 2023	Anuncio sobre la Prevención de la Introducción de la Viruela Ovina y la Viruela Caprina de Grecia en China (Anuncio N° 169 de la GACC)	Grecia	Pequeños rumiantes	Prohibición de importación	El 27 de octubre de 2023 se registró un brote de viruela ovina y viruela caprina en Grecia. A efectos de proteger la seguridad de la ganadería en China y prevenir la introducción de la epidemia, se impusieron restricciones al comercio de ovejas, cabras y productos conexos procedentes de Grecia. Todavía no se ha levantado esa prohibición.
20 de diciembre de 2023	Anuncio sobre las Normas de Ejecución relativas a la Administración de los Contingentes Arancelarios para la Importación de Lanas y Lanas Peinadas de Nueva Zelanda y de Lanas de Australia en 2024 (Anuncio N° 59 del MOFCOM)	Australia, Nueva Zelandia	Productos de lana	Contingentes arancelarios	En relación con los contingentes arancelarios específicos a la importación de lana y lana peinada de Nueva Zelandia y de lana de Australia en 2024, se cumplen tanto el Acuerdo de Libre Comercio entre China y Nueva Zelandia como el Acuerdo de Libre Comercio entre China y Australia. En 2024, el contingente arancelario para la importación de lana de Nueva Zelandia asciende a 36.936 toneladas; el contingente arancelario correspondiente a la lana peinada de Nueva Zelandia asciende a 665 toneladas; y el correspondiente a la lana de Australia asciende a 44.324 toneladas.

Fecha	Anuncio/decreto	Interlocutores comerciales	Productos	Categoría de medidas	Motivo de la aplicación/anulación
22 de diciembre de 2023	Anuncio sobre la Prevención de la Propagación de la Peste de los Pequeños Rumiantes de Türkiye a China (Anuncio N° 191 de la GACC)	Türkiye	Pequeños rumiantes	Prohibición de importación	El 8 de diciembre de 2023 se registró un brote de peste de los pequeños rumiantes en Türkiye. A efectos de proteger la seguridad de la ganadería en China y prevenir la introducción de la epidemia, se impusieron restricciones al comercio de ovejas, cabras y productos conexos procedentes de Türkiye. Todavía no se ha levantado esa prohibición.
26 de enero de 2024	Anuncio sobre la Prevención de la Propagación de la Enfermedad de la Lengua Azul del Iraq a China (Anuncio N° 8 de la GACC)	Iraq	Rumiantes y productos conexos	Prohibición de importación	El 10 de enero de 2024 se registró un brote de la enfermedad de la lengua azul en el Iraq. A efectos de proteger la seguridad de la ganadería en China y prevenir la introducción de la epidemia, se impusieron restricciones al comercio de rumiantes y productos conexos procedentes del Iraq. Todavía no se ha levantado esa prohibición.
1 de febrero de 2024	Anuncio sobre la Prevención de la Propagación de la Peste Porcina Africana de Montenegro a China (Anuncio N° 16 de la GACC)	Montenegro	Cerdos, jabalíes y productos conexos	Prohibición de importación	El 17 de enero de 2024 se registró un brote de peste porcina africana en Montenegro. A efectos de proteger la seguridad de la ganadería en China y prevenir la introducción de la epidemia, se impusieron restricciones al comercio de cerdos, jabalíes y sus productos procedentes de Montenegro. Todavía no se ha levantado esa prohibición.
6 de febrero de 2024	Anuncio sobre la Prevención de la Propagación de la Enfermedad de la Lengua Azul de Italia a China (Anuncio N° 19 de la GACC)	Italia	Rumiantes y productos conexos	Prohibición de importación	El 26 de enero de 2024 se registró un brote de la enfermedad de la lengua azul en las regiones italianas de Cerdeña y Toscana. Políticas fiscales preferenciales para proyectos de agricultura, silvicultura, ganadería y pesca <i>Ley del Impuesto sobre la Renta de las Sociedades, 2007;</i> <i>Reglamento de Aplicación de la Ley del Impuesto sobre la Renta de las Sociedades, 2007;</i> <i>Circular Cai Shui N° 149 del MOF [2008];</i> <i>Circular Cai Shui N° 26 del MOF [2011]</i>	Apoyar el desarrollo de las actividades de elaboración preliminar de los productos de la pesca, entre otras cosas.	Trato fiscal preferencial. En el caso de los ingresos obtenidos de proyectos de agricultura, silvicultura, ganadería y pesca, las empresas pueden beneficiarse de la exención o reducción del impuesto sobre la renta de las sociedades.	2008	No se dispone de datos sobre los ingresos condonados.
Fondo de Subvenciones para el Desarrollo del Sector Pesquero <i>Circular Cai Nong N° 41 del MOF [2021];</i> <i>Circular Cai Nong N° 24 del MOF [2021]</i>	Promover el desarrollo de alta calidad del sector pesquero y resolver los problemas de desarrollo de dicho sector. Optimizar las estructuras industriales y lograr la transformación y modernización de la economía. Reducir la intensidad de la pesca de altura, proteger los recursos pesqueros marinos, y promover el desarrollo de la acuicultura, de las industrias de tratamiento de productos acuáticos y de otras industrias. En consonancia con la tendencia internacional de las subvenciones a la pesca, se eliminarán las subvenciones a los costos directos para orientar a los pescadores en la conservación de los recursos pesqueros y fortalecer la cooperación externa en materia de pesca.	Donación. Pescadores, nuevas entidades comerciales, institutos de investigación y universidades, y otras entidades pertinentes que cumplan los requisitos necesarios y lleven a cabo las correspondientes tareas.	2021	2021: 1. Tareas vinculantes (1.222,5), entre ellas, pastos marinos nacionales (122,5) e instalaciones pesqueras públicas básicas (1.100). 2. Tareas de orientación (6.277,5), entre ellas, equipos e instalaciones de pesca modernos (2.627,5), desarrollo verde y circular del sector pesquero (1.100) y estudio y conservación de los recursos pesqueros y mejora de la capacidad de cumplimiento de las normas internacionales (2.550). (Estimaciones, que pueden diferir de las cuantías reales). 2022: 1. Tareas vinculantes (1.137), entre ellas, pastos marinos nacionales (150) e instalaciones pesqueras públicas básicas (987). 2. Tareas de orientación (6.363), entre ellas, equipos e instalaciones de pesca modernos (2.007,9), desarrollo verde y circular del sector pesquero (1.450) y estudio y conservación de los recursos pesqueros y mejora de la capacidad de cumplimiento de las normas internacionales (2.905,1). (Estimaciones, que pueden diferir de las cuantías reales).

Título <i>Fundamento jurídico</i>	Objetivo	Subvención y beneficiarios	Fecha de inicio	Ingresos condonados/asignación presupuestaria (en millones de CNY)
Otros pagos de transferencia para fines generales del sector pesquero <i>Circular Cai Nong N° 41 del MOF [2021]</i>	Promover el desarrollo de alta calidad del sector pesquero y resolver los problemas de desarrollo de dicho sector. Optimizar las estructuras industriales y lograr la transformación y modernización del sector. Reducir la intensidad de la pesca de altura, proteger los recursos pesqueros marinos, y promover el desarrollo de la acuicultura, de las industrias de tratamiento de productos acuáticos y de otras industrias. En consonancia con la tendencia internacional de las subvenciones a la pesca, se eliminarán las subvenciones a los costos directos para orientar a los pescadores en la conservación de los recursos pesqueros y fortalecer la cooperación externa en materia de pesca.	Donación. Pescadores, nuevas entidades comerciales, institutos de investigación y universidades, y otras entidades pertinentes que cumplan los requisitos necesarios y lleven a cabo las correspondientes tareas.	2021	2021: 16.021 2022: 16.021

Cuadro A4. 2 Ayuda de los Gobiernos locales a la pesca, según se ha notificado a la OMC

Título <i>Fundamento jurídico</i>	Objetivo	Subvención y beneficiarios	Fecha de inicio	Asignación presupuestaria (en decenas de millares de CNY)
Provincia de Liaoning				
Mejora de las poblaciones de peces y liberación de alevines <i>Ley de Pesca, Reglamento relativo a la Administración de las Pesquerías de la Provincia de Liaoning</i>	Mejorar el entorno ecológico de las aguas, restaurar los recursos pesqueros e incrementar los ingresos de los pescadores	Donación. Proyectos y unidades admisibles.	2019	2021: 540 2022: 350
Provincia de Jiangsu				
Subvención y donación para granjas experimentales nacionales para una acuicultura sólida (ciudad de Nanjing) <i>Ning Nong Ji Nº 56 [2021]; Ning Nong Ji Nº 6 [2022]</i>	Transformar el modo de desarrollo del sector de la pesca	Donación y subvención. Granjas experimentales nacionales para una acuicultura sólida.	2019	2021: 50 2022: 100
Subvención para la renovación y normalización de los estanques de acuicultura (distrito de Wuzhong, ciudad de Suzhou) <i>Wu Zheng Fa Nº 139 [2017]</i>	Mejorar las instalaciones de producción de la acuicultura en estanques	Donación. Unidades que cumplen las condiciones establecidas.	2018	2021: 985,5 2022: 485,5
Transformación ecológica de los estanques (ciudad de Changzhou) <i>Su Zheng Ban Fa Nº 51 [2022]</i>	Adherirse a la filosofía de ecología ante todo y desarrollo ecológico	Donación. Unidades o grandes acuicultores que llevan a cabo directamente proyectos de normalización de estanques de acuicultura.	2021	2021: 1.000 2022: 1.800
Provincia de Anhui				
Subvención para el seguro de pensiones de los pescadores que abandonen o tengan prohibida la pesca de captura en el Río Yangtsé (distrito de Xuanzhou, ciudad de Xuancheng) <i>Plan de Aplicación del Seguro de Pensiones Básicas Urbano y Rural para los Pescadores que Abandonen la Pesca de Captura en la Cuenca Principal del Río Yangtsé (Distrito de Xuanzhou)</i>	Garantizar la recolocación de los pescadores que abandonen o tengan prohibida la pesca de captura en el Río Yangtsé	Donación. Pescadores que abandonen la pesca de captura.	2020	2021: 325,7 2022: 372,2
Provincia de Fujian				
Fondo Especial para la Reestructuración de la Pesca <i>Min Cai Nong Nº 36 [2019]</i>	Promover la transformación, la modernización y el desarrollo ecológico y de alta calidad del sector pesquero, y fomentar la innovación y la promoción de la tecnología científica pertinente	Donación. Empresas de tratamiento de productos acuáticos, cooperativas, explotaciones agrícolas familiares, instituciones de promoción de los productos acuáticos, institutos de investigación científica, etc. en Fujian	2019	2021: 5.500

Título <i>Fundamento jurídico</i>	Objetivo	Subvención y beneficiarios	Fecha de inicio	Asignación presupuestaria (en decenas de millares de CNY)
Fondo Especial para el Desarrollo de Alta Calidad de los Servicios Marítimos y la Pesca <i>Min Cai Nong</i> Nº 25 [2022]	Intensificar la protección ambiental de los recursos pesqueros y las pesquerías, y promover la transformación, la modernización y el desarrollo ecológico y de alta calidad de la pesca	Donación. Unidades dependientes del Servicio Provincial de Pesca Marítima, institutos provinciales de investigación pertinentes, unidades administrativas pertinentes de ciudades y los condados (distritos) y entidades empresariales de pesca recreativa	2022	2022: 15.000
Fondo Especial para el Desarrollo de la Economía Marítima <i>Medidas para la Administración de los Fondos Especiales para el Desarrollo de la Economía Marítima (Min Cai Nong</i> Nº 5 [2020])	Apoyar un desarrollo más rápido de la economía marítima	Donación. Ciudades y condados con industria marítima e instituciones centrales y provinciales en Fujian	2020	2021: 12.000 2022: 12.000
Transformación y modernización de la acuicultura marina (ciudad de Zhangzhou) <i>Min Zheng Ban</i> Nº 28 [2021]	Mejorar la calidad y la eficiencia de la pesca y promover el desarrollo ecológico y de alta calidad de la acuicultura	Donación. Explotaciones de acuicultura inscritas en el registro de industria y comercio.	2021	2021: 4.400 2022: 4.200
Fondo Especial para el Desarrollo de la Pesca y del Mar (ciudad de Xiamen) <i>Xia Hai Gui</i> Nº 4 [2020]	Promover la innovación científica marina y acelerar el desarrollo económico	Donación y subvención. Empresas admisibles que participen legalmente en actividades marinas.	2021	2021: 3.878,91 2022: 5.974,19
Provincia de Shandong				
Seguro para la Ostricultura (Rushan, ciudad de Weihai) <i>Ru Fa Gai Zi</i> Nº 3 [2022]	Mejorar la resiliencia al riesgo de los desastres naturales del sector ostrícola	Donación. Ostricultores admisibles.	2021	2021: 148,62 2022: 150
Provincia de Guangdong				
Subvención para la subsistencia y la producción para los pescadores durante los períodos de veda <i>Yue Hai Yu</i> Nº 25 [2018]	Compensar las pérdidas de ingresos de los pescadores por la aplicación de la moratoria de pesca	Donación. Miembros de la tripulación de los buques de pesca locales aprobados por el departamento administrativo de pesca competente durante los períodos de veda.	2018	2021: 3.358 2022: 3.358
Fondo Especial para la Acuicultura (ciudad de Zhongshan) <i>Zhong Hai Yu</i> Nº 73 [2017]	Promover la tecnología de la acuicultura con especies mejoradas, mejorar el control de calidad de los alevines y las crías y promover el desarrollo sostenible del sector pesquero	Donación. Empresas con licencias válidas para la acuicultura en áreas acuáticas y llanuras de marea y con licencias para la producción de especies.	2021	2021: 60

Título <i>Fundamento jurídico</i>	Objetivo	Subvención y beneficiarios	Fecha de inicio	Asignación presupuestaria (en decenas de millares de CNY)
Subvención para la subsistencia de los pescadores durante los períodos de veda (ciudad de Zhongshan) <i>Yue Hai Yu N° 25 [2018]</i>	Conservar los recursos pesqueros y promover el desarrollo sostenible del sector pesquero	La subvención para los miembros de la tripulación de buques pesqueros durante los períodos de veda se basa en los niveles mínimos de subsistencia publicados por los departamentos de asuntos civiles para el año.	2013	2021: 630 2022: 690,424
Subvención para los períodos de veda (prohibición) de la pesca (ciudad de Guangzhou) <i>Sui Nong N° 117 [2019]</i>	Conservar los recursos pesqueros, resolver los problemas de los pescadores durante los períodos de veda (prohibición) de la pesca y promover el desarrollo sostenible del sector pesquero	Donación. Miembros de la tripulación de los buques de pesca de Guangzhou autorizados por el departamento administrativo de pesca regional competente durante los períodos de veda.	2019	2021: 1.196,91 2022: 1.245,71
Seguro Estatal para la Acuicultura (ciudad de Guangzhou) <i>Sui Nong N° 19 [2021]</i>	Ampliar la cobertura de los seguros agrícolas y reforzar la resiliencia de la producción agrícola a los desastres naturales	Donación. Todos los agricultores, empresas y otras entidades comerciales de la ciudad admisibles para el seguro.	2021	2021: 7.579,24 2022: 35.727,20
Subvención para la subsistencia y la producción para los pescadores durante los períodos de veda (ciudad de Dongguan) <i>Dong Nong N° 11 [2021]</i>	Compensar las pérdidas de ingresos de los pescadores por la aplicación de la moratoria de pesca	Donación. Miembros de la tripulación de los buques de pesca locales durante los períodos de veda.	2021	2021: 416 2022: 504,36
Región autónoma de Guangxi Zhuang				
Subvención para que los pescadores de altura reduzcan el número de embarcaciones y pasen a otras actividades de producción <i>Gui Nong Ting Ban Fa N° 17 [2022]</i>	Reducir la intensidad de la pesca, proteger los recursos pesqueros marinos y mejorar la seguridad de los buques pesqueros	Donación. Propietarios de buques de pesca marítima de altura que hayan declarado reducir su número de embarcaciones y pasar a otras actividades de producción comprendidas en el ámbito de aplicación.	2021	2021: 3.381 2022: 1.973,95
Provincia de Hainan				
Subvención para la conservación de los recursos pesqueros de los buques de pesca marítima que faenan durante períodos prolongados <i>Qiong Nong Zi N° 319 [2022]</i>	Mitigar los efectos de la pandemia de COVID-19 en los pescadores	Donación. Buques de pesca marítima que se vean afectados por la pandemia y no puedan faenar.	2022	2022: 2215,78
Subvención para la reforma de los impuestos y las tasas sobre el petróleo refinado (para el sector de la pesca).	Promover el desarrollo de alta calidad y la modernización del sector pesquero	Donación. Pequeñas embarcaciones pesqueras que figuraban en el registro del censo provincial de buques de pesca de 2014	2021	2021: 2.168 2022: 2.168

Título <i>Fundamento jurídico</i>	Objetivo	Subvención y beneficiarios	Fecha de inicio	Asignación presupuestaria (en decenas de millares de CNY)
Subvención para proyectos de acuicultura (condado autónomo de Qiongzong) <i>Qiong Zhong Yu Zi N° 29 [2021]; Qiong Zhong Yu Zi N° 10 [2021]</i>	Promover el aumento de los ingresos de los acuicultores	Distribución de mercancías Explotaciones de acuicultura familiares, estanques piscícolas colectivos de los pueblos, cooperativas y hogares pobres registrados en el condado, etc.	2021	2021: 98 2022: 20
Municipio de Chongqing				
Subvención para el seguro básico mixto de los pescadores que abandonen la pesca de captura (condado de Wushan) <i>Wushan Ren She Fa N° 92 [2021]</i>	Proteger la vida de los pescadores que abandonen la pesca de captura	Donación. Pescadores que abandonen la pesca de captura.	2020	2021: 213,62 2022: 138,23
Provincia de Sichuan				
Subvención de las primas de participación en el seguro mixto pagadas por los pescadores que abandonen la pesca de captura (ciudad de Yibin) <i>Yi Ren She Ban Fa N° 177 [2020]; Yi Ren She Ban Fa N° 99 [2022]</i>	Subvencionar la participación en el seguro básico mixto de los pescadores que abandonen la pesca de captura	Donación. Pescadores que abandonen la pesca de captura y participen en el seguro básico mixto.	2022	2021: 462 2022: 1.332

2024 National Trade Estimate Report on

FOREIGN TRADE BARRIERS

UNITED STATES TRADE REPRESENTATIVE

ACKNOWLEDGEMENTS

The Office of the United States Trade Representative (USTR) is responsible for the preparation of this report. U.S. Trade Representative Katherine C. Tai gratefully acknowledges the contributions of all USTR staff to the writing and production of this report and notes, in particular, the contributions of Brian Rose, Catherine White, Sean Murphy, and Sonia Franceski.

Thanks are extended to partner Executive Branch members of the Trade Policy Staff Committee (TPSC). The TPSC is composed of the following Executive Branch entities: the Departments of Agriculture, State, Commerce, Defense, Energy, Health and Human Services, Homeland Security, Interior, Justice, Transportation, and Treasury; the Environmental Protection Agency; the Office of Management and Budget; the Council of Economic Advisers; the Council on Environmental Quality; the U.S. Agency for International Development; the Small Business Administration; the National Economic Council; the National Security Council; and, the Office of the United States Trade Representative; as well as non-voting member the U.S. International Trade Commission. In preparing the report, substantial information was solicited from U.S. Embassies.

Office of the United States Trade Representative
Ambassador Katherine C. Tai

FOREWORD

SCOPE AND COVERAGE

The 2024 National Trade Estimate Report on Foreign Trade Barriers (NTE) is the 38th report in an annual series that highlights significant foreign barriers to U.S. exports, U.S. foreign direct investment, and U.S. electronic commerce. This document is a companion piece to the President's 2024 Trade Policy Agenda and 2023 Annual Report, published by the Office of the United States Trade Representative (USTR) on March 1, 2024.

In accordance with section 181 of the Trade Act of 1974, as amended by section 303 of the Trade and Tariff Act of 1984 and amended by section 1304 of the Omnibus Trade and Competitiveness Act of 1988, section 311 of the Uruguay Round Trade Agreements Act, and section 1202 of the Internet Tax Freedom Act, USTR is required to submit to the President, the Senate Finance Committee, and appropriate committees in the House of Representatives, an annual report on significant foreign trade barriers. The statute requires an inventory from the previous calendar year of the most important foreign barriers affecting U.S. exports of goods and services, including agricultural commodities and U.S. intellectual property; foreign direct investment by U.S. persons, especially if such investment has implications for trade in goods or services; and U.S. electronic commerce. Such an inventory enhances awareness of these trade restrictions, facilitates U.S. negotiations aimed at reducing or eliminating these barriers, and aids in advancing the interests of workers in the United States.

The NTE Report is based upon information compiled within USTR, the Departments of Commerce and Agriculture, and other U.S. Government agencies, as well as U.S. Embassies and supplemented with information provided in response to a notice published in the [*Federal Register*](#), and by the trade advisory committees.

This Report discusses key export markets for the United States. As always, omission of particular countries and barriers does not imply that they are not of concern to the United States.

The NTE Report covers significant barriers, whether they are consistent or inconsistent with international trading rules. Tariffs, for example, are an accepted method of protection under the General Agreement on Tariffs and Trade 1994. Even a very high tariff does not violate international rules unless a country has made a commitment not to exceed a specified rate, *i.e.*, a tariff binding. Nonetheless, it could be a significant barrier to U.S. exports, and therefore where appropriate covered in the NTE Report. Measures not consistent with international trade agreements, in addition to serving as barriers to trade and causes of concern for policy, are actionable under U.S. trade law as well as through the World Trade Organization and trade agreements. Since early 2020, there were significant trade disruptions as a result of temporary trade measures taken directly as a result of the COVID-19 pandemic.

Trade barriers elude fixed definitions, but may be considered government measures that unduly impede the international exchange of goods and services. It should be noted that the purpose of the NTE Report is to identify barriers the U.S. Government seeks to remove. Each trading partner has a sovereign right to adopt measures in furtherance of legitimate public purposes. However, in some cases a government might pretextually claim that a measure is in furtherance of a legitimate public purpose. In such circumstances, the facts surrounding the measure will be important in evaluating whether the measure is indeed in furtherance of a legitimate public purpose and not an unjustified barrier to trade.

The NTE Report classifies foreign trade barriers in 14 categories, as follows:

- Import policies;
- Technical barriers to trade;
- Sanitary and phytosanitary measures;
- Government procurement;
- Intellectual property protection;
- Services;
- Digital trade;
- Investment;
- Subsidies, especially export subsidies;
- Anticompetitive practices;
- State-owned enterprises;
- Labor;
- Environment; and,
- Other barriers.

The prevalence of corruption is a consistent complaint from U.S. firms that trade with or invest in other economies. Corruption takes many forms and affects trade and development in different ways. In many countries and economies, it affects customs practices, licensing decisions, and the award of government procurement contracts. If left unchecked, bribery and corruption can negate market access gained through trade negotiations, frustrate broader reforms and economic stabilization programs, and undermine the foundations of the international trading system. Corruption also hinders development and contributes to the cycle of poverty. The Foreign Corrupt Practices Act prohibits U.S. companies from bribing foreign public officials, and numerous other domestic laws discipline corruption of public officials at the State and Federal levels. The United States continues to play a leading role in addressing bribery and corruption in international business transactions and has made real progress over the past quarter century building international coalitions to fight bribery and corruption.

Pursuant to Section 1377 of the Omnibus Trade and Competitiveness Act of 1988, USTR annually reviews the operation and effectiveness of U.S. telecommunications trade agreements to make a determination on whether any foreign government that is a party to one of those agreements is failing to comply with that government's obligations or is otherwise denying, within the context of a relevant agreement, "mutually advantageous market opportunities" to U.S. telecommunication products or services suppliers. The NTE Report highlights both ongoing and emerging barriers to U.S. telecommunication services and goods exports from the annual review called for in Section 1377.

TRADE IMPACT OF FOREIGN BARRIERS

Trade barriers or other trade distorting practices affect U.S. goods exports to foreign markets. In some cases, trade barriers may impose costs on U.S. exports that are not imposed on goods produced in the importing market, effectively decreasing the competitiveness of the U.S. goods, while in other cases, trade barriers may prevent U.S. goods from entering the market entirely. Estimating the impact of a foreign trade measure on U.S. exports of goods requires knowledge of the additional cost the measure imposes on them, as well as knowledge of market conditions in the United States, in the foreign market imposing the measure, and in third country markets. In practice, such information often is not available.

In theory, where sufficient data exist, an approximate impact of tariffs on U.S. exports could be derived by obtaining industry-level estimates of supply and demand price elasticities in the importing market and in the United States. Typically, the U.S. share of imports would be assumed constant. When no calculated price elasticities are available, reasonable postulated values would be used. The resulting estimate of lost U.S. exports would be approximate, depend on the assumed elasticities, and would not necessarily reflect changes in trade patterns with third country markets. Similar procedures might be followed to estimate the impact of subsidies that displace U.S. exports in third country markets.

The estimation of the impact of non-tariff measures on U.S. exports is far more difficult, since no readily available estimate exists of the additional cost these restrictions impose. Quantitative restrictions or import licenses limit (or discourage) imports and thus are likely to raise domestic prices, much as a tariff does. However, without detailed information on price differences between markets and on relevant supply and demand conditions, it would be difficult to derive the estimated effects of these measures on U.S. exports. Similarly, it would be difficult to quantify the impact on U.S. exports (or commerce) of other foreign practices, such as government procurement policies, nontransparent standards, or inadequate intellectual property rights protection.

The same limitations apply to estimates of the impact of foreign barriers to U.S. services exports. Furthermore, the trade data on services exports are extremely limited in detail. For these reasons, estimates of the impact of foreign barriers on trade in services also would be difficult to compute. With respect to investment barriers, no accepted techniques for estimating the impact of such barriers on U.S. investment flows exist. The same caution applies to the impact of restrictions on electronic commerce.

To the extent possible, the NTE Report endeavors to present estimates of the impact on U.S. exports, U.S. foreign direct investment, or U.S. electronic commerce of specific foreign trade barriers and other trade distorting practices. In some cases, stakeholder valuations estimating the effects of barriers may be contained in the NTE Report. The methods for computing these valuations are sometimes uncertain. Hence, their inclusion in the NTE Report should not be construed as a U.S. Government endorsement of the estimates they reflect. Where government-to-government consultations related to specific foreign practices were proceeding at the time of this NTE Report's publication, estimates were excluded, in order to avoid prejudice to these consultations.

March 2024

ALGERIA

TRADE AGREEMENTS

The United States–Algeria Trade and Investment Framework Agreement

The United States and Algeria signed a Trade and Investment Framework Agreement on July 13, 2001. This Agreement is the primary mechanism for discussions of trade and investment issues between the United States and Algeria.

IMPORT POLICIES

Tariffs

Algeria is not a Member of the World Trade Organization (WTO) but is a WTO Observer. Goods imported into Algeria face a range of tariffs, from zero percent to 60 percent. Algeria's average Most-Favored-Nation (MFN) applied tariff rate was 18.9 percent in 2022 (latest data available). Algeria's average MFN applied tariff rate was 23.7 percent for agricultural products and 18.1 percent for non-agricultural products in 2022 (latest data available).

Goods facing the highest rates are those for which equivalents are manufactured in Algeria. Citing the need to encourage local production and ease pressure on the country's foreign exchange reserves, Algeria implemented temporary additional safeguard duties (DAPs) of 30 percent to 200 percent on a list of more than 1,000 manufactured and agricultural goods in April 2019, with the 200 percent rate applied to 10 tariff lines covering cement products under the Harmonized System heading 25.23. The items in Algeria's customs code that remain duty free are generally European Union-origin goods that are used in manufacturing and are exempt from tariffs under the 2006 European Union–Algeria Association Agreement.

Non-Tariff Barriers

Import Bans and Import Restrictions

Since January 2009, Algeria's Ministry of Health has restricted the importation of a number of generic pharmaceutical products and medical devices. Since 2007, Algeria has banned the importation of used medical equipment unless the government grants a special exception. Algeria has applied the regulation broadly to block the reimportation of machinery sent abroad for maintenance under warranty, even for equipment owned by state-run hospitals.

Algeria bans the importation of most types of used machinery, except for refurbished assembly line equipment used in domestic industries.

In February 2021, the Ministry of Commerce issued a schedule establishing a seasonal ban for individual agricultural products. The schedule adjusted a year-round restriction on almond imports to a seasonal ban covering June through August. Since October 2021, Algeria has restricted the importation of additional products for which there is minimal demand and for agricultural products not elsewhere specified or indicated in Algeria's tariff schedule. Algeria justified these decisions as necessary to reduce the country's import bill and to combat fraud.

In August 2021, the Ministry of Finance instructed banks to suspend the processing of accounts for importers of products intended for resale starting at the end of October 2021, unless importers complied with a March 2021 decree requiring them to update their import registration to include only one category of product per company. The Ministry of Finance subsequently communicated implementation instructions to the Ministry of Commerce's National Center of Commerce Registry (CNRC) but not to importers themselves. Importers must approach the CNRC individually to seek guidance regarding their particular situation rather than rely on publicly available information.

Quantitative Restrictions

In August 2022, Algeria released a new Book of Specifications concerning the automotive industry. The Book of Specifications covers automobiles, buses, trucks, construction equipment, and motorcycles and eliminates previous import quotas but requires import authorization. Due to customs duties, the VAT, and other taxes, vehicles cost more than double the market rate when purchased by individuals overseas and imported into Algeria. In November 2023, Algeria authorized 38 automobile companies to import vehicles under the 2022 regime. A provision in the October 2022 Complementary Finance Law permits those residing in Algeria to import used cars that are three years old or less; however, purchasers are required to use their own foreign currency to do so.

In 2020, Algeria established a maximum annual import volume of 4 million metric tons of bread (common) wheat. The Algerian president announced in August 2021 that the state grains agency (OAIC) would be the country's exclusive wheat importer to counteract alleged "illicit practices" by private importers. In practice, the OAIC was already the sole buyer of wheat, reselling the commodity on the domestic market at subsidized prices. In 2022, the Algerian president announced that the OAIC would have the exclusive right to import rice and pulses as well. However, Algeria has not codified the OAIC's role as the sole buyer of wheat, rice, and pulses.

Customs Barriers and Trade Facilitation

Many companies continue to face problems clearing goods through Algerian customs. Delays can take weeks or months, in many cases without explanation. In addition to a certificate of origin, the Algerian Government requires all importers to provide certificates of conformity and quality from an independent third party. Algerian customs requires that shipping documents be stamped with a "Visa Fraud" note from the Ministry of Commerce, indicating that the goods have passed a fraud inspection before the goods are cleared. Many importations also require authorizations from multiple ministries, which frequently cause additional delays, especially when the regulations do not clearly specify which ministry's authority is being exercised. Storage fees at Algerian ports of entry are high, and the fees double if goods are stored for longer than 10 days.

The 2022 Book of Specifications for the automotive industry removed the mandate that automotive importers must be 100 percent Algerian-owned. However, importers of vehicles for resale are required to partner with an Algerian company.

SANITARY AND PHYTOSANITARY BARRIERS

Algeria bans the production, importation, distribution, or sale of seeds that are the products of biotechnology. Biotechnology seeds imported for research purposes are excepted.

Algeria maintains animal health certificate requirements for animals and animal products, dairy and dairy products, and processed products of animal origin. In September 2023, the U.S. Department of Agriculture

(USDA) Animal and Plant Health Inspection Service and the Algerian Ministry of Agriculture and Rural Development Services concluded a certificate for U.S. bovine semen exports to Algeria. However, challenges with the recognition and approval of other certificates remain. In 2021 and again in 2023, the USDA Food Safety and Inspection Service submitted a letter requesting that Algeria accept the USDA 9060-5 export certificate for U.S. meat and poultry products. The USDA has not received a response. As of December 31, 2023, U.S. and Algerian veterinary authorities were continuing to negotiate export certificates to allow importation of U.S. beef cattle, dairy breeding cattle, and beef and poultry meat and meat products.

GOVERNMENT PROCUREMENT

Since August 2015, all ministries and state-owned enterprises (SOEs) are required to purchase domestically manufactured products whenever available. Procurement of foreign goods is permitted only with special ministerial authorization and if a locally made product cannot be identified. Algeria requires approval from the Council of Ministers for expenditures in foreign currency that exceed DZD 10 billion (approximately \$72 million).

Algeria is not a Member of the WTO and, therefore, is neither a Party to the WTO Agreement on Government Procurement nor an observer to the WTO Committee on Government Procurement.

INTELLECTUAL PROPERTY PROTECTION

Algeria remained on the Watch List in USTR's [2023 Special 301 Report](#). Algeria has taken some positive steps to improve intellectual property protection and enforcement, including increasing coordination on enforcement and engaging in capacity-building and training efforts. However, concerns remain, including the lack of an effective mechanism for early resolution of potential pharmaceutical patent disputes, inadequate judicial remedies in cases of patent infringement, the lack of administrative opposition in Algeria's trademark system, and the need to increase enforcement efforts against counterfeiting and piracy. In addition, Algeria does not provide an effective system for protecting against the unfair commercial use or unauthorized disclosure of undisclosed test or other data generated to obtain marketing approval for pharmaceutical products.

BARRIERS TO DIGITAL TRADE

Algeria imposes a maximum value per transaction of DZD 100,000 (approximately \$746) on citizens when using international credit cards to purchase goods from outside the country. In addition, Algerian foreign exchange regulations prohibit the use of online payment processors to transfer money from one account to another.

INVESTMENT BARRIERS

In 2020, Algeria lifted its longstanding requirement that Algerian individuals or entities own at least 51 percent of all projects involving foreign investments (known as the 51/49 rule). However, the 2021 Finance Law re-imposed the 51 percent requirement. The requirement was applied retroactively to foreign companies already established in Algeria and owning more than 49 percent of operations in strategic sectors such as energy, mining, defense, transportation and infrastructure, and pharmaceuticals, as well as for activities involving raw materials and importers of goods for resale in Algeria. U.S. companies report that the 51/49 rule creates concerns related to their intellectual property rights and financial control of the local venture. In July 2022, the Algerian Government enacted an investment law that called for the creation of Invest Algeria, a one-stop shop for prospective investors to register in-country. However, as of 2023, Invest

Algeria has not been established, and the Algerian Government has not provided further details as to when the initiative will be developed.

STATE-OWNED ENTERPRISES

SOEs comprise about two-thirds of the Algerian economy by market value. The national oil and gas company, Sonatrach, is the most prominent SOE, but SOEs are present in all sectors of the economy. SOEs leverage their position in the market to gain advantage over privately owned competitors. For example, state-owned telecommunications provider Algérie Télécom holds a monopoly over all undersea data cable traffic in and out of Algeria, offering services at a considerable advantage over private companies operating in the telecommunications sector.

ANGOLA

TRADE AGREEMENTS

The United States–Angola Trade and Investment Framework Agreement

The United States and Angola signed a Trade and Investment Framework Agreement on May 19, 2009. This Agreement is the primary mechanism for discussions of trade and investment issues between the United States and Angola.

IMPORT POLICIES

Tariffs

Angola's average Most-Favored-Nation (MFN) applied tariff rate for all products was 11 percent in 2022 (latest data available). Angola's average MFN applied tariff rate was 21.4 percent for agricultural products and 9.4 percent for non-agricultural products in 2022 (latest data available). Angola has bound 100 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 59.1 percent and average bound rates of 52.7 percent for agricultural products and 60.1 percent for non-agricultural products.

In response to the COVID-19 pandemic, as of March 27, 2020, the General Tax Administration of Angola allows all medicines and biosafety material to be imported duty free.

Non-Tariff Barriers

Import Restrictions

On October 30, 2023, Angola issued Presidential Decree No. 213/23, which focuses on restricting imports to promote domestic production. The decree replaces and expands the scope of products covered by the previous Presidential Decree No. 23/29 from 2019. As of January 31, 2024, Decree No. 213/23 has been minimally enforced. The United States continues to raise this issue with Angola bilaterally and in the WTO Committee on Market Access, the WTO Committee on Import Licensing, and the WTO Committee on Agriculture.

SANITARY AND PHYTOSANITARY BARRIERS

Angola does not maintain an effective risk management program for veterinary and sanitary control purposes. Therefore, consignments of imports classified in Chapters 2 to 23 of the Harmonized System (including animal and vegetable products and foodstuffs) must be laboratory tested prior to importation into Angola and be accompanied by a health certificate.

Agricultural Biotechnology

Angola does not allow the use of agricultural biotechnology in production, and imports containing genetically engineered (GE) components are limited to food aid and scientific research. Angola also prohibits the importation of viable GE grain or seed. The Ministry of Agriculture and Forestry requires importers to present documentation certifying that their goods do not include biotechnology products. Importation of GE food is permitted when it is provided as food aid, but the product must be milled before

it arrives in Angola. The Ministry of Agriculture and Forestry allows biotechnology imports for scientific research, subject to regulation and controls.

GOVERNMENT PROCUREMENT

Despite revisions to increase transparency in the Public Procurement Law that entered into force on January 22, 2021, simplified contracting or direct agreement have continued to be the primary mechanism for public procurement transactions. Civil society and businesses continue to note that the government's continued regular use of direct public contract awards through tenders by pre-qualification, closed bidding, or simplified contracting for a regular and select few companies without the use of public tenders in various sectors, is detrimental to competition for foreign companies. In some instances, companies have reported a lack of clarity in certain tender processes.

Angola is neither a Party to the WTO Agreement on Government Procurement nor an observer to the WTO Committee on Government Procurement.

OTHER BARRIERS

Bribery and Corruption

Levels of corruption and bribery have declined, but corruption remains prevalent in Angola due to a lack of uniform implementation of anticorruption laws, an inadequately trained civil service, and other reasons.

The Criminal Law and Criminal Procedure Codes (Law No. 38/20 and Law No. 39/20) entered into force on February 9, 2021. Notable changes include corporate criminal liability, harsh penalties for corruption of public officials, criminalization of private corruption, and provisions for seizure of proceeds of a crime, among others. The law also contains provisions that criminalize bribery of national and foreign public officials; seek an appropriate balance between immunities and the ability to effectively investigate, prosecute, and adjudicate offences; enhance cooperation within local law enforcement authorities; and, designate a central anticorruption authority.

Enforcement of anticorruption laws remains poor. The United States and the international community have engaged in anticorruption initiatives to help Angola attain its anticorruption objectives. For instance, the U.S. Department of State is funding the Financial Services Volunteer Corps (FSVC), a project that supports Angolan civil society and independent media to increase public awareness and support for anticorruption and transparency reform. The FSVC is also implementing a U.S. Agency for International Development regional program that provides technical assistance, training, and mentoring at key government institutions to improve public financial management; enhance oversight; and, reduce fraud, waste, and abuse of state resources. The U.S. Department of Treasury provided technical assistance to the National Bank of Angola to increase capacity to combat money laundering and terrorist financing.

In June 2023, the Financial Action Task Force regional body—the Eastern and Southern Africa Anti-Money Laundering Group—conducted an interim mutual evaluation report and identified fundamental weaknesses in Angola's anti-money laundering/countering the financing of terrorism/counter proliferation financing system. Deficiencies cited include a lack of capacity in medium and small banks to implement targeted financial sanctions, a lack of bank capacity to determine the identity of the beneficial owner of accounts, and limited prosecutions for money laundering offenses. Angola has until September 2024 to implement the recommendations.

Foreign Exchange

Angola's dependence on oil and gas production means that activity in the sector heavily influences the availability of foreign exchange. Foreign exchange availability has improved in major economic sectors but remains inadequate for individuals and small and medium-sized businesses as a result of limited liquidity which creates delays and hurdles for the importation of goods and payment of services. As of December 2023, Angola's currency had depreciated nearly 40 percent since the beginning of the year due to a shortage of U.S. dollars in the foreign exchange market. The National Bank of Angola issued Notice 3/2023 on March 1, 2023, stipulating that individual Angolans may transfer up to \$250,000 abroad each year.

Business Licensing

Law No. 26/21 of October 2021 transferred the authority to license business activity, from provincial governments and municipal administrations to the Angolan President. The law also expands business licensing eligibility. Commercial stakeholders have expressed concern that the transfer of authority could create dependence on higher governmental powers to authorize commercial activity.

ARAB LEAGUE

The 22 Arab League members are the Palestinian Authority and the following countries: Algeria, Bahrain, Comoros, Djibouti, Egypt, Iraq, Kuwait, Jordan, Lebanon, Libya, Mauritania, Morocco, Oman, Qatar, Saudi Arabia, Somalia, Sudan, Syria, Tunisia, the United Arab Emirates, and Yemen. The effect of the Arab League's boycott of Israeli companies and Israeli-made goods (originally implemented in 1948) on U.S. trade and investment in the Middle East and North Africa varies from country to country. Efforts by various Arab League members to enforce the boycott have had an extremely limited practical effect overall on U.S. trade and investment ties with many key Arab League countries.

The U.S. Departments of Commerce and Treasury and the Office of the United States Trade Representative (USTR) monitor boycott policies and practices of Arab League members, and, aided by U.S. embassies, lend advocacy support to firms facing boycott-related pressures. On October 24, 2023, the U.S. Department of Treasury published the list of countries which require or may require participation in, or cooperation with, an international boycott (within the meaning of section 999(b)(3) of the Internal Revenue Code of 1986). The list included Iraq, Kuwait, Lebanon, Libya, Qatar, Saudi Arabia, Syria, and Yemen.

Arab League members that implement boycotts that pose a potential barrier to the United States include:

IRAQ: As a matter of policy, Iraq does not adhere to the Arab League boycott. Most Iraqi ministries and state-owned enterprises have agreed not to comply with or have rescinded regulations enforcing the boycott, following a 2009 Council of Ministers decision to cease boycott-related implementation practices. However, individual Iraqi Government officials and ministries continue to violate that policy. The Ministry of Health's procurement arm (Kimadia) was among the government entities that still issued boycott-related requests.

QATAR: Qatar has a boycott law, but the extent to which the government enforces it is unclear. Although Qatar renounced implementation of the boycott of U.S. firms that do business in Israel (the secondary and tertiary boycott) in 1994, U.S. firms and their subsidiaries continue to report receiving boycott-related requests from public Qatari companies. In those instances, U.S. companies have made efforts to substitute alternative language.

YEMEN: Although Yemen renounced observance of the secondary and tertiary aspects of the boycott in 1995, in the years since, Yemen has continued to enforce the primary boycott and certain aspects of the secondary and tertiary boycotts. Ongoing political turmoil in the country has made it impossible to ascertain current official Yemeni attitudes toward the boycott.

ARGENTINA

TRADE AGREEMENTS

The United States–Argentina Trade and Investment Framework Agreement

The United States and Argentina signed a Trade and Investment Framework Agreement on March 23, 2016. This Agreement is the primary mechanism for discussions of trade and investment issues between the United States and Argentina.

IMPORT POLICIES

Tariffs and Taxes

Tariffs

Argentina's average Most-Favored-Nation (MFN) applied tariff rate was 13.3 percent in 2022 (latest data available). Argentina's average MFN applied tariff rate was 10.3 percent for agricultural products and 13.8 percent for non-agricultural products in 2022 (latest data available). Argentina has bound 100 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 31.8 percent.

Argentina is a founding member of the Southern Common Market (MERCOSUR), formed in 1991, which also comprises Brazil, Paraguay, and Uruguay. MERCOSUR's Common External Tariff (CET) ranges from zero percent to 35.0 percent *ad valorem* and averages 11.7 percent. In July 2022, MERCOSUR countries agreed to a 10 percent reduction of the CET for over 80 percent of product lines. The decision reduced the block's average CET to 10.3 percent. Any good imported into Argentina (not including free trade zones) is subject to the payment of the CET to Argentina's customs authority. If the product is then re-exported to another MERCOSUR country, the CET must be paid again to the second country. MERCOSUR approved a Common Customs Code (CCC) in 2010 and launched a plan to eliminate the double application of the CET within MERCOSUR in 2021. However, only Argentina has ratified the CCC, and it has not taken effect.

Taxes

Argentina maintains a variety of taxes on, and tax exemptions for, imported goods. On December 23, 2019, the Argentine Congress passed Public Emergency Law 27541, raising to 3 percent the rate of the statistical tax, a fee charged on goods imported for consumption. Temporary imports, inputs used to produce goods for export, and imported goods for scientific and technological research are exempted from this tax. Pursuant to Decree 901/2021, the 3 percent statistical tax rate was extended until December 31, 2024.

Argentina's tax collection processes burden imports by effectively requiring advance payment of income taxes. When goods are imported, Argentina collects a percentage of the value of imports as income tax withholding to be applied to the importer's income taxes. The advance value-added tax (VAT), ranging from 10 percent to 20 percent, is paid by the importer, unless the goods are for personal use. In addition, the importer is responsible for an income tax withholding of 6 percent to 11 percent of the value of the imported goods. Furthermore, imports of consumer goods have an additional advance VAT rate of 20 percent and imports of capital goods have an additional 10 percent. Although some of these taxes on

importation are reconciled after importation, in practice that takes a significant amount of time. In Argentina's inflationary environment, this advance payment system disproportionately burdens imports.

Non-Tariff Barriers

Import Bans

Argentina prohibits the importation of many used capital goods. Under the Argentina–Brazil Bilateral Automobile Pact, Argentina bans the importation of used self-propelled agricultural machinery unless it is imported to be rebuilt in-country. Argentina also prohibits the importation and sale of used or retreaded tires (but in some cases allows remolded tires); used or refurbished medical equipment, including imaging equipment; and, used automotive parts.

Argentina generally restricts or prohibits the importation of any remanufactured good, such as remanufactured automotive parts, earthmoving equipment, medical equipment, and information and communications technology products. In the case of remanufactured medical goods, imports are further restricted by the requirement that the importer of record must be the end user, such as a hospital, doctor, or clinic. These parties are generally not accustomed to importing and are not typically registered as importers.

Import Restrictions

Domestic legislation requires compliance with strict conditions on the entry of those used capital goods that are not prohibited from being imported, as follows: (1) used capital goods can only be imported directly by the end user; (2) overseas reconditioning of goods is allowed only if performed by the original manufacturer and third-party technical appraisals are not permitted; (3) local reconditioning of the good is subject to technical appraisal to be performed only by the state-run Institute of Industrial Technology, except for aircraft-related items; (4) imported used capital goods cannot be transferred (sold or donated) for a period of four years; and, (5) except for a short list of products exempted by Decree 406/2019, and regardless of where the reconditioning takes place, the Argentine Customs Authority requires the presentation of a "Certificate of Import of Used Capital Goods" at the time of importation.

Resolution 909/1994 places restrictions on the importation of certain used goods for consumption, such as parts and components that are not used in the manufacture of other products. The current list imposes import tariffs or other restrictions on goods, including electronic and recording equipment; railroad vehicles and other railroad parts; optic, photography, and filming equipment; tractors; buses; aircraft; and, ships.

Under the Por una Argentina Inclusiva y Solidaria - PAIS tax regime, consumers purchasing goods and services billed in foreign currency or that involve international transportation by air, land (except to countries that border Argentina), or water and sold in Argentina (through a physical or online point of sale) are subject to a 30 percent tax. This affects services supplied by travel and tourism agencies for international travel, as well as the importation of products from online retailers. Decree 99/2019 also sets a lower rate of 8 percent for certain imported digital services that are already subject to the VAT. Since late 2022, pursuant to General Resolution 5272/2022, some purchases also are subject to a personal asset tax equal to 25 percent of the price of the good or service. In July 2023, Argentina issued Decree 377/2023 under the PAIS tax regime, which imposes additional taxes on transactions that require access to the foreign exchange market, charged directly to importing companies. As of December 2023, these rates are 17.5 percent on most goods and 25.0 percent on most services (education and health services are exempt, and freight services pay a reduced rate of 7.5 percent). These taxes are cumulative and make foreign goods and services significantly less competitive in the Argentine market.

Import Licensing

Since 2020, Argentina had significantly expanded its regulation of imports using an extensive list of products subject to non-automatic import licensing. Argentina had focused these license requirements on import-sensitive goods and also used the process to manage its hard currency needs. Despite a nominally digitized process, in practice obtaining licenses for imports was nontransparent, which created significant uncertainty for all imports into Argentina. The United States had raised concerns with Argentina about non-automatic licensing and at the WTO Committee on Import Licensing in light of Argentina's commitments under the WTO Agreement on Import Licensing Procedures.

As a result, Argentina eliminated the non-automatic import licensing requirements and established in December 2023 a new Statistical System of Imports (SEDI), which serves as a platform to record trade data. The creation of SEDI maintains processes similar to non-automatic import licensing. According to the new requirements, Argentina's Federal Public Revenue Administration (AFIP) will verify the tax status of the applicant and whether it has the economic and financial capacity to carry out the import operation. If successfully verified, the SEDI declaration will proceed to "exit" status following the authorization from all relevant agencies within 30 days of the registration. The United States will continue to monitor Argentina's import requirements and encourage transparency and predictability in their administration.

Foreign Exchange Market Access For Imports

As of December 22, 2023, importers of goods can access the foreign exchange market to pay new invoices in installments, with most goods subject to a schedule of four installments at 30 days, 60 days, 90 days, and 120 days. Importers of some goods have preferential access to foreign exchange. Prior to this measure, importers were assigned an estimated date after dispatch on which they would be permitted to access the foreign exchange market to pay for imports. The terms averaged 90 days as of September 2023, but in practice the payment date frequently changed or was not honored. This led to a dramatic increase in Argentina's commercial debt and frequently resulted in importers being delinquent on their payments for goods and services. This has also disrupted commercial relationships, interrupted supply chains, and made imported goods less competitive.

Customs Barriers and Trade Facilitation

Argentina continues to use reference prices for goods that originate in, or are imported from, specified countries for customs valuation purposes. If a good is imported and the invoice price is lower than the reference price, Argentina requires importers to obtain an authenticated invoice, without a basis under the WTO Customs Valuation Agreement. Argentina publishes a list of reference prices and covered countries.

Consularization

Argentina imposes costly and time-consuming consularization requirements on import documentation, a practice at odds with the current trend in customs practice. Shipments to Argentina require commercial invoices and packing lists to be legalized by the Argentine consulate in the country of export. Consulates will only legalize a commercial document after it has been signed by a Chamber of Commerce that is recognized by the relevant consulate. Furthermore, Argentina requires certificates of origin that must be authenticated by an Argentine Embassy or consulate or carry a U.S. Chamber of Commerce seal.

SANITARY AND PHYTOSANITARY BARRIERS

Live Cattle

Argentina banned imports of U.S. cattle and beef products in 2002 due to purported concerns regarding bovine spongiform encephalopathy (BSE). Although the market reopened to U.S. beef in 2018, it remains closed to U.S. live cattle, pending continued technical level engagement between the United States and Argentina on a mutually agreeable sanitary certificate.

Poultry

Argentina has restricted imports of U.S. poultry (*e.g.*, day-old chicks and hatching eggs) and poultry products (fresh, frozen, or chilled meat), during periods of outbreaks of Highly Pathogenic Avian Influenza (HPAI) and virulent Newcastle Disease and due to unsubstantiated food safety concerns. Argentina experienced its first HPAI outbreak in February 2023; the World Organisation of Animal Health (WOAH) declared Argentina HPAI-free in August 2023. The United States continues to encourage Argentina to regionalize HPAI restrictions as recommended by the WOAH.

INTELLECTUAL PROPERTY PROTECTION

Argentina remained on the Priority Watch List in the [2023 Special 301 Report](#). First, the scope of patentable subject matter remains significantly restricted under Argentine law. Patent examination guidelines automatically reject patent applications for categories of pharmaceutical inventions that are eligible for patentability in other jurisdictions, and there are requirements that processes for the manufacture of active compounds disclosed in a specification be reproducible and applicable on an industrial scale. Second, there is inadequate protection against unfair commercial use and unauthorized disclosure of undisclosed test and other data submitted to the Argentine Government in conjunction with its lengthy marketing approval process. The United States urges Argentina to ensure transparency and due process in the protection of geographical indications (GIs) and to ensure that the grant of GI protection does not deprive interested parties of the ability to use common names, particularly as Argentina proceeds with the European Union–MERCOSUR Trade Agreement. In addition, the backlog continues for patent applications for pharmaceuticals and biosimilar products, resulting in unreasonable delays for these products.

Enforcing intellectual property rights in Argentina continues to prove challenging, as counterfeit and pirated goods remain widely available. The physical markets of La Salada and Barrio Once are both listed in the [2023 Review of Notorious Markets for Counterfeiting and Piracy](#) (Notorious Markets List). For example, La Salada in Buenos Aires, one of the largest black markets for counterfeit and pirated goods in Argentina, continue to sell counterfeit products online. Furthermore, the existing legislative regime and weak enforcement hinder the ability of rights holders, law enforcement, and prosecutors to halt, through legal action, the growth of illegal markets, both online and physical.

SERVICES BARRIERS

Similar to goods importers, services suppliers were subject to restrictions on their ability to access the foreign exchange market and were subject to approvals from the Secretary of Trade (within the Ministry of Economy) and AFIP system (Administración Federal de Ingresos Públicos) prior to receiving authorization to import. As of December 2023, Argentina no longer requires import authorization for imports of services and eliminated the electronic system for requesting such authorizations. The United States is monitoring implementation of these changes.

Audiovisual Services

Argentina's Media Law imposes production requirements on advertising and publicity materials. The Media Law also establishes broadcast content requirements on companies with radio licenses (particularly for news and music) and on private television operators.

Telecommunications Services

In 2020, Argentina froze prices for a number of information and communications technology (ICT) services, including fixed and mobile telephone services, Internet access services, and pay television services. Later in 2020, Argentina amended the Information and Communications Technologies Law to classify these services as “essential and strategic public services” and therefore subject to additional regulation by the National Communications Agency (ENACOM), including rate regulation. ENACOM raised the regulated rate limit for these ICT services several times during 2022, but the rates established by ENACOM are still below inflation, undermining competition and discouraging additional investment in this sector in Argentina.

AUSTRALIA

TRADE AGREEMENTS

The United States–Australia Free Trade Agreement

The United States–Australia Free Trade Agreement (FTA) entered into force on January 1, 2005. Under this agreement, as of January 1, 2015, Australia provides duty-free access to all U.S. exports. The United States and Australia meet periodically to review the implementation and functioning of the FTA and to address outstanding issues.

SANITARY AND PHYTOSANITARY BARRIERS

Animal Health

Beef

Australia requires completion of a complex approval process before it will permit the importation of bovine products from a country that has reported any indigenous cases of bovine spongiform encephalopathy (BSE). In 2003, Australia closed its market to U.S. beef after the detection of BSE in the United States. In May 2018, Australia lifted its ban on heat-treated, shelf-stable beef products from the United States. However, Australia's market remains closed to fresh U.S. beef and beef products. The United States continues to press the Australian Government to align its import requirements for U.S. fresh beef and beef product exports with World Organisation for Animal Health (WOAH) guidelines for countries with a negligible risk for BSE.

Pork

Pork and pork products are the third-leading U.S. agricultural export to Australia, valued at approximately \$131.3 million in 2022. However, due to Australia's stated concerns about porcine reproductive and respiratory syndrome (PRRS) and post-weaning multi-systemic wasting syndrome (PMWS), Australia does not permit imports of fresh/chilled pork and bone-in products from the United States. The United States has provided Australia with scientific evidence demonstrating the safety of U.S. pork products; however, the issue remains unresolved. Access to the Australian market for fresh/chilled/frozen pork, bone-in pork, and pork products remains a high priority for the United States.

Poultry

Australia prohibits imports of uncooked poultry meat from all countries except New Zealand. While cooked poultry meat products may be imported, current import requirements (as set out in an import risk analysis) mandate that imported poultry meat products be cooked to a minimum core temperature of 74 degrees Celsius for 165 minutes or the equivalent. This cooking temperature is not suitable for prepared deli meats, resulting in a significant barrier for cooked poultry products that would be suitable for sale in restaurants or delicatessens. Since 2012, the United States and Australia have exchanged technical information to attempt to resolve the issue. The United States has identified this issue as a high priority and will continue to work with Australia to gain meaningful commercial market access for cooked turkey meat.

Plant Health

Apples and Pears

Australia prohibits the importation of apples and pears from the United States based on concerns regarding several pests. In November 2018, Australia announced it was commencing a new risk analysis for fresh apples from U.S. Pacific Northwest states. In October 2020, Australia published the draft risk analysis for a 90-day comment period. The United States provided comments in response to Australia's draft risk analysis for U.S. apples in January 2021 and the final risk analysis for U.S. Pacific Northwest apples was published on October 31, 2022. The United States continues to work with Australia to secure market access for U.S. apples.

Australia currently prohibits the importation of pears from the United States due to the bacterial disease fire blight. Australia is concerned that the disease could be transmitted to its domestic apple and pear crops. However, the United States has provided evidence to Australia that demonstrates that mature, symptomless pears do not support populations of the fire blight bacteria and are not part of the disease pathway.

INTELLECTUAL PROPERTY PROTECTION

Under the FTA, Australia must notify a pharmaceutical product patent owner of a request for marketing approval by a third party for a product claimed by that patent owner. Australia must also provide measures in its marketing approval process to prevent persons other than the patent owner from marketing a patented product during the patent term. U.S. and Australian pharmaceutical companies have expressed concerns about delays in this notification process. The United States has also raised concerns about certain provisions in Australian law regarding potential civil damages in cases where a patent owner seeks a preliminary injunction. The United States will continue to monitor these issues.

SERVICES BARRIERS

Audiovisual Services

Australia is considering imposing Australian screen content requirements on streaming video services as part of its National Cultural Policy. The Policy, published in January 2023, recommends that the Australian Government introduce "requirements for Australian screen content on streaming platforms to ensure continued access to local stories." The Australian Government has consulted on potential models over the course of 2023 and intends to pass legislation codifying the preferred model following further consultations in 2024. The United States will continue to monitor this issue to ensure Australia's compliance with its FTA obligations.

INVESTMENT BARRIERS

In October 2019, a parliamentary legislative committee of the New South Wales (NSW) government recommended that the NSW government address the issue of compensation for certain investors, including shareholders, in a mining project whose operating license was canceled in 2014. When canceling the license, the NSW government also passed legislation precluding the payment of compensation relating to such cancellation. To date, the NSW government has not acted on the parliamentary committee's recommendation to provide shareholders, including U.S. investors, with recourse to seek compensation.

BANGLADESH

TRADE AGREEMENTS

The United States–Bangladesh Trade and Investment Framework Agreement

The United States and Bangladesh signed a Trade and Investment Cooperation Forum Agreement on November 25, 2013. This Agreement is the primary mechanism for discussions of trade and investment issues between the United States and Bangladesh.

IMPORT POLICIES

Bangladesh’s import policies are outlined in the Import Policy Order (IPO) 2015-18 issued by the Ministry of Commerce (MOC). The IPO has two lists: the “List of Controlled Goods” and the “List of Prohibited Goods.” The IPO for the years 2021 through 2024 is valid until June 30, 2024.

Tariffs

Bangladesh’s average Most-Favored-Nation (MFN) applied tariff rate was 14.1 percent in 2022 (latest data available). Bangladesh’s average MFN applied tariff rate was 17.9 percent for agricultural products and 13.5 percent for non-agricultural products in 2022 (latest data available). Bangladesh has bound 17.9 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 156.3 percent.

Non-Tariff Barriers

Customs Barriers and Trade Facilitation

Bangladesh has not notified its customs valuation legislation to the WTO and has not yet responded to the Checklist of Issues describing how the WTO Customs Valuation Agreement is being implemented.

GOVERNMENT PROCUREMENT

Government procurement is primarily undertaken through public tenders under the Public Procurement Act of 2006 and conducted by the Central Procurement Technical Unit. Bangladesh publicly subscribes to principles of international competitive bidding; however, charges of corruption are very common. Bangladesh launched a national electronic government procurement portal, but U.S. stakeholders have raised concerns about the use of outdated technical specifications, the structuring of specifications to favor preferred bidders, and a lack of overall transparency in public tenders. Several U.S. companies have claimed that their foreign competitors often use their local partners to influence the procurement process and to block awards to otherwise competitive U.S. company bids. U.S. companies have reported instances of alleged bid rigging in government tenders in Bangladesh. U.S. companies have also alleged the use of bribery, anticompetitive practices, and a lack of transparency in the bidding process, all of which disadvantage U.S. companies bidding on government tenders.

Bangladesh is neither a Party to the WTO Agreement on Government Procurement nor an observer to the WTO Committee on Government Procurement.

INTELLECTUAL PROPERTY PROTECTION

Bangladesh has taken some steps in recent years to improve intellectual property (IP) protection through legislative reforms. However, the effectiveness of these changes remains uncertain. For example, counterfeit and pirated goods are readily available across Bangladesh.

U.S. stakeholders have reported potential IP violations in various industries, such as fast-moving consumer goods, apparel, pharmaceutical, and software industries. Stakeholders also report a growing trend of Bangladesh serving as a source country for counterfeits distributed globally. The lack of investigative expertise of the police and reluctance of the to initiate independent investigations further exacerbates IP right holders' ability to enforce their rights. In addition, IP right holders have raised concerns about the courts' ability to adjudicate fairly IP cases.

Bangladesh has undertaken several legislative reforms related to IP, including the passing of a new patent law in April 2022, copyright amendments in October 2023, and the enactment of the Industrial Design Act in July 2023. However, the lack of stakeholder interaction and a public comment process in the development of these reforms remains a concern. Bangladesh needs transparent legislative and rulemaking processes that include seeking input from stakeholders in order to address the gaps in IP protection and make meaningful improvements to its IP regime.

To strengthen Bangladesh's IP regime, better coordination among enforcement authorities and other government institutions is crucial. These include Customs, the Office of the Attorney General, the Copyright Office, the Bangladesh Investment Development Authority, and the Department of Patents, Designs, and Trademarks. In addition, customs officials, police, and the judiciary would benefit from participating in available training opportunities as a means of improving Bangladesh's IP rights enforcement.

Recognizing the challenges faced by Bangladesh, the U.S. Department of Commerce Patent and Trademark Office and other U.S. Government agencies regularly provide technical assistance and capacity building programs.

BARRIERS TO DIGITAL TRADE

The Information and Communication Technology Act of 2006, amended in 2013, authorizes the Government of Bangladesh to access any computer system for the purpose of obtaining any information or data, and to intercept information transmitted through any computer resource. Under this law, Bangladesh may also prohibit the transmission of any data or voice call and censor online communications. The Bangladesh Telecommunications Regulatory Commission (BTRC) ordered mobile operators to limit data transmissions for political reasons on several occasions in 2019, 2020, and 2023 ahead of politically sensitive events, including local and national-level elections. The BTRC ordered mobile operators to block all services in the Rohingya refugee camps in Cox's Bazar, except for voice calls, from September 2019 until August 2020.

The Information and Communication Technology Division (ICT Division) of the Ministry of Posts, Telecommunications and Information Technology has made significant updates to the Data Protection Act, now called the Personal Data Protection Act, which received approval in principle from the cabinet in November 2023. As of December 2023, the measure was under review by the Law Ministry. Once adopted in final form, the law will apply to the collection, processing, use, sharing, or other processing of data of individuals within Bangladesh, as well as data outside Bangladesh that is related to citizens of, or business carried out in, Bangladesh. Despite modifications to narrow the definition of the types of data to which the

law is applicable, concerns remain over provisions, particularly in the context of data localization requirements that could allow access to data by Bangladeshi law enforcement.

In February 2022, the BTRC published the Regulation for Digital, Social Media and Over the Top (OTT) Platforms, 2021. The regulations were presented in their final form to a subdivision of the Supreme Court of Bangladesh on October 19, 2022. The regulations are a content governance framework for digital, social media, and media platforms operating in the country. The framework seeks to introduce traceability within end-to-end encrypted services. Industry and civil society stakeholders have expressed concerns that the regulations will grant government authorities sweeping powers to dictate online content with the threat of criminal liability for firms and employees deemed noncompliant.

INVESTMENT BARRIERS

Repatriation of profits, revenue, and external payments is allowed. However, U.S. and other international investors have raised concerns that the procedures and requirements for outbound transfers from Bangladesh remain cumbersome, lack transparency, and include significant delays for applications to repatriate profits, dividends, and other capital, with some companies waiting over a year for approvals. U.S. companies report that agency-level regulators continue to present significant obstacles to securing required approvals for remittances in a timely manner, which are required before companies can seek central bank clearance.

SUBSIDIES

Bangladesh maintains a range of agricultural subsidies but has not submitted an agricultural subsidies notification to the WTO Committee on Agriculture since 2011. These subsidies are provided as export cash incentives for a variety of agricultural products including vegetables, fruits, and processed agricultural products. Bangladesh also provides subsidies to keep the price of production inputs within the purchasing capacity of producers. Bangladesh provides non-product-specific support through subsidized fertilizers, diesel fuel, electricity, irrigation, and agricultural machinery. The subsidized fertilizer is distributed through a controlled channel, which keeps prices reasonably stable.

Bangladesh has never submitted a subsidies notification to the WTO Committee on Subsidies and Countervailing Measures. According to publicly available information from the Bangladesh Investment and Development Authority, industries exporting more than 80 percent of their goods, regardless of their locations (*i.e.*, within or outside of an export processing zone), can be exempted from income tax for 50 percent of their export earnings, provided that the industry is not already paying income tax at a reduced rate. Furthermore, exporters in certain sectors may be eligible for additional benefits in the form of a subsidy or cash incentive based on certain conditions. Other publicly available information indicates that exporters in 43 sectors receive cash incentives to export, ranging from 1 percent to 20 percent of the export value, as long as the product exported contains at least 30 percent domestic value added.

LABOR

In 2013, the United States suspended all of Bangladesh's tariff benefits under the Generalized System of Preferences (GSP) program due to Bangladesh's failure to meet statutory eligibility requirements related to worker rights, particularly with regard to acceptable conditions of work in the ready-made garment sector, including fire and building safety, and freedom of association. As of December 2023, Bangladesh remained ineligible for duty-free treatment under GSP.

OTHER BARRIERS

Bribery and Corruption

Corruption is a pervasive and long-standing problem in Bangladesh, and anticorruption law is inadequately enforced. The Code of Criminal Procedure, the Prevention of Corruption Act, the Penal Code, and the Money Laundering Prevention Act criminalize attempted corruption, extortion, active and passive bribery, bribery of foreign public officials, money laundering, and use of public resources or non-public state information for private gain. However, bribery and extortion in commercial dealings are common features of business despite the illegality of facilitation payments and gifts. There have also been efforts to water down anti-corruption safeguards of government procurement rules. U.S. companies have complained about long delays in obtaining approval of licenses and bids as Bangladeshi Government officials seek bribes.

There have been continuous proposals to curb the independence of the Anti-Corruption Commission (ACC), the main institutional anticorruption watchdog. The Sarkari Chakori Ain Bill (Government Job Act), enacted in October 2018, requires the ACC to seek permission of the authorities concerned before arresting any government official and limits the ability of the ACC in investigating corruption allegations against government officials. While the ACC has increasingly pursued cases against government officials (mainly lower-level officials and some higher-level officials), there remains a large backlog of cases.

BOLIVIA

IMPORT POLICIES

Tariffs

Bolivia's average Most-Favored-Nation (MFN) applied tariff rate was 11.7 percent in 2022 (latest data available). Bolivia's average MFN applied tariff rate for agricultural products was 13.5 percent and 11.4 percent for non-agricultural products in 2022 (latest data available). Bolivia has bound 100 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 40 percent.

Bolivia's MFN tariff structure consists of seven rates ranging from zero percent to 40 percent. The tariff rates are: zero percent for certain capital goods (machinery and equipment) and meat and grain products; 5 percent for other capital goods and inputs; 10 percent for various products including production inputs, food items, and equipment; 15 percent for fruit, vegetables, fish, and raw materials for manufacturing plastics; 20 percent for other manufactured and value-added products; 30 percent for wooden doors, and windows; and, 40 percent for clothing and accessories, alcoholic beverages, wooden furniture, and footwear. Bolivian law allows the government to raise tariffs if necessary to protect domestic industry or, alternatively, to lower tariffs if supplies run short.

Non-Tariff Barriers

Import Bans

In 2023, Bolivia imposed import prohibitions on 33 tariff lines. Prohibited items include some types of vehicles and motor vehicles, in particular, vehicles using liquefied gas, used motor vehicles more than one year old, motor vehicles more than three years old used for the transport of more than 10 persons, and special-purpose motor vehicles more than five years old.

Customs Barriers and Trade Facilitation

Bolivia ratified the WTO Trade Facilitation Agreement (TFA) in January 2018. Bolivia has not yet submitted transparency notifications related to: (1) import, export, and transit regulations; (2) the use of customs brokers; and (3) customs contact points for the exchange of information. Those notifications had been due to the WTO on February 22, 2017, according to Bolivia's self-designated TFA implementation schedule.

SANITARY AND PHYTOSANITARY BARRIERS

The National Agricultural Health and Food Safety Service (SENASAG) is responsible for certifying the health safety status of products for domestic consumption, including imports, and for issuing sanitary and phytosanitary import permits. Importers have voiced concerns regarding SENASAG's transparency and with the inconsistent application of agricultural health and food safety standards and regulations.

SENASAG inspectors exercise significant discretion and use varied criteria when evaluating food health and safety standards and reviewing supporting importation documents. A lack of transparency in the institution increases the uncertainty about whether products entering Bolivia will be examined using consistent and uniform criteria. Bolivia's facility registration requirements for animal products (beef, pork, poultry, dairy, genetic material, and animal by-products) are onerous, and SENASAG applies these

requirements in an inconsistent and discretionary manner. These practices have limited the ability for several U.S. agricultural exporters to gain market access to Bolivia, despite the demand for these products.

GOVERNMENT PROCUREMENT

The Buy Bolivian (Compro Boliviano) program supports domestic production by giving preference margins to domestic goods or suppliers in government procurement.

Importers of foreign products can participate in procurements valued between \$142,000 and \$5.7 million only in cases where domestically-manufactured products and domestic service providers are unavailable or when the Bolivian Government does not initially select a domestic supplier. Foreign companies submitting tenders for government consultancy contracts are required to do so in association with a Bolivian company, although the Bolivian Government occasionally makes exceptions in strategic sectors. For national and international tenders, preference margins are from 10 percent to 25 percent for Bolivian inputs.

As a general matter, the tendering process is nontransparent and acts as a barrier to participation. Government requirements and the details of the tender are not always defined, and procurement notices are not always made public. For example, many of the state-owned companies, including the state-owned oil and gas company, Yacimientos Petroliferos Fiscales Bolivianos (YPFB); the state-owned electricity company, Empresa Nacional de Electricidad (ENDE); and, the state lithium company, Yacimientos de Litio Bolivianos (YLB), are not required to publish tenders through the official procurement website, Sistema de Contrataciones Estatales (SICOES). U.S. stakeholders have raised concerns that these state-owned companies are not required to follow the procedures established in the national procurement law. One U.S. company noted a Bolivian Government tender was prepared in such a way that only one specific company would be able to qualify.

Bolivia is neither a Party to the WTO Agreement on Government Procurement nor an observer to the WTO Committee on Government Procurement.

INTELLECTUAL PROPERTY PROTECTION

Bolivia remained on the Watch List in the [2023 Special 301 Report](#). The report noted that significant challenges continue with respect to adequate and effective intellectual property (IP) protection and enforcement. While certain Bolivian laws provide for the protection of copyrights, patents, and trademarks, they do not address trade secret protection. Significant challenges also persist with respect to widespread piracy and counterfeiting. The Special 301 Report again encouraged Bolivia to improve its weak protection and enforcement of IP. Bolivia's IP agency, Servicio Nacional de Propiedad Intelectual (SENAPI), signed a memorandum of understanding (MOU) with the United States Patent and Trademark Office in 2020 to help address Bolivia's challenges. However, the Bolivian administration that took office at the end of 2020 does not recognize the MOU.

STATE-OWNED ENTERPRISES

In an effort to control key sectors of the economy, the Bolivian Government obtained majority ownership in a number of companies in the hydrocarbons, electricity, mining, and telecommunications sectors. Bolivia has also created dozens of new public companies in "strategic" sectors such as food production, industrialization of natural resources, air travel, banking, and mining. U.S. stakeholders have expressed concern that these state-owned enterprises (SOEs) engage in unfair subsidized competition that constitutes a significant barrier to investment.

The Bolivian Government owns the second-largest bank in Bolivia, Union Bank, which is competitive with U.S. banking providers. Other SOEs include: the Sugar Cane Company of San Buena Aventura; Bolivia's Industrialization Company of Gas and Oil; computer technology company QUIPUS; dairy processing company Lácteosbol; recycled paper company PAPELBOL; Brazil nut export company Empresa Boliviana de Alimentos; Bolivian national airline Boliviana de Aviación, the main operator in Bolivia; oil and gas company YPFB; electricity company ENDE; and, lithium company YLB. Large SOEs such as these can acquire credit from the Central Bank at very low interest rates and on more convenient terms, resulting in an unfair financial subsidy. In many cases, government entities are directed to do business with SOEs. The United States is monitoring these companies for possible impacts on U.S. exports of goods and services.

The Bolivian Government grants ownership rights and controls the exploitation, exploration, and industrialization of natural resources through joint ventures between government entities or state-owned companies and public companies, communities, and private companies. No concessions or contracts may transfer ownership of hydrocarbon deposits to private or other interests.

BRAZIL

TRADE AGREEMENTS

The United States–Brazil Agreement on Trade and Economic Cooperation

The United States and Brazil signed the Agreement on Trade and Economic Cooperation (ATEC) on March 19, 2011. This agreement is the primary mechanism for discussions of trade and investment issues between the United States and Brazil.

On November 17, 2021, the Brazilian Congress ratified the 2020 United States–Brazil Protocol Regarding Trade Rules and Transparency, which entered into force on February 2, 2022. The Protocol updated the ATEC in the areas of anticorruption, good regulatory practices, and trade facilitation and customs administration. Implementation of the Protocol will foster a more transparent economic environment, reduce red tape, and improve regulatory processes, as well as serve as a foundation for future bilateral engagement.

IMPORT POLICIES

Tariffs and Taxes

Tariffs

Brazil's average Most-Favored-Nation (MFN) applied tariff rate was 11.1 percent in 2022 (latest data available). Brazil's average MFN applied tariff rate was 8.0 percent for agricultural products and 11.6 percent for non-agricultural products in 2022 (latest data available). Brazil has bound 100 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 31.4 percent. Brazil's maximum bound tariff rate for non-agricultural products is 35 percent, and its maximum bound tariff rate for most agricultural products is 55 percent.

Brazil is a founding member of the Southern Common Market (MERCOSUR), formed in 1991, which also includes Argentina, Paraguay, and Uruguay. The MERCOSUR Common External Tariff (CET) ranges from zero percent to 35.0 percent *ad valorem* and averages 11.7 percent. In July 2022, MERCOSUR countries agreed to a 10 percent reduction of the CET for over 80 percent of product lines. The decision reduced the block's average CET to 10.3 percent. Any good imported into Brazil (not including from free trade zones) is subject to payment of the CET to Brazil's customs authority. If the product is then re-exported to another MERCOSUR country, the CET must be paid again to the second country. MERCOSUR approved a Common Customs Code (CCC) in 2010 and launched a plan to eliminate the double application of the CET within MERCOSUR in 2021. However, only Argentina has ratified the CCC and it has not taken effect. Although the Brazilian Congress approved the agreement in 2018, it has not been promulgated by the executive branch, which is necessary for ratification.

Brazil imposes relatively high tariffs on imports across a wide range of sectors, including automobiles, automotive parts, information technology and electronics, chemicals, plastics, industrial machinery, steel, and textiles and apparel. In addition, Brazil's bound rates are often much higher than its applied rates, and U.S. exporters face significant uncertainty in the Brazilian market because the government frequently modifies tariff rates within the flexibilities of MERCOSUR. The lack of predictability with regard to tariff rates makes it difficult for U.S. exporters to forecast the costs of doing business in Brazil.

Ethanol Tariff

Between 2011 and 2017, bilateral trade of ethanol between the United States and Brazil, the world's two largest producers and consumers of ethanol, was virtually duty free. However, between September 2017 and January 2022, Brazil imposed first a tariff-rate quota (TRQ) and then the MERCOSUR CET of 20 percent on all imports of ethanol, the vast majority of which are supplied by the United States. Although the tariff was below Brazil's WTO bound tariff rate of 35 percent, the TRQ and the CET have reduced previously robust bilateral trade of ethanol. Brazil temporarily suspended the tariff, effective March 23, 2022, but that suspension expired on January 31, 2023, when the tariff was reimposed at 16 percent. The tariff then increased to 18 percent in 2024. The United States continues to engage with Brazil to lower its ethanol tariff to provide reciprocal treatment for trade in ethanol between the United States and Brazil.

Taxes

Brazil imposes a 25 percent *ad valorem* Industrial Product Tax (IPI) on cachaça, a domestic distinctive product produced from sugarcane, while imposing a 30 percent *ad valorem* IPI on other alcoholic beverages, including imports from the United States.

In audiovisual services, Brazil imposes several taxes on foreign products that it does not apply equally to domestic products.

Brazil imposes a fixed tax on each foreign film released in theaters, foreign home entertainment products, foreign programming for broadcast television, and foreign content and foreign advertising released on cable and satellite channels. The taxes are significantly higher than the corresponding taxes levied on Brazilian products. In addition, 80 percent of the programming aired on "open broadcast" (non-cable) television channels must be Brazilian and foreign ownership in print media and "open broadcast" television is limited to 30 percent.

Remittances to foreign producers of audiovisual works are subject to a 25 percent income withholding tax. As an alternative to paying the full tax, producers can elect to invest 70 percent of the tax value in local independent productions. In addition, local distributors of foreign films are subject to a tax equal to 11 percent of remittances to the foreign producer or, alternatively, the distributor may invest an amount equal to 3 percent of the total remittances in local independent productions. This levy is also assessed on foreign-produced video and audio advertising.

Non-Tariff Barriers

Import Bans

Brazil restricts the entry of certain types of remanufactured goods (*e.g.*, earthmoving equipment, automotive parts, and medical equipment). Brazil only allows the importation of such goods if an importer can provide evidence that the goods are not or cannot be produced domestically, or if they meet certain other limited exceptions.

With some exceptions, Brazil generally prohibits imports of used consumer goods, including automobiles, clothing, tires, medical equipment, and information and communications technology products.

Import Licensing

Brazil has both automatic and non-automatic import licensing requirements. Brazil's non-automatic import licensing system covers imports of products that require authorization from specific ministries or agencies,

such as agricultural commodities and beverages (Ministry of Agriculture, Livestock, and Supply (MAPA)), pharmaceuticals (National Sanitary Regulatory Agency). A list of products subject to non-automatic import licensing procedures is available on the Secretariat of Foreign Trade's computerized documentation system, but specific information related to non-automatic import licensing requirements and explanations for rejections of non-automatic import license applications are lacking. The lack of transparency surrounding these procedures is an impediment to U.S. exports. U.S. exporters of footwear and apparel and in the automotive sector have expressed concerns about these non-automatic licensing requirements. For automobiles, delays in issuing non-automatic import licenses negatively affect exports of U.S. automobile and automotive parts to Brazil.

Customs Barriers and Trade Facilitation

U.S. companies continue to complain of inconsistent documentation requirements for the importation of certain types of goods, such as heavy equipment. These documentation requirements apply even if imports are on a temporary basis and are destined for use in other countries. Brazil terminated the use of ATA Carnet for temporary admission of products in January 2022, making it difficult to bring samples, equipment, or displays for exhibitions into Brazil without paying significant customs duties.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

Wine Regulations

Brazil requires duplicative documentation for imports of wine. Technical Regulation No. 75 of December 31, 2019, requires both a certificate of analysis and an import inspection pre-certification report generated by a Brazilian laboratory upon importation. The United States continues to monitor Brazil's pending updates to its wine regulations, specifically regarding export certification and laboratory testing requirements for wine products. In 2023, the United States continued to raise these issues and seek updates from Brazil on the margins of WTO Committee on Technical Barriers to Trade meetings.

Telecommunications Products

Effective December 2021, Brazil's telecommunications agency (ANATEL) established approval requirements as a prerequisite for importing telecommunications products for usage and sale, with exceptions for products entering the country for demonstration, self-use, scientific purposes, or manufacturing of exports. Approval must be obtained prior to the product's entry into the country.

Sanitary and Phytosanitary Barriers

Pork

In a Joint Statement issued by the White House on March 19, 2019, the United States and Brazil agreed to science-based conditions to open Brazil's market to U.S. pork. However, Brazil's market is still closed to U.S. fresh and frozen pork due to Brazil's concerns, which Brazil has not substantiated with scientific evidence and are inconsistent with World Organisation for Animal Health (WOAH) international standards, that pork products imported into the United States from the European Union increase risks associated with African Swine Fever. Discussions between the U.S. Department of Agriculture and MAPA have been ongoing but have yet to establish access for U.S. pork exports to Brazil.

GOVERNMENT PROCUREMENT

Although Brazil has taken steps to make its procurement market more transparent, restrictions remain. For example, Brazilian state enterprises may only subcontract services to a foreign firm if domestic expertise is unavailable and foreign firms may only bid to provide technical services if there are no qualified Brazilian firms. Brazil also requires some procurement contracts to contain offset requirements, such as providing technology transfer.

Brazil is not a Party to the WTO Government Procurement Agreement (GPA), but has been an observer to the WTO Committee on Government Procurement since October 2017. Although Brazil applied for accession to the GPA in May 2020, the Brazilian Government withdrew its market access offer for accession on May 30, 2023.

INTELLECTUAL PROPERTY PROTECTION

Brazil remained on the Watch List in the [2023 Special 301 Report](#). Despite improvements in recent years, as outlined in that report, enforcement challenges continue, including the absence of deterrent-level penalties and high levels of counterfeiting and piracy online and in physical markets. The Rua 25 de Março area in São Paulo is listed in the [2023 Review of Notorious Markets for Counterfeiting and Piracy](#) (Notorious Markets List) for selling counterfeit and pirated goods. Deterrent-level penalties and increased emphasis on enforcement at the tri-border region between Argentina, Brazil, and Paraguay are critical to make sustained progress on these intellectual property concerns. Patent pendency has been reduced over the past several years, although it remains closer to 10 years for biopharmaceutical patents applications. Other concerns include the pendency of patent applications and the impact on the effective patent term. Also, pharmaceutical stakeholders remain concerned that Brazilian law and regulations do not provide for protection against unfair commercial use of undisclosed test results and other data generated to obtain marketing approval for pharmaceutical products for human use although such protection is provided for veterinary and agricultural chemical products. The United States urges Brazil to ensure transparency and due process in the protection of geographical indications (GIs) and to ensure that the grant of GI protection does not deprive interested parties of the ability to use common names, particularly as Brazil proceeds with the European Union–Mercosur Trade Agreement.

SERVICES BARRIERS

Audiovisual Services

Law 12.485 of 2011 imposes screen content quotas on subscription television services by requiring every channel (both satellite and cable) to air at least three and a half hours per week of Brazilian programming during prime time and that one-third of all channels included in any television package be Brazilian. In addition, the law delegates significant programming and advertising regulatory authority to the national film industry development agency, which raises concerns about the impartiality of regulatory decisions.

Brazil also maintains domestic film quotas for theatrical screening and home video distribution.

Express Delivery

The Brazilian Government charges a flat 60 percent duty for all express shipments imported through the Simplified Customs Clearance process. The Simplified Customs Clearance process limits commercial

shipments to \$100,000 per importer per year. Moreover, Brazilian Customs has established express delivery maximum per-shipment value limits of \$10,000 for exports and \$3,000 for imports.

Financial Services

Brazil maintains reciprocity requirements for foreign banks and insurers to establish operations in Brazil. Foreign banks may establish subsidiaries, but Brazilian residents must be directly responsible for the administration of the financial institution. Since 1995, entry into the banking sector through the establishment of branches has not been permitted.

Telecommunications Services

Satellites

Brazil permits Brazilian-owned entities to acquire the exclusive right to operate a satellite and its associated frequencies from specific positions. However, foreign-licensed satellite operators may obtain only a nonexclusive right (a landing right) to provide service in Brazilian territory. ANATEL grants these landing rights for a fixed term of no longer than 15 years, after which the operator must reacquire the landing rights to continue providing services. Foreign operators are also required to pay higher annual landing fees than Brazilian firms.

Roaming

In 2012, ANATEL ruled that “value-added services” may only be provided by locally licensed carriers using local subscriber identity module (SIM) cards. This ANATEL interpretation restricts permanent roaming options for value-added services such as international machine-to-machine and Internet of Things providers, thus requiring development of devices solely for the Brazilian market and requiring service infrastructure in Brazil.

BRUNEI DARUSSALAM

TRADE AGREEMENTS

The United States–Brunei Trade and Investment Framework Agreement

The United States and Brunei Darussalam (Brunei) signed a Trade and Investment Framework Agreement (TIFA) on December 16, 2002. This Agreement is the primary mechanism for discussions of trade and investment issues between the United States and Brunei.

IMPORT POLICIES

Tariffs

Brunei's average Most-Favored-Nation (MFN) applied tariff rate was 0.2 percent in 2022 (latest data available). Brunei's average MFN applied tariff rate was zero percent for agricultural products and 0.3 percent for non-agricultural products in 2022 (latest data available). Brunei has bound 95.5 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 25.3 percent. Brunei's highest WTO bound tariff rate for non-tobacco products is 50 percent.

Non-Tariff Barriers

Customs Barriers and Trade Facilitation

Brunei ratified the World Trade Organization Trade Facilitation Agreement (TFA) in December 2015, and the TFA entered into force in February 2017. Brunei submitted four transparency notifications related to: (1) import, export, and transit regulations; (2) the operation of the single window; (3) the use of customs brokers; and (4) customs contact points for the exchange of information on May 1, 2023. These notifications had been due to the WTO on February 22, 2017, according to Brunei's self-designated TFA implementation schedule.

TECHNICAL BARRIERS TO TRADE

Halal Import Requirements

Brunei's Halal Certificate and Halal Label Order Amendment, enacted in May 2017, requires all businesses that produce, import, distribute, or serve food and beverages to obtain a halal certificate from the Islamic Religious Council of Brunei (MUIB) and to renew this certificate annually.

Under Brunei's Halal Meat Act, halal meat can be imported only by a person holding a halal import permit issued by the MUIB and an export permit issued by the exporting country. Prior to export, Bruneian Government inspectors must travel to slaughter facilities in the home country of the exporter to inspect the slaughter and processing operations. The Bruneian Government maintains a list of the foreign and local slaughtering centers (abattoirs) that have been inspected and declared fit for supplying meat that can be certified as halal. None of the 40 foreign slaughterhouses currently approved by the MUIB are located in the United States.

OTHER BARRIERS

Residency Requirement

Under the Companies Act, 100 percent foreign-owned companies cannot locally incorporate in Brunei unless at least one of two directors of that locally incorporated company is a resident of Brunei. If a 100 percent foreign-owned company has more than two directors, then at least two must be residents of Brunei. The government may grant an exemption from this requirement, although it has granted none to date.

Transparency

In Brunei, the decision-making process regarding economic policies and regulations is centralized, including with respect to critical sectors like oil and gas, telecommunications, transportation, and energy generation and distribution. Brunei's centralized decision-making lacks public consultation mechanisms. As a result, there is a lack of transparency with respect to state-owned enterprises.

CAMBODIA

TRADE AGREEMENTS

The United States–Cambodia Trade and Investment Framework Agreement

The United States and Cambodia signed a Trade and Investment Framework Agreement on July 14, 2006. This Agreement is the primary mechanism for discussions of trade and investment issues between the United States and Cambodia.

IMPORT POLICIES

Tariffs

Cambodia's average Most-Favored-Nation (MFN) applied tariff rate was 10.2 percent in 2022 (latest data available). Cambodia's average MFN applied tariff rate was 12.5 percent for agricultural products and 9.8 percent for non-agricultural products in 2022 (latest data available). Cambodia has bound 100 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 19.3 percent. Cambodia's highest applied tariff rate is 35 percent, which is imposed on several product categories, including a wide variety of prepared food products, bottled and canned beverages, table salt, paints and varnishes, cosmetic and skin care products, glass and glassware, electrical appliances, cars, furniture, and video games.

On June 6, 2023, Cambodia issued Sub-Decree 122 on the Adjustment of Customs Tariffs and Special Tax Rates on Certain Goods, applicable to sectors such as agriculture, transportation, healthcare, industry, and mining. The Sub-Decree went into effect July 1, 2023. Businesses and importers may check the new tariff rates on the Cambodian General Department of Customs and Excise website by using the relevant Harmonized System (HS) code.

The lack of detailed guidance about HS classification of products by customs officials remains a concern for U.S. stakeholders. Some importers claimed that, due to a lack of clear guidance, if a product could fall under multiple HS codes, Cambodian customs and excise officials will typically classify the product as falling within the HS code with a higher tariff rate.

GOVERNMENT PROCUREMENT

Government procurement is often not transparent, and the Cambodian Government frequently provides short response times to public announcements of tenders, which are posted on the Ministry of Economy and Finance's website. For construction projects, only bidders registered with the Ministry are permitted to participate in tenders.

Irregularities in the government procurement process are common, despite a strict legal requirement for audits and inspections. Despite allegations of malfeasance at several ministries, the Cambodian Government has taken little action to investigate irregularities. In May 2023, the new Law on Public Procurement was promulgated to replace the 2012 law, introducing additional provisions to further regulate the management and implementation of all public procurements. U.S. stakeholders have not reported any noticeable changes to government procurement processes.

Cambodia is neither a Party to the WTO Agreement on Government Procurement nor an observer to the WTO Committee on Government Procurement.

INTELLECTUAL PROPERTY PROTECTION

Despite efforts to raise intellectual property (IP) awareness, the sale of counterfeit and pirated goods remains commonplace in Cambodian markets, especially those frequented by tourists. The Central Market in Phnom Penh is included in the [2023 Review of Notorious Markets for Counterfeiting and Piracy](#) (Notorious Markets List). The rates of signal and cable piracy also remain high, and online sites purveying pirated music, films, electronic books, software, and television shows remain popular. In addition, sales of legitimate films have been negatively affected as a result of the popularity of illegal cinemas that show pirated material.

Various Cambodian authorities that work on IP-related issues include the Interior Ministry's Economic Crime Police unit, the General Department of Customs and Excise of Cambodia (GDCE), the Cambodia Import-Export Inspection and Fraud Repression Directorate General, the National Committee for Intellectual Property Rights, the Institute of Standards of Cambodia, the Ministry of Culture and Fine Arts, and the Ministry of Commerce. Some of these institutions have overlapping responsibilities with respect to IP-related issues. The Interior Ministry's Cambodia Counter Counterfeit Committee, which previously cracked down on counterfeit products, transferred that responsibility to the Economic Crime Police and now focuses on raising awareness only. Draft legislation to address the protection of trade secrets is under review at the Ministry of Commerce but has not been passed.

BARRIERS TO DIGITAL TRADE

Cambodia passed an electronic commerce law in November 2019, which was fully implemented in May 2020. The law governs the conduct of electronic commerce within Cambodia and from overseas. Cambodia's National Assembly passed a sub-decree in February 2021 to establish a National Internet Gateway that would require internet providers to route all online traffic through a single node regulated by a government-appointed operator. Cambodia's implementation of the National Internet Gateway has been paused, but not officially cancelled. Both the private sector and human rights organizations have expressed concerns over the effect the National Internet Gateway could have on freedom and online commerce in Cambodia. Proposed laws governing cybersecurity, cybercrime, and data privacy protection are in draft form.

INVESTMENT BARRIERS

Cambodia's constitution restricts foreign ownership of land. A 2010 law allows foreign ownership of property above the ground floor of a structure but stipulates that no more than 70 percent of a building may be foreign-owned and that foreigners may not own property within 30 kilometers of the national border. Land may be owned by foreign investors, but the title must also be held by at least one Cambodian citizen or entity.

While Cambodia has made significant progress in formalizing its tax regime and increasing tax revenues, some question the General Department of Taxation's tax collection methods, including assessing some organizations with unexplained tax bills and freezing assets for failure to pay purported back taxes. Additional concerns range from surprise tax audits to a lack of stakeholder consultation when implementing new tax codes.

OTHER BARRIERS

Transparency

Despite the Cambodian Government's calls for public consultation on new draft regulations in recent years, some businesses have raised concerns with the lack of opportunity for meaningful stakeholder engagement. Some stakeholders have also expressed concerns regarding the short notice and lack of detailed public comment procedures for proposed laws and regulations.

Foods and health-related products are commonly regulated by multi-ministerial regulations called Joint-Prakas and are subject to review and approval by all ministries listed in the Joint-Prakas for aspects ranging from a product's registration to its sale. U.S. businesses have voiced concerns about a lack of clarity on each ministry's authority under the Joint-Prakas.

Bribery and Corruption

Both foreign and local businesses have identified corruption in Cambodia as a major obstacle and a deterrent to investment. Cambodia's judiciary is viewed as one of the country's most corrupt institutions. In 2010, Cambodia adopted anticorruption legislation and established a national Anti-Corruption Unit (ACU) to undertake investigations, implement law enforcement measures, and conduct public outreach. Enforcement, however, remains inconsistent. U.S. businesses have noted that signing an anticorruption memorandum of understanding with the ACU has helped them to avoid paying "facilitation payments." However, businesses have noted that they still encounter red tape in obtaining licenses and permits.

Cambodia published official fees for all public services in 2012 in an effort to combat "facilitation payments;" however, that publication has not been updated, making it difficult to determine current public service fees. Some ministries publish service fees on their official websites, and others do not. In June 2023, Cambodia rolled out the third phase of an online, single-portal business registration platform aimed to eliminate the need for cash payments and to reduce overall fees for public services. Despite covering a total of 22 ministries and state-run institutions, the platform still does not cover all ministries and relevant agencies.

CANADA

TRADE AGREEMENTS

The United States–Mexico–Canada Agreement

The United States–Mexico–Canada Agreement (USMCA) entered into force on July 1, 2020. The USMCA maintains the zero tariffs that were in place among the three countries under the North American Free Trade Agreement and modernized the agreement to include strong, enforceable labor and environmental obligations, ground-breaking provisions to combat non-market practices, and provisions covering small and medium-sized enterprises.

IMPORT POLICIES

Non-Tariff Barriers

Agricultural Supply Management

Canada uses supply-management systems to regulate its dairy, chicken, turkey, and egg industries. Canada's supply-management system involves production quotas, producer-marketing boards to regulate price and supply, and tariff-rate quotas (TRQs) for imports. Canada's supply-management system severely limits the ability of U.S. producers to increase exports to Canada above TRQ levels and increases the prices that Canadians pay for dairy and poultry products. Under the current system, U.S. imports above quota levels are subject to prohibitively high tariffs (*e.g.*, 245 percent for cheese and 298 percent for butter).

The USMCA expands market access opportunities for dairy products through new TRQs exclusively for U.S. products. Canada has also opened new TRQs for U.S. chicken and U.S. eggs and egg products. In addition, Canada expanded access for U.S. turkey. Canada and the United States also agreed to strong rules to ensure TRQs are administered fairly and transparently to help ensure exporters benefit from the full market access negotiated in the USMCA.

On May 25, 2021, the United States requested and established a dispute settlement panel under the USMCA to review Canada's dairy TRQ allocation measures that undermined the value of the TRQs by setting aside and reserving access to in-quota quantities exclusively for processors. The final panel report was released to the public on January 4, 2022. The panel agreed with the United States that Canada's allocation of dairy TRQs—specifically the set-aside of a percentage of each dairy TRQ exclusively for Canadian processors—is inconsistent with Canada's commitment in Article 3.A.2.11(b) of the USMCA not to “limit access to an allocation to processors.”

Canada made changes to its dairy TRQ allocation measures following the release of the panel report, but the United States rejected those changes as a basis to resolve the dispute. On May 25, 2022, the United States—for the second time—requested dispute settlement consultations with Canada under the USMCA to address Canadian allocation measures that impose new conditions on the allocation and use of the TRQs and prohibit eligible applicants, including retailers, food service operators, and other types of importers, from accessing TRQ allocations. On December 20, 2022, the United States requested new dispute settlement consultations, expanding its challenge of Canada's dairy TRQ allocation measures to include Canada's use of a market-share approach for determining TRQ allocations, which applies different criteria for different segments of applicants, and Canada's failure to allow importers the opportunity to fully utilize TRQ quantities. On January 31, 2023, the United States requested and established a second dispute

settlement panel under the USMCA to address Canada's continued failure to abide by its USMCA commitments with its dairy TRQ allocation measures. The final panel report was released to the public on November 24, 2023. The panel found that Canada's measures are not inconsistent with the USMCA provisions cited by the United States. The panel split on the U.S. claims that Canada's exclusion from eligibility of retailers, food service operators, and other entities and Canada's historical market share approach to allocate its USMCA dairy TRQs breach Canada's USMCA obligations. A dissenting panelist agreed with the United States that by excluding retailers and others, Canada was breaching its commitment to make its dairy TRQs available to all applicants active in the Canadian food or agriculture sector. The United States remains committed to securing the full benefit of the market access that Canada committed to under the USMCA and full compliance with Canada's USMCA obligations.

The United States also remains concerned about potential Canadian actions that would further limit U.S. exports to the Canadian dairy market and continues to monitor closely any tariff reclassifications of dairy products to ensure that U.S. market access is not negatively affected.

Milk Classes

Canada establishes discounted prices for milk components provided to domestic manufacturers of dairy products used in processed food products under the Special Milk Class Permit Program (SMCPP). These prices are "discounted," as they are lower than regular Canadian milk class prices for manufacturers of dairy products and pegged to U.S. prices or world prices. The SMCPP is designed to help Canadian manufacturers of processed food products compete against processed food imported into Canada and in foreign markets. An agreement reached between Canadian dairy farmers and processors in 2016 introduced a new national milk class (Class 7), with discount pricing for a wide range of Canadian dairy ingredients used in dairy products, to decrease imports of U.S. milk protein substances into Canada and increase Canadian exports of skim milk powder into third-country markets. Provincial milk marketing boards (agencies of Canada's provincial governments) began implementing Class 7 in 2017.

Under the USMCA, Canada was obligated to eliminate Class 7 within six months of entry into force. In addition, Canada is obligated to ensure that the price for nonfat solids used to manufacture skim milk powder, milk protein concentrates, and infant formula will be no lower than a level based on the U.S. Department of Agriculture price for nonfat dry milk. Transparency provisions obligate Canada to provide information necessary to monitor compliance with these commitments. Canada is obligated to apply charges to exports of skim milk powder, milk protein concentrates, and infant formula in excess of thresholds specified in the USMCA.

Ministerial Exemptions

Canada prohibits bulk imports of fresh fruits and vegetables in packages exceeding certain sizes (typically 50 kilograms) unless Canada grants a ministerial exemption. To obtain an exemption, importers must demonstrate that the supply of a product in the domestic market is insufficient. The import restrictions apply to all fresh produce in bulk containers if grade names are established in the respective regulations. There are no restrictions on bulk imports of horticultural products without prescribed grade names. In addition, Canadian regulations on fresh fruit and vegetable imports prohibit consignment sales of fresh fruit and vegetables in the absence of a prearranged buyer.

The 2007 Technical Arrangement Concerning Trade in Potatoes between the United States and Canada is designed to provide U.S. potato producers with predictable access to Canadian ministerial exemptions. The United States will continue to engage with U.S. potato growers on any concerns that Canada's procedures for granting ministerial exemptions are not providing access to Canada's market as agreed.

Wine, Beer, and Spirits

Most Canadian provinces restrict the sale of wine, beer, and spirits through province-run liquor control boards, which are the sole authorized sellers of wine, beer, and spirits in those provinces. Market access barriers imposed by the provincial liquor control boards greatly hamper exports of U.S. wine, beer, and spirits to Canada. These barriers include cost-of-service mark-ups, restrictions on listings (products that the liquor board will carry), reference prices (either the maximum prices the liquor board is willing to pay or the prices below which imported products may not be sold), label requirements, discounting policies (requirements that suppliers must offer rebates or reduce their prices to meet sales targets), and distribution policies.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

Compositional Standards for Cheese

Canada's regulations on compositional standards for cheese limit the amount of dry milk protein products that can be used in cheese making, reducing the demand for U.S. dry milk protein products. The United States continues to monitor these regulations for any changes that could have a further adverse impact on U.S. dairy product exports.

Sanitary and Phytosanitary Barriers

Restrictions on U.S. Seeds Exports

For many major field crops, Canada's Seeds Act generally prohibits the sale or advertising for sale in Canada—or import into Canada—of any variety of seed that is not registered with Canada's Food Inspection Agency (CFIA). Canada's variety registration gives the CFIA an oversight role in maintaining and improving quality standards for grains in Canada. The registration is designed to facilitate and support seed certification and the international trade of seed; verify claims made, which contributes to a fair and accurate representation of varieties in the marketplace; and facilitate varietal identity, trait identity, and traceability in the marketplace to ensure standards are met. The United States is concerned, however, that the variety registration system is slow and cumbersome and disadvantages U.S. seed and grain exports to Canada. Under the Canada Grain Act, only grain of varieties produced from seed of varieties registered under the Seeds Act may receive a grade higher than the lowest grade allowable in each class. The USMCA includes a commitment to discuss issues related to seed regulatory systems. In January 2021, the CFIA began seed regulatory modernization efforts. The United States will continue to discuss with Canada steps to modernize and streamline Canada's variety registration system.

INTELLECTUAL PROPERTY PROTECTION

Canada remained on the Watch List in the [2023 Special 301 Report](#). Canada's commitments under the USMCA are designed to significantly improve Canada's intellectual property (IP) environment, addressing areas of longstanding concern, including enforcement against counterfeits, inspection of goods in-transit, transparency with respect to new geographical indications (GIs), and application of full national treatment for copyright. With respect to GIs, the United States remains highly concerned about countries' negotiating product-specific IP outcomes as a condition of market access from the European Union and reiterates the importance of each individual IP right being independently evaluated on its individual merits. Poor

enforcement with respect to counterfeit or pirated goods at the border and within Canada remains a concern. The Pacific Mall in Toronto is listed in the [2023 Review of Notorious Markets for Counterfeiting and Piracy](#) (Notorious Markets List) for selling pirated and counterfeit goods.

SERVICES BARRIERS

Audiovisual Services

For cable television and direct-to-home broadcast services, more than 50 percent of the channels received by subscribers must be Canadian channels. Non-Canadian channels must be preapproved (“listed”) by the Canadian Radio-television and Telecommunications Commission (CRTC). Alternatively, non-Canadian channels can become Canadian by ceding majority equity control to a Canadian partner, as some U.S. channels have done. Foreign channels are prohibited from owning video distribution infrastructure in Canada.

In an annex to the USMCA Cross-Border Trade in Services Chapter, Canada committed to “ensure that U.S. programming services specializing in home shopping, including modified versions . . . are authorized for distribution in Canada.” Since entry into force, the United States has engaged with Canada to ensure its compliance with this commitment, which led Canada to introduce new rules in August 2023. The United States continues to monitor Canada’s implementation to ensure full compliance with the commitment.

Canada permits Canadian cable and satellite suppliers to pick up the signals of U.S. stations near the border and redistribute them throughout Canada without U.S. broadcasters’ consent. Content owners can apply for compensation for the use of such content in Canada from a statutorily mandated fund into which Canadian cable and satellite suppliers pay. U.S. broadcasters consider this compensation to be insufficient and have sought the right to negotiate the carriage of their signals on commercially set rates and terms, as can be done in the United States.

Online Streaming

The Canadian Government passed the Online Streaming Act on April 27, 2023, and has instructed the CRTC to create a new methodology for financial contributions and obligations on streaming platforms to support and promote Canadian programming, as well as review how it defines Canadian programs. The United States will closely monitor the implementation of the Act and any USCMA implications.

BARRIERS TO DIGITAL TRADE

Digital Services Taxation

On August 4, 2023, the Canadian Government published its latest draft legislation for a digital services tax (DST). Canada’s proposed DST could be imposed any time after January 1, 2024, and could be retroactive to January 1, 2022. Canada has taken this step, despite joining the October 8, 2021 OECD/G20 Inclusive Framework on Base Erosion and Profit Shifting [Statement on a Two-Pillar Solution to Address the Tax Challenges Arising from the Digitalization of the Economy](#), which called for all Parties to commit not to introduce DSTs in the future. As the United States noted in comments to Canada in 2021 and 2023, most DSTs have been designed in ways that discriminate against U.S. companies, as they single out U.S. firms for taxation while effectively excluding national firms engaged in similar lines of business. Furthermore, Canada’s proposed DST would create the possibility of significant retroactive tax liabilities with immediate consequences for U.S. companies. The United States has expressed serious concerns that Canada continues to pursue a DST and has urged Canada to join the 140 other members of the OECD negotiations who have

agreed not to impose new DSTs or similar measures through the end of 2024. As of December 31, 2023, Canada and the United States were in ongoing discussions on this issue.

CHINA

TRADE AGREEMENTS

In January 2020, the United States and China signed the Economic and Trade Agreement Between the Government of the United States of America and the Government of the People's Republic of China, commonly referred to as the (Phase One Agreement). This agreement included commitments by China to improve market access for the United States in the agriculture and financial services sectors, refrain from problematic policies and practices related to intellectual property (IP) and technology transfer, and increase its purchases of certain U.S. goods and services.

While China followed through in implementing some provisions of the Phase One Agreement, it has not yet implemented some of the more important commitments. With regard to agriculture trade, for example, the Phase One Agreement addresses many non-tariff barriers and has expanded market access for a variety of U.S. food, agriculture, and seafood product exports. In particular, China implemented significant reforms in some agricultural sub-sectors, such as meat and poultry products, and in facility registration. However, China has not yet implemented some of its more significant agriculture commitments, such as commitments on agricultural biotechnology and the commitment to conduct a risk assessment relating to the use of ractopamine in cattle and swine. Moreover, China fell far short of implementing its commitments to purchase certain amounts of specific U.S. goods and services in 2020 and 2021.

Importantly, it is clear that the Phase One Agreement has not led to fundamental changes to China's state-led, non-market trade regime or its harmful impact on the U.S. economy and U.S. farmers, ranchers, workers, and businesses. Indeed, many of the commitments in the Phase One Agreement reflected changes that China had already been planning or pursuing for its own benefit or that otherwise served China's interests, such as the changes involving IP protection and the opening up of more financial services sectors. Other commitments to which China agreed reflected a calculation, as it saw them as appeasing U.S. priorities of the prior Administration, as evidenced by the attention paid to the agriculture sector in the Phase One Agreement and the novel commitments relating to China's purchases of U.S. goods and services ostensibly as a means to reduce the bilateral trade deficit.

STATE-LED, NON-MARKET TRADE REGIME

Industrial Plans

China continues to pursue an extensive number of industrial plans and supporting policies and practices that target industries for domination by Chinese companies, both in China and globally. Pursuant to these industrial plans, the Chinese Government offers substantial government guidance, resources, and regulatory support to Chinese companies while actively seeking to limit access to the China market for imported goods, foreign manufacturers, and foreign services suppliers. The beneficiaries of these non-market policies and practices, which are constantly evolving, include not only China's state-owned enterprises but also other domestic Chinese companies.

One of the more far-reaching and harmful industrial plans is Made in China 2025. China's State Council released this industrial plan in May 2015. It is a 10-year plan targeting 10 strategic sectors, including advanced information technology, automated machine tools and robotics, aviation and spaceflight equipment, maritime engineering equipment and high-technology vessels, advanced rail transit equipment, new energy vehicles (NEVs), power equipment, farm machinery, new materials, biopharmaceuticals, and advanced medical device products. While purportedly intended simply to raise industrial productivity

through more advanced and flexible manufacturing techniques, Made in China 2025 is emblematic of China's evolving and increasingly sophisticated approach to "indigenous innovation," which is evident in numerous supporting and related industrial plans. Under China's harmful and anticompetitive approach to indigenous innovation, the common, overriding aim is to replace foreign technologies, products and services with Chinese technologies, products and services in the China market through any means possible so as to enable Chinese companies first to dominate the China market and then to use that dominance as a springboard to taking on international markets.

Made in China 2025, which represents the first 10 years of a 30-year strategy known as the Strong Manufacturing Nation Strategy, seeks to build up Chinese companies in the 10 targeted, strategic sectors at the expense of, and to the detriment of, foreign companies and their technologies, products, and services through a multi-step process over 10 years. The initial objective of Made in China 2025 is to ensure, through various means, that Chinese companies develop, extract, or acquire their own "indigenous" technology, intellectual property, and know-how and their own brands. The next objective of Made in China 2025 is to substitute domestic technologies, products and services for foreign technologies, products, and services in the China market. The final objective of Made in China 2025 is to capture much larger worldwide market shares in the 10 targeted, strategic sectors.

In pursuit of these objectives, subsequently released documents set specific targets for capacity and production levels and market share for the dozens of industries that comprise the 10 broad sectors targeted in Made in China 2025. In October 2015, China's National Manufacturing Strategic Advisory Committee published the Made in China 2025 Key Area Technology Roadmap, and since then it has published two updated editions of this document. The first update took place in February 2018, with the issuance of the Made in China 2025 Key Area Technology and Innovation Greenbook – Technology Roadmap (2017). Like its predecessor, the updated document sets explicit market share and other targets to be attained by Chinese companies in dozens of high-technology industries, often both in the China market and globally. For example, it calls for "indigenous new energy vehicle annual production" to have a "supplying capacity that can satisfy more than 80 percent of the market" in China by 2020, up from a 70 percent target set in the 2015 document. In November 2020, the 2017 document was updated with the issuance of the Made in China Key Area Technology Innovation Greenbook – Technology Roadmap (2019).

Many of the policy tools being used by the Chinese Government to achieve the objectives of Made in China 2025 raise serious concerns. Several of these tools are unprecedented and include numerous types of state intervention and support that work in concert with one another and are designed to promote the development of Chinese industry in large part by restricting, taking advantage of, discriminating against, or otherwise creating disadvantages for foreign enterprises and their technologies, products and services. Indeed, even facially neutral measures can be applied in favor of domestic enterprises, as past experience has shown, especially at sub-central levels of government.

Made in China 2025 also differs from industry support pursued by other World Trade Organization (WTO) Members in its level of ambition and, perhaps more importantly, in the scale and type of resources that the Chinese Government is investing in the pursuit of its industrial plan goals. Indeed, by some estimates, the Chinese Government is making available more than \$500 billion of financial support to the Made in China 2025 sectors, often using, among many other vehicles, large "government guidance funds," which China attempts to shield from scrutiny by claiming that they are wholly private. Even if China fails to fully achieve the objectives set forth in Made in China 2025, it is still likely to create or exacerbate market distortions, create severe excess capacity in many of the targeted sectors and distort investment decisions by foreign companies. It is also likely to do long-lasting damage to U.S. interests, as well as the interests of the United States' allies and partners, as China-backed companies increase their market share at the expense of foreign companies operating in these sectors. Developing countries, at least some of which have

themselves experienced deindustrialization, are especially at risk of severe harm from industrial plans like Made in China 2025.

While public references to Made in China 2025 subsided after June 2018 reportedly in response to an order from the central government, it is clear that China remains committed to achieving the underlying goals of Made in China 2025 and continues to seek dominance for Chinese firms in the sectors that it views as strategic, both in China's market and globally. For example, in September 2020, the central government issued a guiding opinion encouraging investment in "strategic emerging industries," a term used to describe an earlier initiative from which Made in China 2025 evolved. Among other things, the guiding opinion called for the support and creation of industrial clusters for strategic emerging industries, along with the use of various types of government support and funding. The guiding opinion specifically encouraged provincial and local governments to support industries such as advanced information technology, NEVs, and biopharmaceuticals. More recently, the October 2022 Report to the 20th Party Congress also underscored the continuing importance of China's industrial policy objectives, calling for efforts to promote the development of strategic emerging industries and to "cultivate new growth engines such as next-generation information technology, artificial intelligence, biotechnology, new energy, new materials, high-end equipment, and green industry."

In March 2021, the National People's Congress passed the 14th Five-Year Plan (2021-2025) for National Economic and Social Development (the 14th Five-Year Plan), together with a document titled Long-Range Objectives Through Year 2035. The 14th Five-Year Plan and subsequently issued sector-specific five-year plans, along with five-year plans issued by sub-central governments, make clear that China will continue to pursue its various industrial domination objectives. While industrial plans like Made in China 2025 were not named in the 14th Five-Year Plan, there continues to be overlap between the industries identified in China's five-year plans with both Made in China 2025 industries and strategic emerging industries. More recent plans, including those issued at the sub-central level of government, also make clear that the Chinese Government will continue to support these key industries. In addition, other longer-ranging plans, such as the New Energy Vehicle Industry Development Plan (2021-2035) and China Standards 2035, reaffirm China's strong commitment to a state-led, non-market approach to the economy and trade.

Technology Transfer

For years, longstanding and serious U.S. concerns regarding forced or pressured technology transfer remained unresolved, despite repeated, high-level bilateral commitments by China to remove or no longer pursue problematic policies and practices. In August 2017, the Office of the United States Trade Representative (USTR) sought to address these concerns by initiating an investigation under Section 301 of the Trade Act of 1974 (Section 301) focused on policies and practices of the Government of China related to technology transfer, intellectual property, and innovation. Specifically, in its initiation notice, USTR identified four categories of reported Chinese Government conduct that would be the subject of its inquiry: (1) the use of a variety of tools to require or pressure the transfer of technologies and intellectual property to Chinese companies; (2) depriving U.S. companies of the ability to set market-based terms in technology licensing negotiations with Chinese companies; (3) intervention in markets by directing or unfairly facilitating the acquisition of U.S. companies and assets by Chinese companies to obtain cutting-edge technologies and intellectual property; and (4) conducting or supporting cyber-enabled theft and unauthorized intrusions into U.S. commercial computer networks for commercial gains. In March 2018, USTR issued a report supporting findings that the four categories of acts, policies, and practices covered in the investigation are unreasonable or discriminatory and burden and/or restrict U.S. commerce. In November 2018, USTR issued an updated report that found that China had not taken any steps to change its problematic policies and practices. Based on the findings in USTR's Section 301 investigation, the United States took a range of responsive actions, including the pursuit of a successful WTO dispute

challenging certain discriminatory technology licensing measures maintained by China in addition to the imposition of substantial additional tariffs on Chinese imports.

The Phase One Agreement, signed in January 2020, addresses certain aspects of the unfair trade practices of China that were identified in USTR's Section 301 report. In the agreement, China committed to end its longstanding practice of forcing or pressuring foreign companies to transfer their technology to Chinese companies as a condition for obtaining market access, securing administrative approvals or receiving advantages from the Chinese Government. China also committed to provide transparency, fairness and due process in administrative proceedings and to ensure that technology transfer and licensing take place on market terms that are voluntary and reflect mutual agreement. Separately, China committed to refrain from directing or supporting outbound investments aimed at acquiring foreign technology pursuant to its distortive industrial plans.

Since the entry into force of the Phase One Agreement in February 2020, the United States has continually engaged with the U.S. business community, which has expressed concern about China's informal, unwritten actions that force or pressure U.S. companies to transfer their technology to Chinese entities, including as a condition for obtaining market access. The United States has engaged China as issues arise and will continue to monitor developments closely.

Throughout 2023, USTR led a statutorily-mandated four-year review of the tariffs that had been imposed on Chinese imports as a result of the Section 301 investigation into China's unfair acts, policies, and practices related to technology transfer, intellectual property, and innovation. As part of this review, USTR has been examining the effectiveness of the tariff actions in achieving the objectives of the original investigation, other actions that could be taken, and the effects of those actions on the United States economy, including consumers.

IMPORT POLICIES

Tariffs and Taxes

Tariffs

China's average Most-Favored-Nation (MFN) applied tariff rate was 7.5 percent in 2022 (latest data available). China's average MFN applied tariff rate was 13.9 percent for agricultural products and 6.4 percent for non-agricultural products in 2022 (latest data available). China has bound 100 percent of its tariff lines in the WTO, with a simple average WTO bound tariff rate of 10.0 percent.

In April 2018, China imposed tariffs ranging from 15 percent to 25 percent on a range of agricultural, steel, and aluminum products imported from the United States in retaliation against the U.S. decision to adjust U.S. imports of steel and aluminum articles under Section 232 of the Trade Expansion Act of 1962, as amended. The U.S. decision was based on a determination that the quantity and circumstances of U.S. imports of steel and aluminum products—including the circumstances of severe excess capacity and resulting overproduction emanating from China—threaten to impair U.S. national security. In July 2018, the United States launched a dispute settlement proceeding against China in the WTO pertaining to China's retaliatory tariffs. In August 2023, a WTO panel issued its report, ruling that those retaliatory tariffs were WTO-inconsistent. China appealed the panel's ruling in September 2023. The United States will continue to take all necessary action to protect U.S. interests in the face of this type of retaliation.

In 2018 and 2019, China imposed a series of retaliatory tariffs on U.S. products following U.S. actions under Section 301 addressing unfair Chinese acts, policies, and practices relating to technology transfer, intellectual property, and innovation. These tariffs remain in place.

Tariff-Rate Quota Administration for Agricultural Commodities

Market access promised through the tariff-rate quota (TRQ) system set up pursuant to China's WTO accession agreement has yet to be fully realized as of December 2023. Due to China's poorly defined criteria for applicants, unclear procedures for distributing TRQ allocations, and failure to announce quota allocation and reallocation results, traders are unsure of available import opportunities and producers worldwide face reduced market access opportunities. As a result, China's TRQs for wheat, corn, and rice seldom fill even when they are oversubscribed. For example, from 2020 to 2023, China's corn imports exceeded TRQ levels, but the TRQ issuance, application, and allocation processes lacked transparency, and large state-owned enterprises in China appear to have been the primary beneficiaries of the increased imports.

In December 2016, the United States launched a WTO dispute challenging China's administration of TRQs for wheat, corn, and rice. Consultations took place in February 2017. A WTO panel was established to hear the case at the United States' request in September 2017, and 17 other WTO Members joined as third parties. The panel issued its report in April 2019, ruling that China's administration of tariff-rate quotas for wheat, corn, and rice was WTO-inconsistent. In July 2021, the United States submitted a request for authorization to suspend concessions and other obligations pursuant to Article 22 of the Understanding on Rules and Procedures Governing the Settlement of Disputes (DSU) on the ground that China had failed to bring its measures into compliance with its WTO obligations. After China objected to this request, the matter was referred to arbitration in accordance with Article 22 of the DSU. The arbitration is currently suspended, and the United States continues to closely monitor China's ongoing administration of the tariff-rate quotas for wheat, corn, and rice.

As part of the Phase One Agreement, China agreed that, from December 31, 2019, its administration of TRQs for wheat, corn, and rice would conform to its WTO obligations. In addition, China agreed to make specific improvements to its administration of the wheat, corn, and rice TRQs, including with regard to the allocation methodology, and to the treatment of non-state trading quota applicants. China also committed to greater transparency. As of December 31, 2023, however, China has not demonstrated full implementation of these commitments.

Taxes

The Chinese Government attempted to manage imports of primary agricultural commodities by raising or lowering the value-added tax (VAT) rebate to manage domestic supplies. China sometimes reinforces its domestic objectives by imposing or retracting VATs. These practices have caused tremendous distortion and uncertainty in the global markets for wheat, corn, and soybeans, as well as intermediate processed products of these commodities.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Food Safety

China's ongoing implementation of its 2015 Food Safety Law has led to the introduction of myriad new measures. These measures include exporter facility and product registration requirements for almost all

food and agricultural products. Overall, China's notification of these measures to the WTO Committee on Technical Barriers to Trade (WTO TBT Committee) and the WTO Committee on Sanitary and Phytosanitary Measures (WTO SPS Committee) has been uneven.

In November 2019, China's regulatory authorities issued draft measures for public comment that would require the registration of all foreign food manufacturers. The United States submitted comprehensive written comments on the draft measures to China's regulatory authorities. The United States also raised concerns about them before the WTO TBT Committee and the WTO SPS Committee. More than 15 WTO Members supported the concerns raised by the United States.

In April 2021, China's regulatory authorities issued final versions of these measures, now known as Decrees 248 and 249, with an implementation date of January 1, 2022. In correspondence delivered to foreign missions in Beijing in September 2021, China's regulatory authorities laid out a non-transparent, multi-tier system where producers of certain products are required to be registered by foreign regulatory authorities, while producers of other products are eligible to self-register. Decrees 248 and 249 also establish new labeling and conformity assessment requirements. In July 2023, China implemented additional registration requirements for certain products under Decree 248, expanding the burden on foreign food safety regulators. Moreover, the tasks being required of foreign food safety regulators are fundamentally beyond the traditional roles of regulatory authorities. These various additional requirements have already disrupted trade, especially for new U.S. food manufacturers unable to meet the requirements for first-time registration.

Decree 248 and similar prior measures continue to place excessive strain on food producers, traders, and exporting countries' regulatory authorities, with no apparent added benefit to food safety. They instead provide China with a tool to control food imports in accordance with the dictates of China's state planners and to retaliate against food producers from countries whose governments challenge Chinese Government policies or practices in non-trade areas.

In the Phase One Agreement, China committed that it would not implement food safety regulations that are not science- or risk-based and that it would only apply food safety regulations to the extent necessary to protect human life or health. China also agreed to certain procedures for registering U.S. facilities that produce various food products. Despite repeated U.S. requests for clarification regarding the relationship between the facility registration procedures set forth in the Phase One Agreement and the requirements of Decree 248, China has not provided sufficient information.

Technical Barriers to Trade

Standards

The Chinese Government continues to pursue changes to its standards system, including by moving from a government-led system to one that incorporates both government guidance and stakeholder input. At times, Chinese Government officials have also indicated they provide equal treatment to foreign companies in connection with China's standardization work. However, in practice, the Chinese Government continues to limit foreign participation in standards setting and, at times, still pursues unique national standards for strategic reasons.

In January 2018, China's revised Standardization Law entered into force. Since then, China has issued numerous implementing measures, some of which contain positive references to the ability of foreign-invested enterprises to participate in China's standardization activities and purport to recognize the value of international standards. Unfortunately, many of these implementing measures cause concern for U.S. industry as they appear to focus on the development of Chinese standards without sufficient consideration

being given to existing standards. In addition, they do not explicitly provide that all foreign stakeholders may participate on equal terms with domestic competitors in all aspects of the standardization process.

As these implementing measures have been issued, China's existing technical committees have continued to develop standards. U.S. and other foreign companies have reported that they are often not permitted to participate in these domestic standards-setting processes, and even in technical committees where participation has been possible for some foreign stakeholders, it has typically been on terms less favorable than those applicable to their domestic competitors. For example, the technical committee for cybersecurity standards (known as TC-260) allows foreign companies to participate in standards development and setting, with several U.S. and other foreign companies being allowed to participate in some of the TC-260 working groups. However, foreign companies are not universally allowed to participate as voting members, and they report challenges to participating in key aspects of the standardization process, such as drafting. They also remain prohibited from participating in certain TC-260 working groups, such as the working group on encryption standards.

Over the years, U.S. stakeholders have also reported that, in some cases, Chinese Government officials have pressured foreign companies seeking to participate in the standards-setting process to license their technology or intellectual property on unfavorable terms. In addition, China has continued to pursue unique national standards in a number of high technology areas. The United States continues to press China to address these specific concerns, but this bilateral engagement has yielded minimal progress.

Notably, U.S. concerns about China's standards regime are not limited to the implications for U.S. companies' access to China's market. China's ongoing efforts to develop unique national standards aims eventually to serve the interests of Chinese companies seeking to compete globally, as the Chinese Government's vision is to use the power of its large domestic market to influence the development of international standards. The United States remains very concerned about China's policies with regard to standards and has expressed, and will continue to express, concerns to China bilaterally and multilaterally as China continues to develop and issue implementing measures for its revised Standardization Law.

In October 2021, the Central Committee of the Chinese Communist Party and the State Council issued the Outline for the Development of National Standardization, which set targets for China's standardization system. It reiterates the desire for China's standardization system to be both guided by the government and driven by the market. It also calls for China's standardization system to refocus from quantity to quality and to shift from a domestic focus to an equal domestic and international focus.

The October 2021 Outline for the Development of National Standardization is partly based on an initiative that China announced in 2019, known as China Standards 2035. A lack of transparency with regard to the initiative's findings is troubling, particularly given longstanding global concerns about inadequate foreign participation in China's standards-setting processes, China's use of bespoke standards without basis, and certain licensing practices in China's standards-setting processes.

Cosmetics

Over the past several years, the United States and U.S. industry have engaged with China's Food and Drug Administration (FDA) and its successor, the National Medical Products Administration (NMPA), to highlight serious concerns with China's regulation of cosmetics. Currently, the regulation of cosmetics in China is governed by the Cosmetics Supervision and Administration Regulation (CSAR), which was issued in June 2020 and entered into effect in January 2021. The United States has repeatedly raised serious concerns with the CSAR and its numerous implementing measures, both bilaterally and in meetings of the WTO TBT Committee and the WTO Council for Trade in Goods, as have several other WTO Members.

The CSAR implementing measures contain provisions that would require companies to disclose full product formulations, ingredient suppliers, manufacturing methods, claims and safety data to both NMPA and local agents in China when products are registered or notified. In addition, these measures require companies to publish claims abstracts that may contain trade secrets and confidential business information on NMPA's website. The United States has expressed concern to China that its regulators are applying an approach that treats cosmetics as having much higher safety risks than is warranted. China's filing and registration requirements for cosmetics also significantly diverge from those in other major markets without a valid regulatory reason, making compliance very burdensome for exporters.

The United States is particularly concerned that the CSAR implementing measures do not provide adequate assurances as to how undisclosed information, trade secrets, and confidential business information will be protected from unauthorized disclosure. China also has not addressed requests from the United States and cosmetics right holders that NMPA provide a legally enforceable mechanism to monitor and protect the trade secrets and confidential business information typically identified by companies in their cosmetics filings.

In addition, China continues to require duplicative in-country testing to assess many product and ingredient safety and performance claims, without considering the applicability of international data or other means of establishing conformity. In response to U.S. concerns, China indicated that it would allow foreign laboratories with facilities in China to conduct its required testing. However, this change does not address the burden of China's requirement, which does not consider the applicability of testing conducted via internationally recognized laboratories outside of China, as well as other means used by foreign regulators and industries to assess the conformity of product and ingredient safety and performance claims.

The United States also questions China's assertion that its cosmetics good manufacturing practices (GMP) requirements provide equal treatment for imported and domestic general and special cosmetics. If the government of a cosmetics importer does not issue GMP or manufacturing export certificates, the only means that China provides to establish conformity with China's GMP for general cosmetics is animal testing. The United States and other WTO Members have made repeated requests that China consider the many alternative means available to establish GMP conformity, including utilizing second party or third party certificates based upon the ISO 22716 Cosmetics GMP Guidelines. Although China accepts some GMP certificates issued by U.S. state governments, the process remains inconsistent and uncertain for exporters.

In sum, after years of the United States engaging with China bilaterally and via the International Cooperation on Cosmetics Regulation, the WTO, and other fora to share views and expertise regarding the regulation of cosmetics, China has not yet addressed key U.S. concerns, including the use of good regulatory practices to facilitate cosmetics conformity assessment and avoid discriminatory treatment, nor has it provided confidence that U.S. intellectual property will be protected. Until China addresses these concerns, many U.S. companies will be impeded in accessing, or simply unable to access, the China market.

Sanitary and Phytosanitary Barriers

Overview

China remains a difficult and unpredictable market for U.S. agricultural exporters, largely because of inconsistent enforcement of regulations and selective intervention in the market by China's regulatory authorities. China's unwillingness to routinely follow science-based international standards and guidelines and to apply regulatory enforcement in a transparent and rules-based manner further complicates and impedes agricultural trade.

Agricultural Biotechnology Approvals

The Chinese regulatory approval process for agricultural biotechnology products creates significant uncertainty among developers and traders, slowing commercialization of products and creating adverse trade impacts, particularly for U.S. exports of corn, soy, canola, and alfalfa. Despite some recent product approvals, the process remains lengthy and opaque and continues to reflect significant asynchrony relative to approvals issued by regulatory authorities in many other countries.

For many years, biotechnology product approvals by China's regulatory authorities mainly materialized only after high-level political intervention. In the Phase One Agreement, the United States was able to secure China's commitment to implement a transparent, predictable, efficient, and science- and risk-based system for the review of products of agricultural biotechnology. The agreement also called for China to improve its regulatory authorization process for agricultural biotechnology products, including by completing reviews of products for use as animal feed or further processing within an average of no more than 24 months and by improving the transparency of its review process. China also agreed to work with importers and the U.S. Government to address situations involving low-level presence of genetically engineered (GE) materials in shipments. In addition, China agreed to establish a regulatory approval process for all food ingredients derived from genetically modified microorganisms (GMMs), rather than continue to restrict market access to GMM-derived enzymes only.

Since 2021, China's National Biosafety Committee (NBC) has issued biosafety certificates to foreign developers for several new GE products for import as feed or for processing, including alfalfa, canola, corn, cotton, soybean, and sugarcane products. Some of these approved products had been under review for more than 10 years. During the same time period, China has issued biosafety certificates to Chinese developers for well over 100 new corn, cotton, and soybean products for domestic cultivation. These approvals continue the recent trend of expanding domestic approvals for GE crops beyond cotton.

China's approach to agricultural biotechnology remains among the most significant commitments under the Phase One Agreement for which China has not demonstrated full implementation. Despite the commitments that China made, there remains a significant lack of transparency regarding the procedures for convening meetings of the NBC, including regarding dates and agenda items for these meetings and the process for notifying applicants of outcomes and for soliciting additional information to support product applications. While the NBC is required to meet at least two times each year, the meetings are not held pursuant to a regular schedule, and information about the meetings is not widely shared with the public in a transparent and predictable manner. In addition, in conducting its approval process, China continues to ask for information that is not relevant to a product's intended use or information that applicants have previously provided. For this and other reasons, China has not reduced the average time for its approval process for agricultural biotechnology products for feed or further processing to no more than 24 months, as it had committed to do in the Phase One Agreement, even when taking into account approvals made in 2023.

Poultry

In the Phase One Agreement, China agreed to maintain measures consistent with the World Organisation for Animal Health (WOAH) guidelines for future outbreaks of avian influenza. China also agreed to sign a regionalization protocol within 30 days of entry into force of the agreement, which it did, to help avoid unwarranted nationwide animal disease restrictions in the future. This protocol requires that China resume acceptance of poultry imports from states with high pathogenicity avian influenza (HPAI) detections within five days of receiving a U.S. report that the states are HPAI-free. Following the implementation of the protocol, China initially complied with its terms.

Starting in February 2022, the United States notified China of detections of HPAI in multiple U.S. states. In the ensuing months, several states recovered from these detections, and they were deemed HPAI-free by the United States. The United States submitted reports to China for these states and requested approval to resume exporting poultry from these states to China. As of the end of 2023, China had yet to confirm the restoration of market access.

Pork

China maintains an approach to U.S. pork that appears inconsistent with international standards, limiting the potential of an important export market given China's growing meat consumption and major shortages of domestic pork due to African swine fever. Specifically, China bans the use of certain veterinary drugs and growth promotants instead of accepting the maximum residue limits (MRLs) set by Codex Alimentarius (Codex).

As part of the Phase One Agreement, China agreed to broaden the list of pork products that are eligible for importation, including processed products such as ham and certain types of offal that are inspected by the U.S. Department of Agriculture Food Safety and Inspection Service for both domestic and international trade. China also agreed to conduct a risk assessment for ractopamine in swine and cattle as soon as possible and to establish a joint working group with the United States to discuss next steps based on the risk assessment. As of December 31, 2023, China has not completed the risk assessment and therefore has not yet made any progress on next steps based on the risk assessment, which will need to include the establishment of MRLs or import tolerances.

Beef

In May 2017, China committed to allow the resumption of U.S. beef shipments into its market consistent with international food safety and animal health standards. However, China back-tracked one month later and insisted that it would retain certain conditions relating to veterinary drugs, growth promotants, and animal health that were inconsistent with international food safety and animal health standards. For example, China insisted on maintaining a zero-tolerance ban on the use of beta-agonists and synthetic hormones commonly used by global cattle producers under strict veterinary controls and following Codex guidelines. Beef from only about three percent of U.S. cattle qualified for importation into China under these conditions.

In the Phase One Agreement, China also agreed to expand the scope of U.S. beef products allowed to be imported, to eliminate age restrictions on cattle slaughtered for export to China, and to recognize the U.S. beef and beef products' traceability system. China also agreed, to establish MRLs consistent with Codex standards and guidelines for three synthetic hormones legally used for decades in the United States. Where Codex standards and guidelines do not yet exist, China agreed to use MRLs established by other countries that have performed science-based risk assessments.

While China confirmed to the United States that it had adopted Codex-consistent MRLs for use of the three synthetic hormones in beef, China still has not published the MRLs. The lack of publication contributes to regulatory ambiguity for U.S. beef producers and traders, who remain uncertain regarding which products will be allowed for import into China. China's failure to publish the MRLs is another example of China's inadequate implementation of the Phase One Agreement.

GOVERNMENT PROCUREMENT

In its WTO accession agreement, China made a commitment to accede to the WTO Agreement on Government Procurement (GPA) and to open up its vast government procurement market to the United States and other GPA Parties. More than two decades later, this commitment remains unfulfilled, while China's government procurement has continued to grow. Indeed, government procurement at the central level of government alone as of December 31, 2023, totals approximately \$500 billion, even without considering procurement by state-owned enterprises.

The United States, the European Union (EU), and other GPA Parties have viewed China's GPA offers over the years as highly disappointing in scope and coverage. China submitted its sixth revised offer in October 2019. This offer showed progress in a number of areas, including thresholds, coverage at the sub-central level of government, entity coverage, and services coverage. Nonetheless, it fell short of U.S. expectations and remains far from acceptable to the United States and other GPA Parties, as significant deficiencies remain in a number of critical areas, including thresholds, entity coverage, coverage of state-owned enterprises, services coverage, and broad exclusions that would require offsets, domestic content requirements, and technology transfer for covered procurement. Although China has since stated that it will "speed up the process of joining" the GPA, it has not submitted a new offer since October 2019. China's most recent submission, made in June 2021, was only an update of its checklist of issues, which informs GPA Parties of changes to China's existing government procurement regime since its last update.

China's current government procurement regime is governed by two important laws. The Government Procurement Law, administered by the Ministry of Finance, governs purchasing activities conducted with fiscal funds by state organs and other organizations at all levels of government in China, but does not apply to procurements by state-owned enterprises. The Tendering and Bidding Law falls under the jurisdiction of the National Development and Reform Commission (NDRC) and imposes uniform tendering and bidding procedures for certain classes of procurement projects in China, notably construction and works projects, without regard for the type of entity (e.g., a government agency or a state-owned enterprise) that conducts the procurement. Both laws cover important procurements that GPA Parties would consider to be government-procurement eligible for coverage under the GPA.

China's Foreign Investment Law, which entered into force in January 2020, and the related October 2021 Ministry of Finance Notice 35 state that China will provide equal treatment to foreign companies invested in China and to domestic Chinese companies with regard to government procurement opportunities. However, foreign companies report a marked increase in preference for domestic Chinese companies over foreign companies invested in China.

In July 2022, the Ministry of Finance issued draft amendments to the Government Procurement Law. Among other changes, these draft amendments would codify the requirement that officials at all levels of government refrain from purchasing non-domestic products whenever domestic products are available. The draft amendments, which have not yet been finalized, do not define the term "domestic product."

In August 2023, China's State Council issued the Opinions on Further Optimizing the Foreign Investment Environment and Enhancing the Attraction of Foreign Investment, known as Document 11. One of the 24 topics addressed in Document 11 is government procurement. Specifically, Article 6 of Document 11 offers various suggestions for how central level ministries and sub-central government authorities could work to ensure that foreign-invested enterprises can participate in China's government procurement market, consistent with existing Chinese law. In Article 6, the State Council recommends clarifying the meaning of "produced in China" as it relates to China's government procurement laws and regulations and providing unspecified support for foreign-invested enterprises to encourage them to develop their cutting-edge

products in China. It also recommends accelerating amendments to the Government Procurement Law. While China's leadership has been touting Document 11 to the foreign business community as a demonstration of China's sincerity about fostering a more welcoming environment for foreign companies in China, Document 11 provides little clarity as to how its suggestions would be implemented, nor does it identify timelines for acting on them. Moreover, many of the suggestions fail to demonstrate a willingness to make meaningful changes, as they either restate outcomes that China previously achieved or offer outcomes that would fall short of China's WTO commitments. Going forward, the United States expects China to make any forthcoming draft implementing measures accessible to the public, including the foreign business community, and to provide a reasonable period of time to submit comments on them.

Under both its government procurement regime and its tendering and bidding regime, China continues to implement policies favoring products, services, and technologies made or developed by Chinese-owned and Chinese-controlled companies through explicit and implicit requirements that hamper foreign companies from fairly competing in China. For example, notwithstanding China's commitment to equal treatment, foreign companies continue to report cases in which "domestic brands" and "indigenous designs" are required in tendering documents. Since China has not yet adopted clear rules on what constitutes a "domestic product," procurement officials often prefer to err on the side of caution and purchase products from domestic Chinese companies.

INTELLECTUAL PROPERTY PROTECTION

Overview

After its accession to the WTO, China undertook a wide-ranging revision of its framework of laws and regulations aimed at protecting the intellectual property rights of domestic and foreign right holders, as required by the WTO Agreement on Trade-Related Aspects of Intellectual Property Rights (the TRIPS Agreement). Despite various plans and directives issued by the State Council, inadequacies in China's IP protection and enforcement regime continue to present serious barriers to U.S. exports and investment. As a result, as in 2022, China was placed on the Priority Watch List in USTR's [2023 Special 301 Report](#). In addition, several markets in China were among those listed in the [2023 Review of Notorious Markets for Counterfeiting and Piracy](#) (Notorious Markets List), which identifies online and physical markets that exemplify key challenges in the global struggle against piracy and counterfeiting and explains the harm not only to U.S. businesses, but also to U.S. workers.

The Phase One Agreement addresses numerous longstanding U.S. concerns relating to China's inadequate intellectual property protection and enforcement. Specifically, the agreement requires China to revise its legal and regulatory regimes in a number of ways in the areas of trade secrets, pharmaceutical-related intellectual property, patents, trademarks, and geographical indications. In addition, the agreement requires China to make numerous changes to its judicial procedures and to establish deterrent-level penalties. China must also take a number of steps to strengthen enforcement against pirated and counterfeit goods, including in the online environment, at physical markets, and at the border.

China has published a number of draft measures for comment and issued some final measures relating to implementation of the intellectual property chapter of the Phase One Agreement. Notably, China amended the Patent Law, the Copyright Law, and the Criminal Law. China has also reported increased enforcement actions against counterfeit medicines and increased customs actions against pirated and counterfeit goods. At the same time, China has outstanding work to finalize the draft measures that it has published and to publish other draft measures, such as certain patent, geographical indications, and trade secret measures, in accordance with the Intellectual Property Action Plan that it released in April 2020. In addition, China has yet to demonstrate that it has: (1) published data online on a quarterly basis regarding enforcement actions

against counterfeit goods with health and safety risks, enforcement actions at physical markets, and enforcement actions at the border; (2) increased enforcement actions against counterfeits with health and safety risks and at physical markets; (3) increased training of customs personnel; or (4) ensured the use of only licensed software in government agencies and state-owned enterprises. The United States continues to monitor China's implementation of the intellectual property chapter of the Phase One Agreement, including the impact of the final measures that have been issued.

Trade Secrets

Serious inadequacies in the protection and enforcement of trade secrets in China have been the subject of high-profile engagement between the United States and China in recent years. Several instances of trade secret theft for the benefit of Chinese companies have occurred both within China and outside of China. Offenders in many cases continue to operate with impunity. Particularly troubling are reports that actors affiliated with the Chinese Government and the Chinese military have infiltrated the computer systems of U.S. companies, stealing terabytes of data, including the companies' proprietary information and intellectual property, for the purpose of providing commercial advantages to Chinese enterprises.

In high-level bilateral dialogues with the United States over the years, China has committed to issue judicial guidance to strengthen its trade secrets regime. China has also committed not to condone state-sponsored misappropriation of trade secrets for commercial use. In addition, the United States has urged China to make certain key amendments to its trade secrets-related laws and regulations, particularly with regard to a draft revision of the Anti-Unfair Competition Law. The United States has also urged China to take actions to address inadequacies across the range of state-sponsored actors and to promote public awareness of trade secrets disciplines.

At the November 2016 U.S.–China Joint Commission on Commerce and Trade (JCCT) meeting, China claimed that it was strengthening its trade secrets regime and bolstering several areas of importance, including the availability of evidence preservation orders and damages based on market value, as well as the issuance of a judicial interpretation on preliminary injunctions and other matters. China amended the Anti-Unfair Competition Law, effective January 2018 and April 2019, as well as the Administrative Licensing Law, effective April 2019, and the Foreign Investment Law, effective January 2020. Nevertheless, the amendments still do not fully address critical shortcomings in the scope of protections and obstacles to enforcement. In 2022, China published additional draft amendments to the Anti-Unfair Competition Law, but they contain few changes to the law's trade secrets provisions.

The Phase One Agreement significantly strengthens protections for trade secrets and enforcement against trade secret theft in China. In particular, the chapter on intellectual property requires China to expand the scope of civil liability for misappropriation beyond entities directly involved in the manufacture or sale of goods and services, to cover acts such as electronic intrusions as prohibited acts of trade secret theft, and to shift the burden of proof in civil cases to the defendants when there is a reasonable indication of trade secret theft. It also requires China to make it easier for rights holders to obtain preliminary injunctions to prevent the use of stolen trade secrets, to allow for initiation of criminal investigations without the need to show actual losses, to ensure that criminal enforcement is available for willful trade secret misappropriation, and to prohibit government personnel and third-party experts and advisors from engaging in the unauthorized disclosure of undisclosed information, trade secrets, and confidential business information submitted to the government.

In 2020, China published various measures relating to civil, criminal, and administrative enforcement of trade secrets. In September 2020, the Supreme People's Court issued the Provisions on Several Issues Concerning the Application of Law in Civil Cases of Trade Secret Infringement and the Interpretation III on Several Issues Concerning the Application of Law in Handling Criminal Cases of Infringement of

Intellectual Property Rights. In September 2020, the Supreme People's Procuratorate and the Ministry of Public Security also issued the Decision on Amendment of Docketing for Prosecution of Criminal Trade Secrets Infringement Cases Standards. These measures relate to issues such as the scope of liability for trade secret misappropriation, prohibited acts of trade secret theft, preliminary injunctions, and thresholds for initiations of criminal investigations for trade secret theft. In December 2020, the National People's Congress passed amendments to the Criminal Law that included changes to the thresholds for criminal investigation and prosecution and the scope of criminal acts of trade secret theft. The Criminal Law amendments require revisions to certain previously issued judicial interpretations and prosecution standards. However, three years after the passage of the Criminal Law amendments, these other measures remain unchanged, and implementation of the Criminal Law amendments therefore remains incomplete. Indeed, China has only published a draft judicial interpretation. The United States will continue to monitor the effectiveness of all of these measures.

Bad Faith Trademark Registration

The continuing registration of trademarks in bad faith in China remains a significant concern. For example, trademark squatters attempt to take advantage when a genuine trademark owner has not yet registered its trademark in China by registering that trademark and then trying to sell it to the genuine trademark owner. Bad faith trademark registration also occurs when trademarks intending to deceive or confuse consumers are registered.

At the November 2016 JCCT meeting, China publicly noted the harm that can be caused by bad faith trademarks and asserted that it was taking further steps to combat bad faith trademark filings. Amendments to the Trademark Law made in 2019 and subsequent implementing measures, including the State Administration for Market Regulation's (SAMR) Provisions on Standardizing Applications for Registrations of Trademarks issued in 2019 and the Trademark Examination and Review Guidelines updated in 2021 by the China National Intellectual Property Administration (CNIPA), require the disallowance of bad faith trademark applications. In January 2023, China proposed further amendments to the Trademark Law regarding bad faith trademarks.

However, implementation in this area by China as of December 31, 2023, suggests that right holders remain insufficiently protected, as bad faith trademarks remain widespread and problems persist with the large number of inconsistent decisions, low rate of success for oppositions, lack of transparency in opposition proceedings, and unavailability of default judgments against applicants who fail to appear in proceedings. Onerous documentation requirements are also an ongoing concern for right holders. China acceded to the Convention of 5 October 1961 Abolishing the Requirement of Legalization for Foreign Public Documents (Apostille Convention), effective November 2023. The United States will monitor China's implementation of the obligations under the Apostille Convention and whether it addresses right holders' concerns regarding foreign government document legalization requirements.

As a result of these deficiencies, U.S. companies across industry sectors continue to face Chinese applicants registering their marks and "holding them for ransom" or seeking to establish a business building off of U.S. companies' global reputations. The Phase One Agreement requires China to ensure adequate and effective protection and enforcement of trademark rights, particularly against bad faith trademark registrations. The United States will continue to monitor closely developments in this area of long-standing concern.

Online Infringement

Online piracy continues on a large scale in China, affecting a wide range of industries, including those involved in distributing legitimate music, motion pictures, books and journals, software, and video games.

While increased enforcement activities have helped stem the flow of online sales of some pirated offerings, much more sustained action and attention is needed to make a meaningful difference for content creators and right holders, particularly small and medium-sized enterprises. In response to the COVID-19 pandemic, reports indicate that many infringers have moved online to distribute their pirated and counterfeit goods, which further increases the need for targeted and sustained enforcement measures in the online environment.

The United States has urged China to consider ways to create a broader policy environment to help foster the growth of healthy markets for licensed and legitimate content. The United States has also urged China to revise existing rules that have proven to be counterproductive.

At the November 2016 JCCT meeting, China agreed to actively promote electronic commerce-related legislation, strengthen supervision over online infringement and counterfeiting, and work with the United States to explore the use of new approaches to enhance online enforcement capacity. In December 2016 and November 2017, China published drafts of a new E-Commerce Law for public comment. In written comments, the United States stressed that the final version of this law should not undermine the existing notice-and-takedown system and should promote effective cooperation in deterring online infringement. In August 2018, China adopted its new E-Commerce Law, which entered into force in January 2019. This law was an opportunity for China to institute strong provisions on intellectual property protection and enforcement for its electronic commerce market, which is the largest in the world. However, as finalized, the law instead introduced provisions that weaken the ability of right holders to protect their rights online and that alleviate the liability of China-based electronic commerce platforms for selling counterfeit and other infringing goods.

The Phase One Agreement requires China to provide enforcement procedures that permit effective and expeditious action against infringement in the online environment and to require expeditious takedowns and to ensure the validity of takedown notices and counter-notifications. It also requires China to take effective action against electronic commerce platforms that fail to take necessary measures against infringement.

In May 2020, the National People's Congress issued the Civil Code, which included updated notice-and-takedown provisions. In September 2020, the Supreme People's Court issued Guiding Opinions on Hearing Intellectual Property Disputes Involving E-Commerce Platform and the Official Reply on the Application of Law in Network-Related Intellectual Property Infringement Disputes. These measures relate to issues such as expeditious takedowns and the validity of notices and counter-notifications, but have only recently taken effect. In November 2020, the National People's Congress adopted long-pending amendments to the Copyright Law, including provisions relating to increasing civil remedies for copyright infringement, new rights of public performance and broadcasting for producers of sound recordings, and protections against circumvention of technological protection measures. Right holders have welcomed these developments but have noted the need for effective implementation as well as new measures to address online piracy. The United States will closely monitor the impact of these measures going forward.

In August 2021, SAMR issued draft amendments to the E-Commerce Law for public comment. These draft amendments further attempt to address concerns that have been raised about procedures and penalties under China's notice-and-takedown system.

Counterfeit Goods

Counterfeiting in China remains widespread and affects a wide range of goods. In April 2019, China amended its Trademark Law, effective November 2019, to require civil courts to order the destruction of counterfeit goods, but these amendments still do not provide the full scope of civil remedies for right

holders. One of many areas of particular U.S. concern involves medications. Despite years of sustained engagement by the United States, China has failed to adequately improve its regulation of the manufacture of active pharmaceutical ingredients to prevent their use in counterfeit and substandard medications. At the July 2014 United States–China Strategic and Economic Dialogue (S&ED) meeting, China committed to develop and seriously consider amendments to the Drug Administration Law that will require regulatory control of the manufacturers of bulk chemicals that can be used as active pharmaceutical ingredients. At the June 2015 S&ED meeting, China further committed to publish revisions to the Drug Administration Law in draft form for public comment and to consider the views of the United States and other relevant stakeholders. In October 2017, China published limited draft revisions to the Drug Administration Law and stated that future proposed revisions to the remainder of this law would be forthcoming. Although the final Drug Administration Law, issued in August 2019, requires pharmaceuticals products and active pharmaceutical ingredients to meet manufacturing standards, it remains unclear how these requirements will be implemented or enforced.

The Phase One Agreement requires China to take effective enforcement action against counterfeit pharmaceuticals and related products, including active pharmaceutical ingredients, and to significantly increase actions to stop the manufacture and distribution of counterfeits with significant health or safety risks. The agreement also requires China to provide that its judicial authorities shall order the forfeiture and destruction of pirated and counterfeit goods, along with the materials and implements predominantly used in their manufacture. In addition, the agreement requires China to significantly increase the number of enforcement actions at physical markets in China and against goods that are exported or in transit. It further requires China to ensure, through third-party audits, that government agencies and state-owned enterprises only use licensed software.

In August 2020, SAMR issued the Opinions on Strengthening the Destruction of Infringing and Counterfeit Goods, and the State Council amended the Provisions on the Transfer of Suspected Criminal Cases by Administrative Organs for Law Enforcement, which relate to the transfer of intellectual property cases from administrative authorities to criminal authorities. China has reported increased enforcement actions against counterfeit medicines and increased customs actions against pirated and counterfeit goods, but has yet to demonstrate that it has increased enforcement actions against counterfeits with health and safety risks and at physical markets, increased training of customs personnel, and ensured the use of only licensed software in government agencies and state-owned enterprises.

Indigenous Innovation

Policies aimed at promoting China’s “indigenous innovation” continue to represent an important component of China’s industrialization efforts. Through intensive, high-level bilateral engagement with China since 2009, the United States has attempted to address these policies, which provide various preferences when intellectual property is owned or developed in China, both broadly across sectors of China’s economy and specifically in the government procurement context. For example, at the May 2012 meeting of the S&ED, China committed to treat intellectual property owned or developed in other countries the same as intellectual property owned or developed in China. The United States also used the JCCT process in 2012 and subsequent discussions to press China to revise or eliminate specific measures that appeared to be inconsistent with this commitment. At the December 2014 JCCT meeting, China clarified and underscored that it will treat intellectual property owned or developed in other countries in the same manner as domestically owned or developed intellectual property. Once again, however, these commitments were not fulfilled. China continues to pursue myriad policies that require or favor the ownership or development of intellectual property in China.

The United States secured a series of similar commitments from China in the government procurement context, where China agreed to de-link indigenous innovation policies at all levels of the Chinese

Government from government procurement preferences, including through the issuance of a State Council measure mandating that provincial and local governments eliminate any remaining linkages by December 2011. Many years later, however, this promise had not been fulfilled. At the November 2016 JCCT meeting, in response to U.S. concerns regarding the continued issuance of scores of inconsistent measures, China announced that its State Council had issued a document requiring all agencies and all sub-central governments to “further clean up related measures linking indigenous innovation policy to the provision of government procurement preference.”

Over the years, the underlying thrust of China’s indigenous innovation policies has remained unchanged, as China’s leadership has continued to emphasize the necessity of advancing indigenous innovation capabilities. Through plans such as the 14th Five-Year Plan for the Protection and Utilization of National Intellectual Property Rights, China has continued to implement discriminatory policies encouraging “indigenous intellectual property rights” and “core technologies” that are owned or developed in China. Accordingly, USTR has been using mechanisms like a Section 301 investigation to seek to address, among other things, China’s use of indigenous innovation policies to force or pressure foreigners to own or develop their intellectual property in China.

SERVICES BARRIERS

Overview

The prospects for U.S. service suppliers in China should be promising, given the size of China’s market. Nevertheless, the U.S. share of China’s services market remains well below the U.S. share of the global services market, and the Organization for Economic Cooperation and Development continues to rate China’s services regime as one of the most restrictive among the world’s major economies.

In 2023, numerous challenges persisted in a number of services sectors. As in past years, Chinese regulators continued to use discriminatory regulatory processes, informal bans on entry and expansion, case-by-case approvals in some services sectors, overly burdensome licensing and operating requirements, and other means to frustrate the efforts of U.S. suppliers of services to achieve their full market potential in China. These policies and practices affect U.S. service suppliers across a wide range of sectors, including cloud computing, telecommunications, film production and distribution, online video and entertainment services, express delivery, and legal services. In addition, China’s Cybersecurity Law and related implementing measures include mandates to purchase domestic information and communications technology (ICT) products and services, while China’s Cybersecurity Law, Data Security Law and Personal Information Protection Law and related implementing measures include excessive restrictions on cross-border data flows, and excessive requirements to store and process data locally. These types of data measures undermine U.S. services suppliers’ ability to take advantage of market access opportunities in China by prohibiting or severely restricting cross-border transfers of information that are routine in the ordinary course of business and are fundamental to any business activity. China’s data localization requirements also raise concerns about state surveillance. In addition, China has failed to fully address U.S. concerns in areas that have been the subject of WTO dispute settlement, including electronic payment services and theatrical film importation and distribution.

The Phase One Agreement addresses a number of longstanding trade and investment barriers to U.S. providers of a wide range of financial services, including banking, insurance, securities, asset management, credit rating, and electronic payment services, among others. The barriers addressed in the agreement include joint venture requirements, foreign equity limitations, and various discriminatory regulatory requirements. Removal of these barriers is designed to allow U.S. financial service providers to compete on a more level playing field and expand their services export offerings in the China market. Nevertheless,

China's excessive restrictions on cross-border data flows could continue to create significant challenges for U.S. financial service providers in China.

Banking Services

Although China has opened its banking sector to foreign competition in the form of wholly foreign-owned banks, China has maintained restrictions on market access in other ways that have kept foreign banks from establishing, expanding, and obtaining significant market share in China. Recently, however, China has taken some steps to ease or remove market access restrictions.

For example, China has removed a number of long-standing barriers for foreign banks, including the \$10 billion minimum asset requirement for establishing a foreign bank in China and the \$20 billion minimum asset requirement for setting up a Chinese branch of a foreign bank. China has also removed the cap on the equity interest that a single foreign investor can hold in a Chinese-owned bank.

In the Phase One Agreement, China committed to remove some of these barriers and to expand opportunities for U.S. financial institutions, including bank branches, to supply securities investment fund custody services by considering their global assets when they seek licenses. China also agreed to review and approve qualified applications by U.S. financial institutions for securities investment fund custody licenses on an expeditious basis. In addition, China committed to consider the international qualifications of U.S. financial institutions when evaluating license applications for Type-A lead underwriting services for all types of non-financial debt instruments in China.

Securities, Asset Management and Futures Services

In the Phase One Agreement, China committed to remove the foreign equity caps in the securities, asset management, and futures sectors by no later than April 1, 2020. It also committed to ensure that U.S. suppliers of securities, asset management, and futures services are able to access China's market on a non-discriminatory basis, including with regard to the review and approval of license applications.

Consistent with its commitments in the Phase One Agreement, China announced that it would allow wholly foreign-owned companies for the securities and asset (*i.e.*, fund) management sectors as of April 1, 2020, and that it would allow wholly foreign-owned companies for the futures sector as of January 1, 2020. Prior to these announcements, China had maintained a foreign equity cap of 51 percent for these sectors. Over the past four years, some U.S. financial institutions have applied for and received licenses to operate as wholly foreign-owned enterprises in these sectors. The United States is monitoring these and other developments as U.S. companies continue to seek to obtain licenses and undertake operations in these sectors.

Insurance Services

In the Phase One Agreement, China committed to accelerate the removal of the foreign equity caps for life, pension, and health insurance so that they are removed no later than April 1, 2020. In addition, it confirmed the removal of the 30-year operating requirement, known as a "seasoning" requirement, which had been applied to foreign insurers seeking to establish operations in China in all insurance sectors. China also committed to remove all other discriminatory regulatory requirements and processes and to expeditiously review and approve license applications.

Consistent with China's commitments in the Phase One Agreement, the China Banking and Insurance Regulatory Commission (CBIRC) announced that China would allow wholly foreign-owned companies for the life, pension, and health insurance sectors as of January 1, 2020. Prior to this announcement, China had

maintained foreign equity caps and only permitted foreign companies to establish as Chinese-foreign joint ventures in these sectors. In December 2020, the CBIRC issued a measure that provided further transparency regarding its intention to allow foreign-invested companies to take advantage of this opening.

In other insurance sectors, the United States continues to encourage China to establish more transparent procedures so as to better enable foreign participation in China's market. Sectors in need of more transparency include export credit insurance and political risk insurance.

Finally, some U.S. insurance companies established in China have encountered difficulties in getting the CBIRC, replaced by the National Administration of Financial Regulation (NAFR) in March 2023, to issue timely approvals of their requests to open up new internal branches to expand their operations. The United States continues to urge NAFR to issue timely approvals when U.S. insurance companies seek to expand their branch networks in China.

Electronic Payment Services

In a WTO dispute that it launched in 2010, the United States challenged China's restrictions on foreign companies, including major U.S. credit and debit card processing companies, which had been seeking to supply electronic payment services to banks and other businesses that issue or accept credit and debit cards in China. The United States argued that China had committed in its WTO accession agreement to open up this sector in 2006, and a WTO panel agreed with the United States in a decision issued in 2012. China subsequently agreed to comply with the WTO panel's rulings in 2013, but China did not allow foreign suppliers to apply for licenses until June 2017, when China's regulator—the People's Bank of China (PBOC)—finalized the establishment of a two-step licensing process in which a supplier must first complete one year of preparatory work before being able to apply for a license.

As of January 2020, when the United States and China entered into the Phase One Agreement, no foreign supplier of electronic payment services had been able to secure the license needed to operate in China's market due largely to delays caused by PBOC. At times, PBOC had refused even to accept applications to begin preparatory work from U.S. suppliers, the first of two required steps in the licensing process. Meanwhile, throughout the years that China actively delayed opening up its market to foreign suppliers, China's national champion, China Union Pay, has used its exclusive access to domestic currency transactions in the China market, and the revenues that come with it, to support its efforts to build out its electronic payment services network abroad, including in the United States. In other words, China consciously decided to maintain market-distorting practices that benefit its own companies, even in the face of adverse rulings at the WTO.

In the Phase One Agreement, China committed to ensure that PBOC operates an improved and timely licensing process for U.S. suppliers of electronic payment services so as to facilitate their access to China's market. In June 2020, four months after the entry into force of the Phase One Agreement, American Express became the first foreign supplier of electronic payment services to secure a license from PBOC to operate in China's market. In November 2023, after years of delays, Mastercard was finally able to secure a license to operate in the China market. Meanwhile, PBOC has been delaying action for even longer periods of time on the licensing application submitted by another U.S. supplier, Visa. The United States continues to closely monitor this situation with concern.

Internet-Enabled Payment Services

PBOC first issued regulations for non-bank suppliers of online payment services in 2010, and it subsequently began processing applications for licensees. Regulations were further strengthened in 2015, with additional provisions aimed at increasing security and traceability of transactions. According to a U.S.

industry report, of more than 200 licenses issued as of June 2014, only two had been issued to foreign-invested suppliers, and those two were for very limited services. This report provided clear evidence supporting stakeholder concerns about the difficulties they faced entering China's market and the slow process foreign firms face in getting licensed. In 2018, PBOC announced that it would allow foreign suppliers, on a nondiscriminatory basis, to supply Internet-enabled payment services. At the same time, as in many other sectors, PBOC requires suppliers to localize their data and facilities in China. In January 2021, PayPal became the first foreign company to obtain full ownership of a payment platform in China, along with a license to supply payment services. The United States will continue to closely monitor developments in this area.

Telecommunications Services

China's restrictions on basic telecommunications services, such as an informal ban on new entry, a 49 percent foreign equity cap, a requirement that foreign suppliers can only enter into joint ventures with state-owned enterprises and exceedingly high capital requirements, have blocked foreign suppliers from accessing China's basic telecommunications services market. Since China acceded to the WTO almost two decades ago, not a single foreign firm has succeeded in establishing a new joint venture to enter this sector.

Restrictions maintained by China on less highly regulated value-added telecommunications services also have created serious barriers to market entry for foreign suppliers seeking to enter this sector. These restrictions include opaque and arbitrary licensing procedures, foreign equity caps, and periodic, unjustified moratoria on the issuance of new licenses. As a result, only a few dozen foreign-invested suppliers have secured licenses to provide value-added telecommunications services, while there are thousands of licensed domestic suppliers.

Internet Regulatory Regime

China's Internet regulatory regime is restrictive and non-transparent, affecting a broad range of commercial services activities conducted via the Internet, and is overseen by multiple agencies without clear lines of jurisdiction. China's Internet economy has boomed over the past decade and is second in size only to that of the United States. Growth in China has been marked in services sectors similar to those found in the United States, including retail websites, search engines, vocational and adult online education, travel, advertising, audiovisual and computer gaming services, electronic mail and text, online job searches, Internet consulting, mapping services, applications, web domain registration, and electronic trading. However, in the China market, Chinese companies dominate due in large part to restrictions imposed on foreign companies by the Chinese Government. At the same time, foreign companies continue to encounter major difficulties in attempting to offer these and other Internet-based services on a cross-border basis.

China continues to engage in extensive blocking of legitimate websites, imposing significant costs on both suppliers and users of web-based services and products. China currently blocks most of the largest global sites, and U.S. industry research has calculated that more than 10,000 sites are blocked, affecting billions of dollars in business, including communications, networking, application stores, news, and other sites. Even when sites are not permanently blocked, the often arbitrary implementation of blocking, and the performance-degrading effect of filtering all traffic into and outside of China, significantly impair the supply of many cross-border services, often to the point of making them unviable.

Voice over Internet Protocol Services

While computer-to-computer Voice over Internet Protocol (VoIP) services are permitted in China, China's regulatory authorities have restricted the ability to offer VoIP services interconnected to the public switched telecommunications network (*i.e.*, to call a traditional phone number) to basic telecommunications service

licensees. There is no obvious rationale for such a restriction, which deprives consumers of a useful communication option, and the United States continues to advocate for eliminating it.

Cloud Computing Services

Especially troubling is China's treatment of foreign companies seeking to participate in the development of cloud computing services, including computer data processing and storage services and software application services provided over the Internet. China prohibits foreign companies established in China from directly providing any of these services. Given the difficulty in providing these services on a cross-border basis (largely due to restrictive Chinese policies), the only option that a foreign company has to access the China market is to establish a contractual partnership with a Chinese company, which is the holder of the necessary Internet data center license, and turn over its valuable technology, intellectual property, know-how, and branding as part of this arrangement. While the foreign service supplier earns a licensing fee from the arrangement, it has no direct relationship with customers in China and no ability to independently develop its business. It has essentially handed over its business to a Chinese company that may well become a global competitor. This treatment has generated serious concerns in the United States and among other WTO Members as well as U.S. and other foreign companies.

In major markets, including China, cloud computing services are typically offered through commercial presence in one of two ways. They are offered as an integrated service in which the owner and operator of a telecommunication network also offers computing services, including data storage and processing function, over that network, or they are offered as a stand-alone computer service, with connectivity to the computing service site provided separately by a telecommunications service supplier. Although China's commitments under the WTO General Agreement on Trade in Services (GATS) include services relevant to both of these approaches, neither one is currently open to foreign-invested companies in China.

Audiovisual and Related Services

China prohibits foreign companies from providing film production and distribution services in China. In addition, China's restrictions in the area of theater services have wholly discouraged investment by foreign companies in cinemas in China.

China's restrictions on services associated with television and radio greatly limit participation by foreign suppliers. For example, China prohibits retransmission of foreign TV channels, foreign investment in TV production, and foreign investment in TV stations and channels. China also imposes quotas on the amount of foreign programming that can be shown on a Chinese TV channel each day. In addition, in September 2018, the National Radio and Television Administration (NRTA) issued a problematic draft measure that would impose new restrictions in China's already highly restricted market for foreign creative content. It would require that spending on foreign content account for no more than 30 percent of available total programs in each of several categories, including foreign movies, TV shows, cartoons, documentaries, and other foreign TV programs, made available for display via broadcasting institutions and online audiovisual content platforms. It also would prohibit foreign TV shows in prime time. Although this measure has not yet been issued in final form, it continues to raise serious concerns, as it appears that, as a matter of practice, it has been implemented in China since 2021, including by online audiovisual content platforms.

Theatrical Films

In February 2012, the United States and China reached an alternative resolution with regard to certain rulings relating to the importation and distribution of theatrical films in a WTO dispute that the United States had won. The two sides signed a memorandum of understanding (MOU) providing for substantial increases in the number of foreign films imported and distributed in China each year, along with substantial

additional revenue for U.S. film producers. However, China has not yet fully implemented its MOU commitments, including with regard to critical commitments to open up film distribution opportunities for imported films. As a result, the United States has been pressing China for full implementation of the MOU.

In 2017, in accordance with the terms of the MOU, the two sides began discussions regarding the provision of further meaningful compensation to the United States in an updated MOU. These discussions continued until March 2018, before stalling when China embarked on a major government reorganization that involved significant changes for China's Film Bureau. Discussions resumed in 2019 as part of the broader U.S.-China trade negotiations that began following a meeting between the two countries' Presidents on the margins of the Group of 20 Heads of State and Government Summit in Buenos Aires in December 2018. As of December 31, 2023, no agreement has been reached on the further meaningful compensation that China owes to the United States. The United States will continue pressing China to fulfill its obligations.

Online Video and Entertainment Services

China restricts the online supply of foreign video and entertainment services through measures affecting both content and distribution platforms, as part of its authoritarian governance structure. China requires foreign companies to license their content to Chinese companies and also imposes burdensome restrictions on content, which are implemented through exhaustive content review requirements that are based on vague and otherwise non-transparent criteria. With respect to distribution platforms, NRTA has required Chinese online platform suppliers to spend no more than 30 percent of their acquisition budget on foreign content. NRTA has also instituted numerous measures that prevent foreign suppliers from qualifying for a license, such as requirements that video platforms all be Chinese-owned. NRTA and other Chinese regulatory authorities have also taken actions to prevent the cross-border supply of online video services, which may implicate China's GATS commitments relating to video distribution.

Legal Services

China restricts the types of legal services that can be provided by foreign law firms, including through a prohibition on foreign law firms hiring lawyers qualified to practice Chinese law. It also restricts the ability of foreign law firms to represent their clients before Chinese Government agencies and imposes lengthy delays on foreign law firms seeking to establish new offices. In addition, beginning with the version of China's Foreign Investment Negative List that entered into force in July 2020, China has added an explicit prohibition on the ability of a foreign lawyer to become a partner in a domestic law firm. Reportedly, China is also considering draft regulatory measures that would even further restrict the ability of foreign law firms to operate in China.

Express Delivery Services

The United States continues to have concerns regarding China's implementation of the 2009 Postal Law and related regulations through which China prevents foreign service suppliers from participating in the document segment of its domestic express delivery market. Meanwhile, in the package segment, China applies overly burdensome and inconsistent regulatory approaches and reportedly has provided more favorable treatment to Chinese service suppliers when awarding business permits. China also does not always allow foreign service suppliers to participate on an equal basis in the development of laws, regulations, and other measures, including standards, for the express delivery services sector, nor does China always publicly announce the requirements for obtaining a business license.

BARRIERS TO DIGITAL TRADE

Data Restrictions

In 2023, China continued to build out its expansive state control over the collection, storage, processing, and sharing of data. China's Data Security Law entered into force in September 2021, and China's Personal Information Protection Law entered into force in November 2021. These laws operate together with the Cybersecurity Law, which took effect in June 2017, the National Security Law, which has been in effect since 2015, and various implementing measures, including the Security Assessment Measures for Outbound Transfers of Data, which took effect in September 2022, to prohibit or severely restrict cross-border transfers of important data, a broadly and vaguely defined term, and, in certain cases, personal information collected by companies through their operations in China. These laws and implementing measures also impose local data storage and processing requirements on companies operating in China that collect important data and, in certain cases, personal information. China's data localization requirements also raise concerns about state surveillance.

It has been reported that, as a result of China's implementation of the Security Assessment Measures for Outbound Transfers of Data, China has a backlog of thousands of applications from companies seeking to export data. In addition, in September 2023, China released a draft of revisions to the Security Assessment Measures for Outbound Transfers of Data, while allowing only a two-week public comment period. Many aspects of the draft revisions appear troubling.

Cross-border transfers of data are routine in the ordinary course of business in many sectors and are fundamental to business activity in those sectors. Given the wide range of businesses and business activities that are dependent on cross-border transfers of data and flexible access to global computing facilities, these developments continue to generate serious concerns in the United States and many other countries.

Secure and Controllable Information and Communications Technology Policies

Implementing measures for China's Cybersecurity Law remain a continued source of serious concern since the law's enactment in 2016. These measures are overbroad and serve to promote domestic industry at the expense of China's trading partners. Of particular concern are the Measures for Cybersecurity Review, first issued in 2016 and later updated in 2020 and 2021. This measure implements one element of the cybersecurity regime created by the Cybersecurity Law. Specifically, the measure puts in place a review process to regulate the purchase of ICT products and services by critical information infrastructure operators and online platform operators in China. The review process is to consider, among other things, potential national security risks related to interruption of service, data leakage, and reliability of supply chains. In addition, in September 2022, China published a draft revision of the Cybersecurity Law with a 15-day public comment period. The draft revision would introduce penalties on operators of critical information infrastructure who use products or services that have not undergone the required security review, and it would also raise fines for certain violations of the Cybersecurity Law.

As demonstrated in implementing measures for the Cybersecurity Law, China's approach is to impose severe restrictions on a wide range of U.S. and other foreign ICT products and services with an apparent goal of supporting China's technology localization policies by encouraging the replacement of foreign ICT products and services with domestic ones. U.S. and other foreign stakeholders and governments around the world expressed serious concerns about requirements that ICT equipment and other ICT products and services in critical sectors be secure and controllable, as these requirements are used by the Chinese Government to disadvantage non-Chinese firms.

In addition to the Cybersecurity Law, China has referenced its secure and controllable requirements in a variety of measures dating back to 2013. Through these measures, China has mandated that Chinese information technology users purchase Chinese products and favor Chinese service suppliers, imposed domestic research and development (R&D) requirements, considered the location of R&D as a cybersecurity risk factor and required the transfer or disclosure of source code or other intellectual property. In the 2019 update of the Measures for Cybersecurity Review, China added political, diplomatic, and other non-market developments as potential risk factors to be considered.

In addition, in 2015, China enacted a National Security Law and a Counterterrorism Law, which include provisions citing not only national security and counterterrorism objectives but also economic and industrial policies. The State Council also published a plan in 2015 that sets a timetable for adopting secure and controllable products and services in critical government ministries by 2020.

Meanwhile, sector-specific policies under this broad framework continue to be proposed and deployed across China's economy. A high-profile example from December 2014 was a proposed measure drafted by the China Banking Regulatory Commission that called for 75 percent of ICT products used in the banking system to be secure and controllable by 2019 and that would have imposed a series of criteria that would shut out foreign ICT providers from China's banking sector. Not long afterwards, a similar measure was proposed for the insurance sector.

In 2015, the United States, in concert with other governments and stakeholders around the world, raised serious concerns about China's secure and controllable regime at the highest levels of government within China. During a state visit in September 2015 in Washington, D.C., the U.S. and Chinese Presidents committed to a set of principles for trade in information technologies. The issue also was raised in connection with the June 2015 S&ED meeting and the November 2015 JCCT meeting, with China making a series of additional important commitments with regard to technology policy. China reiterated many of these commitments at the November 2016 JCCT meeting, where it affirmed that its secure and controllable policies are not to unnecessarily limit or prevent commercial sales opportunities for foreign ICT suppliers or unnecessarily impose nationality-based conditions and restrictions on commercial ICT purchases, sales, or uses. China also agreed that it would notify relevant technical regulations to the WTO TBT Committee.

Again, however, China has not honored its promises. The numerous draft and final implementation measures issued by China since 2017 in the area of cybersecurity raise serious questions about China's approach to cybersecurity regulation. China's measures do not appear to be in line with the non-discriminatory, non-trade restrictive approach to which China has committed, and global stakeholders have grown even more concerned about the implications of China's ICT security measures across the many economic sectors that employ digital technologies. Accordingly, throughout the past year, the United States conveyed its serious concerns about China's approach to cybersecurity regulation through bilateral engagement and multilateral engagement, including at WTO Committee and General Council meetings, in an effort to persuade China to revise its policies in this area in light of its WTO obligations and bilateral commitments. These efforts are currently ongoing.

Encryption

Use of ICT products and services is increasingly dependent on robust encryption, an essential functionality for protecting privacy and safeguarding sensitive commercial information. Onerous requirements on the use of encryption, including intrusive approval processes and, in many cases, mandatory use of indigenous encryption algorithms (*e.g.*, for WiFi and fourth generation (4G) cellular products), continue to be cited by stakeholders as a significant trade barrier.

In October 2019, China adopted a Cryptography Law that includes restrictive requirements for commercial encryption products that “involve national security, the national economy and people’s lives, and public interest,” which must undergo a security assessment. This broad definition of commercial encryption products that must undergo a security assessment raises concerns that the Cryptography Law will lead to unnecessary restrictions on foreign ICT products and services. In August 2020, the State Cryptography Administration issued the draft Commercial Cryptography Administrative Regulations to implement the Cryptography Law. This draft measure did not address the concerns that the United States and numerous other stakeholders had raised regarding the Cryptography Law.

Going forward, the United States will continue to monitor implementation of the Cryptography Law and related measures. The United States will remain vigilant toward the introduction of any new requirements hindering technologically neutral use of robust, standardized encryption.

INVESTMENT BARRIERS

China seeks to protect many domestic industries through a restrictive investment regime. Many aspects of China’s current investment regime continue to cause serious concerns for foreign investors. For example, China’s Foreign Investment Law and implementing regulations, both of which entered into force in January 2020, perpetuate separate regimes for domestic and foreign investors and investments.

There has also been a lack of substantial liberalization of China’s investment regime, evidenced by the continued application of prohibitions, foreign equity caps, and joint venture requirements and other restrictions in certain sectors. China’s most recent version of its Foreign Investment Negative List, which entered into force in January 2022, leaves in place significant investment restrictions in a number of areas important to foreign investors, such as key services sectors, certain types of agriculture, and several extractive industries. With regard to services sectors, China maintains prohibitions or restrictions in key sectors such as cloud computing services and other Internet-related services, telecommunications services, film production and film distribution services, and video and entertainment software services. With regard to agriculture, China maintains prohibitions on the development of agricultural biotechnologies and restrictions on the development of new varieties of corn and wheat. Similarly, China maintains prohibitions on the exploration, mining, and processing of all of the 17 types of rare earth minerals as well as tungsten.

China’s Foreign Investment Law, implementing regulations, and other related measures suggest that China is pursuing the objective of replacing its case-by-case administrative approval system for a broad range of investments with a system that would only be applied to restricted sectors. However, it currently remains unclear whether China is fully achieving that objective in practice. Moreover, even for sectors that have been liberalized, the potential for heightened licensing requirements for foreign firms or the application of licensing processes that disadvantage foreign firms could make it difficult to achieve meaningful market access. In addition, the potential for a new and overly broad national security review mechanism, and the increasingly adverse impact of China’s Cybersecurity Law, Data Security Law, and Personal Information Protection Law and related implementing measures have serious negative implications for foreign investors and investments. Foreign companies also continue to report that Chinese Government officials may condition investment approval on a requirement that a foreign company transfer technology, conduct R&D in China, satisfy performance requirements relating to exportation or the use of local content, or make valuable, deal-specific commercial concessions.

Over the years, the United States has repeatedly raised concerns with China about its restrictive investment regime. Given that China’s investment restrictions place pressure on U.S. companies to transfer technology to Chinese companies, they were a focus of USTR’s Section 301 investigation. The responsive actions taken by the United States in that investigation are intended in part to address this concern.

In the past several years, the investment climate has turned unusually challenging, in large part because of actions taken by the Chinese Government. For example, over the past year, purportedly in implementing amendments to China's Counterespionage Law that broaden the definition of espionage, Chinese security officials raided and detained staff at several multinational companies operating in China that help investors perform due diligence regarding existing or potential new investments in China. With no effective judicial oversight or other means of challenging these actions, investors have reported that their confidence in China has been severely damaged.

In August 2023, China's State Council issued the Opinions on Further Optimizing the Foreign Investment Environment and Enhancing the Attraction of Foreign Investment, in the apparent hope of attracting increased levels of foreign investment. Known as Document 11, this measure sets forth general guidance to central level ministries and sub-central government authorities on 24 topics related to foreign investment. China has issued similar guidance in the past without meaningfully following through.

SUBSIDIES

Industrial Subsidies

China continues to provide massive subsidies to its domestic industries, which have caused injury to U.S. industries and the industries of other WTO Members. Some of these subsidies also appear to be prohibited under WTO rules. To the extent possible, the United States has sought to address these subsidies through countervailing duty proceedings conducted by the U.S. Department of Commerce and dispute settlement cases at the WTO.

The United States and other WTO Members also have continued to press China to notify all of its subsidies to the WTO, in accordance with its WTO obligations while also submitting counter notifications listing hundreds of subsidy programs that China has failed to notify. Over the years, China's required WTO subsidy notifications have marginally improved at times in terms of timeliness and completeness, but not consistently. Nevertheless, since joining the WTO more than 20 years ago, China has not yet submitted to the WTO a complete notification of subsidies maintained by the central government, and it did not notify a single sub-central government subsidy until July 2016, when it provided information largely only on sub-central government subsidies that the United States had challenged as prohibited subsidies in a WTO dispute. While China has continued to notify some sub-central government subsidies in its more recent subsidy notifications, these notifications are woefully inadequate and do not address the most distortionary sub-central government subsidies, such as the increasingly prolific, and very large, "government guidance funds" that can be found at all levels of government in China.

The United States began working with the EU and Japan in 2018 to identify further effective action and potential rules that could address problematic Chinese subsidies practices not currently covered by existing obligations. In January 2020, the trade ministers of the United States, the EU, and Japan issued a statement agreeing to strengthen the WTO subsidy rules by: (1) prohibiting certain egregious types of subsidies; (2) requiring the subsidizing country to demonstrate for other distortive subsidy types that the subsidy provided did not cause adverse effects; (3) building upon the existing "serious prejudice" rules; (4) strengthening the notification rules, and (5) developing a new definition of what constitutes a "public body." In November 2021, the trade ministers of the United States, the EU, and Japan renewed their commitment to collaborate together, including with regard to the identification of areas where further work is needed to develop new tools and other measures to address non-market policies and practices. Since then, the United States, the EU, and Japan have also been working together to uncover China's subsidies practices in specific sectors, such as the semiconductors sector.

Separately, the United States has continued to pursue a series of proposals to reform the functioning of the WTO Committee on Subsidies and Countervailing Measures. These proposals have focused on ensuring that Members timely provide written responses to written questions regarding their subsidy programs.

Agricultural Domestic Support

For several years, China has been significantly increasing domestic subsidies and other support measures for its agricultural sector. China maintains direct payment programs, minimum support prices for basic commodities, and input subsidies. China has implemented a cotton reserve system, based on minimum purchase prices, and cotton target price programs. In 2016, China established subsidies for starch and ethanol producers to incentivize the purchase of domestic corn, resulting in higher volumes of exports of processed corn products from China in 2017 and 2018. In addition, in 2022, China began encouraging soybean production through various support programs, such as through increased subsidies for crop rotations, awards to counties with high oilseed production, incentives to promote the intercropping of corn and soybeans, and subsidies for demonstration farming of soybeans on alkali and salty land.

China submitted a notification concerning domestic support measures to the WTO in May 2015, but it only provided information up to 2010. In December 2018, China notified domestic support measures for the period 2011 to 2016. This notification showed that China had exceeded its *de minimis* level of domestic support for soybeans (in 2012, 2014, and 2015), cotton (from 2011 to 2016), corn (from 2013 to 2016), rapeseed (from 2011 to 2013), and sugar (2012). The situation was likely even worse, as the methodologies used by China to calculate domestic support levels result in underestimates. Moreover, the support programs notified by China seemingly failed to account for support given at the sub-national level by provincial and local governments and, possibly, support administered through state-owned enterprises.

In September 2016, the United States launched a WTO dispute challenging China's government support for the production of wheat, corn, and rice as being in excess of China's commitments. Like other WTO Members, China committed to limit its support for producers of agricultural commodities. China's market price support programs for wheat, corn, and rice appear to provide support far exceeding the agreed levels. This excessive support creates price distortions and skews the playing field against U.S. farmers. In October 2016, consultations at the WTO took place. In January 2017, a WTO panel was established to hear the case. Hearings before the panel took place in January and April 2018, and the panel issued its decision in February 2019, ruling that China's domestic support for wheat and rice was WTO-inconsistent. China originally agreed to come into compliance with the panel's recommendations by March 31, 2020. The United States subsequently agreed to extend this deadline to June 30, 2020. In July 2020, the United States submitted a request for authorization to suspend concessions and other obligations pursuant to Article 22 of the DSU on the ground that China had failed to bring its measures into compliance with its WTO obligations. After China objected to this request, the matter was referred to arbitration in accordance with Article 22 of the DSU. The arbitration is currently suspended, and the United States continues to closely monitor the operation of China's market price support programs for wheat and rice.

Fisheries Subsidies

It is estimated that China is the world's largest provider of harmful fisheries subsidies, with support exceeding \$4.2 billion annually. These subsidies contribute to overfishing and overcapacity that threatens global fish stocks. Indeed, China is the world's largest producer of marine capture fisheries and, in the years since its WTO accession, has continued to support its fishing fleet through subsidies and other market-distorting means. China's annual fisheries harvest is nearly double that of the next largest producer in the world in terms of marine capture and triple that of other top producers, like the United States, India, and Japan. At the same time, reports continue to emerge about Chinese-flagged fishing vessels engaging in

illegal, unreported, and unregulated (IUU) fishing in distant waters, including in areas under the jurisdiction of other WTO Members. While China has made some progress in reducing subsidies to domestic fisheries, it continues to shift its overcapacity to international fisheries by providing a much higher rate of subsidy support to Chinese distant water fishery enterprises.

For several years, the United States has been raising its long-standing concerns over China's fisheries subsidies programs. In 2015, the United States submitted a written request for information pursuant to Article 25.8 of the WTO Agreement on Subsidies and Countervailing Measures (WTO Subsidies Agreement). This submission addressed fisheries subsidies provided by China at central and sub-central levels of government. The subsidies at issue were set forth in nearly 40 measures and included a wide range of subsidies, including fishing vessel acquisition and renovation grants, grants for new fishing equipment, subsidies for insurance, subsidized loans for processing facilities, fuel subsidies, and the preferential provision of water, electricity, and land. When China did not respond to this request, the United States submitted an Article 25.10 counter notification covering these same measures. More recent subsidy notifications by China have been more fulsome but still incomplete.

In addition, the United States has long been an active and constructive participant in the WTO fisheries subsidies negotiations, pressing for a meaningful outcome to prohibit the most harmful types of fisheries subsidies. The United States and various like-minded WTO Members have put forward several proposals designed to achieve an ambitious outcome for those negotiations. Notably, in June 2022, WTO Members adopted the text of the WTO Agreement on Fisheries Subsidies, which includes several important disciplines, including prohibitions on subsidies to vessels or operators engaged in IUU fishing, subsidies to fishing regarding stocks that are overfished, and subsidies to fishing on the unregulated high seas. This agreement also contains robust transparency provisions to strengthen WTO Members' subsidy notifications and to enable effective monitoring of WTO Members' implementation of their obligations. The agreement will enter into force when it has been accepted by two-thirds of WTO Members.

Going forward, the United States will continue to investigate the full extent of China's fisheries subsidies and will continue to press China to fully comply with its relevant WTO subsidy obligations. The United States also will urge WTO Members to support additional, ambitious disciplines on harmful fisheries subsidies as part of the further WTO negotiations on fisheries subsidies.

Excess Capacity

Because of its state-led approach to the economy, China is the world's leading offender in creating non-market capacity, as evidenced by the severe and persistent excess capacity situations in several industries, including steel and aluminum. China is also well on its way to creating severe excess capacity in other industries, such as legacy semiconductors, solar, and electric vehicles, through its pursuit of industrial plans such as Made in China 2025, pursuant to which the Chinese Government is doling out hundreds of billions of dollars to support Chinese companies and requiring them to achieve preset targets for domestic market share—at the expense of imports—and global market share in each of 10 advanced manufacturing industries.

In manufacturing industries such as steel and aluminum, China's economic planners have contributed to massive excess capacity in China through various government support measures. For steel, the resulting over-production has distorted global markets, harming U.S. workers and manufacturers in both the U.S. market and third-country markets, where U.S. exports of steel and steel-intensive products compete with exports from China. This over-production has similarly harmed the workers and manufacturers of many of the United States' allies and partners. While China has publicly acknowledged excess capacity in its steel and aluminum industries, it has yet to take meaningful steps to address the root causes of this problem in a sustainable way. Indeed, China continues to replicate these results in other industries.

From 2000 to 2022, China accounted for 72 percent of global steelmaking capacity growth, an increase well in excess of the increase in global and Chinese demand over the same period. Currently, China's capacity represents about one-half of global capacity and more than twice the combined steelmaking capacity of the EU, Japan, the United States, Canada, Mexico, and Brazil.

At the same time, China's steel production is continually reaching new highs, eclipsing demand. In 2020, China's steel production climbed above one billion metric tons for the first time, reaching 1,065 million metric tons, a seven percent increase from 2019, and remained high at 1,018 million metric tons in 2022, despite a significant contraction in domestic steel demand. This sustained ballooning of greenhouse gas (GHG) emissions-intensive steel production, combined with weakening economic growth and a slowdown in the Chinese construction sector, has flooded the global market with excess steel and steel-intensive products at a time when steel and other manufacturing sectors outside of China are facing renewed weakness in market conditions, growing global excess capacity, a slowdown in world economic growth, and continued disruptions in supply chains. In 2022, China exported more steel than the world's second, third, and fourth largest steel producers (India, Japan, and the United States) combined. Furthermore, China's exports from January through September 2023 were 36 percent higher than during the same period in 2022. Today, China remains by far the world's largest exporter of steel and steel-intensive products. China's steel production also remains far dirtier in terms of GHG emissions than the steel production that it displaces in the United States and most other countries, thereby undermining global efforts to transition to a clean-energy economy.

Similarly, primary aluminum production capacity in China increased by more than 1,400 percent between 2000 and 2022, with China accounting for 80 percent of global capacity growth during that period. China's expansion of production capacity has driven price declines globally, but even with these low prices, China has continued to expand its production capacity. Much of this additional capacity has been built with government support and relies on GHG emissions-intensive sources of electricity. China's primary aluminum capacity accounts for 57 percent of global capacity and is more than double the capacity of the next eight aluminum-producing countries combined. As in the steel sector, China's aluminum production has also ballooned in recent years, as China's aluminum production has continued to increase despite global demand shocks. China's capacity and production continue to contribute to major imbalances and price distortions in global markets, harming U.S. aluminum producers and workers.

Excess capacity in China hurts various U.S. industries and workers not only through direct exports from China to the United States, but also through its impact on global prices and supply and through indirect trade of steel and aluminum-intensive products, which makes it difficult for competitive manufacturers throughout the world to remain viable. Indeed, domestic industries in many of China's trading partners continue to petition their respective governments to impose trade measures to respond to the trade-distortive effects of China's excess capacity. In addition, the United States has acted under Section 232 of the Trade Expansion Act of 1962 to impose additional duties on steel and aluminum products after finding that steel and aluminum products are being imported into the United States in such quantities and under such circumstances as to threaten to impair U.S. national security. In the United States' view, in the absence of efforts to redress China's anticompetitive behavior, the risk is that steel and aluminum producers in the United States and many other countries with market-oriented economies will be forced to close, which would, among other things, create even greater dependencies on China.

ANTICOMPETITIVE PRACTICES

As previously reported, China's implementation of the Anti-Monopoly Law has generated various concerns. A key concern is the extent to which the Anti-Monopoly Law is applied to state-owned enterprises. While Chinese regulatory authorities have clarified that the Anti-Monopoly Law does apply to

state-owned enterprises, as of December 31, 2023, they have brought enforcement actions primarily against provincial government-level state-owned enterprises, rather than central government-level state-owned enterprises under the supervision of the State-owned Asset Supervision and Administration Commission (SASAC). In addition, provisions in the Anti-Monopoly Law protect the lawful operations of state-owned enterprises and government monopolies in industries deemed nationally important. Another key concern relates to how the Anti-Monopoly Law is applied to foreign companies. Many U.S. companies have cited selective enforcement of the Anti-Monopoly Law against foreign companies seeking to do business in China as a major concern, and they have highlighted in particular the comparatively limited enforcement of this law against state-owned enterprises. In recent years, China has begun to increase the number of actions taken against private Chinese companies and wholly domestic transactions.

Another concern expressed by U.S. industry is that remedies imposed on U.S. and other foreign-owned companies in merger cases do not always appear to be aimed at restoring competition. Instead, these remedies seem to be designed to further China's industrial policy goals, such as when the regulatory authorities seek to require the transfer of technology or a reduction in licensing fees for intellectual property.

U.S. industry has also expressed concern about insufficient predictability, due process, and transparency in Anti-Monopoly Law investigative processes of foreign companies. For example, U.S. industry reports that, through the threat of steep fines and other penalties, China's regulatory authorities have pressured foreign companies to cooperate in the face of unspecified allegations and have discouraged or prevented foreign companies from bringing counsel to meetings. In addition, U.S. companies continue to report that the Chinese regulatory authorities sometimes make informal suggestions regarding appropriate company behavior, including how a company is to behave outside China, strongly suggesting that a failure to comply may result in investigations and possible punishment. More recently, high-level policy statements suggest increased Anti-Monopoly Law enforcement where technology owned or controlled by foreign companies allegedly implicates national security concerns or implicates technology being prioritized for indigenous innovation in China.

Given the state-led nature of China's economy, the need for careful scrutiny of anticompetitive government restraints and regulation is high. The Anti-Monopoly Law's provisions on the abuse of administrative (*i.e.*, government) power are potentially important instruments for reducing the government's interference in markets and for promoting the establishment and maintenance of increasingly competitive markets in China. The State Council's adoption of the Opinions on Establishing a Fair Competition Review System in 2016 reflected a useful widening of oversight by China's anti-monopoly enforcement agencies over undue government restraints on competition and anticompetitive regulation of competition. Increased oversight in this area was also reflected in the amendments to the Anti-Monopoly Law in 2022, which included a new chapter regarding the abuse of administrative monopoly. SAMR has since issued draft rules regarding the abuse of administrative monopoly, and SAMR has also identified the elimination of administrative monopolies as an enforcement priority. It remains to be seen whether SAMR will have sufficient authority and resources to implement this enforcement priority robustly.

STATE-OWNED ENTERPRISES

While many provisions in China's WTO accession agreement indirectly discipline the activities of state-owned and state-invested enterprises, China also agreed to some specific disciplines. In particular, it agreed that laws, regulations, and other measures relating to the purchase of goods or services for commercial sale by state-owned and state-invested enterprises, or relating to the production of goods or supply of services for commercial sale or for non-governmental purposes by state-owned and state-invested enterprises, would be subject to certain specified WTO rules. China also affirmatively agreed that state-owned and state-invested enterprises would have to make purchases and sales based solely on commercial considerations,

such as price, quality, marketability, and availability, and that the Chinese Government would not directly or indirectly influence the commercial decisions of state-owned and state-invested enterprises. In addition, China agreed that enterprises of other WTO Members would have an adequate opportunity to compete for sales to and purchases from state-owned and state-invested enterprises on non-discriminatory terms and conditions.

In subsequent bilateral dialogues with the United States, China made further commitments. In particular, China committed to develop a market environment of fair competition for enterprises of all kinds of ownership and to provide them with non-discriminatory treatment in terms of credit provision, taxation incentives, and regulatory policies.

However, instead of adopting measures giving effect to its commitments, China took steps intended to strengthen the role of state-owned and state-invested enterprises in the economy and to protect them against foreign competition. China established the SASAC and adopted the Law on State-owned Assets of Enterprises in addition to numerous other measures that mandate state ownership and control of many important industrial sectors. The Chinese Communist Party (CCP) also ensured itself a decisive role in state-owned and state-invested enterprises' major business decisions, personnel changes, project arrangements, and movement of funds. The fundamental premise of these measures is to enable the Chinese Government and the Party to intervene in the business strategies, management, and investments of these enterprises in order to ensure that they play a dominant role in the national economy in line with the overall objective of developing China's "socialist market economy" and China's plans for industrial domination. Over the past few years, Party leadership in state-owned and state-invested enterprises has been strengthened through practices such as appointing a person as both the chairman of the board and the Party Secretary for a state-owned enterprise and requiring the establishment of Party committees in state-owned enterprises.

Separately, the Chinese Government also has issued a number of measures that restrict the ability of state-owned and state-invested enterprises to accept foreign investment, particularly in key sectors. *(Some of these measures are discussed below in the Investment section of this NTE Report Chapter.)*

In its 2013 Third Plenum Decision, China endorsed a number of far-reaching economic reform pronouncements, which called for making the market "decisive" in allocating resources, reducing Chinese Government intervention in the economy, accelerating China's opening up to foreign goods and services and improving transparency and the rule of law to allow fair competition in China's market. It also called for "reforming" China's state-owned and state-invested enterprises.

However, rather than actually embrace the role of the market, China sought to strengthen the role of the state in the economy. Statements by China's President also made clear that China continues to view the role of the state very differently from the United States and other market economies. In October 2016, China's President called for strengthening the role of the CCP in state-owned enterprises and emphasized that state-owned enterprises should be "important forces" to implement national strategies and enhance national power. In February 2019, in an article in a CCP journal, China's President further called for the strengthening of the Party's "leadership over the rule of law," and vowed that China "must never copy the models or practices of other countries" and "we must never follow the path of Western 'constitutionalism,' 'separation of powers', or 'judicial independence.'"

With regard to the reform of China's state-owned enterprises, one example of China's efforts included an announcement that China would classify these enterprises into commercial, strategic, or public interest categories and require commercial state-owned and state-invested enterprises to garner reasonable returns on capital. However, this plan also allowed for divergence from commercially driven results to meet broadly construed national security interests, including energy and resource interests and cyber and

information security interests. Similarly, in recent years, China has pursued reforms through efforts to realize mixed ownership. These efforts included pressuring private companies to invest in, or merge with, state-owned and state-invested enterprises as a way to inject innovative practices into and create new opportunities for inefficient state-owned and state-invested enterprises. As should be evident, these various reforms do not strengthen the role of the market. Rather, they are intended to strengthen the role of state-owned enterprises in the economy and to direct state capital toward certain industries, including those specified in Made in China 2025, in pursuit of China's industrial domination objectives.

China has also previously indicated that it would consider adopting the principle of "competitive neutrality" for state-owned enterprises. However, China has continued to pursue policies that further enshrine the dominant role of the state and its industrial plans when it comes to the operation of state-owned and state-invested enterprises. For example, China has adopted rules ensuring that the Chinese Government continues to have full authority over how state-owned and state-invested enterprises use allocations of state capital and over the projects that state-owned enterprises pursue.

Overall, while China's efforts at times have appeared to signal a high-level determination to accelerate needed economic reforms, those reforms have not materialized. Indeed, the Chinese Government's role in the economy has increased rather than decreased. It also seems clear that China's past policy initiatives were not designed to reduce the presence of state-owned and state-invested enterprises in China's economy or to force them to compete on the same terms as private commercial operators. Rather, the reform objectives were to strengthen state-owned and state-invested enterprises through consolidation, increased access to state capital, preferential access to goods and services, and the use of other non-market policies and practices designed to give these enterprises unfair competitive advantages, both in China and globally.

This unfair situation is made worse for foreign companies. Like China's state-owned and state-invested enterprises, China's private companies also benefit from a wide array of state intervention and support designed to promote the development of China's domestic industries in accordance with China's industrial domination objectives. These interventions and support are deployed in concert with other non-market policies and practices that restrict, take advantage of, discriminate against, or otherwise create disadvantages for foreign companies and their technologies, products, and services.

LABOR

The Chinese Government represses internationally recognized labor rights and fails to adequately enforce existing prohibitions on forced labor. China has been the subject of international attention for its forced labor practices, especially in the Xinjiang Uyghur Autonomous Region (XUAR), where China has arbitrarily detained more than one million Uyghurs and other mostly Muslim minorities. Victims, news media, and think tanks report that factories, including factories producing cotton and tomato products, frequently engage in coercive recruitment, limit workers' freedom of movement and communication, and subject workers to constant surveillance, retribution for religious beliefs, exclusion from community and social life, and isolation. It is currently estimated that hundreds of thousands of Uyghurs, ethnic Kazakhs, and members of other Muslim minority groups are being subjected to forced labor in China following detention. Based on the U.S. Government's independent analysis of these sources, the U.S. Government has taken several actions to address forced labor and other human rights abuses in the XUAR.

The U.S. Department of Homeland Security Customs and Border Protection has issued several withhold release orders (WROs) pursuant to section 307 of the Tariff Act of 1930 based on information that reasonably indicates the use of detainee or prison labor and situations of forced labor in the XUAR, including a region-wide WRO on cotton and tomato products from the XUAR in January 2021. The scope

of this WRO includes cotton and tomatoes and downstream products that incorporate these products as inputs.

In July 2020, the United States issued a Xinjiang Supply Chain Business Advisory for U.S. businesses whose supply chains run through the XUAR. The United States updated this advisory in July 2021. As updated, the advisory calls urgent attention to U.S. businesses' supply chain risks and identifies serious investing and sourcing considerations for businesses and individuals with exposure to entities engaged in forced labor and other human rights abuses linked to the XUAR. The advisory also describes U.S. Government actions taken to counter the use of forced labor in the XUAR and to prohibit the importation of goods produced in whole or in part with forced labor or convict labor. In September 2023, the United States issued an addendum to the updated advisory to further highlight reports on state-sponsored forced labor and human rights abuses in the XUAR as well as to stress the urgency for businesses to undertake appropriate due diligence measures.

In December 2021, President Biden signed into law the Uyghur Forced Labor Prevention Act (UFLPA), which, among other things, establishes a rebuttable presumption that the importation of goods from the XUAR is prohibited under section 307 of the Tariff Act of 1930. This rebuttable presumption took effect in June 2022.

The United States also published its UFLPA Enforcement Strategy in June 2022. This Enforcement Strategy took into account input received from private individuals, industry associations, consultancy and risk-management companies, civil society organizations, non-governmental organizations (NGOs), labor unions, and others who shared their views on potential measures to prevent the importation of goods mined, produced or manufactured wholly or in part with forced labor in China into the United States. The main components of the Enforcement Strategy include: (1) an assessment of the risk of importing goods made with forced labor in China; (2) the development of the UFLPA Entity List and descriptions of forced-labor schemes; (3) the consideration of efforts, initiatives and tools to identify and trace the origin of goods; (4) a description of relevant legal authorities and tools to prevent entry of violative goods; (5) a description of resources; (6) the development of importer guidance; and (7) the development of a coordination plan with NGOs and the private sector.

Various U.S. agencies have been working to compile and update the UFLPA Entity List, a consolidated register of four distinct lists, including: (1) a list of entities in the XUAR that mine, produce or manufacture wholly or in part any goods, wares, articles, and merchandise with forced labor; (2) a list of entities that work with the government of the XUAR to recruit, transport, transfer, harbor or receive forced labor or Uyghurs, Kazakhs, Kyrgyz, or members of other persecuted groups out of the XUAR; (3) a list of entities that export products mined, produced or manufactured by entities in lists 1 or 2 above from China into the United States; and, (4) a list of facilities and entities, including the Xinjiang Production and Construction Corps, that source material from the XUAR or from persons working with the government authorities in the XUAR or the Xinjiang Production and Construction Corps for purposes of the "poverty alleviation" program or the "pairing assistance" program or any other government labor scheme that uses forced labor. As of December 31, 2023, dozens of entities have been added by the U.S. Government on the UFLPA Entity List.

Separately, in June 2022, President Biden issued the Memorandum on Combating Illegal, Unreported and Unregulated Fishing and Associated Labor Abuses. This Memorandum notes that, if left unchecked, IUU fishing and associated labor abuses threaten the livelihoods and human rights of fishers around the world and will undermine U.S. economic competitiveness, national security, and fishery sustainability. It also notes that this behavior will exacerbate the environmental and socioeconomic effects of climate change. In December 2022, the U.S. Department of Treasury sanctioned individuals associated with China's distant

water fishing vessels for serious human rights abuse, including forced labor, of workers aboard these vessels.

It also remains concerning that China does not adhere to certain other internationally recognized labor standards, including freedom of association and effective recognition of the right to collective bargaining. Chinese law provides for the right to associate and form a union but does not allow workers to form or join an independent union of their own choosing. Unions must affiliate with the official All-China Federation of Trade Unions (ACFTU), which is under the direction of the CCP. Workers at enterprises in China are required to accept the ACFTU as their representative. They cannot instead select another union or decide not to have any union representation. Only collective bargaining through the ACFTU is permitted, and there is no legal obligation for an employer to bargain in good faith. Striking is also prohibited.

ENVIRONMENT

Effect of Import Ban on Scrap Materials, Recyclable Materials, and Recycling Markets

Currently, China restricts almost all imports of unprocessed scrap and recyclable materials. China only allows imports of certain processed materials, including recycled raw materials such as copper, steel, aluminum, and brass that meet purity standards, pelletized scrap plastic and pulped scrap paper. These restrictions have raised the costs of recycling in the United States, leading some communities to end recycling programs. Because China was previously such a large destination market, significant amounts of U.S. scrap materials are being redirected to landfills or incinerators.

Since 2017, China has issued numerous measures that limit or ban imports of most scrap and recovered materials, such as certain types of plastic, paper, and metals. China has also employed import licensing and inspection measures to restrict imports of scrap materials. Notably, China does not universally apply similar restrictions to domestic processors of domestically sourced scrap and recovered materials.

In 2020, China amended the Law on the Prevention and Control of Environmental Pollution by Solid Waste. According to this amended law, the intent is to reduce imports of solid waste essentially to zero.

U.S. exports to China of the unprocessed scrap and recovered materials covered by China's restrictive measures totaled \$479 million in 2016, the year before China started to pursue its more restrictive policies. Since then, U.S. exports of these materials to China have been significantly reduced.

In addition to impacting the global market for scrap and recovered materials, the tightened restrictions have raised the costs of recycling in the United States, as exporters seek domestic processing facilities or international buyers. Additionally, other countries, particularly in Southeast Asia, have introduced their own regulatory changes that in some ways parallel the changes in China's import regime, such as by setting impossibly high purity standards for recyclable materials, imposing new import licensing requirements, and requiring preshipment and post-shipment inspections. As a result, significant amounts of U.S. scrap materials and recyclable materials have not found new buyers, leading to increased landfilling, incineration, and air pollution and increased demand for virgin materials globally.

Import Ban on Remanufactured Products

China prohibits the importation of remanufactured products, which it typically classifies as used goods. China also maintains restrictions that prevent remanufacturing process inputs (known as cores) from being imported into China's customs territory, except special economic zones. These import prohibitions and restrictions undermine the development of industries in many sectors in China, including mining,

agriculture, healthcare, transportation, and communications, because companies in these industries are unable to purchase high-quality, lower-cost remanufactured products produced outside of China. Nevertheless, China is apparently prepared to pay this price in order to limit imports of remanufactured goods.

OTHER BARRIERS

Export Restraints

Over the years, China has deployed a combination of export restraints, including export quotas, export licensing, minimum export prices, export duties, and other restrictions, on a number of raw material inputs where it holds the leverage of being among the world's leading producers. In many instances, through these export restraints, it appears that China has been able to provide substantial economic advantages to a wide range of downstream producers in China at the expense of foreign downstream producers, while creating pressure on foreign downstream producers to move their operations, technologies, and jobs to China.

In 2013, China removed its export quotas and duties on several raw material inputs of key interest to the U.S. steel, aluminum, and chemicals industries after the United States won a dispute against China at the WTO. In 2014, the United States won a second WTO dispute, focusing on China's export restraints on rare earths, tungsten, and molybdenum, which are key inputs for a multitude of U.S.-made products, including hybrid automobile batteries, wind turbines, energy-efficient lighting, steel, advanced electronics, automobiles, petroleum, and chemicals. China removed those export restraints in 2015. In 2016, the United States launched a third WTO dispute challenging export restraints maintained by China. The challenged export restraints include export quotas and export duties maintained by China on various forms of 11 raw materials, including antimony, chromium, cobalt, copper, graphite, indium, lead, magnesia, talc, tantalum, and tin. These raw materials are key inputs in important U.S. manufacturing industries, including aerospace, automotive, construction, and electronics. While China appears to have removed the challenged export restraints, the United States continues to monitor the situation. In the United States' view, it is deeply concerning that the United States was forced to bring multiple cases to address the same obvious WTO compliance issues.

A more recent concern involves China's potential regulation of rare earth exports under its export controls regime. In this regard, China's Ministry of Industry and Information Technology issued the draft Regulations on the Administration of Rare Earths for public comment in January 2021, and one of the provisions in the draft measure provides that rare earth exporters need to abide by laws and regulations in the area of export controls. More recently, in November 2023, China began requiring exporters to provide detailed reporting on transactions involving rare earths.

In 2023, China also began applying its export control regime to other critical minerals. As of August 2023, China is requiring export licenses for products containing gallium or germanium. Similarly, as of December 2023, China is requiring export licenses for products containing graphite.

In November 2021, China announced an export ban on certain fertilizers. Despite repeated requests from its trading partners to lift this export ban and help address growing international concern over rising commodity prices and disrupted global supply chains, China continues to impose this export ban.

Meanwhile, U.S. companies report that China has also instituted export restrictions on corn starch, apparently in an effort to stabilize domestic prices. As of December 31, 2023, however, the Chinese Government still has not published an official notice.

Value-Added Tax Rebates and Related Policies

As in prior years, in 2023, the Chinese Government attempted to manage the export of many primary, intermediate, and downstream products by raising or lowering the VAT rebate available upon export. China sometimes reinforces its objectives by imposing or retracting export duties. These practices have caused tremendous disruption, uncertainty, and unfairness in the global markets for some products, particularly downstream products for which China is a leading world producer or exporter, such as products made by the steel, aluminum, and soda ash industries. These practices, together with other policies, such as excessive government subsidization, have also contributed to severe excess capacity in these same industries.

An apparently positive development took place at the July 2014 S&ED meeting, when China committed to improve its VAT rebate system, including by actively studying international best practices, and to deepen communication with the United States on this matter, including regarding its impact on trade. Once more, however, this promise remains unfulfilled. As of December 31, 2023, China has not made any movement toward the adoption of international best practices.

Trade Remedies

As of December 31, 2023, China had in place 117 antidumping measures, affecting imports from 17 countries or regions, with two new antidumping investigations underway. China also had in place four countervailing duty measures, affecting imports from two countries or regions. The most significant systemic shortcomings in China's antidumping and countervailing duty practice continue to be in the areas of transparency and due process. Over the years, China has often utilized antidumping and countervailing duty investigations as more of a retaliatory tool than as a mechanism to nullify the effects of dumping or unfair subsidization within its domestic market. In response, the United States has pressed China bilaterally, in WTO meetings and through written comments submitted in connection with pending antidumping and countervailing duty proceedings to adhere strictly to WTO rules in the conduct of its trade remedy investigations.

The conduct of antidumping investigations by China's Ministry of Commerce (MOFCOM) continues to fall short of full commitment to the fundamental tenets of transparency and procedural fairness embodied in the WTO Agreement on Implementation of Article VI of the General Agreement on Tariffs and Trade 1994, commonly known as the Antidumping Agreement. The United States and other WTO Members accordingly have expressed concerns about key lapses in transparency and due process in China's conduct of antidumping investigations. The principal areas of concern include: MOFCOM's inadequate disclosure of key documents placed on the record by domestic Chinese producers; insufficient disclosures of the essential facts underlying MOFCOM decisions, such as dumping margin calculations and evidence supporting injury and dumping conclusions; MOFCOM's failure to issue supplemental questionnaires in instances where MOFCOM identifies information deficiencies; the improper rejection of U.S. respondents' reported cost and sales data; the unjustified use of facts available; and, MOFCOM's failure to adequately address critical arguments or evidence put forward by interested parties. These aspects of China's antidumping practice have been raised with MOFCOM in numerous proceedings and at WTO meetings over the past several years.

A review of China's conduct of countervailing duty investigations makes clear that, as in the antidumping area, China has failed to adequately improve its transparency and due process when conducting these investigations. In addition, the United States has noted procedural concerns specific to China's conduct of countervailing duty investigations. For example, in recent years, China has initiated investigations of alleged subsidies that raised concerns, given the requirements regarding sufficient evidence in Article 11.2

of the Subsidies Agreement. The United States is also concerned about China's application of facts available under Article 12.7 of the WTO Subsidies Agreement.

On several occasions in the past, the United States has expressed serious concerns about China's pursuit of antidumping and countervailing duty remedies that appear to be retaliatory and intended to discourage the United States and other trading partners from the legitimate exercise of their rights under WTO antidumping and countervailing duty rules and the trade remedy provisions of China's accession agreement. It also appears that China has used arbitrary economic and trade measures, including antidumping and countervailing duty investigations, as a form of economic coercion designed to achieve China's political goals. The antidumping and countervailing duties that China imposed on imports of Australian barley in 2021 and the antidumping duties that China imposed on imports of Australian wine in 2021 are two obvious examples of this tactic.

In certain recent investigations of U.S. imports, China has also made determinations without legal or factual support. For example, in the final countervailing duty determination on imports of n-propanol from the United States, China found that alleged subsidies to the U.S. oil and gas sector automatically passed through to petrochemical products without providing the analysis required by the Subsidies Agreement.

Pharmaceuticals

For several years, the United States has pressed China on a range of pharmaceuticals issues. These issues have related to matters such as overly restrictive patent application examination practices; regulatory approvals that are delayed or linked to extraneous criteria; weak protections against the unfair commercial use and unauthorized disclosure of regulatory data; issues with the implementation of an efficient mechanism to resolve patent infringement disputes; requirements to share ownership with a Chinese partner of patent rights arising from research generated by using human genetic resources in China; and, implementation of patent term extensions for unreasonable marketing approval delays, including limits on the type of protection provided. While China has implemented some helpful reforms, the United States still has many of the same concerns with China's pharmaceutical market, especially as it pertains to treatment of foreign companies.

In its WTO accession agreement, China committed to provide effective protection against unfair commercial use and unauthorized disclosure of undisclosed test or other data generated to obtain marketing approval for pharmaceutical products. To provide this protection, known as regulatory data protection (RDP), China committed to enact laws and regulations to ensure that no person, other than the submitter of the data, could rely on the submitted data in a product approval application without permission from the submitter for six years from the date on which China granted marketing approval to the submitter.

In 2017, CFDA finally issued several draft notices addressing the issue of RDP. These draft notices set out a conceptual framework to protect against the unfair commercial use and unauthorized disclosure of undisclosed test or other data generated to obtain marketing approval for pharmaceutical products and also sought to promote the efficient resolution of patent disputes between right holders and the producers of generic pharmaceuticals. However, the proposed framework did not provide for a six-year period of RDP despite the commitment that China had made in its WTO accession agreement in 2001.

In 2018, CFDA's successor agency, NMPA, issued draft Drug Registration Regulations and draft implementing measures on drug trial data that would preclude or condition the duration of RDP on whether clinical trials occur in China and whether marketing approval is sought first in China. Subsequently, China issued a revised Drug Administration Law in 2019, followed by NMPA's revised draft Drug Registration Regulations in 2020 and NMPA's revised draft Drug Administration Law Implementing Regulations in 2021. Despite the opportunities that these revised draft measures afforded China's regulatory authorities,

the concerning limitations on RDP were not removed, and China still has not created a regulatory framework providing for the six-year period of RDP as it had committed to do in 2001.

Since 2018, volume-based procurement has presented a new market access complication for foreign suppliers of pharmaceuticals, largely because of the opaque and unpredictable nature of the bidding processes. In November 2018, a National Drug Centralized Procurement Pilot Scheme was launched. Then, in January 2019, the State Council issued a Pilot Plan for National Centralized Drug Procurement and Use. In January 2023, China's National Healthcare Security Administration (NHSA) published the 2022 edition of its annual National Reimbursement Drug List (NRDL), which became effective on March 1, 2023. U.S. industry also cites the need for increased transparency and greater harmony between national and provincial bidding processes as well as a greater emphasis on a competitive, market-based approach to evaluating a product's value and relevant bids. In December 2022, NHSA and CNIPA jointly issued the Opinions on Strengthening the Protection of Intellectual Property Rights in the Field of Centralized Pharmaceutical Procurement, which sets out to establish a coordination mechanism to remove patent-infringing drugs from the NRDL, with further implementing measures to follow.

As part of the Phase One Agreement, the two sides agreed that China would establish a nationwide mechanism for the early resolution of potential pharmaceutical patent disputes that covers both small molecule drugs and biologics, including a cause of action to allow a patent holder to seek expeditious remedies before the marketing of an allegedly infringing product. The United States has been working closely with U.S. industry to monitor developments and to ensure that China's new system works as contemplated. Separately, the agreement also provides for patent term extensions to compensate for unreasonable patent and marketing approval delays that cut into the effective patent term as well as for the use of supplemental data to meet relevant patentability criteria for pharmaceutical patent applications. The United States and China agreed to address data protection for pharmaceuticals in future negotiations.

In October 2020, China amended the Patent Law to provide for patent term extensions for unreasonable patent and marketing approval delays, and it also added a mechanism for the early resolution of potential patent disputes, known as patent linkage. Implementing measures for the patent linkage mechanism were issued in July 2021, as NMPA and CNIPA jointly issued the Trial Implementation Measures for the Mechanism for Early Resolution of Drug Patent Disputes and the Supreme People's Court issued the Regulations on Several Issues Concerning the Application of Law in the Trial of Civil Patent Disputes Related to Drug Registration Application. In 2021 and 2022, CNIPA issued draft implementing rules for the amended Patent Law and drafts of amendments to the Patent Examination Guidelines. In December 2023, China released the final implementing rules for the amended Patent Law.

Among other things, the United States and U.S. stakeholders remain concerned about China's implementation of patent term extensions for unreasonable patent and marketing approval delays, including the limits on the type of protection provided by China's regulatory framework. The United States and U.S. stakeholders also remain concerned about China's patent linkage mechanism.

Medical Devices

For many years, working closely with U.S. industry, the United States has raised concerns about China's pricing and tendering procedures for medical devices and its treatment of imported medical devices. Notably, at the November 2015 JCCT meeting, China committed that, in terms of accessing the market, it will give imported medical devices the same treatment as medical devices manufactured or developed domestically. Unfortunately, despite this commitment, China continues to pursue a wide range of policies that direct China's purchasing authorities to prioritize the procurement of domestic medical device manufacturers over imported medical device manufacturers.

Separately, the United States has pressed China's regulatory authorities to develop sound payment systems for medical devices that are transparent, predictable, and competitive. The United States has also urged China to adequately recognize quality, safety, and the costs of R&D in its approach to procurement policy.

In 2019, China's State Council launched a concerning volume-based procurement (VBP) approach for medical devices in a few provinces and municipalities in an attempt to cut healthcare costs. Since then, the VBP approach has become further engrained in China's system, with the formation of multi-province and municipal alliances to conduct joint procurements under VBP. In 2020, China implemented its first national VBP tender, which has been followed by additional national tenders in 2021 and 2022. However, U.S. industry reports that the vast majority of VBP tendering activities are occurring at the sub-national level. In practice, moreover, implementation of China's VBP prioritizes cost over the product's value or quality.

According to U.S. industry, if China continues to pursue VBP without significant changes, it could lead to the creation of a low-cost, low-quality medical devices sector in China, with Chinese medical device companies developing monopolies in the manufacture and sale of various low-quality medical devices in the China market. This outcome would operate to the disadvantage of innovative medical device companies, many of which are foreign companies, and the patients who rely on advanced medical technologies. Currently, medical device companies that are successful at winning bids often have very thin profit margins or even lose money. Reportedly, some medical device companies are reducing training to healthcare providers in order to offer the expected price cuts. In addition, given the size of China's medical device market, monopolies from China could expand and then prioritize exports of their low-quality medical devices to third countries. With the choice between a higher cost but more effective product or a lower cost, lower quality product, countries with greater budget constraints, and greater vulnerability to Chinese influence, may be more inclined to procure China's offerings. Overall, China's VBP approach poses a risk to the medical device sector and the provision of high-quality medical treatment worldwide.

In July 2022, China's Ministry of Finance issued a revised Government Procurement Law. While China has a history of distributing unofficial, non-public guidance to give preference to domestic over foreign medical devices companies, China's revisions to the Government Procurement Law also officially expands the coverage of products for which domestic alternatives should be given preference.

Meanwhile, the Made in China 2025 industrial plan announced by the State Council in 2015 seeks to prop up China's domestic medical device sector through a series of support policies, including targeted funds and procurement policies. The goal of these policies is to significantly increase the market share of domestically owned and domestically manufactured medical devices, and correspondingly decrease market share of foreign medical devices, by 2025. At the same time, some provincial governments directly subsidize the purchase of domestically manufactured medical devices. In addition, some provincial governments have issued guidelines urging medical institutions to prioritize the procurement of local medical equipment over imported equipment. In at least one province, the guidelines suggest that only imported medical devices for which there is not a domestic replacement will be eligible for procurement.

In August 2023, China's State Council issued the Opinions on Further Optimizing the Foreign Investment Environment and Enhancing the Attraction of Foreign Investment, known as Document 11. (*Document 11 is also discussed in the Government Procurement section of this NTE Report chapter*). Article 6 of Document 11 offers various suggestions for how central level ministries and sub-central government authorities could work to ensure that foreign-invested enterprises are able to participate fairly in China's government procurement market, consistent with existing Chinese law. One of the suggestions is to provide a definition for "produced in China." Currently, the vast majority of medical devices in China are purchased through government procurement. To the extent that China follows through on the State Council's suggestions, the United States urges China to make any draft implementing measures public and to provide a reasonable period for the public to submit comments.

U.S. industry also reports that while sub-central governments in China have always provided some financial support to domestic medical devices companies, their support appears to have increased since 2020. U.S. industry notes that this trend could be attributed to the COVID-19 pandemic, China's five-year industrial plan for medical equipment covering the years 2021 to 2025, the Action Plan to Promote the High-Quality Development of the Medical Equipment Industry (2023-2025), or perhaps all three measures. The United States will monitor this situation closely and will encourage China to be transparent in its approach.

Social Credit System

Since 2014, China has been working to implement a national "social credit" system for both individuals and companies. The implementation of this system is at a more advanced stage for companies versus individuals, as 18-digit "unified social credit codes" are assigned to every domestic and foreign company in China. These 18-digit codes will provide a way for the Chinese Government to track a company's record of administrative and regulatory compliance and generate public credit information. In a report to the 20th National Party Congress in October 2022, China's President, in the capacity as the General Secretary of the Chinese Communist Party, emphasized the need to refine the social credit system. Since then, the Chinese Government has continued to take steps to make the social credit system fully operational.

Under the corporate social credit system, government records, and market-generated corporate compliance data are collected on every legal entity in China. The collected information contains regulatory and administrative records contributed by at least 44 state agencies and their branch offices across every province in China. Previously disparate information relating to a company's financial records, regulatory compliance, inspection results, and other administrative enforcement activities is being consolidated under each company's unified social credit code. All of this data will be aggregated and shared between regulatory agencies via the National Credit Information Sharing Platform. Reportedly, approximately 75 percent of the records collected on companies is intended to be designated as open to the public, while the remaining 25 percent that is intended to be withheld will include potentially sensitive information, such as approval records related to national development projects and details of any criminal cases.

Nationwide data collection under the corporate social credit system provides mechanisms to penalize companies with poor corporate and legal compliance records by, among other things, subjecting them to public censure, while rewarding compliant companies with positive incentives. Negative ratings or placement on a government agency's censure list can lead to various restrictions on a company's business activities. A company could face increased inspections, reduced access to loans and tax incentives, restrictions on government procurement, reduced land-use rights, monetary fines, or permit denials, among other possible penalties.

However, currently, there is no fully integrated national system for assigning comprehensive social credit scores for companies, and the social credit system remains highly fragmented. Certain central government agencies and sub-central government agencies maintain their own rating systems, with each agency making its own decisions about the types of transgressions that warrant negative ratings or placing a company on a censure list.

In November 2022, the NDRC and the PBOC jointly published a draft Social Credit Construction Law that would give the social credit system a legal basis, further embedding it into China's regulatory network. The draft law seeks to establish the NDRC and the PBOC as the main government agencies for construction of the social credit system. Their responsibilities would include overall coordination, supervision and guidance of the construction of the social credit system and taking the lead in organizing the formulation and implementation of relevant policies and standards. The draft law also seeks to provide formal legal definitions for certain terms used in implementing the social credit system, such as "untrustworthy," "credit

supervision” and “credit information.” In addition, the draft law seeks to codify the protection of certain rights, as it calls for the establishment of a social credit system that maintains the security of social credit information and strictly protects state secrets, business secrets, and personal privacy, while also protecting the lawful rights and interests of natural persons, legal persons, and unincorporated organizations. As of December 31, 2023, the draft law has not been issued in final form.

Earlier in 2022, prior to the publication of the draft law, the NDRC issued a draft update of the 2021 National Basic Catalogue of Public Credit Information and a draft update of the 2021 National Basic List of Disciplinary Measures against Dishonest Acts. The draft Catalogue of Public Credit Information compiles the scope and types of credit information that can be collected by government agencies. It also stipulates that certain categories of information are exempt from collection, including state secrets and trade secrets. The draft List of Disciplinary Measures includes a range of punitive actions that may be applied to violators of trust, such as duties, fees, restrictions on market activity, prohibitions, or limitations on occupations and bans from government procurement bidding. Like the draft law, neither the draft Catalogue of Public Credit Information nor the draft List of Disciplinary Measures has been issued in formal form.

The social credit system has been tied to larger policy objectives as well. For example, the General Office of the State Council and the General Office of the Chinese Communist Party issued a joint opinion on promoting a high-quality credit system in order to further China’s “dual circulation” objectives. In addition, in November 2022, China’s Ministry of Science and Technology (MOST) announced a new pilot project for evaluating science, technology, engineering, and mathematics talent. Under the MOST’s new pilot project, evaluation of scientists’ performance is to incorporate metrics related to their moral character, which includes their social credit record, in order to ensure that scientific researchers have no history of plagiarism or academic fraud. This pilot project appears to reflect China’s struggle to improve the quality of its scientific research talent.

Foreign companies also have numerous concerns with China’s social credit system, which is becoming increasingly complex and expansive. They are concerned that the Chinese Government will use it to disadvantage or coerce foreign companies or provide favorable treatment to domestic companies. They are concerned that the Chinese Government will use the social credit system to pressure them to act in furtherance of China’s industrial policies or other state priorities or otherwise to make investments or conduct their business operations in ways that run counter to market principles or their own business strategies. In addition, foreign companies are concerned about the opaque nature of the social credit system. Currently, for example, a company sometimes only learns about its negative ratings when, for example, it requests a permit and receives a denial, even though the Measures for Administration of the List of Serious Violators of Trust and Law includes a requirement that companies be informed of their being censured in advance. Other times, a company learns for the first time that it has been censured when a Chinese Government agency posts its name on the agency’s website, even though the censuring of a company can cause severe harm to the company’s reputation and adversely impact its efforts to attract customers, secure needed financing, or make new investments. When Chinese Government agencies begin to pursue joint punishment in the way that the NDRC envisions, it will mean that an infraction in one regulatory context could have wider consequences across the company’s entire business operations.

Foreign companies are also concerned about the links between corporate social credit and individual social credit. They can foresee the Chinese Government using the social credit system as another tool to coerce foreign companies and those who work for them not to cross political redlines on sensitive matters like deprivation of human rights. Foreign companies can also foresee the Chinese Government potentially using corporate social credit in the future to exert extraterritorial influence by threatening the social credit standing of foreign companies or their officials for behavior or speech outside of China. Similarly, foreign companies are concerned that China will abuse its legion of laws regulating how data is stored and transferred to access information to use against them.

Administrative Licensing

U.S. companies continue to encounter significant problems with a variety of administrative licensing processes in China, including processes to secure product approvals, investment approvals, business expansion approvals, business license renewals, and even approvals for routine business activities. While there has been an overall reduction in license approval requirements and a focus on decentralizing licensing approval processes, U.S. companies continue to report that one of their key concerns involves China's problematic licensing approval processes.

Transparency

One of the core principles reflected throughout China's WTO accession agreement is the enhancement of transparency. Unfortunately, after more than 20 years of WTO membership, China still has a poor record when it comes to adherence to its transparency obligations.

Publication of Trade-Related Measures

In its WTO accession agreement, China committed to adopt a single official journal for the publication of all trade-related laws, regulations, and other measures. China adopted a single official journal, to be administered by the MOFCOM, in 2006. However, it appears that China only publishes trade-related measures from some, but not all, central-government entities in this journal. It also appears that China rarely publishes trade-related measures from sub-central governments in the journal.

At the central government level, moreover, China tends to take a narrow view of the types of trade-related measures that need to be published in the official journal. For those government entities whose trade-related measures are published in the official journal, China more commonly (but still not regularly) publishes trade-related administrative regulations and departmental rules in the journal, but it is rare for China to publish other measures such as opinions, circulars, orders, directives and notices, which are known as "normative documents" in China's legal system. Normative documents are regulatory documents that do not fall into the category of administrative regulations or departmental rules, but still impose binding obligations on enterprises and individuals. Although the State Council introduced a definition for "administrative normative documents" in 2014, this definition is narrow and does not appear to encompass all normative documents, nor has it resulted in their regular publication as required by China's WTO commitments. Among other things, publication of all normative documents would facilitate compliance by enterprises and individuals with the obligations addressed in them.

Meanwhile, China rarely publishes certain types of trade-related measures from either the central level or the sub-central level of government in the official journal; an important example involves subsidy measures.

Notice-and-Comment Procedures

In its WTO accession agreement, China committed to provide a reasonable time period for public notice and comment before implementing new trade-related laws, regulations, and other measures. While little progress has been made in implementing this commitment at the sub-central government level, the National People's Congress instituted notice-and-comment procedures for draft laws in 2008, and shortly thereafter China indicated that it would also publish proposed trade- and economic-related administrative regulations and departmental rules for public comment. Subsequently, the National People's Congress began regularly publishing draft laws for public comment. China's State Council often (but not regularly) published draft administrative regulations for public comment, but many of China's ministries were not consistent in publishing draft departmental rules or normative documents for public comment.

At the May 2011 S&ED meeting, China committed to issue a measure implementing the requirement to publish all proposed trade- and economic-related administrative regulations and departmental rules on the website of the State Council's Legislative Affairs Office (SCLAO) for a public comment period of not less than 30 days. In April 2012, the SCLAO issued two measures that appear to address this requirement.

In the Phase One Agreement, China committed to provide no less than 45 days for public comment on all proposed laws, regulations, and other measures implementing the Phase One Agreement. Since the entry into force of this commitment in February 2020, China has generally been providing the required 45-day public comment period and working constructively with the United States whenever it has raised questions or concerns regarding provisions in proposed implementing measures.

Currently, outside the context of Phase One Agreement implementing measures, the process for issuing new measures in China can be opaque and unpredictable and implemented without adequate notice. China has yet to adequately improve its practices relating to the publication of administrative regulations and departmental rules for public comment. China also has yet to formalize its use of notice-and-comment procedures for all normative documents. In addition, even when China provides for a notice-and-comment period, too often it issues the final measure immediately after the end of the comment period, suggesting that it did not give serious consideration to the comments received.

China also has yet to consistently implement the notice-and-comment obligations applicable to all WTO Members. Most notably, China needs to adhere consistently to the notice-and-comment periods required by the TBT Agreement and the SPS Agreement.

Translations

In its WTO accession agreement, China committed to make available translations of all of its trade-related laws, regulations, and other measures at all levels of government in one or more of the WTO languages, *i.e.*, English, French, and Spanish. Prior to 2014, China had only compiled translations of trade-related laws and administrative regulations (into English), but not other types of measures, such as departmental rules, normative documents, and sub-central government measures. Even for trade-related laws and administrative regulations, China was years behind in publishing these translations. At the July 2014 S&ED meeting, China committed that it would extend its translation efforts to include not only trade-related laws and administrative regulations but also trade-related departmental rules. Subsequently, in March 2015, China issued a measure requiring trade-related departmental rules to be translated into English. This measure also provides that the translation of a departmental rule normally must be published before implementation.

Notably, however, even if China were to fully implement its existing measures requiring translations, they would not be sufficient to bring China into full WTO compliance in this area. China does not consistently publish translations of trade-related laws, administrative regulations, and departmental rules in a timely manner (*i.e.*, before implementation), nor does it publish any translations of trade-related normative documents or trade-related measures issued by sub-central governments.

Enquiry Point

In its WTO accession agreement, China committed to establish an enquiry point that would respond to requests for information relating to legal measures required to be published in its official journal. At times, however, China has refused to provide copies of legal measures in response to legitimate requests directed to its enquiry point.

In April 2020, for example, the United States submitted a request concerning five Chinese legal measures covering semiconductors and fisheries subsidy programs that had not been published in China's official journal and were not otherwise available online, nor had they been notified to the WTO. Despite the obligation in its WTO accession agreement to either provide the documents or respond in writing within 45 days, China did not meet this deadline. The United States made repeated follow-up requests, to no avail. Five months after the United States submitted its request to China's enquiry point, the MOFCOM orally informed the U.S. Embassy in Beijing that it would not be providing any of the requested legal measures because two of the measures would soon be replaced and the other three measures, in China's view, were not relevant to China's WTO obligations. USTR promptly responded to the MOFCOM in writing, countering its assertions and urging it to provide the requested documents. Since then, China has continued to refuse to provide a written response to the United States' request or to provide any of the requested legal measures, even though the United States and other WTO Members have repeatedly raised this matter in the WTO Subsidies Committee and the WTO Council for Trade in Goods.

Other Non-Tariff Measures

A number of other non-tariff measures can adversely affect the ability of U.S. industry to access or invest in China's market. Key areas of concern include laws governing land-use in China, commercial dispute resolution, and the treatment of non-governmental organizations. Corruption among Chinese Government officials, enabled in part by China's incomplete adoption of the rule of law, is also a key area of concern.

COLOMBIA

TRADE AGREEMENTS

The United States–Colombia Trade Promotion Agreement

The United States–Colombia Trade Promotion Agreement (CTPA) entered into force on May 15, 2012. The United States and Colombia work closely to review the implementation and functioning of the CTPA and to address outstanding issues.

IMPORT POLICIES

Tariffs

Since January 1, 2021, U.S. consumer and industrial products have been duty free pursuant to the CTPA. Duties on some remaining U.S. agricultural goods were phased out on January 1, 2023. Tariffs on the most sensitive products for Colombia will be phased out between January 1, 2026, and January 1, 2030. U.S. agricultural exporters also currently benefit from duty-free access under tariff-rate quotas for some sensitive products.

Non-Tariff Barriers

Customs Barriers and Trade Facilitation

Colombia ratified the World Trade Organization (WTO) Trade Facilitation Agreement (TFA) on August 6, 2020. Colombia has not yet implemented customs reforms that would allow traders to submit electronic copies of invoices instead of physical copies, as encouraged by the TFA. Slow customs clearance in Colombia hampers both imports and exports, and the ability to submit electronic copies of documents would help accelerate customs clearances. The Colombian Government reports that its digital system is under development, and the United States will continue to follow the development of the system.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

Automobile Conformity Assessment

Colombia's requirement for third-party safety certification for several components of imported vehicles will go into effect August 2024. U.S. manufacturers already test their products for compliance with U.S. Federal Motor Vehicle Safety Standards. Furthermore, there are no conformity demonstration laboratories and organizations for carrying out technical tests in Colombia. After consultation and the receipt of U.S. Government and other stakeholder comments, Colombia amended its regulations to state that U.S. manufacturers can satisfy the legal requirement for third-party certification by providing documentation issued by the U.S. National Highway Traffic Safety Administration (NHTSA). The U.S. Government and stakeholders remain concerned with this approach, given that NHTSA does not issue such documentation. U.S. industry states that Colombia's burdensome and duplicative requirement will significantly impact exports of U.S.-manufactured vehicles and parts to Colombia. In August 2023, the Colombian Government announced its intention to impose similar requirements on other automobile components but has delayed

implementation of these requirements until September 2024 to allow additional time for discussion. The United States will continue working with the Colombian Government and stakeholders to seek workable alternatives.

Sanitary and Phytosanitary Barriers

Lactic Acid and Bulk Dried Milk

In August 2020, INVIMA (Colombia's regulatory authority equivalent to the U.S. Department of Health and Human Services Food and Drug Administration) informed the United States that all U.S. shipments of milk powder to Colombia must meet the physical and chemical properties requirements in Decree 616 of 2006, including minimum lactic acid content requirements. Decree 616 was notified to the WTO Committee on Sanitary and Phytosanitary Measures (WTO SPS Committee) in 2005 and again in 2012. The scientific basis and rationale for the regulation remain unclear. The Codex Alimentarius Commission standards for food additives only establish a maximum limit for lactic acid and do not set a minimum limit. In July 2022, Colombia's Ministry of Health published a draft regulation to amend Decree 616, which continued to include mandatory minimum lactic acid requirements for milk powder, and added other restrictions on the sale of bulk powdered milk. The United States participated in Colombia's domestic consultation process for the draft regulation, which ended on August 12, 2022. The draft regulation is pending notification to the WTO SPS Committee.

Cessation of Issuance of Import Permits for U.S. Poultry

Since 2012, Colombia had allowed the United States to export poultry products coming from U.S. zones (or counties) free of highly pathogenic avian influenza (HPAI), a procedure recognized in a 2012 regionalization agreement that was signed by the U.S. Trade Representative and the Colombian Ministers of Agriculture and Trade. On August 7, 2023, Colombia's national animal health authority (ICA) stopped issuing import permits for certain U.S. poultry products, pursuant to Resolution 2478 of 2023. This resolution puts in place sanitary restrictions on the importation of poultry products from countries with the presence of HPAI. U.S. regulators have provided extensive technical information regarding U.S. disease control measures and facilitated a number of site visits by ICA officials in December 2023. On February 13, 2024, ICA officially reopened the market to U.S. day-old chicks and hatching eggs. On February 26, 2024, ICA officially reopened the market to U.S. poultry meat.

INTELLECTUAL PROPERTY PROTECTION

Colombia remained on the Watch List in the [2023 Special 301 Report](#). Colombia has not yet implemented the provisions of the CTPA regarding enforcement against online copyright infringement and has not yet acceded to the 1991 Act of the International Convention for the Protection of New Varieties of Plants. During 2023, the United States continued to engage with Colombia on these outstanding CTPA commitments.

With respect to concerns raised about Article 72 of the 2015 National Development Plan, Colombia issued Decree 433 in March 2018 and Decree 710 of April 2018 to clarify that Colombia would not condition regulatory approvals for pharmaceuticals on factors other than the safety and efficacy of the underlying compound. An action challenging both these decrees led Colombia's Council of State to provisionally suspend the decrees in September 2019.

Colombia continues to face a large number of pirated and counterfeit goods crossing the border or sold at markets, on the street, and at other distribution hubs around the country. High levels of digital piracy

persist, and Colombia has not curtailed the number of free-to-air devices, community antennas, and unlicensed Internet Protocol Television services that permit the retransmission of otherwise-licensed content to a large number of nonsubscribers.

SERVICES BARRIERS

Distribution Services

A section of Colombia's commercial code provides protections for agents that can make it difficult and costly for companies to terminate a commercial agent (sales representative) contract. The United States has been working with Colombia to implement its commitments under the CTPA that address this issue.

LABOR

The United States and Colombia continue to consult on labor issues pursuant to Article 17.5.5 of the CTPA. This engagement includes discussing Colombia's progress on implementing specific recommendations contained in a U.S. Department of Labor (DOL) report. The [DOL report](#), published in 2017, raises significant concerns regarding labor law enforcement throughout Colombia, especially with respect to the right to freedom of association, the right to organize and bargain collectively, violence against unionists, and impunity for the perpetrators of the violence.

COSTA RICA

TRADE AGREEMENTS

Dominican Republic–Central America–United States Free Trade Agreement

The Dominican Republic–Central America–United States Free Trade Agreement (CAFTA–DR) entered into force for the United States, El Salvador, Guatemala, Honduras, and Nicaragua in 2006; for the Dominican Republic in 2007; and for Costa Rica in 2009. The United States and the other CAFTA–DR countries meet regularly to review the implementation and functioning of the Agreement and to address outstanding issues.

IMPORT POLICIES

Tariffs and Taxes

Tariffs

As a member of the Central American Common Market, Costa Rica applies a harmonized external tariff on most items at a maximum of 15 percent, with some exceptions. However, under the CAFTA–DR, as of January 1, 2015, U.S. non-agricultural goods enter Costa Rica duty free.

In addition, nearly all U.S. agricultural exports enter Costa Rica duty free under the CAFTA–DR. Costa Rica will eliminate its remaining tariffs on certain rice and dairy products by 2025. On August 12, 2022, Costa Rica unilaterally reduced tariffs on imported rice irrespective of origin. For certain agricultural products, tariff-rate quotas (TRQs) permit duty-free access for specified quantities during the tariff phase-out period, with the duty-free quantities expanding during that period. Costa Rica will liberalize trade in fresh potatoes and onions through continual expansion of a TRQ, rather than the reduction of the out-of-quota tariff. Costa Rica is required under the CAFTA–DR to make TRQs available on January 1 of each year. Costa Rica monitors its TRQs through an import licensing system, which the United States carefully tracks to ensure the timely issuance of these import licensing permits.

Taxes

Costa Rica assesses an excise tax on distilled spirits calculated as a percentage of alcohol per liter, based on three specific rates (Law 7972). The highest rate applies to spirits bottled at a rate above 30 percent alcohol-by-volume (abv). While locally produced spirits (produced in the largest volume by the state-owned alcohol company) are bottled at 30 percent abv, the vast majority of internationally traded spirits are bottled at 40 percent abv. As a result, most imported spirits are taxed at a higher rate than most spirits produced domestically. Furthermore, domestic producers may pay the tax within the first 15 days of each month on sales made during the prior month, while importers must pay the tax prior to release of their product from customs.

SANITARY AND PHYTOSANITARY BARRIERS

The Costa Rican Ministry of Agriculture occasionally delays the issuance of phytosanitary import permits for sensitive products during specific periods, such as harvest time (usually from April to June for onions), creating difficulties for U.S. exporters of those products. The table-stock potato market is closed pending completion of a pest risk assessment. The United States exported approximately \$1.9 million and \$1.7

million of chipping potatoes to Costa Rica in 2021 and 2022, respectively, and an estimated \$2.2 million in 2023. However, industry estimates that exports could increase to over \$5 million if phytosanitary issues are addressed and the table-stock potato market is reopened. The U.S. Department of Agriculture (USDA) Animal and Plant Health Inspection Service and the Costa Rican Ministry of Agriculture conduct frequent bilateral meetings to discuss regulatory procedures for the import and export of new products, promoting market access for new U.S. products.

A 2016 Costa Rican regulation requires completion of extensive questionnaires for certain animal product facilities that export products to Costa Rica, including dairy, seafood, lamb, and egg product facilities. Most U.S. exporting facilities have complained that the questionnaire requests require disclosure of irrelevant and business proprietary information. As a result, U.S. exports of these products face delays of several months or longer when introducing new products to the Costa Rican market. The USDA and the U.S. Department of Health and Human Services Food and Drug Administration have engaged Costa Rica's National Animal Health Service to consider a less burdensome alternative to the questionnaire for U.S. exporters.

GOVERNMENT PROCUREMENT

U.S. companies have indicated that the private sector is sometimes disadvantaged in public bids when competing against Costa Rican state-owned enterprises in both the information and communications technology and insurance sectors. Article 2 of the Public Contracting Law allows for the noncompetitive awarding of contracts to public entities if officials of the awarding entity certify the award to be an efficient use of public funds. The United States has engaged with Costa Rica on these issues.

Costa Rica is not a Party to the World Trade Organization (WTO) Agreement on Government Procurement, but has been an observer to the WTO Committee on Government Procurement since June 2015. Costa Rica applied for membership in the WTO Committee on Government Procurement on September 28, 2023. However, the CAFTA–DR contains disciplines on government procurement.

INTELLECTUAL PROPERTY PROTECTION

Costa Rica was removed from the Watch List in the [2020 Special 301 Report](#) due to the concrete steps it took to improve its intellectual property (IP) regime, including initiating new programs within the government to track licenses to address unlicensed software use in the central government, and to implement an online recordation system to improve border enforcement. While the United States recognizes the progress Costa Rica has made, and the potential of these positive developments, their effectiveness remains to be demonstrated through enforcement and outcomes on the ground. Costa Rica's IP Registry issued its second report on government usage of unlicensed software in July 2022, with results of the use of legal software at 95 government institutions. The decree that calls for these reports does not mandate they be published, and neither the first nor the second report has been published. The Ministry of Science, Innovation, Technology and Telecommunications and the Ministry of Foreign Trade authorities are working to accelerate the analyses and delivery of the reports to the president to coordinate actions needed in the event of noncompliance. The United States continues to request that Costa Rica publish the results of the reports.

The United States also continues to urge Costa Rica to bolster IP enforcement to curb online piracy, address cumbersome border measure processes to deter counterfeit and pirated goods, and effectively utilize *ex officio* authority for border enforcement against counterfeit and pirated goods. Costa Rica has implemented an online recordation system that provides information to improve border enforcement but is not as robust as the U.S. Department of Homeland Security Customs and Border Protection e-Recordation Program. The

Ministry of Foreign Trade is working with IP Registry and private sector representatives to strengthen Costa Rica's recordation system and learn from best practices in this area. The United States continues to encourage Costa Rica to build on initial positive steps to protect and enforce IP and to continue bilateral discussions of these issues.

COTE D'IVOIRE

IMPORT POLICIES

Tariffs and Taxes

Tariffs

Cote d'Ivoire's average Most-Favored-Nation (MFN) applied tariff rate was 12.1 percent in 2022 (latest data available). Cote d'Ivoire's average MFN applied tariff rate remained 15.8 percent for agricultural products and 11.5 percent for non-agricultural products in 2022 (latest data available). Cote d'Ivoire has bound 33.3 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 11.2 percent.

Consistent with the Economic Community of West African States (ECOWAS) Common External Tariff (CET), Cote d'Ivoire applies: (1) zero percent duty on essential social goods (*e.g.*, medicine); (2) 5 percent duty on essential commodities, raw materials, and capital goods; (3) 10 percent duty on intermediate goods; (4) 20 percent duty on final consumer goods; and (5) 35 percent duty on certain goods that the Ivoirian Government elected to afford greater protection. After a three-year delay in harmonizing the CET, as of 2023, it is based on the 2022 Harmonized System nomenclature developed by the World Customs Organization.

Since 2021, the tariff rate was reduced to 9 percent for milk (except yogurt and other dairy products), infant milk, homogenized and composite preparation foods for infants, imported rice, meat imported from outside ECOWAS, pasta products containing 100 percent durum wheat semolina, and equipment designed for solar energy. The Ivoirian Government applies a tariff of 1,000 CFA (approximately \$1.75) per kilogram to imports of frozen meats.

Taxes

Imports from countries that are not members of the West African Economic and Monetary Union (WAEMU) are subject to an additional 2.5 percent tax on the cost, insurance, and freight (CIF) value of imports, which consists of the solidarity tax (0.8 percent), African Union import tax (0.2 percent), ECOWAS community levy (0.5 percent), and statistical charge (1.0 percent), all of which are used for financing WAEMU commissions and assisting landlocked WAEMU members Niger, Burkina Faso, and Mali. Like all ECOWAS countries, Cote d'Ivoire imposes a 1 percent ECOWAS levy on all goods originating from non-ECOWAS countries to finance the activities of the ECOWAS Commission and Community institutions. Cote d'Ivoire levies an additional 1 percent charge on the CIF value of imports, except those destined for re-export, transit, or donations for humanitarian purposes under international agreements.

An import tax of 15 percent is applied on imports of electrical transformers from 16 kilovolt-amperes (kVA) to 500 kVA.

Excise duties apply to certain imports, including alcoholic or nonalcoholic beverages and oil products. The tax on cosmetic products containing hydroquinone decreased from 50 percent to 15 percent.

Non-Tariff Barriers

A number of items are subject to import prohibitions, restrictions, or prior authorization, including: certain petroleum products, animal products, flour, live plants, seeds, plastic bags, distilling equipment, and analog televisions. Textile imports are subject to some authorization requirements by the External Trade Promotion Office.

Import Bans

Cote d'Ivoire has prohibited wheat flour imports without iron and acid folic fortification since 2008. In January 2020, Cote d'Ivoire banned the importation of sugar for five years. By doing so, Cote d'Ivoire ensures the consumption of domestically-produced sugar and protects a well-known national company in this sector. Two local companies are authorized to import sugar in case of a national shortage.

Import Restrictions

A regulation in force since July 2018 limits the age of imported used vehicles to a maximum of five years.

Customs Barriers and Trade Facilitation

All goods imported into Cote d'Ivoire must first be examined by a pre-shipment inspection company for compliance with relevant requirements. U.S. exporters find the process often increases the time and cost to export without providing assurance of a more streamlined clearance process at the border. Four European companies—BIVAC (affiliated with the French group Bureau Veritas), Swiss-based firms COTECNA and SGS, and British company Intertek—are contracted to carry out pre-shipment inspections of goods exported to Cote d'Ivoire with a value exceeding 1 million CFA (approximately \$1,750). A certificate of compliance from one of these firms is required to clear customs. In 2023, customs authorities enforced a rule mandating that all imported containers must undergo a verification scan before being allowed to enter the country.

Cote d'Ivoire notified its latest update to its customs valuation legislation to the WTO in June 2002, but it has not yet responded to the WTO Checklist of Issues that describes how the Customs Valuation Agreement is being implemented.

Minimum Import Prices

The Ivoirian Government imposes minimum import prices on products including cooking oil, sugar, used clothing, concentrated tomato paste, broken rice, matches, notebooks, tissues, polypropylene sacks, alcohol, and milk.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Cote d'Ivoire has not consistently notified draft measures to the WTO Committee on Technical Barriers to Trade nor the WTO Committee on the Application of Sanitary and Phytosanitary Measures since becoming a WTO Member on January 1, 1995. Transparency of the regulatory system in Cote d'Ivoire is a concern, as companies complain that regulations are issued only as final measures without a clear process or a period for public comment on draft regulations.

GOVERNMENT PROCUREMENT

The Ivoirian Government publishes tender notices in the local press and sometimes publishes tenders in international magazines and newspapers. On occasion, there is a charge for the bidding documents. Cote d'Ivoire has a generally decentralized government procurement system, with most ministries undertaking their own procurements. The National Bureau of Technical and Development Studies—the government's technical and investment planning agency and think tank—occasionally serves as an executing agency in major projects to be financed by international institutions.

The Public Procurement Department is a centralized office of public tenders in the Ministry of Finance to help ensure compliance with international bidding practices. Cote d'Ivoire's update to its public procurement code in 2019 introduced some positive changes, including electronic procurement bidding, provisions on sustainable public procurement, and promotion of socially responsible vendors as a bidding qualification. While the public procurement process is open by law, in practice it is often opaque and government contracts are occasionally awarded outside of public tenders. Some foreign companies appear to secure contracts as a result of longstanding relationships with government officials or aided by partnerships with Ivoirian commercial entities that have close connections to the government. In other instances, although specific regulations govern the use of sole source procurements, the government has awarded sole source bids without tenders, citing the high technical capacity of a firm or a declared emergency.

Many firms continue to cite corruption as an obstacle to a transparent understanding of procurement decisions.

Cote d'Ivoire is not a Party to the WTO Agreement on Government Procurement, but has been an observer to the WTO Committee on Government Procurement since July 2020.

INTELLECTUAL PROPERTY PROTECTION

Inadequate enforcement of intellectual property (IP) rights remains a serious concern. The Ivoirian Copyright Office (BURIDA) uses a labeling system to combat counterfeiting and piracy in audio, video, literary, and artistic works. BURIDA has also facilitated stakeholder engagement to promote IP, and its police unit still conducts some raids to confiscate pirated CDs and DVDs; however, due to recent streaming alternatives, CDs and DVDs are circulated less and less in the market. In 2023, Cote d'Ivoire made efforts to operationalize the National Committee for the Fight against Counterfeiting (CNLC), which was created by decree in 2014, accepts IP enforcement complaints from stakeholders, and reportedly will conduct seizures on right holders' behalf. However, detailed information about the CNLC's activities is not publicly available. IP enforcement continues to suffer in Cote d'Ivoire due to limited resources and a lack of customs checks at the country's porous borders.

SERVICES BARRIERS

The chartered accountants' association of Cote d'Ivoire restricts registration to foreign nationals, with the exception of those who have practiced in Cote d'Ivoire for several years under the license of an Ivoirian practitioner.

INVESTMENT BARRIERS

Cote d'Ivoire has restrictions on and requires prior approval for foreign investment in the health sector, law and accounting firms, petroleum and gas, and travel agencies. Majority foreign ownership of companies in

these sectors is not permitted, and all foreign companies currently operating in these sectors do so in partnership with local firms.

SUBSIDIES

In 2023, the Ivorian Government granted cotton producers a subsidy of 29 billion CFA (approximately \$45 million) to offset significant increases in the cost of fertilizer (*e.g.*, an increase of 84 percent for nitrogen, phosphorus, and potassium and 114 percent for urea) and other inputs.

OTHER BARRIERS

Bribery and Corruption

Bribery and corruption remain a significant concern. Stakeholders report that bribes are sometimes solicited to speed up the slow bureaucratic process or to secure public tenders. The High Authority of Good Governance (HABG) is an independent administrative authority that is nominally under the Office of the President. It is responsible for executing the national plan to fight corruption and investigating allegations of corruption. In 2021, the HABG undertook an audit of Ivorian parastatal companies in key sectors. Several parastatals' managers have been suspended from their positions. In addition, 14 entities (11 public companies and 3 private companies) in the health sector were charged with corruption. Corruption, opaque business practices, and capacity constraints on the judiciary and in law enforcement have resulted in poor enforcement of the law. This situation has been particularly acute with regard to the protection of private property rights, particularly when the subject of the judicial proceeding or law enforcement action is a foreigner and the plaintiff is Ivorian or a long-established foreign resident. These situations are further complicated by conflicting modern and traditional concepts of land tenure, the latter including communal ownership. On July 11, 2022, the government launched Spacia, a platform for monitoring and preventing acts of corruption and similar offenses.

Export Policies

Cote d'Ivoire's 2021–2025 National Development Plan prioritizes agro-industrial development. As a result, the government provides incentives and supports funds to investors expanding agro-industrial processing of locally grown cashew, cocoa, and other commodities for export. The government also incentivizes domestic processing of agricultural commodities such as cocoa, rubber, palm oil, and coffee, by imposing a higher export tax on unprocessed commodities. The government prohibits the export of iron products. Exports of metallic ores, gems, and precious metals require prior authorization from both the Ministry of Mining and Geology and the Ministry of Economy and Finance.

DOMINICAN REPUBLIC

TRADE AGREEMENTS

Dominican Republic–Central America–United States Free Trade Agreement

The Dominican Republic–Central America–United States Free Trade Agreement (CAFTA–DR) entered into force for the United States, El Salvador, Guatemala, Honduras, and Nicaragua in 2006; for the Dominican Republic in 2007; and for Costa Rica in 2009. The United States and the other CAFTA–DR countries meet regularly to review the implementation and functioning of the Agreement and to address outstanding issues.

IMPORT POLICIES

Tariffs and Taxes

Tariffs

Under the CAFTA–DR, as of January 1, 2015, non-agricultural goods enter the Dominican Republic duty free. In addition, nearly all U.S. agricultural exports enter the Dominican Republic duty free under the CAFTA–DR. Under the CAFTA–DR, the Dominican Republic has committed to eliminating its remaining tariffs on rice, chicken leg quarters, and some dairy products by 2025. For certain agricultural products, tariff-rate quotas (TRQs) permit duty-free access for specified quantities during the tariff phase-out period. The Dominican Republic is required under the CAFTA–DR to make TRQs available on January 1 of each year.

Taxes

U.S. ethanol imported into the Dominican Republic is subject to an internal 10 percent *ad valorem* tax and an excise tax of approximately \$11 per liter, and these taxes disincentivize importation of U.S. ethanol. Imported ethanol is also subject to the internal Tax on Transfer of Industrial Goods and Services (ITBIS) at a rate of 18 percent. This practice disadvantages U.S. exports as locally produced ethanol is not subject to these internal taxes.

Cheese importers face unequal treatment with regard to taxation; imported cheese is subject to the ITBIS of 18 percent, while locally produced cheese is not. This puts U.S. exports of these products at a competitive disadvantage. In meetings conducted in 2020, 2021 and 2022, the Dominican Republic Government advised that the General Directorate of Internal Taxes (DGII) had discussed implementing the ITBIS on local cheese producers through a schedule. The DGII has not made any progress on this proposed implementation. The U.S. Government will continue to work with the DGII to seek a resolution of this issue.

Non-Tariff Barriers

Import Licensing

The Dominican Republic’s Ministry of Agriculture continues to administer import licenses as a means to manage trade in sensitive commodities such as rice, beans, dairy, sugar, poultry, beef, pork, onions, and garlic and intermittently with respect to other products. In August 2004, a side letter was signed under the

CAFTA–DR by the United States and the Dominican Republic affirming that the Dominican Republic would not grant or deny import licenses on the basis of unjustified sanitary or phytosanitary concerns, domestic purchasing requirements, or discretionary criteria. However, the need to obtain an import license from the Ministry of Agriculture and the way in which the licensing process is handled can lead to inconsistent application of the law and uneven treatment. In 2022, the Dominican Republic proposed a new system to issue import licenses for agricultural products, led by the Ministry of Agriculture. In April 2022, the United States submitted comments on the new regulations. The Dominican Republic Government had not responded to the U.S. comments or implemented the new system as of December 2023. The United States will continue to work with the Ministry of Agriculture to ensure that this new system responds to U.S. concerns.

Importers of U.S.-made used vehicles less than five years old have reported that the Dominican Republic customs authority frequently has challenged the eligibility of those vehicles for preferential tariff treatment under the CAFTA–DR, citing technical difficulties in demonstrating compliance with the rules of origin. The United States continues to engage with the Dominican Republic to address these complaints.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

Regulation of Steel Rebar

Multiple U.S. exporters of steel rebar used for construction have complained that a Dominican Republic technical regulation (RTD 458) constitutes a barrier to trade. Dominican Republic authorities have required imported U.S. rebar to be sampled and tested by third-party laboratories, which is not required of domestic production. Because no suitable third-party laboratories exist in the Dominican Republic, samples have been sent back to the United States for testing. These conformity assessment procedures appear to present unnecessary obstacles to international trade, lack transparency in their application, and have unduly increased the cost and time required for commercialization of rebar in the Dominican Republic.

The United States has continued to engage with U.S. companies and Dominican Republic authorities on this issue. While Dominican Republic authorities have worked with certain individual companies in the U.S. steel industry to accept test results and certify rebar before export so that products may clear customs and enter commerce in the Dominican Republic without delay, the Dominican Republic has yet to reform the regulations and practices to ensure that imported rebar is treated no less favorably than domestically manufactured rebar.

Sanitary and Phytosanitary Barriers

Delays in the process for obtaining sanitary registrations from the Dominican Republic for foods, medicines, and health products have resulted in higher operating costs and delays moving products to market, according to industry representatives. Since April 2018, the General Directorate of Medicines, Food, and Health Products (DIGEMAPS), which oversees the registration process, has requested declarations of product additives, which are not required under Dominican Republic health law. Improvements have been made in expediting new registrations and renewals through the implementation of a simplified procedure, including accepting a sworn statement on why confidential additives are not provided. The functioning of the sanitary registration process remains inconsistent, with certain products taking up to a year to be registered by DIGEMAPS, often resulting in importers choosing not to import the product. On June 5, 2023, the Dominican Republic issued Decree 231-23 decentralizing DIGEMAPS from

the Ministry of Public Health and Social Welfare. The Directorate will now exercise operational and administrative autonomy.

INTELLECTUAL PROPERTY PROTECTION

The Dominican Republic remained on the Watch List in the [2023 Special 301 Report](#). The Dominican Republic continues to demonstrate political will to improve intellectual property (IP) protection and enforcement, including the creation in December 2022 of the National Inter-Ministerial Council of Intellectual Property, intended to coordinate the agencies involved in IP protection and enforcement and ensure better cooperation and information sharing. Despite this progress, the United States remains concerned with prevalent online and signal piracy, the widespread sale of counterfeit goods, and the inconsistent quality of patent examinations. The United States also continues to urge the Dominican Republic to improve coordination among enforcement agencies and to ensure that such agencies are adequately funded and staffed.

GOVERNMENT PROCUREMENT

U.S. suppliers have complained that government procurement in the Dominican Republic is not conducted in a transparent manner and that corruption is a problem. The U.S. Government has engaged with the Dominican Republic Government on this issue and transparency has increased in its procurement system over the last few years. In a Memorandum of Understanding signed by the United States and the Dominican Republic in October 2020, the Dominican Republic Government expressed its intent to prioritize passage of new legislation on public procurement and implement it in a manner that is timely, transparent, and consistent with international best practices. In March 2022, the Dominican Republic issued a draft law on government procurement, which would establish a legal regime for all stages of the procurement process. The draft law excludes “international treaties, trade or integration agreements . . . when so determined by the treaties, agreements, or conventions” from the scope of the law, but it does not offer guidance as to how procuring entities are to implement the law in accordance with the Dominican Republic’s CAFTA–DR commitments. The U.S. Government also engaged the Dominican Republic Government on this matter and will continue to monitor the Dominican Republic’s procurement practices for consistency with the CAFTA–DR’s disciplines.

On September 14, 2023, the new Regulation for the Application of Law No. 340-06 on Procurement and Contracting of Goods, Services and Works and its amendments was approved by Decree 416-23 of the Executive Branch of the Dominican Republic. This regulation repeals the previous Regulation on Procurement and Contracting of Goods, Services and Works No. 543-12 of September 6, 2012. Several elements included are transparency and electronic procurement portals, micro-purchases methodology, streamlining participation for foreign companies in government tenders, integrity and mitigation risks for vendors, value for money, transparency of government procurement committees, exception rules, and sustainability in the valuation criteria for government tenders.

The Dominican Republic is not a Party to the World Trade Organization (WTO) Agreement on Government Procurement but has been an observer to the WTO Committee on Government Procurement since September 2022. However, the CAFTA–DR contains disciplines on government procurement.

LABOR

A review of the Dominican Republic’s progress on implementing specific recommendations from the United States to improve worker rights practices in the Dominican Republic sugar sector has been ongoing since the issuance of a U.S. Department of Labor (DOL) report in 2013. The DOL report, published in

response to a submission from the public under the CAFTA–DR, raised concerns regarding labor law enforcement in the sugar sector related to acceptable conditions of work, the minimum age for work and the worst forms of child labor, and forced labor. In its [seventh report of review](#), published in September 2022, the DOL detailed ongoing concerns and challenges in the Dominican Republic’s sugar industry. Although the country’s Ministry of Labor and sugar companies have made progress in some areas, the country still faces challenges related to labor law enforcement. Concerns remain about dangerous working conditions, verification of pay and hours, unsuitable living conditions, workers’ precarious legal status, and other potential labor rights abuses. The United States has also established a bilateral technical working group with the Dominican Republic under the CAFTA–DR to help improve labor law enforcement in the Dominican Republic sugar sector.

ECUADOR

TRADE AGREEMENTS

The United States–Ecuador Trade and Investment Council Agreement

The United States and Ecuador signed a Trade and Investment Council Agreement (TIC) in 1990. This Agreement is the primary mechanism for discussions of trade and investment issues between the United States and Ecuador.

On December 8, 2020, the United States and Ecuador signed a Protocol on Trade Rules and Transparency (the Protocol), which entered into force on August 15, 2021. The Protocol is an update to the TIC and is an integral part of that Agreement, containing provisions that establish important commitments for increased trade facilitation, transparency in regulatory development, anticorruption policies, and cooperation and information sharing to benefit small and medium-sized enterprises. The Protocol establishes high-level trade rules that will improve opportunities for bilateral trade and investment in all sectors. The United States will continue to work with Ecuador to monitor the full implementation of the Protocol.

IMPORT POLICIES

Tariffs

Ecuador's average Most-Favored-Nation (MFN) applied tariff rate was 11.2 percent in 2022 (latest data available). Ecuador's average MFN applied tariff rate was 17.4 percent for agricultural products and 10.2 percent for non-agricultural products in 2022 (latest data available). Ecuador has bound 100 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 21.9 percent.

When Ecuador joined the WTO in January 1996, it bound most of its tariff rates at or below 30 percent *ad valorem*; most products bound at higher rates are agricultural products covered by the Andean Price Band System (APBS). Ecuador agreed to phase out its participation in the APBS when it joined the WTO; however, as of December 2023 Ecuador had taken no steps to phase out use of the APBS. As a member of the Andean Community of Nations (CAN), Ecuador grants and receives exemptions from tariffs (*i.e.*, reduced *ad valorem* tariffs and no application of the APBS) for products from the other CAN countries.

Through Comex Resolution 009-2023, Comex (Ecuador's Foreign Trade Committee) granted a 50 percent reduction of the import tariff rate for 5,801 vehicles to the affiliates of Ecuador's transportation federations for three years.

Ecuador still imposes a mixed tariff (composed of an *ad valorem* tariff and a specific tariff) on approximately 360 products, including textiles and shoes. In some cases, the mixed tariff appears to result in a 40 percent tariff rate.

Agricultural Products

Ecuador's continued use of the APBS affects many U.S. agricultural exports by subjecting them to a variable levy or surcharge (on top of an *ad valorem* tariff) that increases as world prices decrease. Comex Resolution 008-2023 temporarily reduced tariffs applied to rice products for human consumption to zero

percent and suspended the application of the APBS, up to a total quota of 63,246 tons, until December 31, 2023.

Non-Tariff Barriers

Preshipment Inspection and Import Bans

Comex Resolution 009-2022 has been amended several times. The resolution included a revised list of products that require preshipment control documentation, a list of prohibited imports, and a list of subheadings subject to prior control documentation for products imported under quota within the framework of current trade agreements. The resolution also eliminated preshipment control documents for 601 tariff lines.

Import Licensing

Products subject to a non-automatic import license requirement include certain polymers.

Products subject to an automatic import license requirement include remanufactured parts of aviation engines; blocks and cylinder heads; cylinder liners, connecting rods, pistons, rings, carburetors, and their parts; valves, crankcases, injectors and other parts for fuel systems; and piston pins, among others.

Import Licensing for Agriculture Products

Comex and the Ecuadorian Ministry of Agriculture (MAG) impose a mandatory, cumbersome process for allocating import licenses for 55 agricultural tariff lines, including dairy, potatoes (including frozen french fries), beef, pork, chicken, turkey, soybean meal, beans, sorghum, and corn. After consulting with the domestic private sector consultative committees, Ecuador allocates single import licenses on a per-shipment basis.

Due to the difficulty of obtaining import permits, the licensing policy incentivizes domestic sourcing of products at the expense of imported products. For these products, an importer's total annual import allowance cannot surpass an amount determined by the MAG. For most products subject to the licensing system, MAG also requires that interested parties provide sales and consumption forecasts before it will authorize imports. In the case of wheat, corn, soybean meal, and pork, the MAG requires proof of local purchases to assign amounts for import licenses.

While Ecuador subjects all food and agricultural imports to the import licensing regime, beef, pork, and dairy imports face further impediments because an importer's total allowance for these products cannot surpass a volume predetermined by the MAG, in some cases in consultation with domestic producers of the same commodities. The review process for import licensing applications is often lengthy and lacks transparency. In cases where import licenses are not approved, the Ecuadorian Government does not typically notify companies or provide a formal explanation for the denial. Permits are limited to a single shipment, meaning that importers are required to repeat a lengthy and arduous application process each time they seek to import these products in a given year.

TECHNICAL BARRIERS TO TRADE

Medical Devices

In June 2021, Ecuador implemented a technical regulation that established a Unique Traceability Code (CUT) for medical devices. The CUT differs from the globally harmonized Unique Device Identification guidance documents developed by the International Medical Device Regulators Forum. Ecuador made several notifications to the WTO regarding this measure, beginning in January 2021. U.S. industry provided technical comments to Ecuador through the domestic consultation process and through the U.S. Enquiry Point in September 2021. The U.S. Government held bilateral meetings with Ecuador in the last quarter of 2021. The regulation provides for a 42-month grace period for implementation, until November 2024.

GOVERNMENT PROCUREMENT

Government procurement in Ecuador can be cumbersome and nontransparent. Government institutions reportedly delay payments without explanation despite adequate provision of goods and services and proper work orders and receipts. The lack of transparency poses a risk that procuring entities will administer a procurement to the advantage of a preferred supplier. Ecuador's Public Procurement Law establishes exceptions for procurements made according to special rules established by presidential decrees, such as those for exploration and exploitation of hydrocarbons, for emergency situations, and for national security contracts. Article 34 of the Public Procurement Law also allows public enterprises to follow special procurement rules, provided the National Public Procurement Service issues an open-ended authorization for purchases considered within "the nature of the enterprise."

Ecuador is not a Party to the WTO Agreement on Government Procurement, but has been an observer to the WTO Committee on Government Procurement since June 2019.

Government-to-Government Contracts with the Ministry of Defense

The Ecuadorian Ministry of Defense (MOD) invites foreign companies to participate in military purchasing processes through their respective countries' embassies in Quito. According to Article 50 of the Regulation for the Procurement of Goods for National Defense, foreign embassies must submit a letter to MOD that authorizes technology transfer for these contracts. Currently, U.S. companies are unable to compete for these government-to-government contracts due to an inability to comply with Article 50 of the Regulation for the Procurement of Goods for National Defense.

INTELLECTUAL PROPERTY PROTECTION

Ecuador remained on the Watch List in the [2023 Special 301 Report](#). Among other issues, enforcement of intellectual property (IP) rights against widespread counterfeiting and piracy remains weak, including online and in physical markets.

In addition, the 2016 Code of the Social Economy of Knowledge, Creativity, and Innovation (COESCCI), also known as the Ingenuity Code, contains legislation covering multiple IP matters. In December 2020, Ecuador published the final regulations implementing the COESCCI. The regulations, however, do not fully address concerns raised by the United States and stakeholders on issues related to copyright exceptions and limitations, patentable subject matter, and geographical indications. Ecuador's National Intellectual Property Service continues to consider amendments to the COESCCI and to review feedback from stakeholders, though it has not communicated a timeframe for revisions.

The United States continues to engage with Ecuador on IP issues, including with respect to revisions to COESCCI and its implementing regulations, through the Special 301 process and the TIC.

SERVICES BARRIERS

Advertising

Ecuador's Organic Communications Law (LOC) and its implementing regulations have traditionally banned all foreign-produced advertisements in Ecuador. Advertisements were only considered "national" if a majority of the production company's shareholders were citizens or legal residents of Ecuador and if at least 80 percent of those contributing to an advertisement's production were Ecuadorian citizens or legal residents. In August 2023, the Ecuadorian Government published a new regulation that clarifies that the LOC considers "national" advertisements to include those produced in a country with which Ecuador has signed an integration treaty. The definition of an integration treaty is not spelled out in the regulation, but private sector companies have interpreted the change to be a relaxation of LOC rules on advertisements. The requirement that 80 percent of those contributing to an advertisement's production be Ecuadorian citizens or legal residents remains in place.

INVESTMENT BARRIERS

In May 2017, Ecuador's National Assembly voted to terminate 12 of the country's Bilateral Investment Treaties (BITs), including the United States–Ecuador BIT. The United States–Ecuador BIT was terminated on May 18, 2018, but the sunset provisions of the Agreement protect U.S. investments predating May 18, 2018, for 10 years following the date of termination.

Capital Exit Tax

The Ecuadorian Government levies a capital exit tax (ISD) on any form of currency outflow in cash, debit and credit cards, checks, and Internet payment methods. In 2021, the Ecuadorian Government committed to the gradual phaseout of the 5 percent ISD over four years. The President issued Executive Decree 182 in August 2021, eliminating the ISD for the aviation industry as a first step. In January 2023, the President issued Executive Decree 643, which committed to gradually reducing the ISD to 2 percent by December 2023. Subsequently, the government paused ISD reduction at 3.5 percent in 2023 due to fiscal challenges. As a result of the National Assembly's February 2024 approval of the Organic Law to Confront the Internal Armed Conflict, the ISD returns to 5 percent as of April 1, 2024.

Other Investment Barriers

Ecuador's Energy and Mines Ministry (MEM) has identified illegal mining as a significant deterrent to foreign investment. The Ecuadorian Government is undertaking efforts to combat illegal mining but lacks adequate resources. The U.S. Government has ongoing initiatives to train Ecuadoran authorities to identify and deter illegal mining.

Since 2018, Ecuador's mining cadastre (registry of mining concessions) has been closed, creating a barrier for new mining investments. However, even with a closed cadastre, the national mining company, ENAMI EP, can still request mining concessions from MEM. MEM aims to update its mining tender process and model agreements, together with U.S. Government technical assistance, to meet international standards of transparency and bankability.

SUBSIDIES

The Ecuadorian Government offers tax benefits to some exporters through the 2019 Law on Tax Simplification and Progressivity. These include benefits for income taxes, value-added taxes, and excise taxes dependent on the sector and size of the exporter.

EGYPT

TRADE AGREEMENTS

The United States–Egypt Trade and Investment Framework Agreement

The United States and Egypt signed a Trade and Investment Framework Agreement (TIFA) on July 1, 1999. This Agreement is the primary mechanism for discussions of trade and investment issues between the United States and Egypt.

IMPORT POLICIES

Tariffs

Egypt's average Most-Favored-Nation (MFN) applied tariff rate was 19 percent in 2023. Egypt's average MFN applied tariff rate was 65.1 percent for agricultural products and 11.6 percent for non-agricultural products in 2023. Egypt has bound 99.4 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 36.9 percent.

On June 9, 2022, Egypt lowered tariffs under Decree No. 218/2022 on over 150 categories of imported products, including pharmaceuticals and natural gas-powered automobiles, with most reductions aimed at capital goods and inputs for agriculture and industry. These lowered tariff levels remained in place in 2023. Tariffs on agricultural equipment, fertilizer, and seeds have dropped from 5 percent to 2 percent. Tariffs on industrial vehicles, such as aircraft, tractors, railcars, and ships, have fallen from 40 percent to 2 percent, and the duty on natural gas-powered automobiles has fallen from 30 percent to 2 percent.

Egypt's tariff on passenger cars with engines of 1600 cubic centimeters (cc) or less is 40 percent, and its tariff on cars with engines of greater than 1600 cc is 135 percent. Tariffs on a number of processed and high-value food products, including poultry, meat, apples, pears, cherries, and almonds, range from 20 percent to 30 percent. Alcoholic beverages for use in the tourism sector have a 300 percent tariff plus a 40 percent sales tax. The tariffs on alcoholic beverages for use outside the tourism sector range from 1,200 percent on beer and 1,800 percent on wine to 3,000 percent on sparkling wine and spirits.

On October 11, 2023, Prime Minister Decree No. 3912/2023 exempted 12 basic food commodities from customs tariffs for a period of six months to combat high consumer prices. The list includes poultry products (chicken, ducks, geese, and turkey); dairy products (milk, butter, and cheese); tea; fats; oils; sugar; and pasta. The decree also applies to any fodder or active pharmaceutical ingredients of the above-mentioned items.

On June 3, 2023, the Egyptian Ministry of Finance issued a statement indicating that importers are now required to make an advance payment of 1 percent of the estimated taxes and fees due on imported goods, instead of the 30 percent payment previously required. Importers will pay the balance in addition to the customs tariffs when the goods arrive in Egypt.

Non-Tariff Barriers

Import Restrictions

In 2003, Egypt imposed restrictions on poultry, limiting imports to whole and frozen poultry. The executive regulations to Egypt's Import and Export Law (Ministry of Trade and Industry Decree 770/2005) suspended the importation of chicken limbs and offal, which acted as a *de facto* ban on U.S. chicken leg quarter exports to Egypt. In 2022, Egypt began allowing shipments of chicken leg quarters from the United States on a limited basis. The United States pushed to expand access for poultry at the December 2022 TIFA meeting in Cairo and continues to make this request.

Import Licensing

The National Food Safety Authority (NFSA) must register and approve all nutritional supplements, specialty foods, and dietary foods according to NFSA Decision No. 1/2018 on the Rules Governing the Registration and Handling of Foods for Special Dietary Uses. Importers must apply for a license to import specialty food products and renew the license every five years. License renewals can cost up to \$1,000 per renewal, depending on the product. In December 2021, the NFSA issued Decree No. 11/2021, which more than doubled the cost of conducting an inspection of imported food.

Customs Barriers and Trade Facilitation

Egypt's Customs Authority continues to employ reference pricing when assessing duties. Egypt's Customs Valuation Committee often engages in lengthy deliberations without coming to a final decision on customs valuation appeals filed by U.S. businesses. Egyptian Ministerial Decree No. 86/2023 established a committee to plan for and implement an advance ruling system, following significant engagement by the U.S. Government through the TIFA dialogue and in other bilateral and multilateral fora. The U.S. Government is working closely with Egypt's Customs Authority on the implementation of an advance ruling system, including on the draft regulation.

Egyptian Ministerial Decrees No. 283/2023 and No. 284/2023 implemented a new integrated risk management system for inspecting imported non-food industrial goods. Egyptian Ministerial Decree No. 347/2023 introduced amended customs procedures to facilitate transit trade.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

Vehicles

U.S. vehicle and automotive parts exports face significant barriers in Egypt. In 2012, Egypt became a Contracting Party to the United Nations Economic Commission for Europe (UNECE) 1958 Agreement. As of June 2014, Egypt has applied European Union regional emissions and UNECE safety standards for vehicles and automotive parts, thereby blocking imports of U.S. vehicles that meet comparable U.S. regulatory emissions and safety standards. Egyptian law also prohibits the importation of used vehicles for commercial purposes, pursuant to Ministerial Decree No. 580/1998 and Annex 2 to Ministerial Decree No. 770/2005.

Egypt does not recognize U.S. Federal Motor Vehicle Safety Standards (FMVSS), even though U.S. standards achieve comparable regulatory goals. As a result, exports of these goods to Egypt have declined significantly since 2015. The United States has raised this issue in TIFA Council meetings. The U.S. Agency for International Development, in collaboration with the U.S. Department of Commerce, conducted a regulatory environmental assessment in June 2022 and is communicating with U.S. and Egyptian stakeholders to come up with a recommended approach to address these issues that could be accepted by both the United States and Egypt. At the most recent TIFA Council meeting in December 2022, Egypt indicated its willingness to consider recognition of the FMVSS. The United States and Egypt held technical consultations and discussions in May 2023 and February 2024 to assist Egypt in working through its standards concerns.

Halal Import Requirements

In August 2021, the Government of Egypt announced that it would extend the scope of its halal certification requirements to include dairy and other agricultural products in addition to the existing requirement for imports of poultry and meat products. It also announced that IS EG Halal, a private U.S. company, would be the sole certifying body approved to certify imports into Egypt as halal. In December 2021, Egypt notified this measure to the WTO Committee on Technical Barriers to Trade (TBT Committee) with an implementation date of January 29, 2022; however, following U.S. and other WTO Members' requests, Egypt has postponed implementation multiple times, most recently until January 1, 2025. The lack of transparency and the uncertainty created by these new requirements has contributed to a drop in U.S. dairy exports to Egypt. In 2022, the volume of U.S. dairy exports dropped 54 percent to 16 million tons. In 2023, it dropped another 25 percent. The U.S. Government has engaged in bilateral and multilateral fora with Egypt to request that Egypt publish an implementing regulation for these new requirements, allow U.S. and other halal certification bodies (HCBs) to continue certifying product destined for Egypt, and to suspend any new requirements until additional transparency and flexibility are in place.

The United States continues to assess the situation and actively engage with Egypt regarding these matters, including through the TIFA dialogue and in other bilateral and multilateral fora.

SANITARY AND PHYTOSANITARY BARRIERS

Seed Potatoes

The U.S. Department of Agriculture Animal and Plant Health Inspection Service (APHIS) has submitted four market access requests for U.S. seed potato importation to Egypt since 2008. The United States remains unable to export seed potatoes to Egypt because the Central Administration for Plant Quarantine (CAPQ) at the Ministry of Agriculture and APHIS have not been able to come to an agreement on the results and mitigation measures of a pest risk assessment completed by the CAPQ. The CAPQ requirements are based on Egyptian Ministerial Decree No. 562/2019, which does not allow measures equivalent to those proposed by APHIS. According to APHIS, several of the proposed mitigation measures are not science- or risk-based. Despite several rounds of bilateral technical meetings and exchanges of correspondence in 2019 and 2021, U.S. seed potatoes remain barred from Egypt. Egypt has been importing in vitro micro tubers from the United States, potentially signaling an interest in growing U.S. seed potato varieties.

INTELLECTUAL PROPERTY PROTECTION

Egypt remained on the Watch List in the [2023 Special 301 Report](#). Egypt has made some efforts to strengthen intellectual property (IP) protection and enforcement, including by adopting a new national IP strategy, passing Law No. 163/2023 in August 2023 to establish the Egyptian Agency for Intellectual

Property, and adopting a new system that facilitates information sharing among customs offices on potential counterfeiting. Despite these improvements, concerns remain. Egypt continues to lack deterrent-level penalties for IP violations and *ex officio* authority for customs officials to seize counterfeit and pirated goods at the border. Egypt's lack of up-to-date, publicly available general patent and trademark examination guides online remains an obstacle for the growth of U.S. IP exports to Egypt. Stakeholders have raised concerns regarding the lack of an effective mechanism for the early resolution of potential patent disputes and the mandatory requirement to record trademark licenses. Additionally, Egypt is not currently a member of the World Intellectual Property Organization (WIPO) Performances and Phonograms Treaty or the WIPO Copyright Treaty.

SERVICES BARRIERS

Express Delivery Services

The Egyptian National Post Organization (ENPO) must grant special authorization to foreign-owned private courier and express delivery service suppliers seeking to operate in Egypt. Although express delivery services constitute a separate market, the ENPO requires private foreign express delivery operators to pay a postal agency fee of 10 percent of annual revenue on shipments of less than 20 kilograms (approximately 44 pounds.). The ENPO imposes an additional fee of 5 Egyptian pounds (approximately \$0.16) on private couriers and express delivery services for all shipments under 5 kilograms (approximately 11 pounds.). Civil Aviation Decree 607/2015 requires all courier and express delivery services to have at least 51 percent Egyptian ownership.

Financial Services

No legal barriers prohibit foreign banks from establishing branches in Egypt. In May 2023, the Central Bank of Egypt granted a license under the Central Bank and Banking Act (Law 194/2020) to London-based Standard Chartered Bank to establish a branch in Egypt, the first new commercial banking license issued to a foreign bank since 1979. Three state-owned banks (Banque Misr, Banque du Caire, and the National Bank of Egypt) control approximately 60 percent of the banking sector's total assets.

BARRIERS TO DIGITAL TRADE

Egypt's Personal Data Protection Act, Law No. 151/2020, requires licenses for cross-border data transfers. The United States is monitoring the implementation of this law and its draft regulations, which are expected to be implemented by the Data Protection Authority. The Data Protection Authority had not been established as of December 2023. The United States will continue to engage with Egypt regarding best practices for privacy and data security through various bilateral and multilateral fora.

INVESTMENT BARRIERS

Egypt implemented investment Law No. 72/2017 in 2017 to address longstanding complaints of foreign investors. Although the law allows foreign investors to operate sole proprietorships and partnerships, it continues to limit the number of non-nationals working at any business to 10 percent of the workforce, or up to 20 percent of the workforce if it is not possible to find Egyptian citizens with the necessary qualifications. Egypt restricts foreign equity in construction and transport services to 49 percent.

On October 29, 2023, Egypt issued Law No. 173/2023 in 2023 amending the Importers Registry Law No. 121/1982 of 1982, lifting the existing 51 percent minimum Egyptian ownership requirement for importers of record. It also made Egyptian companies with foreign ownership eligible to receive an importation

license for a 10-year term, subject to meeting other qualifying conditions for the license such as minimum capital reserves or sales revenue.

On April 11, 2023, Egyptian Ministerial Decree No. 141/2023 established the Supreme Council for Investment, replacing the Investment Council established in 2016. On July 25, 2023, Egypt passed Law No. 160/2023, which amends Law No. 72/2017. Law No. 160/2023 introduced new investment incentives and expanded the Golden License program—a platform that streamlines permits and approvals required to establish a business.

EL SALVADOR

TRADE AGREEMENTS

Dominican Republic–Central America–United States Free Trade Agreement

The Dominican Republic–Central America–United States Free Trade Agreement (CAFTA–DR) entered into force for the United States, El Salvador, Guatemala, Honduras, and Nicaragua in 2006; for the Dominican Republic in 2007; and for Costa Rica in 2009. The United States and the other CAFTA–DR countries meet regularly to review the implementation and functioning of the Agreement and to address outstanding issues.

IMPORT POLICIES

Tariffs and Taxes

Tariffs

As a member of the Central American Common Market, El Salvador applies a harmonized external tariff on most items at a maximum of 15 percent, with some exceptions. However, under the CAFTA–DR, as of January 1, 2015, U.S. non-agricultural goods enter El Salvador duty free.

In addition, nearly all U.S. agricultural exports enter El Salvador duty free under the CAFTA–DR. El Salvador eliminated its remaining tariffs on rice, yellow corn, and chicken leg quarters on January 1, 2023, and is scheduled to eliminate remaining tariffs on dairy products by 2025. For certain agricultural products, tariff-rate quotas (TRQs) will permit duty-free access for specified quantities during the tariff phaseout period, with the duty-free quantities expanding during that period. El Salvador is required under the CAFTA–DR to make TRQs available on January 1 of each year. El Salvador monitors its TRQs through an import licensing system, which the United States carefully tracks to ensure the timely issuance of these permits.

Taxes

El Salvador, under its general alcoholic beverage law, assesses a specific excise tax on distilled spirits that is applied on a per-liter of alcohol basis, with four specific rates (\$0.0325 per liter, \$0.05 per liter, \$0.09 per liter, and \$0.16 per liter). The lowest rate applies only to aguardiente, a locally bottled spirit made from cane sugar. Whiskey, which is exclusively imported, is assessed at the highest rate. Distinctions between types of distilled spirits result in lower tax rates on domestically produced spirits compared to imported products.

Non-Tariff Barriers

Customs Barriers and Trade Facilitation

U.S. companies have expressed concerns regarding the inconsistent and discretionary application of customs regulations and procedures, resulting in unpredictable delays and administrative fines. For example, exporting from a duty-free zone is unduly cumbersome, with a requirement that representatives of the receiving company and the shipping company be physically present for the exchange of documents and release of materials. Additionally, U.S. companies have indicated that El Salvador's procedures for

applying for an advance ruling are difficult to find online, making it hard to get advance assurance of how Salvadoran customs will treat a good upon importation. Additionally, the customs valuation process for imports of express shipments is not clear.

The United States continues to monitor customs practices and offer technical assistance.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

El Salvador requires a Certificate of Free Sale to register food products. The Ministry of Health agreed in 2019 to accept the U.S. Department of Agriculture (USDA) Food Safety Inspection Service (FSIS) Form 9060-5 Meat and Poultry Export Certificate of Wholesomeness for meat and meat products in lieu of the Certificate of Free-Sale. However, the Ministry of Agriculture (MAG) requires an original FSIS 9060-5 certificate. Obtaining the original health certificate for the purpose of food product registration is problematic because this document only accompanies actual shipments of meat or processed meat products. Since these shipments cannot occur until the food product is registered, exporters cannot obtain certificates for the purpose of product registration. Additionally, under the CAFTA–DR, El Salvador granted equivalence to the U.S. sanitary inspection system for beef, pork, and poultry and poultry products, which may make the health certificate requirement unnecessary or duplicative for U.S. exports. Unnecessary and duplicative import requirements provide no discernable food safety benefits and, if the duplicative requirements result in higher prices, also can make U.S. products less competitive in the local marketplace. The United States continues to monitor these import requirements. The United States has begun offering comprehensive technical assistance to support El Salvador’s efforts to streamline its border processes.

Sanitary and Phytosanitary Barriers

Animal product exporting facilities are subject to MAG inspection and certification every three years. Because the CAFTA–DR provides equivalence for the U.S. beef, pork, and poultry inspection systems, the inspection and certification requirements apply to only U.S. animal products not covered by the CAFTA–DR, such as pet food and pet food additives or probiotics.

Extensive laboratory tests are mandatory for all new imported food products, including samples, even for those low-risk products that are permitted into other markets without testing. To register product samples, the Ministry of Health requires large quantities of the product for testing, including samples of each available flavor of the same product. The Ministry of Health, in consultation with U.S. Government officials, is reviewing laboratory testing requirements to determine to what extent additional flexibility would be permissible under the existing health code.

The Salvadoran Government requires that grain shipments be fumigated at importers’ expense unless they are accompanied by a USDA Animal Plant and Health Inspection Service (APHIS) certificate stating that the grain is free of weed seeds, including *Tilletia barclayana* (a rice fungus). Because no chemical treatment is both practical and effective against this plant pathogen, APHIS cannot issue these certificates. El Salvador has not notified the World Trade Organization (WTO) of this requirement.

GOVERNMENT PROCUREMENT

U.S. companies have expressed concerns about Salvadoran Government agencies not providing sufficient advance notice, as required under the CAFTA–DR, to foster wide participation in bidding procedures, particularly complex infrastructure works or public-private partnership projects.

On March 23, 2023, the Public Procurement Law for government entities and municipalities took effect, replacing the Public Administration and Procurement Contracting Law that had been in force since 2000. The new legislation establishes the National Directorate of Public Procurement, an autonomous entity charged with dictating policies and regulations for government purchases and overseeing contract execution. The legislation has a framework for new purchasing methods, such as competitive bidding for contracts over \$87,600, price comparison for contracts under \$87,600, and electronic product catalogues for framework agreements for purchases under \$87,600, among others. However, strategic infrastructure projects, municipal projects executed under the Directorate of Municipal Works, and purchases of subsidiaries of state-owned companies are exempt. Some implementing regulations remained pending as of December 2023.

El Salvador has been operating under a State of Emergency since March 2022. Initially intended to be in effect for 30 days, the State of Emergency has been extended every month since April 2022. One consequence of the State of Emergency is that it allows the Executive branch to enter negotiations and make direct purchases of goods and services without adhering to the Public Procurement Law. Legal experts and businesses have expressed concerns that excluding purchases from bidding procedures for as long as the State of Emergency is in place will further undermine transparency.

El Salvador is neither a Party to the WTO Agreement on Government Procurement nor an observer to the WTO Committee on Government Procurement. However, the CAFTA–DR contains disciplines on government procurement.

INTELLECTUAL PROPERTY PROTECTION

To implement its CAFTA–DR obligations, El Salvador undertook legislative reforms providing for stronger intellectual property (IP) protection and enforcement. However, several concerns remain, including trafficking in counterfeit products, music and video piracy, and the unlicensed use of software. The United States remains concerned about the adequacy of implementing regulations to protect against the unfair commercial use, as well as unauthorized disclosure, of undisclosed test or other data generated to obtain marketing approval for pharmaceutical products. The effectiveness of the IP system to address patent issues expeditiously in connection with applications to market pharmaceutical products is unclear. The United States continues to engage El Salvador to ensure protections for geographical indications do not negatively impact the existing rights and market access of U.S. stakeholders. The United States will continue to monitor El Salvador’s implementation of its IP obligations under the CAFTA–DR.

BARRIERS TO DIGITAL TRADE

Data Localization Requirements

On August 17, 2021, the Legislative Assembly passed amendments to the Credit History Law. The amendments introduce data localization requirements mandating credit bureaus and economic agents that report on credit history to store data and their backup exclusively in El Salvador and grant unrestricted access to the Central Bank and the Superintendence of the Financial System. U.S. stakeholders have

expressed concerns that these requirements could compromise consumer data privacy and protection. The United States continues to engage El Salvador on this issue.

ETHIOPIA

IMPORT POLICIES

Tariffs and Taxes

In September 2021, the Government of Ethiopia lifted taxes and tariffs on the importation of wheat, rice, sugar, and edible oil to address rising inflation.

Tariffs

Ethiopia's average Most-Favored-Nation (MFN) applied tariff rate was 17 percent in 2021 (latest data available). Ethiopia's MFN applied tariff rate averaged 22.5 percent for agricultural products and 16.1 percent for non-agricultural products in 2021 (latest data available). Ethiopia implemented tariff reductions for certain raw materials, intermediate goods, and capital goods to promote the growth of the manufacturing sector in 2021. Ethiopia is not a member of the World Trade Organization (WTO) and so has no bound tariff rates.

Non-Tariff Barriers

Import Bans and Import Restrictions

Ethiopia prohibits imports of used clothing and used or refurbished medical equipment intended for resale. Imports of other goods intended for resale or commercial purposes are permitted, provided payment transactions are carried out through Ethiopian banks.

Import Licensing

In July 2022, the Government of Ethiopia decentralized the import licensing process and delegated the authority to issue import licenses to regional state trade bureaus. Most regions have operationalized the new online import licensing process, although the new process remains unavailable in some regions because of structural issues such as poor Internet access. In addition to obtaining an import business license, importers must obtain an import registration number before bringing products into the country. Imports of food or drug items must receive additional certification from the Ethiopian Food and Drug Administration without regard to the risk posed by the food or drug product. Trading companies must submit a proposal to the Ministry of Trade and Regional Integration or regional authorities to obtain a currency exchange permit certificate, which includes obtaining a letter of credit for the total value of an import transaction and applying for an import permit, before placing an order. Even with a letter of credit, import permits are not always granted and several months—up to a year or longer—can pass before an importer is allocated foreign exchange.

SANITARY AND PHYTOSANITARY BARRIERS

In preparation for the African Continental Free Trade Area, the Government of Ethiopia is exerting considerable effort to harmonize its national sanitary and phytosanitary (SPS) standards with standards used in African Regional Economic Communities, such as the Common Market for Eastern and Southern Africa (COMESA) and the Intergovernmental Authority on Development (IGAD). When a national standard is not available for a specific product, Ethiopia defers to the Codex Alimentarius Commission standards. Furthermore, Ethiopia is investing in the expansion of national and regional laboratories, quarantine

stations, and standards for quality assurance. SPS-related barriers that impede international trade in Ethiopia are associated with cumbersome requirements for registration and approval of imported products, such as processed foods, planting seeds, fertilizer, and plant protection products.

In September 2022, the Ethiopian Environmental Protection Authority issued an environmental clearance for genetically modified maize, which is a drought-tolerant and insect-resistant variety of maize. If approved for commercial cultivation, the maize would be the first genetically modified food crop in Ethiopia. Stakeholders report that the approval process for commercial imports of genetically modified grains and oilseeds for food and feed remains overly burdensome.

GOVERNMENT PROCUREMENT

Some Ethiopian Government tenders are open to foreign participation and tender announcements are usually public, but many major procurements do not go through a transparent tendering process. Obstacles to foreign participation in government procurement tenders include complicated and inadequately established procedures, repeated cancellation of published requests for proposals, capacity gaps on the part of procurement agencies, delays in decision-making, lack of public information, and the need for personal connections to compete effectively. Furthermore, since 2018, several dozen government procurement officials across a variety of Ethiopian Government agencies have been arrested for corruption as part of a broader reform effort.

On February 16, 2022, four Ethiopian federal institutions started to process their procurement electronically—the first step by Ethiopia to institute electronic government procurement aimed at increased transparency. In 2023, the system expanded to 74 federal agencies, including those responsible for agriculture, technology, health, and education.

Ethiopia is not a Member of the WTO and, therefore, it is neither a Party to the WTO Agreement on Government Procurement nor an observer to the WTO Committee on Government Procurement.

INTELLECTUAL PROPERTY PROTECTION

Inadequate intellectual property (IP) protection and enforcement remain a serious concern in Ethiopia. Ethiopia is a member of the World Intellectual Property Organization (WIPO) and has demonstrated an interest in strengthening its IP regime. Ethiopia is not a member of most major international IP treaties, including the WTO Agreement on Trade-Related Aspects of Intellectual Property Rights. Trademark infringement, especially in the hospitality and retail sectors, continues to be an issue. Because enforcement capacity and coordination among Ethiopian Government agencies is lacking, IP enforcement is inconsistent. The Ethiopian Intellectual Property Authority is responsible for the administration and arbitration of IP cases, but actions to combat the sale of pirated goods remain inadequate.

SERVICES BARRIERS

Financial Services

Ethiopia prohibits foreign investment in the financial services industry, including banking and insurance, with an exception for foreign nationals of Ethiopian origin. Few international banks maintain representative offices, and all trade financing is required by law to go through an Ethiopian bank. This creates significant challenges for foreign investors with accounts outside Ethiopia. In September 2023, the National Bank of Ethiopia (NBE) for the first time allowed some foreign direct investors to open accounts not in Ethiopia that can be used to service external debts, pay for foreign insurance and warranty claims, meet financial

obligations to foreign contractors, and cover other foreign capital and operational expenses. In November 2023, a U.S.-backed leasing company, which was the only foreign-owned financial services company operating in Ethiopia, closed in response to a multiyear dispute with the Government of Ethiopia over its prohibitions in 2021 of U.S. dollar-dominated lease agreements. As of December 31, 2023, the NBE continued work on draft legislation that, once approved by the legislature, would open the financial sector to foreign investment.

INVESTMENT BARRIERS

Many formal and informal barriers impede foreign investment in Ethiopia. The 2020 Investment Law allows foreign investors to invest in any area except those that are clearly reserved for domestic investors. The law reserves banking, insurance, microfinance, electricity transmission and distribution, and retail and wholesale trade for domestic investors. Foreign investors can jointly invest as minority stakeholders with domestic investors in areas such as freight forwarding and shipping, domestic air transportation services, cross-country public transport services, advertisement and promotion, and accounting and auditing services. For joint ventures with state-owned enterprises (SOEs), some investors report informal requirements of up to 30 percent domestic content in goods or technology, or both.

STATE-OWNED ENTERPRISES

Although the Government of Ethiopia has launched processes to fully or partially privatize some SOEs—most notably under the Homegrown Economic Reform Plan—SOEs continue to dominate major sectors of the economy. These include the telecommunications, power, banking, insurance, air transport, certain agricultural processing, industrial parks, and shipping industries. Many SOEs maintain a monopoly over their respective sectors, which allows the Government of Ethiopia to dictate prevailing rates for many goods and services. U.S. investors complain of the lack of a level playing field when it comes to SOEs. The Government of Ethiopia passed a law in 2019 that prohibits SOEs from accessing new loans and instructs them to focus on completing outstanding projects. SOEs, however, have considerable advantages over private firms, such as expedited customs clearance processing, priority access to financing and foreign currency from the Commercial Bank of Ethiopia, preferences in government tenders and land acquisition, and marketing assistance. In December 2021, the Government of Ethiopia established Ethiopian Investment Holdings, a sovereign wealth fund, to prepare over 40 SOEs for full or partial privatization. The Government of Ethiopia has offered to sell eight state-owned sugar enterprises and a 45 percent stake in Ethio Telecom.

Transport and logistics are predominantly conducted by SOEs in Ethiopia, and monopolistic market conditions in multimodal transport operations and inadequate infrastructure inhibit private sector logistics companies. Consequently, logistics costs comprise approximately 22 percent to 27 percent of final costs for many products and shipping and freight costs are approximately 60 percent higher than in neighboring countries. Under the framework of a comprehensive logistics strategy, the Government of Ethiopia has slated the logistics sector for liberalization and Ethiopian Railways officials report the border crossing process between Ethiopia and Djibouti by train has been streamlined.

OTHER BARRIERS

Bribery and Corruption

Ethiopian and foreign businesses routinely encounter corruption in tax collection, customs clearance, and land administration. Some U.S. businesses operating in Ethiopia reported that they were frequently solicited for bribes to secure business contracts. Tax administration in Ethiopia is corrupt and inefficient,

and the Ethiopian Government supplements revenues by levying higher taxes on foreign investors and businesses and limiting their ability to appeal tax levies. U.S. and other foreign companies complain they are unfairly targeted for tax collection compared with local companies and are presented with spurious tax bills. In November 2022, the Government of Ethiopia recognized corruption as a threat to national security and an obstacle to doing business and formed a new National Anti-Corruption Committee led by the head of the National Intelligence and Security Service. Between June 2022 and June 2023, the Ministry of Justice Anti-Corruption Directorate heard 628 corruption cases.

Commercial Code Enforcement

In 2021, Ethiopia reformed its Commercial Code for the first time in 62 years, aiming to bring its commercial law in line with international best practices and address business community concerns. Implementation of the new code across ministries is ongoing, which is expected to lessen the difficulty of doing business in Ethiopia by facilitating trade license registration and renewal, providing registration exemptions for some companies, and allowing new and different types of businesses to form and operate in Ethiopia. Some members of the business community have expressed concern about inconsistent enforcement of the new code.

Foreign Currency Controls

The NBE administers a strict foreign currency control regime. Ethiopia's foreign currency shortage and the extreme difficulty in obtaining foreign currency from legal sources hamper the ability of manufacturers to import raw materials and semifinished goods and restricts the repatriation of profits, despite laws allowing foreign investors to remit profits and dividends. All imports, exports, and outgoing foreign payments require a foreign exchange permit. In August 2023, the NBE imposed regulations requiring exporters and commercial banks to surrender 50 percent of foreign currency obtained from export transactions to the NBE. Exporters, however, may retain 40 percent in foreign currency and 10 percent must be exchanged at a commercial bank to the equivalent amount in Ethiopian birr, the national currency.

Difficulty obtaining foreign currency for inputs and repatriating profits has been cited by U.S. companies as a major impediment to foreign investment. Larger private firms, SOEs, businesses that import goods prioritized by the Ethiopian Government's development plan, manufacturers in prioritized export sectors, and importers of emergency food generally have priority access to foreign currency. Investors in non-priority sectors and politically less well-connected importers, particularly smaller new-to-market firms, can face long delays in arranging trade-related payments and, on occasion, may be denied foreign currency.

A critical shortage of foreign currency caused the Government of Ethiopia on April 8, 2022, to issue a directive allowing franco-valuta imports, a scheme that facilitates the importation of essential food commodities—wheat, rice, sugar, edible oils, and instant baby milk—by permitting the use of foreign currency from official sources, including personal foreign currency supplies and foreign accounts. In November 2022, the NBE imposed a requirement that importers use franco-valuta provisions to provide information about the source of their foreign currency.

EUROPEAN UNION

OVERVIEW

The United States and the Member States of the European Union (EU) share the largest economic relationship in the world. Trade and investment flows between the United States and the EU are a key pillar of prosperity on both sides of the Atlantic and generate substantial economic opportunities.

Goods and services produced by the United States nonetheless face persistent barriers entering and maintaining access to certain sectors of the EU market, which limits the opportunity of U.S. workers and businesses to benefit from transatlantic trade. This chapter of the National Trade Estimate (NTE) Report highlights the most significant of these barriers, some of which have persisted despite repeated efforts at resolution through bilateral consultations, World Trade Organization (WTO) committee meetings, or WTO dispute settlement. Certain barriers have been highlighted in the annual NTE Report for many years.

IMPORT POLICIES

Tariffs

The EU's average Most-Favored-Nation (MFN) applied tariff rate was 5.1 percent in 2022 (latest data available). The EU's average MFN applied tariff rate was 11.4 percent for agricultural products and 4.1 percent for non-agricultural products in 2022 (latest data available). The EU has bound 100 percent of its tariff lines in the WTO, with an average WTO bound tariff rate of 5.1 percent.

Although the EU's tariffs are generally low for non-agricultural goods, some EU tariffs are high, such as rates of up to 26 percent for fish and seafood, 22 percent for trucks, 14 percent for bicycles, 10 percent for passenger vehicles, 12 percent for processed wood products, and 6.5 percent for fertilizers and plastics.

Meursing Table Tariff Codes

Many processed food products, such as confectionary products, baked goods, and miscellaneous food preparations, are subject to a special tariff code system in the EU. Under this system, often referred to as the "Meursing" table, the EU charges a tariff on each imported product based on the product's content of milk protein, milk fat, starch, and sugar. As a result, products that the United States and other countries might consider equivalent for tariff classification purposes sometimes receive different rates of duty in the EU depending on the particular composition of each product. The difficulty of calculating Meursing duties imposes an unnecessary administrative burden on, and creates uncertainty for, exporters, especially those seeking to ship new products to the EU.

Non-Tariff Barriers

Import Licensing – Bananas

Following years of disputes, beginning under the General Agreement on Tariffs and Trade (GATT) and later involving litigation under WTO dispute settlement proceedings, the United States and other countries in 2010 reached agreements with the EU to resolve complaints about successive EU banana import regimes. Beginning in 2013, a U.S. stakeholder expressed concerns to the U.S. Government about actions taken since 2010 by Italian customs authorities to collect retroactive payment of customs duties due to the authorities' unilateral re-interpretation of the validity of certain EU banana import licenses under pre-2006 EU

regulations. In 2013, the Italian Supreme Court, on jurisdictional grounds, ruled against the Italian Government and ordered authorities to repay the collected duties to the U.S. stakeholder. However, as of December 31, 2023, the duties had not been completely repaid, and Italian customs authorities, claiming to have resolved the jurisdictional issues cited by the Italian Supreme Court, continue to re-issue some of the previous retroactive duty assessments against the stakeholder.

Customs Barriers and Trade Facilitation

Notwithstanding the existence of customs legislation that governs all Member States, the EU does not administer its laws through a single customs administration. Rather, there are separate agencies responsible for the administration of EU customs law in each Member State. It is thus difficult for the EU to ensure that its rules and decisions on classification, valuation, origin, and customs procedures are applied uniformly throughout the Member States, and U.S. exports suffer from the uneven and inconsistent application of these requirements.

The Binding Tariff Information program provided for by EU-level law, but administered at the Member State level, does provide for advance rulings on tariff classification and country of origin. However, EU rules do not require the customs agency in one Member State to follow the decisions of the customs agency in another Member State with respect to materially identical issues. In some cases where the customs agency of a Member State administers EU law differently from, or disagrees with, the Binding Tariff Information issued by, another Member State, the matter may be referred to the Customs Code Committee (CCC). The CCC consists of Member State representatives and is chaired by a European Commission representative. Although a stated goal for the CCC is to help reconcile differences among Member States and thereby help to achieve uniformity of administration, in practice its success in this regard has been limited. The CCC and other EU-level institutions do not provide transparency in decision-making or opportunities for participation by traders, which might make them more effective tools for achieving the uniform administration and application of EU customs law.

In addition, the EU lacks tribunals or procedures for the prompt review and EU-wide correction of administrative actions relating to customs matters. Instead, review is provided in the tribunals of each Member State, and the rules regarding these reviews vary from Member State to Member State. A trader encountering differing treatment in multiple Member States must bring a separate appeal in each Member State whose agency rendered an adverse decision.

Ultimately, a question of interpretation of EU law may be referred to the Court of Justice of the European Union (CJEU). Although the judgments of the CJEU apply throughout the EU, referral of a question to the CJEU is generally discretionary, may take many years, and may not afford sufficient redress. Thus, obtaining corrections with EU-wide effect for administrative actions relating to customs matters is frequently cumbersome and time-consuming. The United States has raised concerns regarding the uniform administration of EU customs law with the EU in various forums, including in the WTO Dispute Settlement Body (DSB).

The European Commission has sought to modernize and simplify customs rules and processes. The Union Customs Code (UCC), adopted by the European Commission in 2013, entered into force in 2016. While the UCC contains a number of procedural changes, the key element of a harmonized information technology infrastructure has yet to be completed. Member States continue to use different data templates. In 2019, the expected completion date for full implementation of harmonized customs data systems was extended from the end of 2020 to the end of 2025.

The United States will continue to monitor the UCC implementation process, focusing on its impact on the consistency of customs treatment under EU customs law.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

Transparency and Notification

U.S. exporters face a proliferation of technical barriers to trade (TBT) in the EU, attributable in part to aspects of the EU's regulatory processes, which prescribe conditions for the consideration and adoption of regulations and related decisions without adequate notification or the opportunity to incorporate meaningful public comments from trading partners. The United States regularly raises concerns, both in bilateral engagement and in the WTO Committee on Technical Barriers to Trade (WTO TBT Committee), that EU notifications often take place at a procedural stage when it is too late to revise the measure to take into consideration any substantive concerns raised by other WTO Members. Furthermore, notifications of proposed measures often lack specificity, or incorporate by reference the publication of future, European-unique standards that do not yet exist, so that non-European producers do not have a meaningful opportunity to engage or offer informed comments.

For example, under the EU's regulatory processes for Registration, Evaluation, Authorization, and Restriction of Chemicals (REACH, Regulation (EC) 1907/2006) and Classification, Labeling, and Packaging (CLP, Regulation (EC) 1272/2008), proposed restrictions are typically notified to the WTO only after scientific review and regulatory impact committees have convened and the European Commission's domestic consultations have concluded. These domestic consultations are not always transparent to non-EU stakeholders, which can limit their ability to provide comment and for those comments to be taken into consideration. In other cases, measures undergo significant changes during the negotiations among the Council of the European Union (European Council), European Commission, and European Parliament, absent additional consultations with stakeholders, notifications, or impact assessments. Finally, failure to notify measures with adequate comment periods is also observed at the Member State level, including in the case of recent Irish alcohol labeling regulations. Improvement and greater consistency in EU and Member State notification of measures could have a significant effect on trade contributing to a more predictable market environment.

European Standardization and Conformity Assessment Procedures

The EU's exclusionary approach to standards-related measures, including its conformity assessment framework, and its efforts to encourage governments around the world to adopt its restrictive approach, imposes significant burdens on U.S. workers and exporters. In particular, the EU's approach impedes market access for products that do not conform to European regional standards (ENs), including products that comply with international standards that are not harmonized with ENs, even though these international standards may meet or exceed the EU regulatory requirements. Products regulated by the EU must conform to these EU-specific regional standards in order to benefit from a presumption of conformity with the EU's essential regulatory requirements. U.S. workers and exporters thus face additional burdens in accessing the EU market not faced by domestic producers in the EU and often not faced by EU exporters when accessing the U.S. market.

ENs can only be developed through three European Standards Organizations (ESOs), as directed by the European Commission through a standardization request. The three ESOs are the European Committee for Standardization (CEN), the European Committee for Electrotechnical Standardization (CENELEC), and the European Telecommunications Standards Institute (ETSI). Within these designated ESOs, the CEN

and CENELEC technical committees draft harmonized ENs. Both generally exclude non-EU nationals from participating in their standard-drafting process. In the limited instances where non-EU nationals do participate, they are not allowed to vote.

On February 2, 2022, the EU published the European Standardization Strategy, which, *inter alia*, amends Regulation (EU) 1025/2012 on European Standardization Organizations to require that the ESOs restrict the involvement of non-EU interests in the development of harmonized EN standards. The change primarily affects the development of standards at the ETSI, which specializes in information and communications technologies and had been the only ESO to provide for direct participation by foreign firms. In addition, new policies implemented by the European Commission, such as a refusal to reference underlying standards developed outside of Europe and new restrictions imposed on participation in expert advisory groups (including the newly created High Level Forum on European Standardization), suggest a sustained effort to exclude foreign participants, undermine the acceptance of international standards developed in the United States, and project European regional standards abroad. The United States is concerned that the European Standardization Strategy and other exclusionary steps indicate that the EU is moving further from cooperation with trading partners in standardization, and barriers in the transatlantic market will thus be exacerbated rather than ameliorated. The United States has relayed its concerns to the EU through the United States–European Union Trade and Technology Council.

As part of its free trade agreements, the EU seeks commitments affirming that only a standard issued by a subset of specific standards-developing organizations, none of which are domiciled in the United States, be considered an international standard (e.g., the EU–Japan Economic Partnership Agreement, Article 7.6). This practice accords preferential treatment to organizations in which the EU carries an outsized influence (e.g., the World Forum for Harmonization of Vehicle Regulations within the framework of the United Nations Economic Commission for Europe) or with which the ESOs have existing cooperation agreements (e.g., the International Organization for Standardization (ISO) and the International Electrotechnical Commission). This approach is narrower than what is provided for under the WTO TBT Agreement and related decisions of the WTO TBT Committee, which recognize international standards as those developed in accordance with certain principles, and without reference to particular institutions or methods of organization.

The United States also has serious concerns regarding the EU’s conformity assessment framework, set out in Regulation (EC) 765/2008 and Decision 768/2008/EC. Regulation (EC) 765/2008 requires each Member State to appoint a single national accreditation body that can accredit conformity assessment bodies and prohibits competition among Member States’ national accreditation bodies. Further, the EU’s interpretation of Decision 768/2008/EC sets out that conformity assessment bodies must be located in the EU in order to test to EU regulations. This geographic restriction denies U.S.-domiciled conformity assessment bodies the opportunity to certify products for the EU market outside of existing mutual recognition agreements. It also raises significant market access concerns for U.S. producers whose products have been tested or certified by conformity assessment bodies located outside the EU. Without any associated improvement in quality or safety, the EU conformity assessment approach increases time to market and raises costs for exporters.

Chemical Regulations

The EU’s proposed Chemicals Strategy for Sustainability and the planned updates to the REACH and CLP present a number of significant barriers for U.S. exporters. Stakeholders have raised concerns that, as part of the registration process under REACH, they must provide data that is not relevant to the specific hazards and proposed uses of a registered substance. Amendments to the classification of chemicals under the CLP often appear arbitrary, driven by a process that does not allow adequate time for stakeholder comment, even when the proposed changes differ significantly from the globally harmonized classifications followed by

industry and other economies. As with other sectors, the United States is also concerned that the EU's reliance on a "precautionary" or "hazard-based" approach to regulation of products can result in severe limitations on the use of products without reference to scientific assessment of the actual risks of exposure in a specific use. Additionally, Member States' application of REACH appears to be inconsistent and lacks transparency, which can result in requirements that are more onerous for U.S. exporters than they are for EU businesses and products that are already in the EU market.

Classification, Labeling, and Packaging Hazard Classes

The United States has voiced concerns regarding the draft European Commission Delegated Regulation (EU) 2023/707 of December 19, 2022 (amending Regulation (EC) 1272/2008) regarding hazard classes and criteria for the classification, labeling and packaging of substances and mixtures, noting that the new CLP classification and labeling requirements will diverge from the Globally Harmonized System of Classification and Labelling of Chemicals (GHS). The United States has encouraged the EU not to preempt a scientific review by the Organization for Economic Cooperation and Development (OECD) of new labeling requirements and to remain harmonized with the GHS. The EU is expected to issue guidance on these new classification and labeling requirements in 2024, with the new requirements going into effect in May 2025 for new substances and November 2026 for substances already on the market.

Per- and Polyfluoroalkyl Substances

In 2023, the European Chemicals Agency published a proposed restriction that would largely eliminate the production and use of per- and polyfluoroalkyl substances (PFAS). The United States is concerned that the EU did not consider the implications of the ban for several critical uses, such as in the production of some renewable energy products, for which there are, as yet, no feasible alternatives to PFAS. Additionally, the proposal could impact the implementation of global treaties to reduce ozone depletion and global warming, such as the Kigali Amendment to the Montreal Protocol, by restricting climate friendly alternatives to existing substances.

Fluorinated Greenhouse Gases

An update to the 2014 Fluorinated Greenhouse Gas (F-Gas) Regulation (EU) 2024/573, which was adopted in February 2024, would accelerate implementation of a blanket ban on all fluorinated gases. The decision on a blanket ban was taken before determining if there are viable alternatives for these gases, which were created as substitutes for ozone-depleting substances. The United States is concerned that the F-gas policies overlook the contributions of these gases to the avoidance of global warming. The United States continued to raise concerns regarding the EU's approach both bilaterally and at the WTO TBT Committee, particularly in light of the negative impact on global climate targets.

(Additional concerns with the EU policies in regard to F-Gas are discussed in the Other Barriers section of this NTE Report chapter.)

Packaging and Packing Waste Regulation

On November 30, 2022, the European Commission published its proposal for a Packaging and Packaging Waste Regulation to replace an existing directive in an effort to harmonize Member State packaging and packaging waste regulations. The update is a part of the Green Deal's Circular Economy Action Plan announced in 2020 and is intended to reduce overpackaging, promote the reusability and recyclability of packaging, and reduce the complexity of packaging materials. Trilogue negotiations on the regulation are expected to start in early 2024. The United States continues to engage the EU as the legislation progresses

to ensure that the final version adopted does indeed promote harmonized rules across Member States and continues to seek additional clarification necessary to help stakeholders comply with the requirements.

Deforestation-Free Supply Chain Regulation

On June 29, 2023, the EU issued a deforestation-free supply chain regulation (Regulation (EU) 2023/1115), which has an 18-month transition period until it enters into application on December 30, 2024. Several U.S. stakeholders have argued this is insufficient time for compliance. The regulation aims to curb deforestation and forest degradation linked to European consumption and production of beef, coffee, cocoa, palm oil, soy, wood, rubber, and their derived products (e.g., charcoal, furniture, tires, paper, leather), with potential expansion to other products and ecosystems. U.S. stakeholders have raised concerns that due diligence and traceability requirements in the regulation may not be possible for companies to meet. To date, the EU has refused to notify the regulation to WTO Members or to provide an opportunity for WTO Members and other stakeholders to comment on the regulation. Fourteen WTO Members (the United States, Argentina, Australia, Brazil, Canada, Colombia, Guatemala, India, Indonesia, New Zealand, Panama, Paraguay, Peru, and the Russian Federation) raised concerns with the regulation at the November 2023 WTO TBT Committee meeting. The United States continues to seek WTO notification of the measure and to engage the EU on its implementation. In 2023, U.S. exports of products covered by the EU's deforestation-free regulation exceeded \$8 billion.

Eco-design for Sustainable Products Regulation and the Digital Product Passport

On December 5, 2023, EU institutions reached agreement on a regulation to establish an eco-design framework for sustainable products that will require industry to meet new sustainability requirements. Articles 7 through 14 of the regulation require industry to develop and implement a new digital label (known as a Digital Product Passport, or DPP) to track lifecycle information and other aspects of a product in order to inform consumers and help public authorities to better perform checks and controls. Some U.S. stakeholders are concerned that the DPP requirements set unrealistic implementation timelines and do not include sufficient safeguards to prevent the unauthorized disclosure of confidential business information. The United States made multiple requests to the EU during 2023 to notify the measure to the WTO to allow trading partners the opportunity to provide feedback. To date, the EU has refused to notify the measure.

Green Claims Directive

In March 2023, the EU released the proposal for a directive on substantiation and communication of explicit environmental claims ("Green Claims Directive," notified to the WTO in May 2023) to combat misleading environmental claims ("greenwashing"). The United States has been engaging with the European Commission to ensure that the directive is clear and specific as to the elements needed to substantiate environmental claims, including documentation requirements and implementation periods for the measure's conformity assessment procedures and labeling requirements related to product characteristics. The United States is also seeking to collaborate with the EU to achieve greater alignment on the recognition of eco-label schemes and measures to combat greenwashing.

(Sanitary and phytosanitary concerns with the European Green Deal are discussed in the Sanitary and Phytosanitary Barriers section of this NTE Report chapter.)

Renewable Energy Directive

The EU Renewable Energy Directive (RED) ((EC) 2009/28) requires that biofuels and biofuel feedstocks obtain a "Proof of Sustainability" certification to qualify for tax incentives and national use targets. RED

also establishes a methodology and accounting system by which Member States may record and calculate required greenhouse gas emission savings as compared to a baseline for fossil fuels.

In 2018, the European Commission adopted a new renewable energy directive (RED II) for the period 2021 to 2030. RED II entered into force on January 1, 2021 and introduces sustainability requirements for forestry biomass (wood pellets). As part of the Fit for 55 package, the European Commission began revisions of RED II in 2022, and the final revisions were published on October 31, 2023. The revisions to RED II increased the EU's binding renewable target for 2030 to a minimum of 42.5 percent, up from the current 32 percent target. However, the sustainability criteria for biofuels and biomass was not fundamentally changed, which may limit U.S. exports of biofuels and biomass that would otherwise provide viable renewable sources for the EU's renewable energy targets. The United States exported approximately \$443 million in wood pellets to the EU in 2022 (latest data available).

Pesticide Maximum Residue Limits for Environmental Objectives

On February 15, 2023, the EU published Commission Regulation (EU) 2023/334 to reduce maximum residue limits (MRLs) for clothianidin and thiamethoxam to the limit of determination, in an effort to protect pollinators, particularly bees, in countries outside of the EU. The measure would effectively bar all imports of products to the EU that contain any detectable residue of the two widely used pesticides after March 7, 2026.

The United States shares the EU's concerns about pollinator health and is actively working to protect bees and other pollinators in the United States. However, the global scientific and regulatory community has found that complex interactions among multiple factors affect pollinator health, including the health of bees, and that the safe use of the two pesticides may be determined based on local, national, or regional contexts by the appropriate competent authorities. The United States has also raised concerns with the EU that the use of MRLs as an environmental safety management tool could undermine the development and use of international standards for food safety. Given the critical importance of the pesticides identified in the regulation, the measure appears to pose a significant obstacle to international trade and production of agricultural products. The European Commission intends to consider additional substances under a similar approach. In 2022 and 2023, the United States raised this issue with the EU at the WTO TBT Committee, WTO Committee on Sanitary and Phytosanitary Measures (WTO SPS Committee), and WTO Council for Trade in Goods. The United States continues to encourage the EU to pursue a collaborative approach to protect pollinators worldwide.

(Other MRL concerns with the European Union are discussed in the Sanitary and Phytosanitary Barriers section of this NTE Report chapter.)

Medical Devices and In-Vitro Diagnostics Regulation

The United States continues to be concerned about the implementation of the Medical Device Regulation (MDR) and the In-Vitro Medical Device Regulation (IVDR), especially the shortage of notified bodies available to assess medical devices and in-vitro medical devices. The ongoing lack of capacity to conduct conformity assessment has led to longer review times, and it is still difficult for some companies to obtain access to reviews. The lengthy review times and lack of access impact the ability of companies to keep legacy devices on the EU market and to bring new devices to healthcare providers and patients.

The United States engaged the EU in 2022 through the WTO TBT Committee and bilateral discussions around those meetings to seek updates on the implementation of the MDR and IVDR, including the number of qualified notified bodies to perform conformity assessment requirements. On January 6, 2023, the European Commission published a proposal to amend the MDR and allow for staggered and conditional

extension of a transition period to the new rules until 2027 or 2028, according to the risk class of the devices. In addition, the proposal will extend validity of certificates and cancel the “sell-off” date, which will allow devices placed on the market before or during the transition period to continue to be made available absent time limitations. On March 20, 2023, Regulation (EU) 2023/607 amending the MDR and IVDR was published in the EU Official Journal with immediate effect.

Wine Labeling

In January 2023, the EU issued a draft European Commission Delegated Regulation (EU) 2019/33 outlining new rules for the indication and designation of ingredients for wine. The regulation was adopted in May 2023 and introduced a compulsory nutrition declaration and list of ingredients to be displayed on the label of wine products sold on the EU market beginning December 8, 2023. The regulation permits producers to provide mandatory lists of ingredients and nutritional information, excluding allergens and energy content, via an electronic label accessed through a quick-response (QR) code on the physical label. In November 2023, the EU issued guidance, which added the requirement for QR codes to be accompanied by a textual heading (*e.g.*, ingredients). U.S. industry supports the use of electronic labels to provide additional information for consumers; however, industry has raised concerns that textual headings may require them to develop country-specific headings for various Member States, contrary to the nature of the EU as a single market. U.S. industry has requested that the EU consider an alternative modality in place of a textual heading for QR codes. In 2023, the United States raised this issue with the EU bilaterally as part of the United States–European Union Wine Dialogue and on the margins of the WTO TBT Committee. In 2023, the United States exported more than \$186 million in wine to the EU.

Traditional Terms on Wine

The EU continues to restrict the use of “traditional terms,” such as “tawny,” “ruby,” and “chateau,” on labels on imported wine. This impedes U.S. wine exports to the EU, including U.S. wines that include these traditional terms as part of their trademarks. U.S. wines sold under a trademark that includes one of the traditional terms can only be marketed in the EU if the trademark was registered before May 2002.

The EU has not taken any visible steps to address the concerns of the United States and has consistently refused to provide a timeline for review of the applications for the use of terms submitted by U.S. industry.

Alcohol Labeling

In May 2023, Ireland introduced a Public Health (Alcohol) (Labelling) regulation, which sets unique health labeling requirements for alcohol being sold in the Irish market. The regulation mandates that all alcohol beverages display warnings on product packaging informing consumers about the risk of consuming alcohol when pregnant and the risk of liver disease and fatal cancers from alcohol consumption. While supportive of the goals of the regulation, in June and November 2023, the United States raised procedural concerns about the regulation in the WTO TBT Committee. Ireland responded extending the transition period and by permitting importers to affix stickers with the required information to imported products.

Sanitary and Phytosanitary Barriers

The United States remains concerned about a number of measures the EU maintains ostensibly for the purposes of food safety and protecting human, animal, or plant life or health. Specifically, the United States is concerned that these measures may unnecessarily restrict trade without furthering safety objectives, because they appear to be applied beyond the extent necessary to protect human, animal, or plant life or health, not based on science, or maintained without sufficient scientific evidence.

Farm to Fork Strategy

As part of the European Green Deal, described in the Technical Barriers to Trade section of this Chapter, the European Commission published its Farm to Fork (F2F) Strategy in May 2020 that included targets and policy proposals for enhancing food and agricultural sustainability by 2030. Among other things, these targets aim to reduce pesticide and fertilizer use by farmers and antimicrobial use in livestock, and to change land use in agriculture by transitioning farmland into organic production or taking other farmland out of production.

The EU has stated it will seek to “obtain ambitious commitments from third countries in key areas,” and is increasingly attempting to expand the reach of this policy beyond the EU. The targets must be converted into legislative proposals, and the European Parliament and European Council have begun to shape and amend these proposals as part of the EU legislative process between 2021 and 2024. The EU Ministers of Agriculture adopted conclusions on the F2F Strategy in October 2020, endorsing goals while registering a request that farming models other than organics be considered and that any new legislation be based on “scientifically-sound ex-ante impact assessments.”

The United States shares the EU’s goals for more sustainable food systems and recognizes the importance of considering the economic, social, and environmental dimensions of sustainability. However, it remains to be seen how the EU will implement the broader objectives of the F2F through these interrelated initiatives, which appear to blend SPS issues with potential TBT requirements like labeling or certification schemes. U.S. stakeholders are concerned that EU implementing regulations may focus on promoting EU production practices that are not appropriate, effective, or efficient in other parts of the world and, if required, could unnecessarily restrict trade or require farmers in the United States and other countries outside the EU to produce crops in less sustainable ways than they otherwise would have, as a precondition for gaining access to the EU market.

Hormones and Beta-Agonists

The EU maintains various measures that impose bans and restrictions on meat produced using hormones, beta-agonists, and other growth promotants, despite scientific evidence that such meat is safe for consumers. U.S. producers cannot export meat or meat products to the EU unless they participate in a costly and burdensome verification program to ensure that hormones, beta-agonists, or other growth promotants have not been used in their production.

For example, the EU continues to ban the use of the beta-agonist ractopamine, which promotes leanness in animals raised for meat. The EU maintains this ban even though international standards promulgated by Codex Alimentarius Commission (Codex) have established an MRL for the safe trade in products produced with ractopamine. The Codex MRL was established following a scientific study by the United Nations Food and Agriculture Organization/World Health Organization Joint Expert Committee on Food Additives that found ractopamine at the specified MRL does not have an adverse impact on human health.

In 2019, as part of a compromise solution to the U.S.–EU hormone beef dispute, the United States and the EU concluded an agreement that established a duty-free tariff-rate quota (TRQ) for the United States. The agreement went into effect on January 1, 2020, and provided American ranchers an initial TRQ of 18,500 metric tons annually, valued at approximately \$220 million. Over seven years, the TRQ will grow to 35,000 metric tons annually, valued at approximately \$420 million.

Antimicrobial Resistance and the Restrictions on the Use of Veterinary Medicinal Products

In December 2018, the EU published Regulation (EU) 2019/6 on veterinary medicinal products that seeks to address antimicrobial resistance by more strictly defining the criteria for use of antimicrobial products in animal medicine. Regulation (EU) 2019/6 also identifies a list of products that will be exclusively reserved for human medicine and no longer permitted in agricultural production. Article 118 of the regulation expands these restrictions to operators in third countries, who will be required to ensure that animal products exported to the EU and intended for human consumption do not originate from animals that have been treated with specified antimicrobial medicines reserved for human use or utilized for growth promotion. To date, the EU has failed to provide a scientific justification for these restrictions.

The official implementation date for Regulation (EU) 2019/6 was set for January 28, 2022, but the EU is still finalizing the legislation necessary to implement the regulation. In March 2021, the EU published an amendment to the official controls Regulation (EU) 2017/625 that clarified the legal mechanism for verification of compliance with Article 118 of the regulation. In October 2021, the EU published European Commission Delegated Regulation (EU) 2021/1760 that fixed the criteria used to establish the list of antibiotics exclusively preserved for human medicine. The European Commission adopted the European Medicines Agency's (EMA) advice as European Commission Implementing Regulation (EU) 2022/1255, which was published in the EU Official Journal on July 20, 2022. In May 2023, the EU published Commission Delegated Regulation (EU) 2023/905, which formalizes the prohibition foreseen in Regulation (EU) 2019/6 on the use of certain antimicrobials to food-producing animals and derivative products imported from non-EU countries. The European Commission is drafting two implementing regulations to enforce Regulation (EU) 2023/905, which will include a list of approved third countries and the requirement of an official health certificate attestation for the export of covered products. U.S. stakeholders are concerned about the potential impacts of the as yet unfinalized implementing regulation's attestation requirements on U.S. exports of animal products to the EU once it enters into force. Stakeholders have raised concerns about other provisions that are not based on science or risk and instead promote the adoption of EU practices by third countries rather than recognizing the alternative ways that different authorities can arrive at the same level of product safety. U.S. stakeholders are also concerned about the EU's prohibition on the use of non-medically important antimicrobials to promote growth and increase yield, as this prohibition does not appear to have a scientific justification and specific food safety concerns have not been identified. The United States continues to engage the EU regarding management of antimicrobial resistance and encourage science-based approaches.

Agricultural Biotechnology

Decades of data and experience demonstrate the safety of genetically engineered (GE) crops, in addition to the benefits of their use in reducing carbon emissions, pesticide use, and impact on non-target organisms, while increasing soil health, crop yields, and farmers' incomes. Despite these benefits, the lack of predictability, excessive data requirements, and delays in the EU's approval process for GE crops have prevented products from being exported to the EU, even though these products have been approved and grown safely in the United States for many years.

The United States continues to reiterate concerns with delays in the EU's biotechnology approval procedures and to engage the EU in efforts to normalize trade in these products, including through semiannual consultations in accordance with the 2008 decision by the United States and the EU to suspend Article 22.6 arbitration proceedings associated with the WTO dispute settlement proceeding against the European Communities (the EU predecessor entity) regarding the approval of biotechnology products. In 2023, the EU issued eight approvals and five renewals for GE crops, compared to six approvals and one renewal in 2022. While these new authorizations are welcomed, the EU's average approval time for new GE crops in 2023 was approximately six years. In contrast, the EU's own legally prescribed approval time

for such products is 12 months (6 months for the review with the European Food Safety Authority (EFSA) and 6 months for the political committee process known as comitology).

As of December 31, 2023, the United States was tracking approximately 30 agricultural biotechnology product applications (including renewals) submitted to the EU, including with respect to corn, soybean, rapeseed, and cotton. Of those applications, 29 were under scientific review by the EFSA and 6 await action by the European Commission through comitology. Delays in both of these stages contribute to increasingly lengthy EU approval timelines. For example, EFSA continues to demand unnecessary studies while conducting risk assessments, which result in unpredictable delays in issuing final opinions. In comitology, repeated findings of “no opinion” by the relevant Standing Committee on Plants, Animals, Food and Feed also delay the EU from making decisions on GE approvals, by requiring products to go through an additional assessment by an Appeal Committee before receiving a final approval. The United States continues to engage the EU on delays of this nature and urge the EU to address other barriers to trade in biotechnology products. For example, the EU has yet to establish a practical low-level presence policy and instead maintains a 0.1 percent limit for unapproved biotechnology traits in feed shipments, which is not commercially feasible and disrupts trade in products that have otherwise passed U.S. safety assessments.

Member State Measures on Agriculture Biotechnology

In March 2015, the EU adopted a directive allowing Member States to ban the cultivation of GE plants in their respective territories for non-scientific reasons (Directive (EU) 2015/412). Under the transitional measures, Member States had until October 2015 to request exemption from the geographical scope of the authorizations already granted or that were under regulatory review for EU cultivation approval. Eighteen Member States “opted-out” of GE crop cultivation for all or part of their territories, and none of the five Member States (the Czech Republic, Portugal, Romania, Slovakia, and Spain) that grew GE corn opted out. However, as of 2023, only Portugal and Spain commercially cultivated GE corn.

Seventeen Member States have opted out of cultivation using biotechnology seeds. The 17 Member States that requested exclusion of their entire territory from the geographical scope of biotechnology applications are Austria, Bulgaria, Croatia, Cyprus, Denmark, France, Germany, Greece, Hungary, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Poland, and Slovenia. Additionally, one region in Belgium, Wallonia, has also opted out of cultivation. All of these Member States and regions have decided to ban the cultivation of Monsanto 810 corn (MON810) and the seven varieties of corn that were submitted for EU-wide approval in 2015 (apart from Denmark and Luxembourg, which have only banned MON810 and three of the seven varieties of corn that were submitted for EU-wide approval).

EU Fumigation Requirements for Hardwood Lumber and Logs

The EU previously banned the use of methyl bromide to fumigate logs and wood chips imports. Fumigation with sulfuryl fluoride is considered an equally effective substitute and is used throughout the EU, including for EU log exports. While the EU approved the use of sulfuryl fluoride for certain U.S. log exports in 2023, the decision on its use for U.S. pine wood chips remains pending scientific review, which leaves U.S. exporters of pine wood chips without a commercially viable fumigation option. Heat treatment, which is the EU alternative to fumigation, is not scalable in many instances. The United States will continue to engage with the EU on this issue to identify a path forward.

Pathogen Reduction Treatments

The EU maintains measures that prohibit the use of any substance other than water to remove contamination from animal products unless the substance has been approved by the European Commission. These measures significantly affect U.S. exports of beef, pork, and poultry to the EU because the European

Commission has failed to approve several pathogen reduction treatments (PRTs) that have been approved for use in the United States. PRTs are rinses used to kill microbial pathogens that commonly exist on meat after slaughter. The PRTs at issue have been approved by U.S. Department of Agriculture (USDA) after establishing their safety on the basis of scientific evidence.

In March 2017, the National Pork Producers Council submitted an application to the European Commission for the approval of two organic acids, lactic and acetic, for use on pork. The application was submitted to EFSA by the European Commission in September 2017. EFSA published its evaluation in December 2018, confirming the safety of the use of acetic acid and lactic acid in pork processing. As of December 31, 2023, the European Commission has taken no action for the approval of pork PRTs.

The United States maintains that the use of PRTs is a critical tool during meat processing that helps further the safety of products being placed on the market. The United States has engaged the EU to share scientific data regarding the safe use of PRTs and will continue to engage the EU regarding the approval of PRTs for beef, pork, and poultry as an effective tool to improve food safety.

Certification Requirements

Since January 2022, the EU has published at least seven versions of the health certificate it requires for U.S. agricultural exports of fish, meat, dairy, eggs, processed products, and animal byproducts. U.S. exporters are concerned about exporting products of animal and animal origin to the EU market and to third-country markets that require transit through the EU because of the unpredictability of health certificate requirements. Differing interpretations of requirements among Member States adds to this uncertainty. The EU is currently contemplating the addition of attestations related to use of antimicrobials and animal welfare, which may further complicate this issue.

It appears that EU health certification requirements and subsequent modifications are not necessary for the protection of human or animal health and burden to the movement of goods. The certification requirements also are enforced irrespective of whether these goods are destined for commercial sale in the EU or transiting through the EU. The EU's requirements often appear to have been established without scientific evidence, a risk assessment, or consideration of Codex guidance on certifications, the latter of which recommend that official certificates require only the minimum amount of information necessary to meet the objectives of the country's food safety system. Moreover, the EU's changes to certificates are increasingly frequent, complex, and instituted through updates to multiple EU implementing or delegated regulations, making compliance difficult for manufacturers, exporters, foreign competent authorities, and EU importers. Certificates based on the standardized templates published in EU regulations are a condition for trade, but it is increasingly difficult for U.S. regulators to issue the required EU certificates. Differences in interpretation of EU legislation by Member State authorities also create legal instability and often result in trade disruptions, creating additional burden for U.S. exporters.

The United States continues to engage the EU bilaterally to resolve concerns regarding the EU's certification requirements.

Titanium Dioxide

In November 2021, the European Commission published European Commission Implementing Regulation (EU) 2021/2090 in the EU Official Journal denying the authorization of titanium dioxide (E171) as a feed additive for all animal species. Following this action, Regulation (EU) 2022/63 banned titanium dioxide (E171) as a food additive in the EU as of August 7, 2022. The regulation includes a commitment to review the necessity to maintain or delete titanium dioxide from the EU list of food additives for exclusive use as a color in medicinal products. The European Commission has tasked the EMA with reviewing the situation

by April 2024. The regulation calls on the pharmaceutical industry to accelerate research and development for alternatives to titanium dioxide in both new and previously authorized products. The EMA has published information for pharmaceutical companies and is monitoring industry efforts.

Animal Byproducts, Including Tallow

The EU considers all animal byproducts sourced from animals raised under conditions not essentially identical to those in the EU to be hazardous materials. Since 2002, the EU has made modifications to its regulations and implementation practices governing animal byproducts that have resulted in the treatment of U.S. products being considered hazardous. The current EU interpretation of the animal byproducts regulations could potentially prevent most exports of U.S. animal byproducts. Several Member State border inspection posts have already blocked consignments of various technical blood products.

The United States has requested that tallow be allowed entry into the EU for any purpose without verification other than that the tallow and derivatives made from the tallow contain no more than a maximum level of insoluble impurities consistent with the internationally recognized standard for trade in tallow and with World Organisation for Animal Health (WOAH) recommendations.

Live Cattle

Live cattle from the United States are not authorized to be exported to the EU, or transited through the EU en route to third countries, due to EU certification requirements for several bovine diseases. U.S. exports remain blocked because the United States and EU have not agreed on the conditions and format for an export certificate. The EU implemented new animal health laws in 2021, and the USDA Animal and Plant Health Inspection Service (APHIS) continues to explore alternative solutions, particularly with regard to a mutually acceptable animal health certificate, to resolve the issue of market access to the EU for live cattle.

Trade in Raw and Processed Shellfish

In February 2022, the EU determined the U.S. food safety system for raw bivalve mollusks (shellfish) to be equivalent to the EU's food safety system for these products. At the same time, the U.S. Department of Health and Human Services Food and Drug Administration (FDA) found two EU Member States to be operating a food safety system for shellfish to be equivalent to the U.S. food safety system. Trade was reopened for two U.S. states (Massachusetts and Washington) and opened for two EU Member States (Spain and the Netherlands), with an agreed mechanism for expediting the consideration of additional U.S. states and EU Member States. In April 2022, the United States sent dossiers for Connecticut, Maine, and Rhode Island seeking to export raw product to the EU. Although the EU committed to expedited reviews of U.S. state dossiers, as of December 31, 2023, the EU had only considered Connecticut's dossier and has not completed its review. The EU has not begun its review of the other two dossiers.

Processed shellfish from the United States is not currently authorized to be exported to the EU. The EU requires a determination of equivalence for processed and raw shellfish, a level of control for a processed product that has not been supported by science-based risk assessment. The European Directorate-General for Health and Food Safety (DG SANTE) conducted an audit in November 2022, which evaluated whether U.S. controls to deliver and certify processed bivalve shellfish were compliant with U.S. food safety requirements and regulations. Following the audit, the U.S. FDA and U.S. Department of Commerce National Oceanic and Atmospheric Administration (NOAA) identified sections of the audit report that were incorrect or inaccurate and required editing to reflect a correct understanding of the U.S. national control system for processed bivalve shellfish. Technical discussions between FDA, NOAA, and DG SANTE are ongoing.

Specified Risk Materials Certification Requirement

The EU has a different definition of specified risk materials (SRM) from the United States for the animal tissues most at risk of harboring the transmissible spongiform encephalopathies (BSE). The EU requires that materials exported to the EU meet the EU's SRM definition and be derived from carcasses of animals that can be confirmed as never having been outside of regions that the EU considers to be of negligible risk for BSE. Although WOAHA has recognized the United States as having negligible risk, the source cattle for U.S. ruminant origin animal byproduct exports may not necessarily come from negligible risk countries. The EU SRM requirement unnecessarily impedes U.S. exports of ruminant origin animal byproducts considered safe in the United States and would potentially limit the market for ovine/caprine byproducts were other market impediments removed.

The SRM requirement otherwise has not been an issue for bovine meat for human consumption, because the special EU-required production controls in the non-hormone-treated cattle program already provide the necessary verifications regarding the history of the animal. The EU's "born and raised" BSE requirement is based on its non-recognition of WOAHA animal disease status for the United States and is related to animal health versus the origin of the products. Consistent with the recommendations of WOAHA, it is the BSE status of the country of export that should determine whether SRMs have to be removed. The United States continues to raise this issue in appropriate fora, including bilateral technical working groups, and has requested the removal of the EU's requirement for all relevant U.S. commodities.

Hazard-based Cutoff Criteria for Agricultural Chemicals

Active substances can only be approved for use in crop protection products in the EU if they fulfill the approval criteria established in Regulation (EC) 1107/2009. Under this regulation, the EU's determination includes hazard-based "cutoff" criteria that exclude certain categories of products from consideration for normal authorization for use in the EU. In instances where an active substance triggers the cut-off criteria, the EU regulatory process allows for an active substance to remain unapproved, regardless of risk of exposure. For such products, the EU does not complete a risk assessment. Rather, the EU discontinues authorization for a particular product at the time of re-approval, as has happened for an increasing number of substances. The EU has also been taking a "hazard-based approach" to new products, declaring them to be ineligible for authorization based solely on the intrinsic properties of the product, without taking important risk factors such as level of exposure or dosage into account. The United States is concerned that an increasing number of safe and widely-used substances are not being reapproved or having reasonable import tolerances set for their use, due to these arbitrary cut-off criteria when current registrations expire.

Categorization of Compounds as Endocrine Disruptors

One category of crop protection products subject to the hazard-based approach set out in Regulation (EC) 1107/2009 are substances classified as endocrine disruptors (EDs). EDs are naturally occurring or man-made substances that may mimic or interfere with hormone functions. The United States evaluates possible endocrine effects associated with the use of certain chemicals to ensure protection of public health and the environment. In contrast, the EU established an approach to regulating these compounds that appears not to be based on scientific principles or is maintained without scientific evidence, thereby restricting trade without improving public health.

The scope of trade effects of Regulation (EC) 1107/2009 is broad and overlaps with that of the other hazard criteria and environmental criteria the EU uses in regulating pesticides. The EU obscures its hazard-based decisions with onerous data requirements that allow the European Commission to claim an inability to measure risk. The United States continues to monitor this issue and raise concerns in international and bilateral fora.

Pesticide Maximum Residue Limits

Maximum residue limits and import tolerances are established under legislation, Regulation (EC) 396/2005, which, unlike Regulation (EC) 1107/2009, is risk-based rather than hazard-based. However, for active substances that are not approved due to the EU's cut-off criteria under Regulation (EC) 1107/2009, the EU may withdraw MRLs established under Regulation (EC) 396/2005, and reduce import tolerances to the default level of 0.01 mg/kg. The EU conducted an evaluation of existing legislation on plant protection products and pesticide residues through the Regulatory Fitness and Performance process. At this time, the EU has no intention to further align Regulation (EC) 396/2005 with the hazard-based principles of Regulation (EC) 1107/2009. As the number of substances ineligible for reauthorization by the EU increases, and as the EU reduces the corresponding MRLs and import tolerances to the default level, the significant negative effect on agricultural production and trade is likely to increase.

The EU regulations also establish transitional periods to allow producers to adjust to changes in EU MRLs, although the transition periods established by the EU are generally not long enough to avoid trade disruption. For many products, there may be a gap of several years between pesticide application and when a final product is offered for sale, creating a situation where products that are compliant with EU MRLs at the time of production do not have time to clear the channels of trade. EU products, on the other hand, appear to remain available for sale as long as they are produced prior to MRLs changing.

The United States has raised concerns over the EU's policy approaches for years and continues to engage on these issues in the WTO SPS Committee. The United States is also monitoring the EU's actions with regard to evaluating and establishing import tolerances for active substances, which have the potential to create further trade disruptions when MRLs are set at levels that are lower than necessary to protect human health and are not viable. According to U.S. industry estimates, U.S. exports valued at over \$5 billion and global trade amounting to \$75 billion are at risk of significant harm. Discontinuing the use of critical substances without a proper science-based risk assessment, and withdrawing or lowering MRLs to levels that are not commensurate with the findings of risk assessments, would have serious adverse effects on agricultural productivity and global markets.

Glyphosate Renewal

The EU requires that the approval of the active substance of a pesticide (*i.e.*, the substance that works against pests or plant diseases) be periodically renewed. Glyphosate, the herbicide used in certain plant protection products, had been approved by the EU as an active substance until December 15, 2023. In July 2023, the EFSA found no critical areas of concern for human, animal, and environmental health from the use of glyphosate in agriculture. Based on the EFSA assessment, on November 28, 2023, the European Commission adopted Implementing Regulation (EU) 2023/2660 to renew the approval of glyphosate for 10 years, until December 15, 2033, following the absence of a qualified majority vote required to approve or reject the renewal from Member States in the Standing Committee on Plants, Animals, Food and Feed and the Appeals Committee.

Following approval of an active substance in the EU, Member States control the authorization of formulated products containing that substance. Member States have various regulations limiting the use of products containing glyphosate. Despite the recent EU renewal of approval of glyphosate in November 2023, some Member States continue to ban glyphosate partially or entirely, including Austria, Belgium, France, Germany, Italy, Luxembourg, and the Netherlands. Member State bans affect the use of the substance within that country's national borders but do not affect any glyphosate MRLs, as all pesticide MRLs are determined at the EU level.

GOVERNMENT PROCUREMENT

Government procurement is governed by the EU public procurement directives. The directive on procurement in the utilities sector covers purchases in the water, transportation, energy, and postal sectors. The EU content requirement applies to foreign suppliers of goods and services in water (the production, transport, and distribution of drinking water), energy (gas and heat), urban transport (urban rail, automated systems, trams, buses), and postal services.

The EU is a Party to the WTO Agreement on Government Procurement (GPA).

Member State Measures on Public Procurement

Lack of transparency in certain Member State public procurement processes continues to be a barrier to the participation of U.S. firms. U.S. firms have also voiced concerns over onerous documentation requirements and implicit biases in favor of local vendors and other suppliers based on lowest cost instead of the full lifecycle of the procurement. Additional Member State-specific trade barriers to U.S. stakeholder participation in public procurement processes are discussed below.

- *Croatia*: U.S. companies have complained about instances in which technical specifications and scoring in public procurement tenders appear to favor a specific bidder, typically a local or other Member State supplier, thus impacting the participation of competitive U.S. firms.
- *Greece*: U.S. firms have complained that Greece often requires suppliers to source services and production locally or partner with Greek manufacturers as a condition for the awarding of some defense contracts. Additional complaints center on onerous certification and documentation requirements for foreign firms.
- *Hungary*: In April 2022, the European Commission launched a budget conditionality mechanism against Hungary over the “systemic irregularities, deficiencies and weaknesses” in its public procurement procedures. U.S. companies express serious concerns that public procurements in Hungary are not transparent and tend to favor either local or other non-EU countries, including China.
- *Lithuania and Portugal*: U.S. firms have raised concerns over Lithuania’s and Portugal’s use of “lowest cost” criteria as the primary determination for awarding contracts. Although EU law allows for consideration of factors such as quality, company reputation, and prior experience in the decision-making criteria, “lowest cost” bidding continues to be a common practice in these two countries.
- *Slovakia*: The excessive length and complexity of tender verification and appeal procedures remains an impediment to the widest possible participation of potential bidders. Lock-in contracts, in which the Slovakian Government commits to procure a basic service and subsequently expands the contract to include additional services, continue to hamper the access of U.S. firms to public procurement, especially with regard to information technology services.
- *Slovenia*: U.S. firms report instances of tendering documentation that provide unfair advantages to favored vendors, typically an EU Member State company, and opacity in the bid evaluation process as major impediments. Slovenia’s quasi-judicial National Revision Commission (NRC), which reviews all disputed public procurement cases, has received multiple complaints. The NRC has the authority to review, amend, and cancel tenders, and its decisions are not subject to judicial appeal.

In the instances where U.S. companies alleged improprieties in the procurement process, Slovenian authorities directed them to the NRC, which is not required to justify its decisions.

Cybersecurity

Proposed EU Cybersecurity Certification Scheme for Cloud Services

The EU is considering a new certification scheme for cloud services (EUCS). Once finalized, the EUCS is expected to be mandatory for certain public sector and possibly select private sector cloud services. The EU covers cloud services in their GPA schedule and is required to offer non-discriminatory access to U.S. and other GPA suppliers for covered procurements. The United States has presented its concerns about these policies in the WTO Committee on Government Procurement.

Member State Measures on Cloud Services

- *France:* France's national digital security agency, Agence Nationale de la Securite des Systemes d'Information (ANSSI), maintains a security certification scheme for cloud services, commonly referred to as SecNumCloud. In May 2021, the French Government issued a strategy for the use of cloud computing by the state (Trusted Cloud strategy), requiring that government agencies and commercial entities considered "critical" must select only cloud services vendors with a SecNumCloud certification to handle their highly sensitive data. As part of this strategy, ANSSI published in March 2022 a revision to the SecNumCloud certification requirements. This revision requires that any cloud provider that handles "highly sensitive" data must be at least 61 percent EU-owned and "immune" from non-EU laws. France's Prime Minister signed an official circular on May 31, 2023, defining "sensitive data" to which SecNumCloud certification requirements apply. The vague definition of "sensitive data" could lead foreign cloud services suppliers to be increasingly precluded from providing cloud services to French public authorities. There are also concerns that in the future the French private sector would adopt a SecNumCloud certification requirement, which could further hamper foreign cloud service providers from providing services in France.
- *Czech Republic:* The Czech Cyber and Information Security Agency (NUKIB) published a "Strategic Analysis of Cloud Services" in December 2022, which advised Czech public and private sector organizations on security considerations related to selecting a cloud service provider. The analysis, which consists of non-binding recommendations rather than directives, acknowledged that U.S. cloud service companies are preferable to China-based competitors from a security perspective. However, U.S. stakeholders have expressed concern that the analysis refers to the potential transfer of data to the U.S. Government but omits key information (e.g., the analysis fails to mention that the controls in the United States over government access to data are more stringent than the controls in many EU Member States). As a result, it could mislead readers with regard to the risk of their data being handed over to the U.S. Government.
- *Hungary:* State and local government bodies and organizations are only allowed to process data in systems operated in the territory of Hungary. Electronic information systems can only be hosted in EU Member States for organizations providing services deemed as critical, which include energy, transportation, agriculture, and health industries.

INTELLECTUAL PROPERTY PROTECTION

As part of the European Commission's Digital Single Market Strategy, the Directive on Copyright in the Digital Single Market (Copyright Directive) went into effect in June 2019, with the stated goal of addressing legal uncertainty for both rights holders and users with regard to certain uses of copyright-protected works and other subject matter in the digital environment. Member States were required to transpose it by June 7, 2021, but as of December 31, 2023, Poland and Portugal still had not transposed the Copyright Directive in full. The United States continues to follow copyright issues in the EU and its Member States, including legislative developments relating to the transposition of the Copyright Directive into national laws, and will continue to engage with various EU entities as appropriate to address U.S. stakeholder equities.

The Digital Services Act (DSA) initially went into effect on November 16, 2022, and is intended to regulate certain online services, including through rules for how content is shared online. U.S. stakeholders have expressed concerns that the DSA's adoption of a framework for limitations of liability included modifications to the eligibility threshold and conditions that had been set in the E-Commerce Directive, which may adversely impact their intellectual property (IP) rights, in particular for copyright and trademarks.

The European Commission proposed a Data Act in February 2022 with the goal of maximizing the value of data and promoting innovation by increasing the transfer of data that is stored within devices and applications. The Data Act requires the disclosure and making available of data that may be protected by the data holder's or a third party's trade secrets, copyright, or other IP. The final text of the Data Act was published in the EU Official Journal on December 22, 2023, and it entered into force on January 11, 2024.

The European Commission proposed an Artificial Intelligence (AI) Act in April 2021 with the aim of providing a risk-based approach to regulating the development, deployment, and use of AI-driven products, services, and systems. Drafts of the AI Act neglect to provide strong, consistent, and transparent protection schemes for innovative and proprietary information embedded in the source code when the source code is required to be disclosed to the authorities.

In response to the CJEU's judgment in Recorded Artists Actors Performers (RAPP), the European Commission is exploring the possibility of publishing a draft amendment to the Rental and Lending Directive to require or permit material reciprocity for equitable remuneration collected for the performance and communication of sound recordings. The CJEU held that all sound recording producers and performers from contracting parties to the World Intellectual Property Organization (WIPO) Performances and Phonograms Treaty (WPPT) are entitled to equitable remuneration. U.S. stakeholders are concerned that such a legislative change reversing the CJEU holding will result in EU Member States withholding full payment of royalties to U.S. producers and performers.

The United States remains very concerned by the EU's overbroad protection of geographical indications (GIs), which adversely impacts both protection of U.S. trademarks and market access for U.S. products that use common names in the EU and third country markets. For example, Regulation (EU) 1151/2012 contains numerous problematic provisions governing the scope of protection and enforcement of Protected Designations of Origin (PDOs) and Protected Geographical Indications (PGIs), including expansive rules about evocation, extension, co-existence, and translation, among others. These troubling provisions not only adversely affect trademark rights and the ability to use common names, but also undermine access to the EU market for U.S. rights holders and producers. In addition, the EU has granted GI protection to thousands of terms that limits use in the EU market to only certain EU producers, and the use of any term that even "evokes" a GI is also blocked. Despite this level of protection afforded to products sold within the EU, it appears that some producers in Member States continue to produce products featuring terms that

are protected as GIs in other Member States and then export these products outside the EU. The EU has also granted GI protection to the cheese names danbo and havarti, widely traded cheeses that are covered by international standards under Codex. Several countries, including the United States, opposed GI protection of these common names both during the EU's opposition period and at the WTO, but the European Commission granted the protection over that opposition and without sufficient explanation to interested parties.

Regulation (EU) 1151/2012 also serves as the basis for the EU's international GI agenda, which includes requiring EU trading partners to protect and enforce specific EU GIs in their markets, often with only limited due process requirements to safeguard existing producers, right holders, consumers, importers, and other interested parties. Regulation (EU) 1151/2012 replaced the former GI regulation for food products, Council Regulation (EC) 510/2006, which was adopted in response to WTO DSB findings in a successful challenge brought by the United States (and a related case brought by Australia) that asserted that the EU GI system impermissibly discriminated against non-EU products and persons. The DSB findings also agreed with the United States that the EU could not create broad exceptions to trademark rights guaranteed by the Agreement on Trade-Related Aspects of International Property Rights (TRIPS). Regulation 1151/2012 sped up the registration procedure for registering GIs, reduced the opposition period from six to three months, and expanded the types of products capable of being registered as a GI.

The United States continues to have concerns about the EU's GI regulations and proposals, and monitors carefully their implementation and effects on bilateral trade. As to new GI proposals in 2023, the United States is concerned about the proposed revision of the GI system for agricultural products, foodstuffs, wines, and spirit drinks. The United States is also concerned about Regulation (EU) 2023/2411, which goes into effect from December 1, 2025, and expands the scope of GI protection to craft and industrial products. The United States also does not believe that the EU should bargain for specific GI recognition in its bilateral trade agreements in return for market access, because such IP rights should be evaluated independently on their merits, based on the unique circumstances of each jurisdiction. Similarly, the United States is concerned by the EU's attempts to restrict common terms for wine in third country markets. The United States is carefully monitoring the EU's GI regulations and proposals as well as the implementation and effects of these regulations and proposals on bilateral trade.

The United States remains very concerned by the conduct and outcome of the 2015 WIPO negotiations to expand the Lisbon Agreement for the Protection of Appellations of Origin and their International Registration to include GIs. Of particular concern to the United States was the manner of engagement in these negotiations by the European Commission and by several Member States, including the Czech Republic, France, Greece, Italy, and Portugal, which took precedent-setting steps to deny the United States and the vast majority of WIPO countries full negotiating rights and depart from longstanding WIPO practice regarding consensus-based decision-making. Likewise, the resulting text—the Geneva Act of the Lisbon Agreement on Appellations of Origin and Geographical Indications—raises numerous and serious legal and commercial concerns, including with respect to the degree of inconsistency with the trademark systems of many WIPO countries, and could have significant negative commercial consequences for trademark holders and U.S. exporters that use common terms. The EU became a party to this Agreement in November 2019. The Agreement entered into force in February 2020.

Member State Measures on Intellectual Property

Although Member States generally maintain high levels of IP protection and enforcement, the United States remains concerned about the IP practices of several countries. The United States actively engages with the relevant authorities in these countries and will continue to monitor the adequacy and effectiveness of IP protection and enforcement, including through the annual Special 301 review process. The United States is particularly concerned about counterfeit pharmaceuticals and personal protective equipment.

- *Austria:* With regard to trade secrets, U.S. companies reported gaps in criminal liability, insufficient specialization of judges, low criminal penalties, and procedural obstacles that limit the Austrian Government's efforts to effectively combat trade secret theft and misappropriation. In July 2023, Austria took steps to address these concerns, and amended its Unfair Competition Statutes and its Criminal Code to establish higher criminal penalties for trade secret theft and strengthen its criminal procedures as they relate to such theft.
- *Bulgaria:* Enforcement concerns in Bulgaria include inadequate prosecution efforts, lengthy procedures, and insufficient criminal penalties, particularly in the area of online piracy. Stakeholders have raised concerns as to notorious online pirate sites reportedly hosted in Bulgaria. As a result, USTR listed Bulgaria in the [2023 Special 301 Report](#) Watch List. As part of this process, USTR has been conducting an [Out-of-Cycle Review](#) of Bulgaria to assess progress in IP enforcement. In August 2023, Bulgaria amended its Criminal Code in an effort to enhance its ability to investigate and prosecute digital piracy cases. The United States will monitor whether implementation of this legislation results in an improved rate of criminal prosecutions in Bulgaria.
- *Germany:* When Germany implemented the Copyright Directive in 2021, it introduced new requirements for online platforms regarding the filtering of user uploads to prevent the automatic blocking of potentially copyright-protected content for uses that are presumably authorized by law. Some U.S. stakeholders are concerned that Germany also introduced an overly broad copyright presumption that makes it difficult for creators to enforce their copyrights in music and videos that are used in the background of short-form content that is often posted on social media. U.S. stakeholders also voiced concerns that Germany's legal framework for technological protection measures remain inadequate and that Germany's private copy exception is too broad. The United States will monitor how implementation impacts U.S. stakeholders.
- *Poland:* Stakeholders continue to identify copyright piracy online as a significant concern in Poland and noted inconsistent enforcement on the part of law enforcement and backlogs in the Polish courts. Stakeholders also are concerned about illegal camcording and easy access to counterfeit products.
- *Romania:* Online piracy remains a concern with some notorious online pirate sites reportedly hosted or registered in Romania. Low penalties for IP violations impede investigations and do not offer any meaningful deterrent to further IP crimes, so law enforcement choose to bundle significant cases under tax evasion penal files. Romania lacks an effective and timely mechanism for rights holders to submit takedown requests against online markets and hosting platforms for infringing material. Adequate resources, including additional training for law enforcement, are needed to enhance enforcement quality. Although Romania has made progress on addressing long-standing IP protection and enforcement concerns, the United States continues to closely follow IP-related developments in the country.

SERVICES BARRIERS

Telecommunications Services

Regulation on Privacy and Electronic Communications

In January 2017, the European Commission proposed a new Regulation on Privacy and Electronic Communications, which would replace the e-Privacy Directive of 2002. The proposed regulation would

expand the scope of the existing directive, which applies to traditional telecommunications services providers, to include over-the-top Internet-enabled services. U.S. suppliers have expressed concerns that, although the proposed regulation is supposed to align the specific rules for telecommunications services with the General Data Protection Regulation (GDPR), it may actually lead to additional and potentially conflicting requirements. In late 2017, the European Parliament adopted its final amendments to the proposed regulation, and in February 2021, the European Council announced that it had finalized its version, clearing the way for trilogue negotiations to begin. Those negotiations have proceeded slowly and are ongoing.

Audiovisual Services

In November 2018, amendments to the 2007 Audiovisual Media Services Directive (AVMSD) were adopted to reflect developments in the audiovisual and video-on-demand markets. Member States were given 21 months to transpose the amendments into national legislation. On November 23, 2021, the European Commission launched proceedings against 23 Member States for failure to transpose the AVMSD into national law. As of December 31, 2023, proceedings were still ongoing for Ireland, which has a case before the CJEU. The European Commission also has open proceedings against Slovenia, Croatia, France, and Estonia.

The original AVMSD established minimum content quotas for broadcasting that had to be enforced by all Member States. Member State requirements were permitted to exceed this minimum quota for EU content, and several have done so. However, the original AVMSD did not set any strict content quotas for on-demand services, although it still required Member States to ensure that on-demand services encourage production of, and access to, “EU works.”

The 2018 amendments include provisions that impose on Internet-based video-on-demand providers a minimum 30 percent threshold for EU content in their catalogs and require that they give prominence to EU content in their offerings. The new AVMSD also provides Member States the option of requiring on-demand service providers not based in their territory, but whose targeted audience is in their territory, to contribute financially to EU works, based on revenues generated in that Member State. In addition, the new rules extend the scope of the AVMSD to video-sharing platforms that tag and organize content.

Member State Measures on Audiovisual Services

A number of Member States maintain measures that affect trade in audiovisual services. A summary of some of the more significant national practices follows.

- *Austria:* Austria transposed the AVMSD into federal law in January 2021. Austria has a 30 percent quota for European works, as defined in the measure, in Video-on-Demand (VOD) catalogues and requires European works to be highlighted and labelled as such. At least 10 percent of transmission time, or 10 percent of the programming budget is to be dedicated to independent work.
- *Belgium:* In the Wallonia-Brussels Federation, video-on-demand services must invest a percentage of revenue into regional audiovisual works or pay a levy to the region’s Cinema and Audiovisual Centre. In March 2023, the Belgian French Community notified a draft decree to the European Commission that would increase the mandatory contribution for the largest service suppliers from the current 2.2 percent of revenue to 9.5 percent.
- *France:* France’s implementing legislation, approved by the European Commission in 1992, requires that 60 percent of television programming in France be of EU origin, thus exceeding the AVMSD threshold. In addition, 40 percent of the programming devoted to EU origin must include

original French-language content. These quotas apply to both regular and prime-time programming slots, and the definition of prime time differs from network to network. The French Government issued an order in December 2020, and an additional six decrees in December 2021, transposing the AVMSD into French law.

Internet, cable, and satellite networks are permitted to broadcast as little as 50 percent EU content (the AVMSD minimum) and 30 percent to 35 percent French-language content, but channels and services are required to increase their investment in the production of French-language content. France's Audiovisual and Digital Communication Regulatory Authority oversees implementation of the quotas.

Beyond broadcasting quotas, cinemas must reserve five weeks per quarter for the exhibition of French feature films. This requirement is reduced to four weeks per quarter for theaters that include a French short subject film during six weeks of the preceding quarter. Operators of multiplexes may not screen any one film in such a way as to account for more than 30 percent of the multiplex's weekly shows.

- *Italy:* The Italian Consolidated Audiovisual Media Services Act requires that 50 percent of eligible broadcast hours be European works, as defined in the measure, and that commercial television channel devote 16.6 percent of eligible hours to Italian works and public broadcasters devote 25 percent of eligible hours to Italian works. In addition, domestic video-on-demand services must ensure that 30 percent of their catalogues are for European works produced within the past five years. Fifteen percent of a subscription video-on demand service's catalogue must be dedicated to Italian works produced by independent producers within the past five years. Non-linear video-on-demand providers subject to Italian jurisdiction must also give prominence to EU works.

Under the Italian law, commercial broadcasters must annually invest 12.5 percent of their revenues in the production of independent European works. Half of this money is reserved for Italian works. Foreign and domestic video-in-demand providers must devote 17 percent of their annual net revenues generated in Italy to the production of European independent works. This quota increased to 18 percent in 2023 and will increase to 20 percent in 2024. Fifty percent of the investment obligation must be reserved for Italian works produced by independent Italian producers.

- *Poland:* Television broadcasters must dedicate at least 33 percent of their broadcasting time (excluding time allocated to information services, advertisements, telemarketing, sports broadcasts, and game shows) to programs originally produced in the Polish language, at least 50 percent of their broadcasting time to programs of EU origin, and at least 10 percent of their broadcasting time to programs by EU independent producers. On-demand services must promote content of EU origin, especially content originally produced in Polish, and dedicate at least 20 percent of their catalog to EU content.
- *Spain:* For every three days that a film from a non-EU country is screened, one EU film must be shown in movie theaters. This ratio is reduced to every four days if the cinema screens a film in an official language of Spain other than Spanish and keeps showing the film in that language throughout the day. In addition, broadcasters and on-demand services must invest 5 percent of their revenues in the production of EU and Spanish works, and 60 percent of this allocation should be directed towards productions in any of Spain's official languages. This also applies to digital terrestrial television.

Professional Services

Austria, Belgium, Bulgaria, Croatia, Cyprus, Greece, Hungary, Latvia, Lithuania, and Malta require EU or European Economic Area (EEA) nationality or citizenship for full admission to the bar, which is necessary for the practice of EU and Member State law. In many cases, non-EU lawyers holding authorization to practice law in one Member State face more burdensome procedures to obtain authorization in another Member State than would a similarly situated lawyer holding EU citizenship.

Financial Services

The European Commission has taken the position that its directive on statutory auditing prohibits Member States from considering professional experience of foreign auditors acquired outside of the EU when considering whether to grant statutory auditing rights. The United States will continue to advocate for Member States to take into account the experience of U.S. certified public accountants acquired outside of the EU.

BARRIERS TO DIGITAL TRADE

Digital Services Taxation

The United States and EU Member States are among the 137 member jurisdictions to have joined the OECD/G20 Inclusive Framework on Base Erosion and Profit Shifting [Statement on a Two-Pillar Solution to Address the Tax Challenges Arising from the Digitalization of the Economy](#), which called for all Parties to commit not to introduce digital services taxes (DSTs) in the future. On October 21, 2021, the United States, Austria, France, Italy, Spain, and the United Kingdom issued a [joint statement](#) “on a transitional approach to existing Unilateral Measures while implementing Pillar 1.” According to the statement, DST liability that accrues to Austria, France, Italy, Spain, or the United Kingdom during a transitional period prior to implementation of Pillar 1 will be creditable in defined circumstances against future corporate income tax liability due under Pillar 1. In return, the United States terminated the existing Section 301 trade actions on goods with respect to each country and committed not to take further trade actions against each country with respect to existing DSTs, provided that the country follows through on the agreement described in the joint statement, until the earlier of the date the Pillar 1 multilateral convention comes into force or December 31, 2023. The arrangement set out in the October 21 joint statement was extended to June 30, 2024, according to a [joint statement](#) issued on February 15, 2024. In coordination with the U.S. Department of Treasury, USTR continues to monitor the implementation of the political agreement and the transitional approach as provided in the joint statement.

Network Usage Fees

On May 2, 2022, the European Telecommunications Network Operators Association (ETNO) released a report urging the European Commission to adopt new regulation that would require large Internet-enabled service suppliers to pay network usage fees to European telecommunications network operators in order to recoup costs they claim telecommunications network operators bear due to carrying high-bandwidth content. Both the European Commission’s Executive Vice President for A Europe Fit for the Digital Age and the European Commissioner for Internal Market have expressed some support for ETNO’s concerns and have indicated that they want to examine how content providers could help finance telecommunications infrastructure. However, a number of other stakeholders, including some Member States, have raised concerns with the ETNO proposal. On October 7, 2022, the Body of European Regulators for Electronic Communications (BEREC) adopted a report that concluded the ETNO proposal was unnecessary and “could be of significant harm to the Internet ecosystem.”

On February 23, 2023, the European Commission launched a public consultation on the EU's connectivity sector and telecommunications infrastructure. On May 19, 2023, U.S. Department of Commerce submitted formal comments raising concerns with mandating direct payments from content and application suppliers to telecommunications network operators. The U.S. filing also explains the U.S. approach to financing the deployment of high-speed broadband service and closing the digital divide including expanding connectivity to rural and other underserved areas. On October 10, 2023, the European Commission published the results of this consultation, concluding that no plan for network usage fees would proceed given the feedback from stakeholders. Instead, the European Commission announced they would undertake a broader approach, aiming to develop a white paper on a broader scoped "Digital Networks Act" in the first quarter of 2024 and file a proposal before the summer of 2025.

INVESTMENT BARRIERS

With few exceptions, EU law generally requires that any company established under the law of one Member State must receive national treatment in all other Member States, regardless of the company's ultimate ownership. Laws and regulations pertaining to the initial entry of foreign (*i.e.*, non-EU) investors, however, are largely still in the purview of individual Member States. As discussed below, the policies and practices of Member States can have a significant impact on U.S. investment.

Member State Measures on Investment

- *Croatia*: While Croatia generally affords foreign investors the same treatment as domestic investors, Croatian law restricts non-EU foreign ownership and control in certain sectors, such as inland waterways transport, maritime transport, rail transport, air to ground handling, freight-forwarding, publishing, ski instruction, and primary mandated healthcare.
- *Cyprus*: Cypriot law imposes restrictions on non-EU foreign ownership in certain sectors and activities. For example, only EU citizens have the right to register as construction contractors in Cyprus, and non-EU investors are not allowed to own a majority stake in a local construction company.
- *Hungary*: In 2020, the Hungarian Parliament passed a law requiring the reporting of foreign investments to the government in certain sectors, including transportation, healthcare, energy, tourism, defense, finance, and information technology. The Hungarian Government will grant approvals on the basis of the impact of the notified investment on the public interest, public safety, or public order, among other factors. This process is separate from Hungary's national security-based investment screening mechanism, which was established in 2018. Although this legislation was originally set to expire on December 31, 2022, it was extended in December 2021 without a date of expiry. Stakeholders report that there are key differences between the two investment screening mechanisms, including their scopes, definitions, implementing ministries, and review procedures, which lead to complexities and delays with investing in Hungary.
- *Italy*: U.S. companies have complained that unclear processes and lengthy delays have hindered their ability to apply for and obtain licenses for energy exploration and satellite services. Once licenses have been obtained, U.S. companies have faced legal and bureaucratic hurdles that have hindered their ability to get concessions.
- *Latvia*: U.S. investors have reported that the judicial system in Latvia can present significant challenges, particularly in regard to insolvency proceedings that often take several years to resolve.

There also have been reports of abuse by both insolvency administrators and bad-faith creditors who have used insolvency proceedings to seize control of assets and companies and to extract unwarranted settlements and fees. U.S. stakeholders also continue to voice similar concerns about civil cases.

In 2017, Latvia enacted amendments to its Law on Land Privatization in Rural Areas that, among other things, prohibit foreigners who do not possess a working knowledge of the Latvian language from purchasing agricultural land. In June 2020, the CJEU found that the law violated European law. Despite the CJEU decision, Latvia has taken no action to change the law.

- *Poland:* U.S. investors report that the Polish tax system continues to be a problem because of its complexity, unpredictability, and generally short time periods between the announcement and entry into force of legislation.

Polish law limits non-EU citizens to 49 percent ownership of companies operating in air transport, radio and television broadcasting, and airport and seaport operations. In addition, the Polish Government has expressed a desire to increase the percentage of domestic ownership in some industries such as media, banking, and retail, which have large holdings by foreign companies, and has employed sectoral taxes and other measures to advance this aim.

- *Portugal:* While Portugal generally affords foreign investors the same treatment as domestic investors, Portuguese law limits foreign ownership of companies engaged in the production, transmission, and distribution of electricity; the production of gas; the pipeline transportation of fuels; wholesale services of electricity; retailing services of electricity and non-bottled gas; and, services incidental to electricity and natural gas distribution. Concessions in the electricity and gas sectors are assigned only to companies with their headquarters and effective management in Portugal.

SUBSIDIES

Various financial transactions and equity arrangements in the EU raise questions about the role of state funding in supporting or subsidizing private or quasi-private organizations, including in the manufacture of civil aircraft.

Government Support for Airbus

In October 2019, after 15 years of litigation, the WTO authorized the United States to take \$7.5 billion in trade countermeasures in the dispute against the EU, France, Germany, Spain, and the United Kingdom regarding their illegal subsidies for the Airbus consortium.

On June 15, 2021, the United States and the EU announced a cooperative framework to address the large civil aircraft disputes. The cooperative framework suspended each side's tariffs related to this dispute for five years. The United States and the EU also agreed to principles for government support in this sector, including their shared intent that any financing for the production or development of large civil aircraft be on market terms. The United States and EU further agreed to collaborate on jointly analyzing and addressing non-market practices of third countries that may harm our large civil aircraft industries.

Over many years, France, Germany, Spain, and, to a much lesser extent, Belgium, have provided subsidies to Airbus-affiliated national companies to aid in the development, production, and marketing of Airbus's large civil aircraft. These governments have financed from 33 percent to 100 percent of the development

costs (launch aid) for all Airbus aircraft models. They have also provided other forms of support, including equity infusions, debt forgiveness, debt rollovers, marketing assistance, and research and development funding, and have applied political and economic pressure on purchasing governments. The cooperative framework affirms the EU's intent to provide future funding only on market terms.

In addition to these subsidies, the EU maintains aeronautics research programs that are driven significantly by a policy intended to enhance the international competitiveness of the EU civil aeronautics industry. EU Member State governments have spent hundreds of millions of euros to create infrastructure for Airbus programs.

The United States will monitor any government financing of Airbus closely.

Subsidies for Fruit and Vegetables

The EU Common Market Organization (CMO) provides a framework for market measures under the EU's Common Agricultural Policy, including for measures related to the promotion of fruit and vegetables. Implementing rules covering fresh and processed products are designed to encourage the development of producer organizations (POs) as the main vehicle for crisis management and market promotion. The CMO makes payments to POs for dozens of products, including peaches, citrus fruits, and olives.

In 2015, a new basic payment scheme and greening payments were introduced, replacing the single payment scheme. Direct payments also are paid to support certain processing sectors, including, for example, peaches for juicing in Greece. The general lack of transparency around the distribution of EU subsidies at the Member State level in the fruit and vegetable industry raises questions about whether the payments are decoupled from production, and U.S. producers remain concerned about potential hidden subsidies. The United States continues to monitor and review EU assistance in this sector, evaluating potential trade-distorting effects.

OTHER BARRIERS

Pharmaceutical Products

On April 26, 2023, the European Commission published a proposal to revise the EU's general pharmaceutical legislation. The proposal included a new directive and a new regulation relating to medicinal products for human use intended to address, in part, regulatory protection for innovative medicines and create more favorable procedures for marketing authorization. This would provide incentives for companies to launch simultaneously across the EU. However, the conditions attached to the incentives include factors that may not be fully within outside the control of companies, such as processing times for marketing authorization and reimbursement determinations in each EU Member State. The European Commission also published on October 24, 2023, a "Communication on Addressing medicine shortages in the EU," which adopted a set of actions to address critical shortages of medicines and enhance the security of their supply in the EU. The United States is monitoring both developments.

Member State Measures on Pharmaceutical Products

U.S. pharmaceutical stakeholders have expressed concerns about several EU Member State policies affecting market access for pharmaceutical products, including non-transparent procedures and a lack of meaningful stakeholder input into policies related to pricing and reimbursement. These policies have been identified in several Member States as described below. Stakeholders have also expressed concerns over inconsistent and lengthy time periods for pricing and reimbursement decisions. U.S. industry stakeholders

have grown increasingly concerned about policies that are being formulated with little opportunity for engagement. In addition, changes to EMA policy regarding disclosures of clinical trial data, including potential disclosure of confidential commercial information submitted to EMA by pharmaceutical firms seeking marketing authorization, are also of concern to stakeholders. The United States continues to engage with the EU and individual Member States on these matters.

- *Austria:* U.S. pharmaceutical companies continue to express concerns about reimbursement pricing decisions by the statutory insurance providers association that are non-transparent and not preceded by a meaningful opportunity for stakeholder engagement.
- *Belgium:* U.S. industry stakeholders report that domestically manufactured medicines are permitted a price premium of up to 10 percent on the manufacturing cost component when calculating their manufacturer's selling price. Imported products are only eligible for up to a five percent price premium. Meanwhile, initiatives intended to lead to faster market access for new innovative drugs have been slowly, and incompletely, implemented.
- *Czech Republic:* Although the Czech Republic's system for determining pharmaceutical pricing and reimbursement for innovation remains challenging for U.S. companies, many report the situation has improved after new legislation came into effect in early 2022. Still, U.S. companies continue to express concerns regarding non-transparent and lengthy reimbursement processes.
- *France:* U.S. stakeholders have expressed concerns that the process of gaining market access for drugs in France is slower than elsewhere in the EU, resulting from delays in reimbursement approvals of as much as 19 months after marketing authorization, compared to the no more than 16 months required by EU law. A drug is effectively not on the market until it receives reimbursement approval.
- *Greece:* U.S. pharmaceutical industry stakeholders have continued to raise major concerns about the lack of transparency or opportunities for meaningful stakeholder input into the application of policies. Stakeholders have also raised concerns about lengthy reimbursement timelines and inconsistent application of pricing and reimbursement processes.
- *Hungary:* U.S. pharmaceutical industry stakeholders express concerns regarding delays in decision-making and reimbursement and lengthy processes for making changes to the list of drugs approved for reimbursement. U.S. pharmaceutical industry stakeholders note the lack of opportunity to provide input into these pricing and reimbursement processes.
- *Ireland:* Pharmaceutical industry stakeholders, including many U.S. firms, continue to express concerns over the Irish Government's delays in reimbursement decisions. Access to new drugs and innovative medicines are subject to a lengthy decision process.
- *Italy:* U.S. healthcare industry stakeholders face an unpredictable business environment in Italy, which includes the Italian Government's highly variable implementation of complex pricing and reimbursement policies, and have raised concerns about reimbursement delays for pharmaceutical products and delayed payments for medical devices. Moreover, the average time Italian public hospitals take to pay medical device suppliers continues to exceed the maximum period permitted by EU law. U.S. industry stakeholders continue to request that the Italian Government address these issues.

- *Poland:* U.S. stakeholders have expressed concerns over the lack of opportunity for meaningful stakeholder input into Poland’s rulemaking and tendering processes, as well as the transparency of reimbursement rules for pharmaceutical products. U.S. industry stakeholders report that Poland’s pricing and reimbursement system is backlogged, taking more than 844 days on average from regulatory approval to patient access. The United States will continue to urge Poland to engage meaningfully with stakeholders with respect to their concerns.
- *Romania:* Innovative pharmaceutical producers have identified several significant challenges resulting from the Romanian Government’s failure to update, despite repeated requests, the lists of innovative pharmaceuticals that are eligible for reimbursement under the national health system, with numerous applications pending. In addition, both innovative and generic pharmaceutical companies have withdrawn drugs from the Romanian market, as the official prices set in Romania can fall below production costs.
- *Slovakia:* Notwithstanding the Slovakian Government’s adoption in 2022 of legislation designed to streamline and accelerate the approval and reimbursement of innovative medicines, U.S. pharmaceutical stakeholders report that the processes for such approval and reimbursement continue to suffer from a lack of transparency and excessive delays.
- *Spain:* U.S. pharmaceutical industry stakeholders continue to note concerns as to cost containment measures affecting the industry, including lack of clarity around criteria for reimbursement, substantial delays in reimbursement processes, and uneven patient access across autonomous regions.
- *Sweden:* U.S. pharmaceutical industry stakeholders have raised concerns about Sweden’s increasingly challenging and nontransparent environment with regard to pricing and reimbursement.

EU Fluorinated Greenhouse Gas Regulation

The F-Gas policies initially discussed in the Technical Barriers to Trade section of this NTE Report chapter place restrictions on the sale of certain refrigeration and air conditioning equipment, foams, and propellants that use fluorinated gases. In particular, using a quota system, the F-Gas policies limit and, over time, progressively restricts the quantity of hydrofluorocarbons (HFCs) available for use in the EU.

The European Union’s update to its F-Gas policies, Regulation (EU) 2024/573, went into force in March 2024 with additional restrictions relative to current 2030 targets. U.S. stakeholders have expressed concerns that the regulation’s reductions in HFC quotas and imposition of an unrealistic timeline to introduce lower Global Warming Potential (GWP) alternatives risks increasing illegal trade in HFCs. U.S. stakeholders also have expressed concerns that insufficient oversight and enforcement by the EU and many Member States of F-Gas Regulation (EU) 2024/573 will allow for widespread importation of HFCs that exceed, and otherwise are not accounted for under, the EU’s quota system. Such imports negatively affect U.S. exporters of environmentally friendly alternative refrigerants and undermine stated EU environmental objectives. U.S. stakeholders have further expressed concerns that the potentially different approaches between F-Gas Regulation (EU) 2024/573 and REACH’s forthcoming definition of PFAS could pose a compliance challenge.

The United States and stakeholders are also concerned that HFCs are trafficked without the knowledge of customs officials, either hidden or falsely declared on customs forms, or they are imported unaccounted for when already integrated in equipment containing HFCs.

EU Carbon Border Adjustment Mechanism

On October 1, 2023, the EU began implementing the transitional period for its Carbon Border Adjustment Mechanism (CBAM) regulation. Beginning in 2026, CBAM will impose a fee on embedded emissions of imports. The fee will be linked to the carbon price in the EU Emissions Trading System (ETS). While the EU's CBAM will credit imports for explicit carbon prices paid by foreign producers in their home market, U.S. exports may not be eligible for such credits since CBAM does not offer credits for regulatory and other non-price mechanisms for reducing carbon emissions.

GHANA

IMPORT POLICIES

Tariffs and Taxes

Tariffs

Ghana's average Most-Favored-Nation (MFN) applied tariff rate was 12 percent in 2022 (latest data available). Ghana's average MFN applied tariff rate was 15.9 percent for agricultural products and 11.4 percent for nonagricultural products in 2022 (latest data available). Ghana has bound 15.1 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 92.0 percent. Ghana has bound all agricultural tariffs in the WTO at an average rate of 96.6 percent—more than six times the average level of its MFN applied rates on agricultural goods. Ghana has bound some selected agricultural goods, including milk and cream, eggs, tea, wheat, and oil cake at 15 percent. Nearly 99 percent of Ghana's tariffs on industrial goods are unbound at the WTO.

Consistent with the Economic Community of West African States (ECOWAS) Common External Tariff (CET), Ghana applies five tariff bands: (1) zero percent duty on essential social goods (*e.g.*, medicine); (2) 5 percent duty on essential commodities, raw materials, and capital goods; (3) 10 percent duty on intermediate goods; (4) 20 percent duty on consumer goods; and (5) 35 percent duty on certain goods that the Ghanaian Government elected to afford greater protection. The CET was slated to be fully harmonized by 2020, but, in practice, some ECOWAS Member States have maintained deviations from the CET beyond the January 1, 2020 deadline. Ghana was still in the process of adopting the Harmonized Schedule 2022 changes to the CET tariff schedule as of December 2023.

The Customs (Amendment) Act, 2020 (Act 1014) increased the import duty on vehicles and parts from between 5 percent and 20 percent to 35 percent on some specified vehicles such as passenger cars, sport utility vehicles, and light commercial vehicles. Ghana applied the 35 percent tariff rate to vehicles that are less than five years old, retaining the current lower tariffs on older vehicles. Ghana has not notified this proposed tariff change to the WTO.

Taxes

Imports are subject to a variety of fees and charges in addition to tariffs. Ghana's standard value-added tax (VAT) rate of 15 percent is applied to imports. Ghana is not currently imposing its 15 percent VAT on domestically assembled automobiles, although it is applying it to imports of automobiles. The Ghana Revenue Authority announced in April 2022 that, effective immediately, it will begin collecting the 15 percent VAT from nonresident companies or persons that conduct business transactions in Ghana via the electronic transmission of data over communications networks like the Internet. It will also apply a series of other charges to those transactions, with an effective tax rate of more than 22 percent.

Like all ECOWAS countries, Ghana imposes a 1 percent ECOWAS levy on all goods originating from non-ECOWAS countries to finance the activities of the ECOWAS Commission and Community institutions. Ghana also imposes a 0.2 percent levy on imports from outside African Union (AU) Member States to fund its contribution to the AU.

Other taxes and charges have proliferated in recent years. Under the Ghana Export-Import Bank Act, 2017, Ghana imposes a 0.75 percent levy on all nonpetroleum products imported in commercial quantities.

Effective through 2024, Ghana imposes a special levy of 2 percent on all imports, except for machinery and equipment listed under Chapters 84 and 85 of the Harmonized System and some petroleum products and fertilizers.

Ghana imposes taxes on imported items such as rice, poultry, printed materials, and electricity—a 15.0 percent VAT, a 2.5 percent Ghana Education Trust Fund levy, a 2.5 percent National Health Insurance levy, and a 1.0 percent COVID-19 Health Recovery levy. In principle, these taxes are chargeable on the value of goods and services produced or provided in Ghana, but the government is largely unable to exact the taxes from domestic retailers, who rarely comply. All four of these charges are imposed on most other imported items as well as their domestically produced equivalents.

Non-Tariff Barriers

Import Bans and Import Restrictions

Ghana requires registration certificates for imports of food, cosmetics, pharmaceuticals, and agricultural goods. Since 2014, Ghana has banned the importation of tilapia and has limited the issuance of import permits for corn, poultry, and poultry products, although the government no longer enforces a domestic purchase requirement as a condition for import.

Since 2019, the Ministry of Agriculture has issued and renewed poultry import permits on an *ad hoc* basis, and the issuance and renewal application and approval processes lack transparency, leading to uncertainty for traders.

Under the Customs (Amendment) Act, 2020 (Act 1014), imports of vehicles older than 10 years are prohibited. The implementation continues to be delayed.

Ghana imposed a temporary ban on the importation of excavators to regulate their use in illegal mining, effective May 2019. Import exemptions are granted on an exceptional basis, but the issuance is often delayed.

Foreign Exchange Restrictions

On November 17, 2022, the Bank of Ghana announced the temporary withdrawal of foreign exchange support for the importation of goods classified as “non-critical” or “non-essential.” Affected goods include rice, poultry, vegetable oils, pasta, and fruit juice, as well as ceramic tiles and toothpicks. This restriction was expected to remain in place until May 2023, but as of December 2023, there had been no review and the restriction remained in place.

Ghana defends its action as part of efforts to ensure the country’s foreign exchange reserves while encouraging domestic production and consumption of import substitutes; however, Ghana is unable to meet domestic demand for poultry meat and rice with domestic production. U.S. rice and poultry exports are down significantly since Ghana first implemented its foreign exchange restrictions in 2021. In 2023, U.S. rice exports were significantly lower, under \$400,000, down from \$3.9 million during 2021. In 2023, U.S. poultry meat exports were \$57.2 million, down from \$92.6 million during 2021.

Customs Barriers and Trade Facilitation

Ghanaian customs practices and port infrastructure continue to present major obstacles to trade. Officials have introduced risk management approaches; however, the majority of imports are still subject to inspection on arrival. Anecdotal reports suggest between 60 percent and 80 percent of imports are still

subject to physical inspection or scanning, causing delays. This is well beyond Ghana's announced goal of reducing inspections to roughly 10 percent of imports, based on risk for agricultural products. Importers report erratic application of customs and other import regulations, lengthy clearance procedures, and corruption. The resulting delays can contribute to unnecessary demurrage charges and product deterioration, resulting in significant losses for importers of perishable goods.

The Customs Division of the Ghana Revenue Authority (GRA) has taken on the inspection and valuation role once occupied by five licensed destination inspection companies. This has slightly reduced delays, although the high rate of physical inspections noted above remains an impediment. Ghana has launched several initiatives since 2017 to support online information and processing of trade transactions, including the development of a National Single Window. In September 2017, Ghana introduced electronic ("paperless") cargo clearance at ports to reduce clearance times.

Although Ghana's Customs Act of 2015 (section 67) indicates that customs valuation should primarily be based on transaction value or the price actually paid or payable for goods imported into the country, in practice, stakeholders indicate that the GRA often applies a benchmark to determine customs valuation for every imported product or uses the higher of the benchmark or the transaction value. The GRA Customs Technical Services Bureau (CTSB) uses a customs valuation database that includes data from customs valuation databases of various tax authorities from other countries. The GRA CTSB subscribes to these data on an annual basis. Data from these entities, together with the GRA's own data, are then used to determine the benchmark values. Although the GRA CTSB's customs valuation may address the concern about under-invoicing goods and under-collecting duties, a system of risk management to assess transaction value trends of imported goods can identify real under-invoicing, without imposing potential inaccurate benchmarking on all goods.

Imported vehicles in Ghana are subject to a customs examination fee of 1 percent. Section 60 of the Customs Act of 2015 indicates that valuation for purposes of the tariff and other duties and charges should be based on the first purchase price, then discounted by fixed amount by age. In practice, to establish the customs value of imported vehicles, the GRA Customs Division uses a system of online vehicle identification number information and age-based value benchmarking for each vehicle. This system tends to overvalue used vehicles, in particular. Imported used vehicles more than 10 years old incur an additional charge ranging from 12.5 percent to 20.0 percent of the cost, insurance, and freight value.

Ghana ratified the WTO Trade Facilitation Agreement (TFA) in January 2017. Ghana has not yet submitted notifications related to: import, export, and transit regulations. This notification had been due to the WTO on July 22, 2022, according to Ghana's self-designated TFA implementation schedule.

Ghana has not yet notified its customs valuation legislation to the WTO and has not yet responded to the Checklist of Issues that describes how the Customs Valuation Agreement is being implemented.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

Standards

The Ghana Standards Authority (GSA) develops Ghanaian national standards and adopts international standards for most products. The GSA has over 3,356 national standards on, *inter alia*, building materials, food and agricultural products, household products, electrical goods, and pharmaceuticals. Ghana has

adopted 29 ECOWAS standards. The Ghanaian Food and Drugs Authority (FDA Ghana) is responsible for enforcing standards for food, drugs, cosmetics, and health items.

High Risk Goods

Ghana classifies some imports as “high risk goods” (HRGs) that must be inspected to ensure they meet Ghanaian or international standards. Since January 2019, the GSA ceded its responsibility of verifying a certificate of analysis or a certificate of conformance at Ghanaian ports to Bureau Veritas and Intertek. Under a process called the EasyPASS Program, either Bureau Veritas or Intertek, after satisfactory verification, issues an EasyPASS Certificate (certificate of conformity), which is used to facilitate customs clearance. While exporters pay fees ranging from 0.35 percent to 0.50 percent of the FOB to Bureau Veritas or Intertek; importers in Ghana are required to register with the GSA and pay an annual registration fee, ranging from \$20 to \$4,000, depending on the type of products they import. Upon arrival of goods at a port in Ghana, the GSA checks the validity of the EasyPASS Certificate before releasing a consignment for clearance.

The GSA classifies these HRGs into 11 broad groups (reduced from 20 in 2019 after ceding the inspection of food, cosmetics, and pharmaceutical and household chemical products to FDA Ghana), including toys, sports equipment, electrical appliances, and chemical products. Stakeholders have found this classification system vague and confusing. According to GSA officials, they classify these imports as high risk because they pose “potential hazards,” although that phrase remains undefined in law or regulation.

Food Products

FDA Ghana ensures that all food products comply with the GSA General Labelling Rules, which include food expiration and shelf-life dates. Prepackaged foods to be imported for distribution or sale for local consumption must have at least two-thirds of their shelf-life intact at the time of clearance from the port of entry. Goods that do not meet shelf-life requirements are rejected and must be re-exported or destroyed under the supervision of FDA Ghana at the expense of the importer. The United States has asked for clarification regarding the requirement’s legitimate objective.

Automobile Policy and Standards

Ghana’s Automotive Development Policy of 2019 aimed at creating a domestic automotive industry as part of Ghana’s industrialization plans. It is targeted at attracting automotive assembly manufacturers to invest in Ghana through tax incentives and other facilitation measures such as import incentives. The government was unable to implement the policy by its target deadline of May 2023 and did not propose a new timeline for implementation. The automotive policy could have a significant impact on U.S. exports to Ghana. In 2023, the United States exported \$185 million in new and used automobiles and vehicle parts to Ghana, representing 21.7 percent of U.S. total exports to Ghana.

In December 2019, Ghana also established compulsory vehicle safety and emissions standards for both imported and locally produced vehicles. Ghana’s standards were modeled broadly on the United Nations Economic Commission for Europe (UNECE) 1958 Agreement automobile standards. The GSA noted in the issued standards that it would accept and publish other applicable standards not listed as an amendment or revision after the establishment of their equivalence to the Ghana standards. Following U.S. advocacy with Ghana, the Ministry of Trade and Industry and the GSA incorporated amendments to include U.S. Federal Motor Vehicle Safety Standards self-certification and documentation from the U.S. Environmental Protection Agency. Effective January 2021, all vehicle importers are required to register with the GSA and present a motor vehicle emissions report, a road worthiness test report from an agency approved by the GSA, and a certificate of conformity. In early 2022, Ghana notified the WTO of a new set of standards, a

required vehicle safety inspection upon arrival, and other requirements specifically for used vehicles. As of December 2023, Ghana had not published a list of the accredited bodies and vehicle dealerships for certification to these new requirements.

Sanitary and Phytosanitary Barriers

Ghana prohibits the importation of meat with a fat content by weight greater than 25 percent for beef, 25 percent for pork, 25 percent for mutton, and 15 percent for poultry. Imported turkeys must have their oil glands removed. The United States continues to engage with Ghana on these import requirements and to urge Ghana to use science- and risk-based approaches to regulate these products.

GOVERNMENT PROCUREMENT

U.S. suppliers of goods and services face difficulties accessing the Ghanaian procurement market. Ghana's procurements are often awarded on a sole-source basis and lack clear timeframes and procedures. Guidelines that apply to current tenders open to international competitive bidding give a margin of preference of 7.5 percent to 20.0 percent to domestic suppliers of goods and services. In July 2020, the Ghanaian Government issued a directive to public institutions for preferential procurement of locally assembled vehicles. Despite the public procurement law, companies report that locally funded contracts lack full transparency. Supplier or foreign government-subsidized financing arrangements appear in some cases to be a crucial factor in the award of government procurements. Allegations of corruption persist in the tender processes across ministries.

Ghana is neither a Party to the WTO Agreement on Government Procurement nor an observer to the WTO Committee on Government Procurement.

INTELLECTUAL PROPERTY PROTECTION

Ghana is a member of many intellectual property (IP) treaties. Ghana has taken steps to update its IP laws, including by depositing its Instrument of Ratification of the Arusha Protocol for the Protection of New Varieties of Plants in 2023. Government officials periodically inspect import shipments and conduct raids on physical markets for counterfeit and pirated goods. However, concerns remain that IP enforcement activity is weak, and unreasonable delays in infringement proceedings discourage right holders from filing new claims in local courts. Small and medium-sized enterprises, including financial technology and payment companies, have expressed frustration with Ghana's IP environment, especially IP theft. In addition, more public education on IP is needed.

INVESTMENT BARRIERS

Ghana limits foreign participation in several sectors, including telecommunications, banking, fishing, mining, petroleum, and real estate. Foreign investors have expressed concerns about respect for contract sanctity in Ghana, including threats to abrogate contracts, unilateral changes to contract terms, and forced contract renegotiations with the government and its state-owned enterprises. The concerns have undermined confidence in Ghana's investment climate.

Mining

Pursuant to the Minerals and Mining Act, 2006, foreign investors are restricted from obtaining a small-scale mining license for mining operations of an area less than or equal to 25 acres (10 hectares). Non-

Ghanaians may apply for industrial mineral rights only for projects involving an investment of at least \$10 million.

The Minerals and Mining Act mandates compulsory local participation, through which the government acquires a 10 percent equity stake in ventures at no cost. In order to qualify for a mineral license, a non-Ghanaian company must be registered in Ghana, either as a branch office or a subsidiary incorporated under the Companies Act, 2019, or the Private Partnership Act, 2020.

Oil and Gas

The oil and gas sector is subject to a variety of state ownership and local content requirements. The 2016 Petroleum (Exploration and Production) Act mandates local participation. All entities seeking petroleum exploration and development licenses in Ghana must create a consortium in which the state-owned Ghana National Petroleum Corporation (GNPC) holds a minimum 15 percent participating carried interest and a local Ghanaian firm or individual holds a minimum 5 percent interest. The GNPC has the option to acquire an additional participating interest as determined in the petroleum agreement. The interest of the local Ghanaian firm is not transferable to a foreign company.

The Petroleum Commission issues all licenses, but exploration licenses require additional approval by Parliament. Regulations specify in-country sourcing requirements with respect to goods, services, hiring, and training associated with petroleum operations—standards that many international companies describe as unattainable. These regulations also require mandatory local equity participation for all suppliers and contractors. The Minister of Energy must approve all contracts, subcontracts, and purchase orders above \$100,000 and has the authority to alter the requirements set by law for any specific contract. The criteria for the Minister’s approval of local equity partners in commercial transactions remain unclear, which raises concerns of potential corruption and favoritism in the selection of local equity partners in government-approved concessions or contracts. Noncompliance with these regulations may result in a criminal penalty, including imprisonment for up to five years.

The Petroleum Commission applies registration fees and annual renewal fees on foreign oil and gas service providers, which, depending on a company’s annual revenue, range from \$70,000 to \$150,000, compared to fees of \$5,000 to \$30,000 for local companies.

OTHER BARRIERS

Export Ban

Since 2013, Ghana has banned the exportation of ferrous scrap metals.

In 2021, the government placed a temporary ban on the export of rice, corn, and soybeans. This ban was expected to expire on September 30, 2022; however, as of December 2023, no announcement had been made.

In May 2023, the Ghanaian Government, through the Minister of Lands and Natural Resources, announced a ban on the export of raw critical minerals ore. However, the ban had not been moved to the Parliament for a required vote as of December 2023.

GUATEMALA

TRADE AGREEMENTS

Dominican Republic–Central America–United States Free Trade Agreement

The Dominican Republic–Central America–United States Free Trade Agreement (CAFTA–DR) entered into force for the United States, El Salvador, Guatemala, Honduras, and Nicaragua in 2006; for the Dominican Republic in 2007; and for Costa Rica in 2009. The United States and the other CAFTA–DR countries meet regularly to review the implementation and functioning of the Agreement and to address outstanding issues.

IMPORT POLICIES

Tariffs and Taxes

Tariffs

As a member of the Central American Common Market, Guatemala applies a harmonized external tariff on most items at a maximum of 15 percent, with some exceptions. However, under the CAFTA–DR, as of January 1, 2015, non-agricultural goods enter Guatemala duty free.

In addition, nearly all U.S. agricultural exports enter Guatemala duty free under the CAFTA–DR. Guatemala eliminated its remaining tariffs on rice on January 1, 2023, and is scheduled to eliminate tariffs on dairy products by 2025. In 2017, Guatemala eliminated its out-of-quota tariff for fresh, frozen, and chilled chicken leg quarters five years early. For certain agricultural products, tariff-rate quotas (TRQs) permit duty-free access for specified quantities during the tariff phaseout period, with the duty-free quantities expanding during that period. Guatemala will liberalize trade in white corn through continual expansion of a TRQ, rather than the reduction of the out-of-quota tariff. Guatemala is required under the CAFTA–DR to make TRQs available on January 1 of each year. Guatemala monitors its TRQs through an import licensing system, which the United States carefully tracks to ensure the timely issuance of these permits.

Taxes

Guatemalan tax law requires that some companies that purchase imported goods and services from other companies withhold 15 percent of the value-added tax (VAT) paid and seek refunds for the VAT credit that they cannot offset after two years. This process is onerous, and timely refunds are not guaranteed.

Non-Tariff Barriers

Customs Barriers and Trade Facilitation

U.S. companies have raised concerns that Guatemala's Tax Authority (SAT) uses an inaccurate reference price database to determine the value of imported goods, erroneously applies database values as minimums rather than as a reference, and compares imports to dissimilar products in the database. Furthermore, when SAT performs investigations of declared values, the review process often results in the detention of the imported product for 20 days or more. Appeals involve a lengthy, opaque process that has lasted up to four

years. In 2022, the U.S. Government engaged with the Guatemalan Government to help introduce an automated system to provide more transparency and help clear shipments more quickly on bond.

Guatemala ratified the WTO Trade Facilitation Agreement (TFA) on March 8, 2017. Guatemala submitted its transparency notification related to providing contact information regarding enquiry points on June 20, 2023. This notification had been due to the World Trade Organization on February 1, 2020, according to Guatemala's self-designated TFA implementation schedule.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

Guatemala requires product registration for food products (e.g., dairy products) from every importer, as well as for animal feed and pet food. Importers are required to submit necessary documents to the Ministry of Public Health and Social Assistance and receive approval before products are sold into the market, even if another importer has already registered that product. Stakeholders have raised concerns that the process is burdensome and can delay the importation process by months.

Sanitary and Phytosanitary Barriers

In response to a U.S. Government request for more transparent quarantine protocols at ports, in 2021 the Ministry of Agriculture, Livestock and Food (MAGA) published Ministerial Decree 57-2021, which establishes official quarantine protocols for plant and animal health. In addition, in response to industry complaints that quarantine inspections break the cold chain, the Intraregional Organization for Plant and Animal Health (OIRSA), to which the MAGA delegates quarantine inspection and fumigation services, now also conducts inspections within refrigerated spaces at Quetzal Port. OIRSA also authorized construction of a cold room within Santo Tomas Port, which became operational in 2023. OIRSA's continued inspection of all imported fresh produce causes delays, and the U.S. Department of Agriculture has asked the MAGA to establish a risk-based inspection system.

GOVERNMENT PROCUREMENT

Government institutions have been required to use the online government procurement system, GUATECOMPRAS, to track Government of Guatemala procurement processes since March 2004. Although GUATECOMPRAS initially improved the efficiency and transparency of government tendering processes, U.S. suppliers have expressed reluctance to bid on Guatemalan public procurement tenders because of corruption in procurement. As of December 2023, the Guatemalan Congress was considering a new government procurement law that would create 24 different procurement modalities, of which only 5 appear to be competitive. The proposed new law would also change GUATECOMPRAS to a system that could be used only as a record of historic information on government procurement. Experts have warned that the proposal would weaken the use of GUATECOMPRAS as a transparency tool.

Foreign suppliers must appoint a national representative to represent the interest of the company in Guatemala.

Guatemala is neither a Party to the WTO Agreement on Government Procurement nor an observer to the WTO Committee on Government Procurement. However, the CAFTA–DR contains disciplines on government procurement.

INTELLECTUAL PROPERTY PROTECTION

Guatemala remained on the Watch List in the [2023 Special 301 Report](#). Although the country generally has a strong legal framework, and intellectual property (IP) protection appears to have improved, concerns remain. IP enforcement activities remain limited and appear inadequate in relation to the scope of the problem due to resource constraints and poor coordination among law enforcement agencies. The production of counterfeit apparel with little interference or deterrence from law enforcement continues to be a significant concern. Other concerns include the sale of counterfeit pharmaceuticals and government use of unlicensed software. Major cable television providers and content distributors agreed in 2018 to not renew contracts to rebroadcast U.S. network signals due to signal piracy of U.S. broadcasted networks. However, cable signal piracy remains a problem, and online piracy through Internet Protocol Television services is also a concern. The United States continues to urge Guatemala to ensure that its IP enforcement agencies receive sufficient resources and to strengthen enforcement, including with respect to criminal prosecution, administrative and border actions, and intergovernmental coordination to address widespread copyright piracy and commercial-scale sales of counterfeit goods. The United States will continue to engage Guatemala on these and other concerns, including through the Special 301 process, and will continue to monitor Guatemala's implementation of its IP obligations under the CAFTA–DR.

SERVICES BARRIERS

Professional Services

Foreign enterprises may provide licensed professional services in Guatemala only through a contract or other relationship with an enterprise established in Guatemala. Additionally, public notaries must be Guatemalan nationals.

INVESTMENT BARRIERS

A number of U.S. companies operating in Guatemala complain that complex and unclear laws and regulations and inconsistent judicial decisions effectively operate as barriers to investment.

LABOR

The U.S. labor enforcement case brought against Guatemala under Article 16.2.1(a) of the CAFTA–DR was formally concluded in 2017 with the issuance of the panel's final report. Nevertheless, labor concerns—including with respect to the right of association, the right to organize and bargain collectively, and acceptable conditions of work—persist in the port, agriculture, apparel, and agricultural processing sectors and the U.S. Government continues to engage Guatemala.

OTHER BARRIERS

Bribery and Corruption

The CAFTA–DR contains public sector anti-bribery commitments and anticorruption measures in government contracting, designed to ensure that U.S. firms are guaranteed a fair and transparent process to sell goods and services to a wide range of government entities.

U.S. stakeholders have expressed concerns that corruption in Guatemala constrains successful investment. The Ministry of Governance in Guatemala, which is responsible for security at ports, airports, and land

borders in Guatemala, operates through three police task force units known as DIPAFRONT (Ports, Airports, and Land Border Division), SGAIA (Anti-narcotics Analysis General Sub direction), and UCC (Container Control Unit). These units started operations in the middle of the pandemic, independently from the other operating authorities at ports, such as the MAGA and Guatemala's Customs authority, which have memoranda of understanding to carry out joint inspections. In response to a U.S. Coast Guard requirement, 100 percent of Guatemalan exports to the United States need to pass inspection by at least one of the three units. The Government of Guatemala is also subjecting imports to inspections by these authorities, and importers complain that inspectors are afforded unchecked discretion about which shipments to inspect and that inspections are not integrated into existing inspection processes, resulting in additional delays at already busy ports. As DIPAFRONT, SGAIA, and UCC have their own independent inspection ramps, importers report corruption at multiple steps to avoid shipments being sent through the secondary ramp.

GULF COOPERATION COUNCIL

The Gulf Cooperation Council (GCC) is comprised of Bahrain, Kuwait, Oman, Qatar, Saudi Arabia, and the United Arab Emirates (UAE).

TRADE AGREEMENTS

The United States–Bahrain Free Trade Agreement

The United States–Bahrain Free Trade Agreement (FTA) entered into force on August 1, 2006. Under the FTA, as of January 1, 2015, Bahrain provides duty-free access to all U.S. exports.

The United States–Kuwait Trade and Investment Framework Agreement

The United States and Kuwait signed a Trade and Investment Framework Agreement (TIFA) in 2004. This Agreement is the primary mechanism for discussions of trade and investment issues between the United States and Kuwait.

The United States–Oman Free Trade Agreement

The United States–Oman FTA entered into force on January 1, 2009. Under this Agreement, as of January 1, 2019, Oman provides duty-free access to all U.S. exports.

The United States–Qatar Trade and Investment Framework Agreement

The United States and Qatar signed a TIFA in March 2004. This Agreement is the primary mechanism for discussions of trade and investment issues between the United States and Qatar.

The United States–Saudi Arabia Trade and Investment Framework Agreement

The United States and Saudi Arabia signed a TIFA in July 2003. This Agreement is the primary mechanism for discussions of trade and investment issues between the United States and Saudi Arabia.

The United States–United Arab Emirates Trade and Investment Framework Agreement

The United States and the UAE signed a TIFA in March 2004. This Agreement is the primary mechanism for discussions of trade and investment issues between the United States and the UAE.

IMPORT POLICIES

Tariffs and Taxes

Tariffs

GCC Member States apply an *ad valorem* Common External Tariff (CET) of five percent on the value of most imported products, with several commodity-specific exceptions.

Kuwait's exceptions include 417 basic foodstuffs, agricultural, medical, and pharmaceutical items that are exempt from customs duties.

Qatar's exceptions include more than 600 goods, wheat, flour, rice, feed grains, and powdered milk that are exempt from customs duties. Certain products, including alcohol, are subject to a 100 percent tariff. Urea and ammonia are subject to a 30 percent tariff, and steel to a 20 percent tariff.

Saudi Arabia's applied tariff rates range from 6.5 percent to 40.0 percent on goods that compete with domestic industries. In June 2022, the Zakat, Saudi Arabia's tax and customs authority, increased customs duties on 99 products, primarily foodstuffs, beverages, and industrial and agricultural products. The increased tariff rates range from 5.5 percent to 25.0 percent. Since July 2021, preferential market access under the GCC tariff agreements no longer applies to goods made in free trade zones or using Israeli inputs.

The UAE's exceptions include 811 items that are exempt from customs duties, including imports by philanthropic societies and the diplomatic corps, military goods, personal goods, used household items, gifts, and returned goods.

Taxes

In 2016, GCC Member States agreed to introduce common GCC excise taxes on products including carbonated drinks (50 percent). U.S. beverage producers report that the excise tax structure for carbonated drinks, which also applies to sugar-free carbonated beverages but exempts GCC manufactured sugary juices, disadvantages U.S. products, and fails to address public health concerns.

Kuwait introduced legislation to implement the common GCC excise taxes in the National Assembly in 2018. It remains under debate.

Qatar implemented the common GCC excise taxes in January 2019, as well as an excise tax for "special purpose goods," which includes alcohol and pork (100 percent).

The UAE implemented the common GCC excise taxes in October 2017.

U.S. industry continues to seek reimbursement for claims related to the UAE's value-added tax (VAT) on goods and services dating back to January 2019. U.S. defense contractors are exempt from the five percent VAT on goods and services provided to the U.S. military in the UAE, as stipulated in the bilateral Defense Cooperation Agreement. The UAE has stated it will provide a one-time retroactive reimbursement once all U.S. defense contractors have provided their comprehensive updates to the UAE Federal Tax Authority database. Per the Federal Tax Authority database, all future reimbursements will be made quarterly according to a bilaterally approved list that will be updated annually.

Non-Tariff Barriers

Import Bans and Restrictions

Kuwait prohibits the importation of a range of goods, including used medical equipment and automobiles that are more than ten years old.

Saudi Arabia prohibits the importation of 37 categories of products, including alcohol and pork products.

The UAE restricts the importation of a number of products including alcoholic beverages and products, industrial methyl alcohol, methylated and medicated spirits, pork products, medicinal substances, and agricultural pesticides. The UAE bans the importation of all waste-derived fuel.

Import Licensing

Kuwait maintains an import licensing regime for a wide variety of products. Importers of products subject to import licensing must be citizens of Kuwait or be Kuwait-based brokers and are required to register with the Ministry of Commerce and Industry.

In Oman, importers of food and agricultural commodities are required to obtain an import permit prior to shipping the product from the country of origin. Companies must obtain a special license for the importation of certain products, including alcohol, livestock, and poultry. The process of obtaining a license can be complicated, significantly adding to the time it takes to import goods.

Qatar requires an import license for the importation of most products. The Qatari Government issues import licenses to Qatari citizens, Qatari partners in limited liability companies, and to foreign-owned entities operating in Qatar that are registered with the Ministry of Commerce and Industry. On occasion, Qatar has established special import procedures through government-owned companies to address increases in demand. Only authorized local agents of foreign firms are allowed to import goods produced by the firms they represent. In the telecommunications sector, commercially registered companies in Qatar can import telecommunications equipment by obtaining an Import Authorization License from the Communications Regulatory Authority. The Qatar Distribution Company, a subsidiary of the national air carrier Qatar Airways, has sole authority to import pork and alcohol.

Saudi Arabia requires special approval for the importation of 23 categories of restricted products, including agricultural seeds and wireless equipment.

In the UAE, only UAE-registered companies can obtain licenses to import goods. This licensing requirement does not apply to goods imported into free trade zones. Importation of certain goods for personal consumption also does not require an import license.

Import Documentation Requirements

Kuwait requires a health certificate from the country of origin for imported cosmetics and pharmaceuticals that is certified by the Kuwaiti Public Authority for Food and Nutrition or the Ministry of Health. Some customs officials have refused to accept certificates of free sale from U.S. state governments, increasing delays in obtaining document approvals.

In order to clear goods from customs zones at air and seaports in Qatar, importers must submit a detailed customs declaration, a bill of lading, a certificate of origin, a *pro forma* invoice, and an import license. The Qatari Embassy, a Qatari consulate, or the Qatari Chamber of Commerce in the United States must authenticate import documentation for U.S.-origin imports. This “consularization” process, or authentication requirement, is the kind of unnecessary burden that the United States seeks to eliminate. Industry representatives have complained about the limited transparency of changes to Qatar’s customs procedures. Qatar’s customs authority charges a fine of one percent on the shipment value if the invoice is not legalized by the Qatari chamber of commerce in the country of origin of the exported products. Imported agricultural products require different certificates depending on the category of the product. Meat, fish, eggs, livestock, live poultry, grains, animal feed, and planting seeds require an original health certificate. All processed or shelf-stable foods exported from the United States to Qatar require a U.S. Department of Health and Human Services Food and Drug Administration (FDA) Certificate to a Foreign Government: Food for Human Consumption.

The UAE requires that documentation for all non-agricultural products imported from the United States be authenticated by the Embassy of the UAE in the United States, including delivery orders from the shipping

or line agents, original supplier commercial invoices, certificates of origin, and packing lists. Stakeholders report that this “consularization” requirement is burdensome and costly.

Customs Barriers and Trade Facilitation

Kuwait notified its customs valuation legislation to the World Trade Organization (WTO) in December 2017, but has not yet responded to the WTO Checklist of Issues describing how the Customs Valuation Agreement is being implemented.

Kuwait ratified the WTO Trade Facilitation Agreement (TFA) in April 2018. Kuwait notified the self-designation of its implementation dates for each TFA commitment on September 25, 2023. These definitive dates for implementation had been due to the WTO on August 19, 2028. Kuwait has not yet submitted four transparency notifications related to: (1) import, export, and transit regulations; (2) the use of customs brokers; (3) customs contact points for the exchange of information; and, (4) details on the operation of the single window. The first two notifications had been due to the WTO on February 22, 2017 and the remaining two notifications had been due to the WTO on June 30, 2022, according to Kuwait’s self-designated TFA implementation schedule.

Kuwait does not use a risk management system for clearing food shipments for import, instead requiring customs authorities to inspect every food shipment into Kuwait before it is cleared for entry. This process can add several days to the delivery time, reduce the longevity of the food, and increase costs.

Companies importing U.S. goods into Oman occasionally report difficulties in demonstrating eligibility for preferential tariff treatment under the FTA for goods that enter Oman over land via the UAE. The Royal Oman Police Customs Directorate inconsistently applies requirements for origin marking, segregation of FTA cargo, and other documentation.

Qatar ratified the WTO TFA in June 2017. Qatar has not yet submitted four transparency notifications required by the TFA related to: (1) import, export, and transit regulations; (2) details on the operation of the single window; (3) the use of customs brokers; and, (4) customs contact points for the exchange of information. These notifications had been due to the WTO on February 22, 2017, according to Qatar’s self-designated TFA implementation schedule.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

Over the years, Saudi Arabia has revised technical regulations for a variety of products to reflect a preference for standards developed by the International Organization for Standardization and the International Electrotechnical Commission. Saudi Arabia has been increasingly reluctant to accept other international standards that may meet or exceed Saudi Arabia’s regulatory objectives, including those developed by U.S.-domiciled organizations through open, transparent, and consensus-based processes. Saudi Arabia’s refusal to accept these other international standards, which are often used by U.S. manufacturers, creates significant market access restrictions for certain industrial and consumer products exported from the United States, including protective footwear, automobiles, electrical equipment, and appliances.

The United States continues to encourage Saudi Arabia to develop and implement effective mechanisms for stakeholder consultation in regulatory decision-making to help ensure that interested parties have

opportunities to provide comments on draft regulations and to provide reasonable time for those comments to be considered. U.S. manufacturers have noted the importance of such consultations as Saudi Arabia develops and implements Corporate Average Fuel Economy (CAFE) regulations, as well as new energy efficiency regulations for a variety of consumer and industrial products, including air conditioners, electrical appliances, lighting, electrical motors, energy usage intensity, tires, and insulation.

Automobiles

U.S. automakers have raised concerns over growing regulatory fragmentation in the GCC. While the Gulf Standardization Organization (GSO) is supposed to set standards for the entire GCC market, individual GCC Member States have instituted unique standards for automobiles that deviate from GCC automobile standards. The United States will be monitoring this issue across GCC Member States going forward.

While Saudi Arabia has historically accepted automobiles built to conform to either U.S. Federal Motor Vehicle Safety Standards or United Nations Economic Commission for Europe (UNECE) 1958 Agreement regulations, Saudi Arabia has taken steps toward solely adopting UNECE regulations. For example, Saudi Arabia adopted a UNECE low rolling resistance tire regulation that effectively excludes tires needed for certain U.S. sport utility vehicles (SUVs) and pickup trucks sold in the Middle East. Saudi Arabia's new electric vehicle certification likewise is based only on UNECE regulations. While Saudi Arabia has largely adopted U.S. CAFE standards, the country's draft CAFE regulation does not contain certain flexibilities used in the U.S. program, which may ultimately lead to reduced sales of certain vehicle types in Saudi Arabia, one of the largest export markets for U.S. automakers.

U.S. automakers also raised concerns about implementation challenges of the UAE Emergency Call (eCall) and Digital Audio Broadcasting (DAB+) requirements. The UAE requires full integration of DAB+ radio, an expensive feature, but the UAE does not have any active DAB+ broadcast stations. The UAE also has its own electric vehicle regulations, which are not consistent with regulations developed by the GSO.

Conformity Assessment Procedures for Hazardous Substances – Electrical Goods

In March 2018, GCC Member States notified the WTO of a draft GSO technical regulation that would establish the rules for the conformity assessment of certain hazardous substances in electrical goods. The measure deviates significantly from common international practice, which typically requires a supplier's declaration of conformity requiring pre-market third-party conformity assessment, and certification from a list of approved accredited bodies. The draft regulation also requires each type of good to be registered annually with the GSO. The United States raised concerns that the proposed GCC regulatory requirements establish procedural requirements that are far more burdensome and costly than other markets regulating the same goods and may dissuade U.S. producers of these products from exporting to the region. The draft regulation has not yet entered into force, and does not make clear whether all of the GCC Member States would accept a single test result or how the measure would be transposed and applied across all Member States.

Saudi Arabia notified to the WTO its draft Technical Regulation for the Restrictions of Hazardous Substances (RoHS) in December 2020, and subsequently published a revised version in the Official Gazette in July 2021. The regulation took effect for small household electrical items on July 4, 2022; implementation for other covered products will follow at scheduled intervals. A revised version of the regulation, published on July 29, 2022, offered additional flexibilities but does not fully address concerns outlined in detailed comments from the U.S. Government and U.S. industry, or similar comments from other trading partners and global industry.

In 2023, the United States sought additional information from Saudi Arabia regarding the precise scope of the regulation, guidance on the process for testing whole equipment and critical components of a product, and clarity on the requirement for suppliers to attach information that may include sensitive intellectual property as a part of their technical file of supporting documentation. Subsequent guidance issued for the regulation has provided some flexibility in the ability of producers to satisfy certification requirements by submitting an SDoC, though it remains unclear whether these flexibilities will be afforded to all importers or only to manufacturers and their legal representatives.

Conformity Assessment and Marking Requirements

The Emirates Conformity Assessment Scheme (ECAS) monitors industry compliance with UAE standards for goods to be sold in the country. The ECAS, initially notified to the WTO in 2004, applies to items such as textiles, building materials, energy drinks, dairy, juice, honey, and organic products. In addition, obtaining the Emirates Quality Mark (EQM) is mandatory for bottled drinking water, natural mineral water, and ice for human consumption. The application of ECAS and EQM to these items duplicates the regulatory system overseen by the MOCCA.

In 2018, Saudi Arabia implemented the Saudi Product Safety Program and launched an online certification and conformity assessment process (Saber) for all imported goods entering Saudi Arabia. Saber covers both regulated and unregulated products. Importers of regulated products must use Saber to initiate a certification request. If the product receives a Product Certificate of Conformity (PCoC), the importer is then issued a Shipment Certificate of Conformity (SCoC). Products requiring PCoCs include, but are not limited to: detergents, building materials, paints, vehicle spare parts, lubricant oils, toys, and textiles. For unregulated products, the importer must use Saber to self-declare whether the product meets a voluntary standard and that the good can be imported into the Saudi market. Following this self-declaration, the importer will be issued a Requester Declaration (S-DoC). An increasing number of U.S. companies have expressed concerns with the new Saber platform, including undue delays, and inconsistencies in product testing fees and clearance processes. The United States has also asked for clarification from Saudi Arabia how the program relates to GCC conformity assessment requirements.

Halal Regulations

In 2020, GCC Member States notified the WTO of a draft GSO technical regulation establishing halal requirements and certification for animal feed. The U.S. animal feed, beef, and poultry industries have raised concerns that the technical regulation places additional requirements on U.S. suppliers without offering additional assurance of compliance. The United States has raised concerns with GCC Member States, noting the unprecedented and potentially trade restrictive nature of the measure.

In October 2022, Qatar expanded application of its halal certification requirement to animal feed, slaughterhouses, handling, packaging, storing, and food additives.

Saudi Arabia suspended imports of U.S. poultry in June 2018 after enforcing halal regulations that ban stunning of poultry prior to slaughter. U.S. officials have informed the Saudi Food and Drug Authority (SFDA) that the U.S. production system and government regulations ensure that poultry is alive prior to the slaughter process and explained the scientific basis how the stunning process immobilizes birds to ensure that the slaughtering process is humane and effective. In 2019, several other trading partners with similar production practices resumed exports to Saudi Arabia, while imports from the United States remain prohibited. Saudi Arabia also maintains halal feed restrictions for imports of meat products from the United States, including a ban on animal protein in cattle feed and restrictions on the feeding of beef tallow to cattle, which limit U.S. beef exports to Saudi Arabia.

In November 2022, the UAE updated halal slaughtering requirements to allow for poultry stunning that does not directly result in death of the animal.

Energy Drinks

In January 2016, GCC Member States notified to the WTO a draft GSO technical regulation for energy drinks, which was revised in March 2022. The U.S. Government and private sector stakeholders raised concerns through bilateral and multilateral fora regarding the draft regulation. These concerns include the proposed marketing-based definition for energy drinks and labeling requirements regarding recommended consumption. Industry stakeholders still report that caffeine-content limitations unduly target energy drinks in GCC Member States. In many cases, such limitations do not apply to other drink products that contain similar or even higher levels of caffeine, such as tea, brewed coffee and other ready-to-drink coffee products.

In September 2021, Bahrain began to implement Executive Regulations for the Public Health Law on Energy Drinks. These regulations: (1) prohibit the sale of energy drinks to individuals under the age of 18 and require all locations selling such products to display a prominent notice of this prohibition; (2) prohibit the sale of such products in restaurants, cafeterias, educational facilities, and health facilities; (3) require prior licensing in order to advertise such products through any form of media; and, (4) ban free samples of such products. In addition, manufacturers are required to include a warning label on energy drinks noting that the product is not suitable for: pregnant and nursing women; individuals allergic to caffeine or other ingredients contained in the product; individuals suffering from heart problems, high blood pressure or diabetes; athletes engaged in exercise; or individuals under 18 years of age.

The United States has submitted comments and held bilateral discussions with Bahrain regarding questions and concerns over the regulations, including the timetable for implementation and the criteria and rationale for some of the requirements. The United States has also raised concerns that Bahrain had accelerated the implementation of the final measure without providing the necessary comment period and without notifying the final measure to the WTO, as required by the WTO Agreement on Technical Barriers to Trade. Bahrain has signaled that it will replace these current regulations with the GCC regulation once that measure is finalized.

Dairy Regulations

In June 2019, Qatar's Ministry of Public Health released a Council of Ministers' circular on both imported and domestically-produced dairy products that implemented limited shelf-life requirements on long life milk and white cheeses. Qatar did not notify the WTO of this regulation prior to implementation. The U.S. Government pressed Qatar on concerning aspects of its regulation in bilateral discussions and at meetings of the WTO Committee on Technical Barriers to Trade. On August 22, 2021, the Ministry issued an update to the June 2019 regulation that expanded its scope, increasing the concerns of the U.S. dairy industry. Qatar again failed to notify the WTO of the new regulation prior to its implementation. The U.S. Government and private sector stakeholders continue to raise concerns with Qatar on this regulation, including the transparency of its implementation and the food safety and food quality rationale of the measure.

Sanitary and Phytosanitary Barriers

Zoning and Compartmentalization

The World Organisation for Animal Health (WOAH) standards on zoning and compartmentalization provide recommendations for safe international trade between countries. Despite following WOAH

guidelines for zoning or compartmentalization in most cases, Saudi Arabia does not recognize the existence of United States zones or compartments in the event that highly pathogenic avian influenza occurs within the United States. The United States continues to press Saudi Arabia to act consistently with WOA guidelines.

MRL Approximation

Saudi Arabia generally follows the Codex Alimentarius Commission (Codex) for maximum residue limits (MRL) for pesticides applicable to grains and horticultural products. However, in the absence of a Codex MRL limit, Saudi Arabia applies MRLs based on EU regulations that are not necessarily based on science-based decision-making and, as a result, could impede U.S. trade.

Facility Listing Requirements

In 2021, Saudi Arabia notified the WTO of new requirements related to pre-export approval for multiple products, including animal and dairy products, grains, and processed vegetables. Saudi Arabia implemented the requirements for honey and seafood products on November 20, 2021, but has not indicated a concrete timeline for implementing facility requirements for other products. This regulation requires an overseas audit, and Saudi Arabia expects the interested establishments and countries to potentially pay related travel expenses. The U.S. competent authorities, which include the U.S. FDA and the U.S. Department of Agriculture Food Safety and Inspection Service, have worked with SFDA to confirm approved U.S. facilities. Discussions between SFDA and the U.S. competent authorities are ongoing.

Agricultural Biotechnology

In May 2020, the UAE issued Federal Law No. 9 regarding the biosafety of agricultural biotechnology products. The law prohibits the import, export, re-export, transit, production, and circulation of any agricultural products with biotechnology content of equal to or higher than 0.9 percent. For agricultural products with biotechnology content less than this threshold, a permit is required. UAE Resolution No. 84 of 2022 regarding the executive bylaws for Federal Law No. 9 of 2020 regarding the biological safety of genetically engineered commodities and their products places several restrictions, requirements, and specifications for the import, transport, circulation, and re-export of such products.

Certification

In 2021, Saudi Arabia began implementation of new regulations that require trading partners to adopt model certificates. The United States has requested Saudi authorities to accept comparable certifications currently issued by the U.S. competent authorities but as of December 2023 they had not yet done so.

Titanium Dioxide

In May 2022, GCC Member States notified to the WTO an amendment to the GSO technical regulations on Additives Permitted for Use in Foodstuffs that bans the use of titanium dioxide as a food additive, in line with EU food additive regulations. Titanium dioxide is an adopted food additive that is included in the Codex General Standard for Food Additives (GSFA). As such, it may be used in specified foods under the conditions of good manufacturing practices as outlined in the Codex GSFA. The FDA continues to allow for the safe use of titanium dioxide as a color additive in foods, subject to certain restrictions, including that the quantity of titanium dioxide does not exceed one percent in weight of the food. In November 2023, the Joint FAO/WHO Expert Committee on Food Additives (JECFA), administered jointly by the Food and Agriculture Organization of the United Nations (FAO) and the World Health Organization (WHO), confirmed a reevaluation of titanium dioxide and concluded that there is no safety concern or risk associated

with the use of the substance as food additive. The United States has requested that the GCC Member States allow the use of titanium dioxide based on Codex, justified by science and consistent with the recent JECFA conclusion.

GOVERNMENT PROCUREMENT

The United States–Bahrain FTA contains disciplines on government procurement. The FTA requires covered entities in Bahrain to conduct procurements covered by the agreement in a fair, transparent, and nondiscriminatory manner. Some U.S. companies report that they have faced prolonged issues with the tendering process related to GCC-funded projects.

Bahrain is not a Party to the WTO Agreement on Government Procurement (GPA), but has been an observer to the WTO Committee on Government Procurement since December 2008.

Kuwait's Public Tenders Law No. 49 of 2016 regulates government procurement and requires that any procurement with a value greater than KD 75,000 (approximately \$250,000) be conducted through the Central Agency for Public Tenders. Certain contracts from the Kuwait Petroleum Corporation that exceed KD 5 million (approximately \$16.5 million) are exempt. Ministry of Interior, Defense, National Guard, and core (*i.e.*, drilling and extraction) Kuwait Petroleum Corporation contracts are also exempted. Kuwait provides a 15 percent price preference for domestic and GCC goods, and requires foreign contractors to purchase at least 30 percent of their inputs domestically and to subcontract at least 30 percent of the work to domestic contractors where available.

Kuwait is neither a Party to the WTO Agreement on Government Procurement (GPA) nor an observer to the WTO Committee on Government Procurement.

The United States–Oman FTA requires covered government entities in Oman to conduct procurements covered by the Agreement in a fair, transparent, and nondiscriminatory manner. Oman provides a 10 percent price preference to tenders that contain a high content of local goods or services, including direct employment of Omani nationals, as per its in-country value requirements. However, Oman may not apply such price preferences to bids offering goods and services from the United States in procurements covered by the United States–Oman FTA.

For most major tenders, Oman invites bids from international firms or firms pre-selected by project consultants, but stakeholders report that in recent years Oman has favored local community contractors and Omani small and medium-sized enterprises (SMEs). Suppliers are requested to be physically present at the opening of tenders and interested persons may view the process on Oman's Tender Board website. Some U.S. companies report that award decisions are delayed, sometimes for years, or that the tendering is reopened with modified specifications and short deadlines.

Oman is not a Party to the WTO Agreement on Government Procurement (GPA), but has been an observer to the WTO Committee on Government Procurement since May 2001.

Qatar's Cabinet Decision 16/2019 stipulates that non-Qatari companies participating in tenders must utilize local goods and services for at least 30 percent of a tender's value, including local raw materials, locally-manufactured goods, transportation services, security, guarding and catering services, or any other local services provided. Cabinet Decision 11/2022 additionally favors local SMEs, by exempting them from providing bonds when bidding for government tenders, and incentivizing greater support for the local economy, by encouraging government clients to consider bidders' in-country value ratios when evaluating bid prices. Participation in government tenders with a value of QAR 5,000,000 or less (equivalent to

approximately \$1.37 million) is limited to local SME contractors, suppliers, and merchants registered with the Qatar Chamber of Commerce.

Qatar is neither a Party to the WTO Agreement on Government Procurement (GPA) nor an observer to the WTO Committee on Government Procurement.

Saudi Arabia requires foreign contractors to subcontract 30 percent of the value of any government procurement, including support services, to firms that are majority-owned by Saudi nationals. An exemption is granted when no Saudi-owned company can provide the goods or services necessary to fulfill the requirements of a tender. The Saudi Government is in the process of reforming its procurement processes and policies. In addition to offsets, the Saudi Government promotes purchases of goods and services in Saudi Arabia and increasing the percentage of Saudi nationals employed by foreign firms—a policy known as “Saudization.” The Saudi Government currently requires offsets in investments of up to 40 percent of a program’s value for defense contracts, depending on the value of the contract. Saudi Arabia provides a 10 percent price preference for GCC goods used in procurements in which foreign suppliers participate.

Saudi Arabia revised its Government Tenders and Procurement Law in April 2020. The law regulates the contractual relationship between a public or government entity and contractors. U.S. companies have reported that the procurement systems lack transparency. In 2018, the Ministry of Finance launched the Electronic Government Procurement System (Etimad Portal) to consolidate and facilitate the procurement process for the public sector. The General Authority for Military Industries manages Saudi Arabia’s armaments procurement activities.

U.S. companies have reported long delays and difficulties in Saudi Arabia in receiving payments for procurement contracts with national and regional government entities, with some delays lasting more than two years. Delays increased significantly in late 2015, when declining oil revenues prompted the Saudi Government to freeze payments to major contractors, accruing tens of billions of dollars in arrears and leading some companies to lay off workers. Since late 2020, Saudi Arabia has prioritized timelier payments to contractors and uses the Etimad Portal to facilitate payments. U.S. companies continue to report significant payment delays but report that the overall amounts owed to them in 2023 are less than what was owed in 2022.

In November 2022, Saudi Arabia announced its Economic Participation Policy, which requires foreign companies participating in local tenders above SAR100 million to demonstrate an economic contribution to the Kingdom of at least 35 percent of the tender’s total value.

In 2021, Saudi Arabia announced that by January 1, 2024 all international companies must establish a regional headquarters (RHQ) in Saudi Arabia or be barred from bidding on government contracts. Companies bidding on contracts with a cumulative annual value of less than \$266,000 are exempt from this requirement. Key concerns for U.S. companies regarding the RHQ policy include: the absence of a regulatory/legislative text outlining the policy parameters; a lack of clarity on the rights and obligations associated with the RHQ; and a lack of clarity or predictability on the tax regime for RHQs. International companies can obtain RHQ licenses through the Ministry of Investment’s (MISA) “Invest Saudi” website. To be considered an RHQ, a company’s Saudi branch must conduct strategic and management functions including budgeting, business planning, regional strategy reviews, regional market monitoring and operational and financial reporting. An RHQ must have a minimum of 15 full-time employees within its first year of operation, including at least three senior executives. The Saudi Government may award contracts to sole-source technology or intellectual property providers without RHQs. A non-RHQ company can also be awarded a tender if its bid is at least 25 percent less than an RHQ company’s proposal. Contracts for projects outside of Saudi Arabia are not subject to the RHQ policy. It remains unclear whether other

Saudi government entities that do not utilize the Etimad Portal, such as the General Authority for Military Industries, will apply the RHQ policy to their contracting decisions. According to the MISA, the RHQ policy will apply to a company that submits a bid but had not signed a procurement contract by January 1, 2024. The United States has been actively engaged on this issue and continues to press for more clarity regarding this regulation.

In September 2019, the Saudi Government issued a royal decree prohibiting government agencies from granting contracts to foreign consultancy firms, except in circumstances where there are no qualified Saudi alternatives. However, because the royal decree does not define the criteria for exemptions, and does not clarify whether local branches of foreign-owned firms are covered by the prohibition, it remains subject to interpretation. As of 2023, MISA will issue consultancy licenses on a case-by-case basis.

Saudi Arabia is not a Party to the WTO Agreement on Government Procurement (GPA), but has been an observer to the WTO Committee on Government Procurement since December 2007.

U.S. companies have raised concerns regarding a lack of transparency in the UAE's government procurement processes, in addition to lengthy delays and burdensome procedures to receive payment.

In March 2022, the UAE Ministry of Economy announced a revised UAE National Program for Emirati SMEs, which gives an advantage to Emirati-owned SMEs by providing them with several new incentives and preferential services, including: registration for federal government procurement tenders, provision of a range of business services from telecommunications to internal audits, and easier access to funding.

Foreign defense contractors active in the UAE market continue to raise concerns about satisfying contractual obligations to enter into an agreement under the Tawazun Economic Program—referred to as an offset agreement by defense contractors. Despite recent reforms to the program, satisfying offset requirements in the UAE remains a challenge for U.S. defense contractors.

In July 2020, the UAE established a national In Country Value (ICV) Program to expand local procurement preferences. In March 2021, the UAE revised the ICV Program as part of its ten-year comprehensive strategy, “Operation 300 Billion,” to promote UAE products. U.S. firms have raised concerns that the ICV Program is not transparent and that criteria change frequently. The UAE has expanded the ICV program to all seven emirates and several other government entities, bringing the total number of participants to 28 federal and local government entities. In February 2023, the Abu Dhabi National Oil Company signed agreements worth \$4.63 billion with 23 companies to locally manufacture materials and supplies for its operations.

The UAE is neither a Party to the WTO Agreement on Government Procurement (GPA) nor an observer to the WTO Committee on Government Procurement.

INTELLECTUAL PROPERTY PROTECTION

As part of its FTA obligations, Bahrain continues to enact laws to improve protection and enforcement of copyrights, trademarks, patents, and plant varieties. However, Bahrain has yet to accede to the International Convention for the Protection of New Varieties of Plants (UPOV 1991), as required under the FTA. Bahrain's record on intellectual property (IP) enforcement is mixed. Over the past several years, Bahrain has launched several campaigns to block illegal broadcast signals and to prohibit the sale of decoding devices in order to combat piracy of cable and satellite television, and has launched several public awareness campaigns regarding copyright piracy. However, many counterfeit consumer goods continue to be sold openly.

In 2021, the UAE was removed from the Special 301 Watch List after resolving concerns with IP protection of pharmaceutical products, making progress on long-standing IP enforcement issues, and increasing transparency with stakeholders. In 2023, the UAE adopted legislation to combat commercial fraud with significant penalties, and enforcement authorities launched several inspection campaigns targeting counterfeit goods. However, the Deira District markets in Dubai remain in the [2023 Review of Notorious Markets for Counterfeiting and Piracy](#) (Notorious Markets List). In addition, entertainment industry stakeholders continue to press for the establishment of a collective management organization to enable the collection of music royalty payments. Right holders also continue to ask the UAE Telecommunication and Digital Regulatory Authority to engage with domain name registrars and other intermediaries to facilitate effective enforcement actions against copyright infringement, encourage customs authorities to ban the importation of illegal set-top boxes, and put more restrictions on free or paid subscription-based services that unlawfully retransmit TV channels broadcasting copyrighted content.

SERVICES BARRIERS

Oman limits customs brokerage activities to Omani nationals. The United States has raised concerns about the consistency of this limitation with provisions of the FTA.

Financial Services

Foreign bank members of the Kuwait Banking Association may operate in Kuwait. However, foreign banks are subject to a maximum credit concentration limit equivalent to less than half of the largest local bank. Foreign banks may open representative offices but are prohibited from directing clients to borrow from external branches of their bank.

Oman does not permit representative banking offices or offshore banking.

Foreign banks established in Qatar are licensed by the Qatar Central Bank (QCB) or the Qatar Financial Centre Regulatory Authority (QFCRA). The Qatari Government permits foreign banks licensed by QFCRA to establish a physical presence and conduct most types of banking business, including provision of shariah-compliant banking services, in the Qatar Financial Centre (QFC). These banks are not allowed to offer stand-alone retail banking services outside the QFC.

Saudi Arabia limits foreign ownership in commercial banks to 60 percent of any individual bank operation, but investment banks and brokerages can be 100 percent foreign-owned.

Although the UAE Central Bank allows foreign ownership up to 40 percent in national banks, the actual foreign ownership share is far lower. Foreign banks operating onshore are not allowed to open more than eight branches. Foreign banks are subject to a unique corporate income tax at the sub-federal emirate level.

Insurance Services

The UAE only allows foreign insurance companies to operate independently as branches. Foreign equity in domestic insurance companies is limited to 49 percent.

A May 2019 resolution on regulations for reinsurance businesses requires that at least 51 percent of the capital of any insurance company incorporated in the UAE be owned by natural persons who are UAE or GCC nationals, or by legal persons fully owned by UAE or GCC nationals. However, a foreign reinsurance company may seek a license from the regulator to operate as a branch.

In September 2020, the UAE Cabinet amended Council of Ministers Resolution No. 31 of 2019 to include onerous reporting requirements for foreign-owned financial firms, including banks, insurers, and purveyors of other financial products. Companies that are majority-owned by UAE nationals are exempt from these requirements.

Telecommunications Services

Although Kuwait's telecommunications industry is technically open to private investment, in practice, the Kuwaiti Government maintains extensive ownership in the sector, and controls licensing and infrastructure development. Kuwait's telecommunications law gives authorities sweeping power to revoke licenses and block content with little judicial oversight.

Qatar restricts the provision of telecommunications services to locally-licensed entities. Ooredoo and Vodafone Qatar are Qatar's only licensed telecommunications service providers.

The UAE Government maintains majority ownership in Etisalat (e&) and du, which are the only telecommunications service suppliers, Internet service providers, and mobile phone operators in the UAE. In January 2021, both telecommunications providers raised their foreign investment cap to 49 percent, though actual foreign ownership is 8.4 percent for Etisalat and less than one percent for du.

Professional Services

Non-Omani attorneys, including U.S. attorneys practicing in Oman, are prohibited from appearing in courts of first instance. The United States has raised concerns about the consistency of this limitation with provisions of the FTA. In January 2021, Oman barred non-Omani attorneys from appearing or pleading in higher courts in Oman.

Saudi Arabia requires that entities providing certain professional services, including engineering, legal services, accounting, architecture, healthcare, dental, and veterinary services have a Saudi partner. In general, the foreign entity's equity in the joint venture cannot exceed 75 percent of the total investment. In order to avoid the equity cap, a 2017 measure requires foreign engineering consulting firms that are seeking to register a local branch or subsidiary to demonstrate that they have been incorporated for at least ten years and have operations in at least four different countries.

Distribution Services

Only Qatari individuals and domestically-licensed entities are allowed to serve as local commercial agents for foreign firms distributing products or services, except in certain sectors. The Minister of Commerce and Industry can waive the nationality requirement for commercial agents of foreign companies that have direct contracts with the Qatari Government.

UAE's Federal Law No. 11 of 2020 amended the Commercial Agency Law No. 18 of 1981 to require that all commercial agents within the UAE must be UAE nationals, a UAE public joint stock company (PJSC) that is owned at least 51 percent by UAE nationals, a UAE private entity owned by a PJSC meeting the previous requirements, or a UAE private entity that is 100 percent owned by UAE nationals. In December 2022, the UAE authorized foreign entities to sell their products directly in the UAE without an agent, if there is no agent already appointed in the UAE and the principal has not previously had any agreement registered with a commercial agent in the UAE.

BARRIERS TO DIGITAL TRADE

Oman, operating through its government majority-owned telecommunications service providers and through its Telecommunications Regulatory Authority (TRA), periodically slows or blocks access to certain over-the-top services such as Voice over Internet Protocol (VoIP) services. Oman has temporarily lifted a ban on most VoIP services since the start of the COVID-19 pandemic.

The TRA announced in September 2022 a new regulation limiting the provision of Internet voice and video internet protocol services only to companies in the educational, commercial, or medical sectors. The regulation requires service providers to obtain TRA permits and house data servers and equipment in Oman, and it limits the provision of services to corporate customers only (not individuals). The Omani Government has yet to issue clarifying details on the regulation or its implementation. In December 2019, the TRA announced a new regulation limiting the use of international roaming Subscriber Identity Module (SIM) cards for Internet of Things (IoT) devices to a maximum use period of 90 days.

The Qatari Government requires a license for telecommunications and VoIP services providers; however, it grants licenses only to companies intending to charter in Qatar. This requirement serves as a barrier for foreign or Internet-based communications service providers. Ooredoo and Vodafone Qatar are Qatar's only VoIP and telecommunications service providers, and both are majority-owned by state-controlled entities.

In March 2018, Saudi Arabia's Communications and Information Technology Commission (CITC) issued the Cloud Computing Regulatory Framework. This measure granted the CITC broad powers to require cloud and other information and communications technology service providers to install and maintain governmental filtering software on their networks, restricting Internet-based services.

In September 2021, Saudi Arabia enacted the Personal Data Protection Law (PDPL). Stakeholders have noted concerns that the PDPL includes unnecessary data transfer restrictions. The Saudi Arabian Data and Artificial Intelligence Authority (SDAIA) published an amended draft of the PDPL in December 2022 but postponed full enforcement to address feedback received during the public comment period. The SDAIA published additional draft implementing regulations in June 2023, and published the final regulations in September 2023. U.S. companies remain concerned that the PDPL did not clearly include the United States as an approved jurisdiction for data transfers; that the guidelines for compliance and harmonization of sector-specific regulations and the rules for application of "legitimate interest" in transferring data in the healthcare sector are unclear; and that Saudi Arabia did not provide a sufficient implementation period for compliance.

In January 2022, the UAE's Federal Decree No. 45 of 2021 regarding personal data protection (the Data Protection Law) came into effect. Details on implementation of the Decree will be further clarified in the executive regulations for implementing the Data Protection Law, which were still under draft as of December 2023.

Internet Services

The UAE's nationally-controlled telecommunications service suppliers, Etisalat and du, block access to many over-the-top Internet-based communications services, such as VoIP services, video communication services, and messaging services. UAE regulators have declined to intervene, effectively prohibiting market access for foreign suppliers of such services. In March 2020, UAE regulators announced the temporary availability of five applications to support distance learning and remote working amid the COVID-19 pandemic. In 2021 and 2022, UAE regulators continued allowing these applications on a temporary basis. Stakeholders raised concern that Etisalat and du consistently control access to, and quality

of, foreign Internet-based communications services, creating significant market access barriers for U.S.-based Internet services and apps. UAE regulators continue to insist that only national providers can provide these forms of communications services.

INVESTMENT BARRIERS

Limitations on Foreign Equity Participation

Existing law generally mandates that businesses established in Kuwait must be majority-owned (at least 51 percent) by Kuwaiti or other GCC nationals. However, Kuwait's Foreign Direct Investment Law of 2013 permits the Kuwait Direct Investment Promotion Authority (KDIPA) to authorize, on a case-by-case basis, up to 100 percent foreign ownership in the following industries: infrastructure (water, power, wastewater treatment, and communications); insurance; information technology and software development; hospitals and pharmaceuticals; air, land, and sea freight; tourism, hotels, and entertainment; housing projects and urban development; and investment management. The KDIPA approved the first wholly-owned U.S. business in 2015, and since then has approved 37 additional U.S. companies for up to 100 percent ownership. Notwithstanding these efforts, significant barriers to foreign investment persist, including regulations prohibiting foreigners from investing in real estate, extraction of crude petroleum and natural gas, manufacture of coke oven products and fertilizers, and publishing; long delays associated with establishing new enterprises, which can take as long as 12 months; and difficulty identifying a required local sponsor and agent.

Omani Royal Decree 29/2018 of 2019 banned foreign ownership of real estate and land in certain governorates and areas that the government deems necessary to restrict. However, non-Omanis may purchase residential units in multi-storied commercial and residential buildings in certain areas of the Muscat governorate under usufruct rights (*i.e.*, the right to lease one's property to another person), with certain restrictions. Oman has allowed the establishment of real estate investment funds (REIF) to encourage new inflows of capital into Oman's property sector. The regulations permit foreign investors, as well as expatriates in Oman, to own shares in REIFs.

Qatar's Law 1/2019 on Regulating the Investment of Non-Qatari Capital in Economic Activity generally limits foreign ownership to 49 percent of an enterprise and requires majority ownership by one or more local Qatari investors. However, foreign investors may apply to the Ministry of Commerce and Industry for up to 100 percent foreign ownership. Full foreign ownership in the banking and insurance sectors and commercial agencies is prohibited unless the Qatari Cabinet grants special approval. In April 2021, the Qatari Government permitted foreign investors up to 100 percent ownership of companies listed on the Qatar Stock Exchange, including in the banking and insurance sectors, subject to compliance with the Qatar Central Bank. Foreign investment in national oil and gas companies, or companies with the right of exploration of national resources, cannot exceed 49 percent.

Saudi Arabia generally permits up to 100 percent foreign ownership in most sectors, but foreign investment is prohibited in 10 sectors, including oil exploration, drilling, and production; security and detective services; fisheries; tourist guidance services related to religious pilgrimage; and food catering services to the military. For sectors in which foreign ownership is permitted, foreign investors are generally required to satisfy several conditions, including investing more than \$50 million in the Saudi economy over five years and meeting sector-specific localization requirements. These conditions have limited the ability of foreign investors to exercise full ownership in these sectors.

Only "qualified foreign investors" (QFI) designated by Saudi Arabia's Capital Market Authority are permitted to buy directly the shares or convertible debt of an issuer listed on the local Tadawul stock

exchange, with their investments capped at 10 percent of any individual company. Cumulative foreign ownership cannot exceed 10 percent of the total Tadawul market capitalization or 49 percent of any individual company. Entities eligible for QFI status include banks, brokerages and securities firms, insurance companies, investment funds, and government and government-related entities with at least \$500 million in assets under management.

Pursuant to amendments to the UAE Commercial Companies Law in 2020, there is no longer a requirement that UAE or GCC nationals own at least 51 percent of the shares of a UAE company. In 2021, the UAE began to implement these legislative changes that allow up to 100 percent foreign ownership in more than 1,100 listed commercial and industrial business activities. However, foreign investment remains restricted for commercial agencies or companies engaged in strategic activities, including the military, banking, insurance and re-insurance, and telecommunication sectors, or certain professional activities such as consultancies.

LABOR

The United States and Bahrain have been engaged in labor consultations under Article 15.6 of the FTA since 2013 regarding Bahrain's obligations under Article 15.1. The United States formally requested consultations after the U.S. Department of Labor released a report in response to a submission from the public. The consultations concern employment discrimination and freedom of association. During 2023, the Office of the United States Trade Representative and the U.S. Department of Labor continued to engage with the Government of Bahrain in an effort to address these and related issues.

HONDURAS

TRADE AGREEMENTS

Dominican Republic–Central America–United States Free Trade Agreement

The Dominican Republic–Central America–United States Free Trade Agreement (CAFTA–DR) entered into force for the United States, El Salvador, Guatemala, Honduras, and Nicaragua in 2006; for the Dominican Republic in 2007; and for Costa Rica in 2009. The United States and the other CAFTA–DR countries meet regularly to review the implementation and functioning of the Agreement and to address outstanding issues.

Tariffs and Taxes

Tariffs

As a member of the Central American Common Market, Honduras applies a harmonized external tariff on most items at a maximum of 15 percent, with some exceptions. However, under the CAFTA–DR, as of January 1, 2015, non-agricultural goods enter Honduras duty free.

In addition, nearly all U.S. agricultural exports enter Honduras duty free under the CAFTA–DR. Honduras eliminated its remaining tariffs on rice and chicken leg quarters on January 1, 2023, and is scheduled to eliminate its remaining tariffs on dairy products by 2025. For certain agricultural products, tariff-rate quotas (TRQs) permit duty-free access for specified quantities during the tariff phaseout period, with the duty-free quantities expanding during that period. Honduras will liberalize trade in white corn through continual expansion of a TRQ, rather than by the reduction of the out-of-quota tariff. Honduras is required under the CAFTA–DR to make TRQs available on January 1 of each year. Honduras monitors its TRQs through an import licensing system, which the United States carefully tracks to ensure the timely issuance of these permits.

Taxes

Honduran Customs imposes a 15 percent sales tax on pork rib imports when the product description is in English. However, if the product description is in Spanish, according to Decree 05-2014, the pork ribs are considered basic necessities and are exempt from sales tax. The U.S. Government has asked the Ministry of Finance to revise Decree 05-2014 to treat pork cuts labeled in English the same as those labeled in Spanish for dutiability purposes.

Import Licensing – Poultry and Rice

In 2023, Honduras implemented a new series of complicated licensing systems for the importation of poultry and rice. The new system includes requirements that do not explicitly limit the importation of these products but create reporting requirements to obtain the required import licenses that have created challenges for U.S. exporters. For example, U.S. exporters are required to engage with multiple Honduran Government agencies to apply for a license. After the United States repeatedly raised these concerns, Honduras made some changes to streamline and improve the process. However, importers of rice and poultry still face challenges complying with the requirements. Each administrative agency of the

Government of Honduras—Honduras Ministry of Agriculture, Animal Health and Food Safety Service (SENASA), Ministry of Economic Development, and Customs Office—has approximately eight additional steps necessary for approval. A lack of digitalization requires paper applications and physical signatures where only one Official/Minister can authorize, causing a significant bottleneck for approvals.

The new requirements for poultry are contained in Ministerial Agreement 021-2023, published in the Official Gazette on February 16, 2023, as amended in June 17, 2023, through decree modification 055-2023. The new requirements for rice are contained in Ministerial Agreement 020-2023, also published in the Official Gazette on February 16, 2023, as amended through Ministerial Agreement 104-2023, published on October 31, 2023.

SANITARY AND PHYTOSANITARY BARRIERS

Raw Materials and Additives for Food and Beverage Production

On November 3, 2020, the Sanitary Regulation Agency (ARSA) implemented a new import requirement called the Sanitary Authorization for the Import of Raw Materials and Additives for Food and Beverage Production. This import requirement is redundant with the existing import permit mandated by SENASA for cuts of meat that match ARSA's definition of raw materials for food consumption. Honduras notified this regulatory requirement to the World Trade Organization in April 2019. The U.S. Government continues to engage with ARSA.

INTELLECTUAL PROPERTY PROTECTION

The United States continues to have significant concerns regarding intellectual property (IP) protection and enforcement in Honduras, including with respect to online and software piracy, cable signal piracy, and the distribution and sale of counterfeit and pirated goods. The United States continues to urge Honduras to fully enforce its IP laws. The United States continues to monitor Honduras's implementation of its IP obligations under the CAFTA–DR.

SERVICES BARRIERS

Distribution Services

U.S. firms have reported challenges working with local distributors of products from the United States. Citing the 1977 Honduran Law on Agents, Distributors and Representatives of Domestic and Foreign Companies (Decree Law No. 549), Honduras has required foreign firms to enter into agreements with local distributors to supply local markets and allowed distributors to register as the sole distributor of certain products or brands, which has at times resulted in U.S. exports being barred from import. The application of certain requirements under Decree Law No. 549 that restricted the ability of U.S. producers to distribute U.S. products in Honduras had been eliminated with the entry into force of the CAFTA–DR. However, U.S. firms raised concerns during 2022, under the CAFTA–DR, with certain restrictions being applied to U.S. exports.

INVESTMENT BARRIERS

Honduran law places certain restrictions on foreign ownership of land within 40 kilometers of the country's coastlines and national boundaries. However, the law allows foreigners to purchase properties, with some acreage restrictions, in designated zones established by the Ministry of Tourism to construct permanent or

vacation homes. Inadequate land title procedures have led to investment disputes, including complaints of fraud and official malfeasance, harming U.S. nationals who are landowners in Honduras.

LABOR

The United States and Honduras continue to meet through their contact points, under Article 16.4.3 of the CAFTA–DR. This engagement includes reviewing Honduras’ progress toward implementing specific recommendations from the United States that resulted from a U.S. Department of Labor (DOL) report and the United States–Honduras Labor Rights Monitoring and Action Plan. The [DOL report](#), published in 2015 in response to a submission from the public under the CAFTA–DR raised significant concerns regarding labor law enforcement in Honduras, especially with respect to the right to freedom of association; the right to organize and bargain collectively; the minimum age for work and the worst forms of child labor; and acceptable conditions of work in various economic sectors, including apparel, automotive parts, and agriculture.

HONG KONG

Hong Kong, China (Hong Kong) is a separate customs territory from mainland China, and the Basic Law of the Hong Kong Special Administrative Region of the People's Republic of China states that Hong Kong can enter into international agreements in commercial, economic, and certain other matters. Hong Kong is a separate and founding Member of both the World Trade Organization and the Asia-Pacific Economic Cooperation forum.

On June 30, 2020, the Chinese Government in Beijing imposed a National Security Law (NSL) on Hong Kong. Among other provisions, Article 31 of the NSL stipulates that an incorporated or unincorporated body, which may include domestic corporations, international businesses, international non-governmental organizations, and media outlets, can be prosecuted for violating the NSL.

On July 14, 2020, following imposition of the NSL, as well as other actions taken by Beijing to undermine Hong Kong's autonomy, the U.S. President issued Executive Order (EO) 13936, reflecting a presidential determination that Hong Kong is no longer sufficiently autonomous to justify differential treatment in relation to China under the particular laws set out in the Executive Order, and that the situation with respect to Hong Kong constitutes an unusual and extraordinary threat to the national security, foreign policy, and economy of the United States. Accordingly, EO 13936 directed U.S. Government agencies to suspend or eliminate certain policy exemptions under U.S. law that had given Hong Kong differential treatment in relation to China.

INTELLECTUAL PROPERTY PROTECTION

Hong Kong generally provides strong intellectual property (IP) protection and enforcement and, for the most part, has strong IP laws in place. In June 2020, Hong Kong passed a Trade Marks Ordinance that will enable application of the Protocol Relating to the Madrid Agreement Concerning the International Registration of Marks (the Madrid Protocol) in Hong Kong. As of December 2023, the ordinance had not yet been implemented.

Hong Kong's failure to modernize its copyright system had allowed it to become vulnerable to digital copyright piracy, particularly from streaming websites and illicit streaming devices (ISDs), with negative ramifications for businesses and innovators. In December 2022, Hong Kong adopted the final Copyright (Amendment) Ordinance 2022, which came into operation on May 1, 2023. The updated law introduces a new exclusive right for copyright owners to communicate their works to the public through any mode of electronic transmission, including streaming, and makes a violation of that right subject to criminal sanctions. At the same time, the updated law did not introduce specific provisions to combat ISDs. U.S. stakeholders stated that copyright holders still face uncertainty obtaining effective civil relief against illegal video streaming and that ISDs continue to be a concern in Hong Kong, noting the lack of criminal enforcement against sales of ISDs and the availability of ISDs on electronic-commerce platforms and in independent electronics stores in Hong Kong.

The Customs and Excise Department of Hong Kong investigates IP crimes and routinely seizes IP-infringing products arriving from mainland China and elsewhere. However, U.S. Government officials and private sector stakeholders report that counterfeit pharmaceuticals, luxury goods, and other infringing products continue to enter Hong Kong. These products are typically destined for both the Hong Kong market and markets outside of Hong Kong.

INDIA

TRADE AGREEMENTS

The United States–India Trade Policy Forum

The United States and India launched the Trade Policy Forum (TPF) in July 2005 and signed an agreement in March 2010 that formally established the TPF as the primary mechanism for discussions of trade and investment issues between the United States and India. The U.S. Trade Representative and the Indian Minister of Commerce and Industry (MOCI) met in New Delhi, India for the fourteenth TPF Ministerial in January 2024.

IMPORT POLICIES

Tariffs and Taxes

Tariffs

India's average Most-Favored-Nation (MFN) applied tariff rate was 18.1 percent in 2022 (latest data available), which was the highest of any major world economy, with an average applied tariff rate of 14.7 percent for non-agricultural goods and 39.6 percent for agricultural goods.

India maintains high applied tariffs on a wide range of goods, including vegetable oils (as high as 45 percent); apples, corn, and motorcycles (50 percent); automobiles and flowers (60 percent); natural rubber (70 percent); coffee, raisins, and walnuts (100 percent); and alcoholic beverages (150 percent). In addition, India maintains very high basic customs duties (in some cases exceeding 20 percent) on drug formulations, including life-saving drugs and finished medicines listed on the World Health Organization's [list of essential medicines](#). High tariff rates also present a significant barrier to trade in other agricultural goods and processed foods (e.g., poultry, potatoes, citrus, almonds, pecans, apples, grapes, canned peaches, chocolate, cookies, frozen french fries, and other prepared foods used in fast-food restaurants).

India's World Trade Organization (WTO) bound tariff rates on agricultural products are among the highest in the world, averaging 113.1 percent and ranging as high as 300.0 percent. Given the large disparity between WTO bound and applied rates, India has considerable flexibility to change tariff rates for both agricultural and non-agricultural products at any time, creating tremendous uncertainty for U.S. workers, farmers, ranchers, and exporters. The Government of India took advantage of this tariff flexibility in the 2019/2020 budget by increasing tariffs without any notice or public consultation process on approximately 70 product categories, including those covering key U.S. exports in the agricultural, information and communication technology, medical devices, paper products, chemicals, and automotive parts sectors. In its 2020/2021 budget, India further raised tariffs for 31 product categories, including solar inverters and solar lanterns. In its 2021/2022 budget, India further raised tariff rates on imported headphones, loudspeakers, and smart meters used by power distribution companies. In addition, starting in 2014, India has repeatedly raised tariffs on certain telecommunications equipment, including network switches.

In June 2019, following the U.S. withdrawal of India's preferential tariff benefits under the unilateral Generalized System of Preferences (GSP) program due to India's failure to comply with the program's eligibility criteria, India implemented retaliatory tariffs ranging from 1.7 percent to 20 percent on 28 different products imported from the United States, including almonds, apples, walnuts, chickpeas, lentils, phosphoric acid, boric acid, diagnostic reagents, binders for foundry molds, select steel and aluminum

products, and threaded nuts. While the decision to implement these tariffs followed the U.S. withdrawal of India's GSP benefits, India had originally announced the intention to adopt the tariffs in June 2018 in retaliation against the U.S. decision to implement tariffs on U.S. imports of steel and aluminum products under Section 232 of the Trade Expansion Act of 1962, as amended (19 U.S.C. § 1862). In July 2019, the United States launched a WTO dispute settlement proceeding against India challenging the retaliatory tariffs. In June 2023, in the course of discussions related to the termination of outstanding dispute settlement proceedings between the United States and India under the WTO Agreement, India agreed to rescind certain retaliatory tariffs on the following U.S. origin products: chickpeas, lentils, almonds, walnuts, apples, boric acid, and diagnostic reagents. The dispute related to India's retaliatory tariffs was terminated in July 2023. India's Ministry of Finance published a customs notification rescinding the duties effective September 2023. The United States continues to urge India to participate in multilateral efforts to address the problem of global non-market excess capacity in the steel and aluminum sectors.

Taxes

Since 2018, India has applied a 10 percent surcharge on imports, which is assessed on the value of other duties rather than the customs value of the imported product. Certain products are exempted from the surcharge pursuant to official customs notifications. India routinely changes the surcharge on a range of agricultural products. A landing fee of one percent is included in the valuation of all imported products unless exempted through separate notification.

Non-Tariff Barriers

India maintains various forms of non-tariff barriers on three categories of products: banned or prohibited items that are denied entry into India (*e.g.*, tallow, fat, and oils of animal origin); items that require an import license (*e.g.*, certain livestock products, certain chemicals, certain information technology products); and items that are importable only by government trading monopolies and are subject to cabinet approval regarding import timing and quantity (*e.g.*, pharmaceuticals, corn under a tariff-rate quota).

While the MOCI's Directorate General of Foreign Trade (DGFT) maintains a list of all three categories of prohibited or restricted items on its [website](#), India often fails to observe other transparency requirements, such as publication in the Gazette of India of the timing and quantity of restrictions and notification to relevant WTO committees.

Import Restrictions

To manage domestic oversupply, the Indian Government began imposing quantitative restrictions on imports of various pulses in 2017, based on local supply and demand conditions. In February 2022, India issued a notification to restrict the import of mung beans until March 31, 2023, but imports are now allowed without any quantitative restrictions. However, the opaque and unpredictable nature of India's application of quantitative restrictions has affected the ability of U.S. exporters to access the market. The United States continues to raise this issue, along with other trading partners, at the WTO.

India applies restrictions on boric acid imports, including arbitrary import quantity approval restrictions and other requirements that only apply to imports. Long periods of time can pass without the issuance of any import licenses. In addition, the import application specifies that non-insecticidal boric acid can only be imported directly by a domestic manufacturer, which prevents independent traders from importing boric acid for resale purposes. Meanwhile, domestic producers continue to be able to sell boric acid for non-insecticidal use, subject only to a requirement to maintain records showing they are not selling to end users who will use the product as an insecticide. India has cited state-level court cases in Kerala and Gujarat endorsing the legal rationale for applying the restriction on boric acid imports.

Import Licensing

When assessing whether import licenses are required, India distinguishes between goods that are new and those that are secondhand, remanufactured, refurbished, or reconditioned. India allows imports of secondhand capital goods by end users without an import license if the goods have a residual life of at least five years. India requires import licenses for all remanufactured goods because India does not recognize that remanufactured goods have typically been restored to original working condition and meet the technical and safety specifications applied to products made from new materials. Refurbished items must be no more than seven years old and have a remaining life span of at least five years. U.S. stakeholders have reported that obtaining an import license for remanufactured goods is onerous. Stakeholders noted excessive details are required in the license application, quantity limitations are set for specific parts, and long delays occur between the submission of an application and the grant of a license. A Chartered Engineer's Certificate is also required to import both refurbished goods and used manufactured goods.

On August 3, 2023, the Indian Government announced the immediate restriction of imports of certain information and communications technology products, including laptops, tablets, and servers classified under the Harmonized System (HS) heading 8471. Under the new requirements, which went into effect in November 2023, imports would be allowed only with a valid import license for each product. U.S. exporters have raised concerns over the lack of prior stakeholder consultations. The United States continues to monitor implementation and to raise concerns with India.

Customs Barriers and Trade Facilitation

India's tariff rates are announced with the annual budget and are modified on an *ad hoc* basis through notifications in the Gazette of India. The tariff rates are subject to numerous exemptions that vary according to the product, user, intended use, or specific export promotion program. This renders India's customs system complex and open to administrative discretion.

U.S. exporters have raised concerns regarding India's application of customs valuation criteria to import transactions. Indian customs officials sometimes reject the declared transaction value of an import, especially if it is a product for which India maintains benchmark prices, potentially raising the cost of exports beyond what is expected given India's applied tariff rates. U.S. walnut exporters have raised concerns that Indian importers are under-invoicing certain imported products, disadvantaging U.S. trade. U.S. companies have also faced extensive investigations related to their use of certain valuation methodologies when importing computer equipment. U.S. companies have reported being subject to extensive searches and seizures of imports that do not appear to be risk-based. India's customs authority generally requires extensive clearance documentation, which often leads to lengthy processing delays.

Medical Device Price Controls

India's National Pharmaceutical Pricing Authority (NPPA) caps prices of coronary stents. U.S. companies have raised concerns noting that price controls for cardiac stents do not differentiate on the basis of the cost of production or technological innovation, which dissuades U.S. companies from serving the market.

Ethanol Import Restrictions

Despite ambitious targets for blending ethanol with gasoline, India prohibits the importation of ethanol for fuel use. In addition, the DGFT restricts biofuel imports (HS 2207.20, HS 2710.20, and HS 3826) for non-fuel use to actual users. Since May 2019, the MOCI requires an import license for importing biofuels (HS

2207.20, HS 2710.20, and HS 3826). The MOCI also requires that Indian importers obtain an import license from DGFT to import ethanol for non-fuel purposes.

Agriculture Subsidies

India provides a broad range of subsidies to its large agricultural sector, including credit subsidies, debt waivers, crop insurance, and subsidies for inputs (such as fertilizer, fuel, electricity, and seeds) at both the central government and state government levels. These subsidies, which are of substantial cost to the government, lower the cost of production for India's producers and have the potential to distort the market in which imported products compete. In addition, producers of 25 agricultural products benefit from the government's Minimum Support Price (MSP) program, which utilizes one of the most production- and trade-distorting types of support, market-price support. Rice and wheat account for the largest share of products procured under the MSP program and are stockpiled and distributed through India's public stockpiling system. India's announcement of MSPs can have the effect of providing a subsidy to the entire crop by setting a price floor for India's farmers. The prices are announced before the planting season. Therefore, the MSP bolsters planting decisions, resulting in overproduction and limited demand for imports. In addition, in certain years and for specific products, states have provided additional incentives in the form of "bonuses" above the MSPs announced by the Government of India.

India's public food stockholding program is a large and complex series of programs designed to carry out multiple objectives. India's public stockholding programs are controversial because the government procures food grains and other commodities at guaranteed supported prices through MSP programs rather than at market prices. In the case of rice, in particular, India's excessive subsidization through market-price support has gone far beyond its domestic food security needs and has helped India secure its place as the top global exporter of rice, accounting for more than 40 percent of global rice exports in recent years. India has notified the World Trade Organization (WTO) that it is exceeding its WTO agricultural subsidy limits for rice for the last four years, but it claims the breach is covered under the 2013 interim WTO Ministerial Decision on Public Stockholding for Food Security Purposes. India is leading efforts at the WTO for an expanded permanent solution on public stockholding, which would allow all WTO developing country Members to use unlimited market-price support for purchases of any products associated with a public stockholding program. While WTO Members can procure unlimited quantities of food for public stockholding at market prices and the number of WTO Members utilizing market-price support for procurement is limited, India and others have framed the issue as a food security issue. In addition, in the past, India has used export subsidies to reduce government-held stocks and has permitted exports of certain agricultural commodities (*e.g.*, wheat) from government public-stockholding reserves at below the government's costs.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

The United States has discussed technical barriers to trade (TBT) matters with India through the TPF as well as at, and on the margins of, meetings of the WTO Committee on Technical Barriers to Trade (WTO TBT Committee).

Quality Control Orders for Chemicals and Other Materials

Since 2019, India has made a number of Bureau of India Standards (BIS) standards mandatory for chemicals and petrochemicals, for quality control purposes. India requires that these products have BIS marks before

importation, which can only be issued following a site visit by an Indian inspector to the manufacturing facility. The United States has concerns that stakeholders were not consulted during the development of many of these standards, and has also asked India to clarify timelines for transition periods and license validity. For example, in January 2020, India notified the WTO about the Polyethylene Material for Moulding and Extrusion Quality Control Order (QCO). In April 2021, the Ministry of Chemicals and Fertilizers published an order establishing an initial implementation date of October 15, 2021. The polyethylene QCO introduced and mandated labeling requirements based on the Indian Standard IS 7328:2020 for polyethylene material for molding and extrusion. The QCO requires manufacturers to label the smallest bag or individual unit package delivered to the customer with a “designation code” identifying a range of information about the packaged polyethylene product, such as grades, properties, and applications. This type of package labeling for polyethylene products, if implemented, would be unique to India. In March 2021, the U.S. Government raised concerns over the polyethylene QCO at the WTO, highlighting specific concerns regarding the complexity of the labeling requirements and offered an alternative solution to meet the requirements. The Ministry of Chemicals and Fertilizers implemented the QCO on January 4, 2024 and announced on January 5 that many of the products covered by the QCOs would be exempted. For those products still subject to the QCOs, U.S. industry has asked the Indian Department of Chemicals and Petrochemicals to issue clear guidelines and instructions to the Indian customs authority for both the QCO exemptions and QCO implementation so that imports are not unnecessarily delayed.

Alcoholic Beverages

In July 2019, the Food Safety and Standards Authority of India (FSSAI) published its Food Safety Standards (Alcoholic Beverages) Amendment Regulations and notified the amendments to the WTO. The amendments revised FSSAI’s 2018 mandatory alcoholic beverage standards, which took effect in April 2019. In June 2020, the FSSAI issued a directive to operationalize certain provisions of the standards, but has not clarified the timeline for enforcement of its amended regulations. Although the FSSAI addressed several of the issues that the United States raised with India, some concerns remain, including: (1) the establishment of analytical parameters for a range of naturally-occurring components in distilled spirits; (2) minimum and maximum requirements for ethyl alcohol; (3) the lack of explicit protection for Bourbon, American Rye Whiskey, and Tennessee Whiskey as distinctive products of the United States; and (4) a lack of clarity on definitions related to brand owners, date markings, non-retail containers, and multi-unit packs.

Mandatory Domestic Testing and Certification Requirements for Equipment

In September 2017, India’s Ministry of Communications, Department of Telecommunications, published the Indian Telegraph (Amendment) Rules, which require all telegraph equipment to undergo mandatory testing and certification. Under these rules, in 2019 India implemented the Mandatory Testing and Certification for Telecom Equipment (MTCTE) procedures, which require local security testing for telecommunication products. In May 2021, India’s Telecommunication Engineering Center proposed implementing procedures for the MTCTE program and then further expanded the scope in September 2021 to require mandatory testing for 175 products. U.S. industry remains concerned with the in-country testing and certification requirements. The United States, bilaterally through the TPF and multilaterally in the WTO TBT Committee, has urged India to reconsider its domestic testing and certification requirements; to accept test results from International Laboratory Accreditation Cooperation accredited labs; and, to adopt the use of the Common Criteria Recognition Arrangement.

The United States continues to raise concerns that U.S. electronics and information and communication technology manufacturers have expressed regarding the Ministry of Electronics and Information Technology’s (MEITY) Compulsory Registration Order (CRO). The policy, which took effect in January 2014, mandates that manufacturers register their products and have them certified by laboratories accredited

by the Bureau of Indian Standards, even if the products have already been certified by accredited international laboratories. In October 2021, India increased the coverage of the CRO to 63 product categories and U.S. stakeholders report MEITY plans to continue to expand the CRO coverage. U.S. stakeholders have cited the following as continued issues: lack of government testing capacity; a cumbersome registration process; canceled registrations due to administrative reasons that are unrelated to safety; and additional compliance costs that can exceed tens of millions of dollars, including costs associated with factory-level and component-level testing.

The U.S. Government has recommended that the Indian Government recognize internationally accredited labs, harmonize labeling requirements with global practices, harmonize the validity period of test reports and certification, and eliminate retesting requirements.

Sanitary and Phytosanitary Barriers

The United States has raised concerns about the science and risk basis for India's sanitary and phytosanitary-related trade barriers to food and agricultural imports in bilateral and multilateral fora, including the TPF, the WTO Committee on Sanitary and Phytosanitary Measures (SPS Committee), and the Codex Alimentarius Commission. The United States will continue to make use of all available fora with a view to securing the entry of U.S. agricultural products (including dairy products, alfalfa hay, dried distillers' grains, fish feed, and pet food) into the Indian market.

Agricultural Biotechnology

Products derived from modern biotechnology must be approved by the Genetic Engineering Appraisal Committee (GEAC) before importation or domestic cultivation. The Food Safety and Standards Act of 2006 includes specific provisions for regulating food products derived from genetically engineered (GE) products. India's biotechnology approval processes are slow, opaque, and subject to political influences and do not appear to take into account science-based approval processes for GE products in exporting countries. GEAC's uncertain approval process continues to hamper GE product registrations needed to facilitate trade in food and feed products.

Non-Genetically Modified and Genetically Modified-Free Certificates

In March 2021, the FSSAI implemented an order requiring a non-Genetically Modified (non-GM) origin and "Genetically Modified free" (GM-free) certificate for 24 listed products. Each consignment of these products entering India must be accompanied by (1) a non-GM origin and GM-free attestation on the phytosanitary or health certificate that contains the information specified in FSSAI's order of August 21, 2020, or (2) a non-GM origin and GM-free certificate issued by a regional (*i.e.*, state level) government authority of the exporting country. The 24 products include grains, oilseeds, fruits, and vegetable products, regardless of whether GE varieties of those crops are in commercial production or are being exported to India. India has not provided any scientific or risk-based justification for the requirement. The United States and several other countries have pressed India to rescind the requirement in comments submitted to the WTO TBT and SPS Committees, and continue to engage the Indian Government, including the FSSAI, on the order.

Certificate Requirements

In September 2022, the FSSAI issued a clarification notice to its earlier notification F. No. 1829/Health Certificate/FSSAI/Imports (2021). The notice states that the FSSAI will require a new health certificate for the import of milk and milk products, pork and pork products, and fish and fish products. The certificate contains a number of duplicate attestations already required by the Department of Animal Husbandry,

Dairying, and Fisheries, but also requires new attestations that are not relevant to food safety or based on science. India has indicated that it will continue to add additional commodities to the list of products that require the new certificate. The United States continues to engage with India on this issue.

Foreign Facilities Registration

As of February 2023, the FSSAI requires the competent authorities of exporting countries to provide a list of exporters of milk and milk products; meat and meat products, including poultry and fish; egg powder; infant food; and nutraceuticals to India in the mandated FSSAI format.

Dairy Products

India imposes onerous requirements on dairy imports. India requires dairy products intended for food be derived from animals that have not consumed feeds containing internal organs, blood meal, or tissues of ruminant origin and that exporting countries certify to these conditions. This requirement, along with the recent dairy health certificate requirements, new facility registration requirements, and high tariff rates continue to hamper market access for U.S. milk and dairy product exports to India, one of the largest dairy markets in the world. The U.S. Government continues to press the Indian Government, including through the TPF, to provide greater access to the Indian dairy market.

Distiller's Dried Grains with Solubles

India's regulatory requirements on distiller's dried grains with solubles (DDGS) remain unclear. Since 2015, the GEAC has received at least 11 applications from Indian importers to import U.S. DDGS. Local feed companies, along with the U.S. Government, continue to advocate that DDGS be exempted from further regulatory requirements, noting that DDGS are a processed product and pose no risk to the environment. In July 2018, the GEAC formed the Sub-Committee on Guidelines for Imports of Animal Feed to establish procedures for applications related to the imports of animal feeds, including DDGS. The Sub-Committee submitted recommendations for approval to the GEAC in November 2019. As of the January 2024 TPF Ministerial meeting, the GEAC has not officially confirmed that it will not regulate DDGS as living modified organisms.

In addition, unclear jurisdiction for the approval process for animal feed continues to complicate the process. For example, in December 2019, the FSSAI published Direction 1-95, announcing new requirements for commercial animal feeds and feed materials that are manufactured, imported, or distributed in India. Prior to the publication of Direction 1-95, however, the FSSAI had not regulated the manufacture, import, or distribution of either commercial animal feeds or feed ingredients in India. India may issue an administrative order to clarify the formal regulatory authority of animal feed in 2024.

Alfalfa Hay

The United States continues to pursue market access for alfalfa hay. The U.S. Department of Agriculture Animal and Plant Health Inspection Service and India's Ministry of Agriculture and Farmer's Welfare held several rounds of technical discussions to address India's import requirements. In 2021, India and the United States agreed to a framework for bilateral market access for several agricultural products, including conventional and GE alfalfa hay from the United States. In August 2022, the GEAC issued a "no objection" to imports of GE alfalfa hay from the United States, and referred the matter to the FSSAI. In October 2022, India's FSSAI raised concerns regarding the approval of GE animal feed imports, including alfalfa hay, impeding additional progress on this issue. The United States raised the issue at the 14th TPF Ministerial meeting in January 2024, and India indicated its intention to address import approvals of alfalfa hay and other feeds later in the year.

Poultry

In 2012, the United States commenced WTO dispute settlement proceedings against India's import prohibitions on various agricultural products from the United States, including poultry and poultry products, ostensibly due to concerns regarding avian influenza. The WTO panel and Appellate Body issued reports in favor of the United States. In 2016, the United States requested authorization from the WTO Dispute Settlement Body (DSB) to suspend concessions or other obligations on the grounds that India had failed to comply with the DSB recommendations within the "reasonable period of time" to which the parties agreed. The U.S. request was referred to arbitration. In April 2017, India requested the establishment of a compliance panel, asserting that it had enacted a revised avian influenza measure that complied with its WTO obligations. In September 2023, the United States and India announced an agreement to settle this dispute. As part of the agreement, India agreed to reduce tariffs on certain U.S. products, including frozen turkey, frozen duck, fresh blueberries and cranberries, frozen blueberries and cranberries, dried blueberries and cranberries, and processed blueberries and cranberries. On March 15, 2024, the parties notified a mutually agreed solution to the WTO.

Plant Health Issues

India maintains zero-tolerance standards for certain plant quarantine pests, such as weed seeds and ergot, that do not appear to be based on risk assessments and that constrain U.S. grain and pulse exports. Bilateral discussions to resolve these issues, including at the senior official level, have achieved little success.

India requires methyl bromide (MB) fumigation at the port of origin as a condition for the importation of pulses. This type of fumigation is not permitted in the United States, so the United States requested that India permit entry of U.S. peas and pulses subject to inspection and fumigation at the port of arrival, to which India acquiesced. India has granted a series of extensions allowing MB fumigation on arrival but has offered no permanent solution. In April 2018, the Indian Government confirmed the extension of the fumigation-upon-arrival waiver for U.S. peas and pulses, including chickpeas, indefinitely until both parties come to an understanding on the U.S. systems-based approach. The U.S. walnut industry requested a change to India's fumigation protocol to allow sulfuryl fluoride and phosphine in place of MB. However, the United States is still awaiting official approval of such change through notification in the Indian Gazette. Similarly, the United States is seeking approval for an alternative treatment to MB fumigation for U.S.-origin in-shell pecans, recommending either a cold treatment or a hot water bath treatment for in-shell pecans. The United States is awaiting a response from the Indian Ministry of Agriculture & Farmers Welfare's Directorate of Plant Protection, Quarantine and Storage as well as approval through notification in the Indian Gazette.

GOVERNMENT PROCUREMENT

India lacks an overarching government procurement policy and, as a result, its government procurement practices and procedures vary among different ministries within the central government. India provides procurement preferences to Indian micro-, small, and medium-sized enterprises and to state-owned enterprises. In defense procurements, India's offset program requires companies to invest 30 percent or more of the acquisition cost of contracts above the threshold value in Indian-produced parts, equipment, or services, which continues to be challenging for manufacturers of high-technology equipment to meet given changing rules and limited opportunities.

In June 2020, the Department of Promotion of Industry and Internal Trade issued the Public Procurement (Preference to Make in India) Order 2020, a revision to the 2017 procurement order mandating preferences

for domestically manufactured goods. The rule was updated again in September 2020 and took immediate effect, instructing each ministry or department to draft a follow-on procurement order that favors domestic suppliers, and permitting ministries and departments to mandate percentages that could be used to benefit Indian suppliers.

The August 2020 changes to General Financial Rules section 161 state that global tender enquiries may not be accepted under \$31 million and further reductions of the minimum requirements related to domestic production cannot be implemented without permission of an appropriate authority. Furthermore, companies must use a third-party or internal auditor to certify the amount of domestic production that will be used if the value is equal to or greater than 10 crore or 100 million rupees (approximately \$1.22 million).

In September 2020, the Ministry of New and Renewable Energy released an order reserving a list of 80 products, including solar cells, modules, wind turbines, and electrical equipment for hydro and biogas for bidding only by suppliers with 50 percent or more Indian content, irrespective of the purchase value. The Ministry of Power also reserved 78 products for local procurement through a similar order published in June 2021.

In April 2020, MEITY issued a notification that entities must procure cellular mobile phones only from local suppliers meeting the domestic production requirement of 50 percent, irrespective of purchase value. A September 2020 MEITY notification specified the mechanism for calculation of domestic production for: (1) desktop PCs; (2) thin clients; (3) computer monitors; (4) laptop PCs; (5) tablets; (6) dot matrix printers; (7) contact and contactless smart cards; (8) LED products; (9) biometric access control/authentication devices; (10) biometric fingerprint sensors; (11) biometric iris sensors; (12) servers; and (13) cellular mobile phones.

India is not a party to the WTO Agreement on Government Procurement, but has been an observer to the WTO Committee on Government Procurement since February 2010.

INTELLECTUAL PROPERTY PROTECTION

India remained on the Priority Watch List in the [2023 Special 301 Report](#) due to inconsistent progress on long-standing intellectual property (IP) concerns raised in prior Special 301 Reports. The [2023 Review of Notorious Markets for Counterfeiting and Piracy](#) (Notorious Markets List) includes physical and online marketplaces located in or connected to India. The United States and India continue to engage on a range of IP challenges facing U.S. companies in India with the intention of creating stronger IP protection and enforcement in India.

In the field of copyright, policy uncertainty and ineffective enforcement remain concerns. Copyright holders continue to report high levels of piracy, particularly online. Court cases and government memoranda raise concerns that a broad range of published works will not be afforded meaningful copyright protection. Amending Section 31D of the Indian Copyright Act to permit statutory licensing of interactive transmissions, as recommended by a Parliamentary committee in 2021, would have severe implications for copyright holders who make their content available online. The breadth of some licenses available under Chapter VI of the Indian Copyright Act and overly broad exceptions for certain uses have raised concerns regarding the strength of copyright protection in India. Amendments to the Indian Copyright Act needed to bring India's domestic legislation into alignment with international best practices are absent. India's decision in 2021 to abolish the Intellectual Property Appellate Board (IPAB) and redirect matters previously handled by the IPAB to courts has created uncertainty around adjudication of IP cases and copyright royalty rate setting.

In the field of patents, several factors negatively affect stakeholders' perception of India's overall IP regime, investment climate, and innovation goals. As of December 2023, patent applicants continue to face long waiting periods to receive patent grants, and excessive reporting requirements. Concerns remain with respect to whether Indian authorities will treat as confidential sensitive business information that parties are required to disclose on the current "Statement of Working of Patents" (Form 27). Among other concerns, the potential threat of patent revocations and the procedural and discretionary invocation of patentability criteria under the Indian Patents Act impact companies across different sectors. In the pharmaceutical sector, the United States continues to monitor the restriction on patent-eligible subject matter in Section 3(d) of the Indian Patents Act and its impacts. Pharmaceutical stakeholders continue to raise concerns as to whether India has an effective system for protecting against unfair commercial use and unauthorized disclosure of undisclosed test or other data generated to obtain marketing approval for pharmaceutical and agricultural chemical products. U.S. stakeholders also express concerns as to whether India has an effective mechanism for the early resolution of potential pharmaceutical patent disputes.

India's overall IP enforcement remains inadequate. U.S. brand owners also continue to report excessive delays in trademark opposition proceedings and a lack of quality in examination. Finally, U.S. and Indian companies have identified trade secret protection as a growing concern and expressed interest in eliminating gaps in India's trade secrets regime, such as through the adoption of trade secret legislation that comprehensively addresses these concerns.

SERVICES BARRIERS

Foreign investment in businesses in certain major services sectors, including financial services and retail, is subject to limitations on foreign equity, and foreign participation in professional services is significantly restricted. In addition, barriers to digital trade and electronic commerce, such as those imposed on electronic payment providers, have secondary effects on a wide variety of services.

Audiovisual Services

The Telecommunications Regulatory Authority's regulations on content aggregation and distribution do not allow bundling of channels or certain types of distribution partnerships. Content aggregation is commonly used internationally, as it allows niche and foreign content to be bundled and sold by domestic partners without a large local presence or sales force. These regulations cause difficulties for small and international content providers because these companies must interact with each of the 60,000 local cable operators, radio broadcasters, and television broadcasters they seek to target.

There are also some limits on foreign ownership in the audiovisual and media sectors, namely FM radio (49 percent), newspapers (26 percent), and digital media firms that upload and stream news and current affairs (26 percent).

Distribution Services

India imposes certain restrictions on foreign direct investment (FDI) in the retail industry. With respect to single-brand retail, foreign investments exceeding 51 percent are contingent on, among other things, a requirement to source at least 30 percent of the value of products sold from Indian sources. India has modified the requirements in recent years, including by allowing firms to offset the sourcing requirement by sourcing products from India for global supply chains.

India caps foreign ownership in the multi-brand retail sector at 51 percent and leaves to each Indian state the final decision on whether to authorize such FDI in its territory. In addition, where FDI is allowed, it is

subject to conditions, including: (1) a minimum investment of approximately \$100 million, at least 50 percent of which must be in “back-end infrastructure” (e.g., processing, distribution, quality control, packaging, logistics, storage, and warehousing); (2) a requirement to operate only in cities that have been identified by the relevant state government; and (3) a requirement to source at least 30 percent of the value of products sold from a subset of Indian enterprises. These conditions on foreign investment diminish the commercial incentive for multi-brand retailers seeking to invest in India’s retail sector.

India prohibits foreign investment in business-to-consumer (or “inventory-based”) electronic commerce. In February 2019, India implemented regulations that expressly prohibit subsidiaries of foreign-owned marketplace-based electronic commerce sites from selling products on their parent companies’ sites. The only exceptions for FDI in inventory-based electronic commerce are for food-product retailing and single-brand retailers that meet certain conditions, including the operation of physical stores in India.

Financial Services

Banking Services

Although India allows privately held banks to operate in the country, the banking system is dominated by state-owned banks, which account for approximately 60 percent of total market share and 67 percent of all Indian bank branches. Most privately owned banks are Indian owned, with foreign banks constituting less than 0.6 percent of the total bank branches in India. Under India’s branch authorization policy, foreign banks are required to submit their internal branch expansion plans on an annual basis and their ability to expand is hindered by non-transparent limitations established by the Indian Government on branch office expansion. India caps foreign ownership of private banks at 74 percent and public banks at 20 percent. Foreign ownership of infrastructure companies in the securities markets (such as stock exchanges, commodity exchanges, depositories, and clearing corporations) is limited to 49 percent.

Insurance Services

India maintains an unlevel playing field in the insurance market. State-owned companies are not subject to the same law and prudential supervision as private firms and enjoy various guarantees from the government. Currently, the Indian Government maintains an explicit sovereign guarantee on every Life Insurance Corporation (LIC) policy. As a result, many customers choose to buy LIC policies over those offered by private insurers, giving LIC an unfair competitive advantage.

In March 2021, India passed the Insurance (Amendment) Bill, 2021, which removed restrictions on foreign ownership and control of Indian insurance companies and increased the maximum foreign investment allowed from 49 percent to 74 percent. While this represented progress, the law instituted new limitations, such as calling for a majority of board members to be Indian residents and, if an insurer is incorporated or domiciled outside of India, to maintain a higher solvency requirement for foreign-invested insurers. These requirements also apply to any insurer incorporated in India that has at least 33 percent of its capital owned by investors domiciled outside India or 33 percent of the members of the governing body domiciled outside India.

In 2015, the Insurance Regulatory and Development Authority of India (IRDAI) issued a revision to its regulations governing the provision of reinsurance services in India. The regulations afforded Indian reinsurers a mandatory first order of preference (or right of first refusal) for reinsurance business in India. In 2017, the Reinsurance Experts Committee unanimously recommended that IRDAI implement a waiver process for life insurance products, which it did in 2019. Non-life reinsurance remains subject to a two-step procedure where foreign firms can offer terms to cedents, but every cedent must then first offer the best terms obtained to Indian reinsurers. This results in unequal treatment for foreign reinsurers and

consolidates risk in a small number of Indian reinsurers, which is counter to global best practices of global diversification of risk.

Electronic Payment Services

The United States has continued to raise concerns relating to informal and formal policies with respect to electronic payments services that appear to favor Indian domestic suppliers over foreign suppliers. In November 2020, the National Payments Corporation of India (NPCI), a state-owned company, announced a market share limitation of 30 percent (measured by transactions) for foreign electronic payment service suppliers processing online payments made through India's United Payment Interface (UPI), which is owned and operated by NPCI. Foreign digital payment companies were given until January 2023 to ensure their market shares met the 30 percent limit. The United States also has expressed concern over plans to expand the adoption of a National Common Mobility Card (NCMC) that only uses a domestic proprietary QR code standard, which disadvantages foreign suppliers. India has not yet shared the domestic qSPARC standard, effectively prohibiting firms from participating in the roll-out of the NCMC.

Professional Services

Legal Services

Membership in the Bar Council of India (BCI), the governing body for the legal profession, is mandatory to practice law in India and is limited to Indian citizens. In 2023, the BCI notified "Rules for Registration and Regulation of Foreign Lawyers and Foreign Law Firms in India, 2022" in the Gazette of India, creating the first step toward allowing foreign law firms to open offices in India for the practice of international and foreign-country law. Stakeholders have commented that the rules are limited in scope and ambiguous—including a clarification issued by the BCI shortly after the notification that appears to restrict international law firms to advising non-Indian clients only—which has limited the impact of the new rules on foreign firms' ability to operate in India.

Accounting Services

Foreign accounting firms face obstacles to entering the Indian accounting services sector. Only accounting firms structured as partnerships under Indian law may supply financial auditing services, and only Indian-licensed accountants may be equity partners in an Indian accounting firm.

Telecommunications Services

Satellite Services

India's Ministry of Information and Broadcasting maintains a preference for Indian satellites to provide capacity for direct-to-home (DTH) subscription television services. In practice, DTH licensees have not been permitted to contract directly with foreign satellite operators and have encountered procedural delays when they have sought to do so. Rather, DTH licensees must procure satellite capacity through Antrix, the commercial arm of the Indian Space Research Organization (ISRO), which in turn only permits foreign procurements if it does not have available capacity on Indian satellites. When ISRO does permit the use of foreign satellite capacity, the foreign satellite operator must sell the capacity to ISRO, which in turn resells the capacity to the end-user with a surcharge. The United States continues to encourage India to adopt an "open skies" satellite policy to allow consumers the flexibility to select the satellite capacity provider that best suits their business requirements and to promote market access for foreign satellite service providers.

BARRIERS TO DIGITAL TRADE

Electronic Payment Services

In 2018, the Reserve Bank of India (RBI) implemented a requirement that all payment service suppliers store all information related to electronic payments by Indian citizens on servers located in India. RBI announced this rule without advance notice or input from stakeholders. In 2019, RBI stated the requirement to store payments data locally also applied to banks operating in India. Foreign firms assert that the data storage requirement hampers the ability of service suppliers to detect fraud and ensure the security of their global networks.

Internet Services

In February 2021, the Indian Government published regulations, the Information Technology (Intermediary Guidelines and Digital Media Ethics Code) Rules, 2021 (IT Rules), to govern a wide range of Internet-based service providers, particularly those that operate social media, messaging, and news and entertainment content in India. The IT Rules require compliance by “significant” social media intermediaries and platforms with five million registered users or more. The IT Rules impose a number of requirements that U.S. stakeholders have identified as concerning. For example, the IT Rules impose personal criminal liability on individual employees in cases where a firm is not in compliance with the rules. The IT Rules also include imposition of impractical compliance deadlines and take-down protocols. Since 2021, U.S. firms have been subject to an increasing number of takedown requests for content and user accounts related to issues that appear politically motivated.

Digital Services Taxation

In 2017, India began assessing a six percent “equalization levy,” a withholding tax on foreign online advertising platforms, with the ostensible goal of equalizing the playing field between resident service suppliers and non-resident service suppliers. However, its provisions do not provide credit for tax paid in other countries for the service supplied in India. The Fiscal Year 2020-2021 budget included an expansion of the equalization levy, adding a two percent digital services tax (DST) on foreign electronic commerce and digital services providers.

The United States and India, along with 137 other jurisdictions, have joined the October 8, 2021, OECD/G20 Inclusive Framework on Base Erosion and Profit Shifting [Statement on a Two-Pillar Solution to Address the Tax Challenges Arising from the Digitalization of the Economy](#), which called for all Parties to commit not to introduce DSTs in the future. On November 24, 2021, the United States and India issued [statements](#) reflecting a political agreement on a transitional approach to India’s DST during the implementation period of Pillar 1 of the Two-Pillar solution. Under this agreement and in defined circumstances, the liability from India’s DST that U.S. companies accrue in India during the interim period will be creditable against future taxes due under Pillar 1 of the OECD agreement. The period during which the credit accrues is from April 1, 2022, until the earlier of either the implementation of Pillar 1 or March 31, 2024. In return, the United States committed to terminate the Section 301 trade action on goods of India and not to impose further trade actions against India with respect to its existing DST until the earlier of the date the Pillar 1 multilateral convention comes into force or March 31, 2024. In coordination with the U.S. Department of the Treasury, USTR continued to monitor the implementation of the political agreement and the transitional approach agreed to by India.

OTHER BARRIERS

Transparency

A lack of transparency continues to affect new and proposed laws and regulations, as well as a lack of uniform notice and comment procedures and inconsistent notification of these measures to the WTO. This, in turn, inhibits the ability of domestic and foreign stakeholders and foreign governments to provide input on new proposals or to adjust to new requirements. U.S. stakeholders continue to report that new requirements are issued with inadequate public notice and comment periods and/or inadequate consultation or notification at the WTO. The U.S. Government continues to raise concerns regarding uniform notice and comment procedures with the Indian Government bilaterally through the TPF and multilaterally in the WTO and other fora.

INDONESIA

TRADE AGREEMENTS

The United States–Indonesia Trade and Investment Framework Agreement

The United States and Indonesia signed a Trade and Investment Framework Agreement (TIFA) on July 16, 1996. The TIFA is the primary mechanism for discussions of trade and investment issues between the United States and Indonesia.

IMPORT POLICIES

Tariffs and Taxes

Tariffs

Indonesia's average Most-Favored-Nation (MFN) applied tariff rate was 8 percent in 2022 (latest data available). Indonesia's average MFN applied tariff rate was 8.6 percent for agricultural products and 7.9 percent for non-agricultural products in 2022 (latest data available). Indonesia has bound 96.3 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 37.1 percent.

Over the last decade, Indonesia has increased its applied tariff rates for a range of goods that compete with locally manufactured products, including electronic products, milling machines, chemicals, cosmetics, medicines, wine and spirits, iron wire and wire nails, and a range of agricultural products. Most Indonesian tariffs on non-agricultural goods are bound at 35.5 percent, although tariff rates exceed 35.5 percent or remain unbound on automobiles, iron, steel, and some chemical products. In the agricultural sector, tariffs on more than 1,300 products have bindings at or above 35.5 percent.

In 2020, Indonesia issued Minister of Finance (MOF) Regulation No. 199/2019 to lower the price threshold for import duty exemptions on imported consumer goods (known as consignment goods) from \$75 to \$3. Certain types of books, bags, garments, and footwear are exempted from the regulation.

U.S. stakeholders have asserted that Indonesia continues to apply tariffs in excess of its WTO bound rates for certain categories of information and communication technology products. For example, despite having a WTO bound rate of zero percent for Harmonized System (HS) code subheading 8517, which includes switching and routing equipment, Indonesia appears to be applying a 10 percent duty for these products.

MOF Regulation No. 96/2023, effective on October 17, 2023, imposed new tariff rates on cosmetics, bicycles, watches, and other iron and steel goods. The new rates followed related regulations issued earlier in 2023. Currently, the types of products subject to Indonesia's new tariff rates are bags (15 percent to 20 percent), textile products (5 percent to 25 percent), footwear/shoes (5 percent to 30 percent), cosmetics (10 percent to 15 percent), iron and steel goods (zero percent to 20 percent), bicycles (25 percent to 40 percent), and watches (10 percent).

Taxes

U.S. stakeholders continue to express concerns about the MOF's Directorate General of Taxes' tax assessment process. Such concerns include: a non-transparent and cumbersome auditing process; heavy

finances for administrative mistakes; lengthy dispute mechanisms; and, a lack of legal precedent within the Tax Court.

MOF Regulation No. 110/2018 increased withholding tax rates for 1,147 imported products, including consumer and luxury goods. The stated objective for this policy is to decrease Indonesia's current account deficit by reducing imports of these goods.

Indonesia's current excise tax regime imposes higher excise tax rates on imported spirits than on domestic spirits. The excise tax rates for imported products are 150 percent on spirits and 90 percent on wine.

MOF Regulation No. 41/2022, effective April 1, 2022, increased the number of imported items that are subject to a prepayment of income tax at the time of import under Income Tax Article 22. The regulation adds HS codes for 716 categories of imported goods subject to income tax at a rate of 10 percent of the transaction value. The regulation lists 1,188 HS codes subject to income tax at a rate of 7.5 percent and seven HS codes with an income tax at a rate of 0.5 percent. Stakeholders have raised concerns that the process of claiming a return of excess pre-paid income tax at the time of import can take multiple years and considerable effort.

Non-Tariff Barriers

Import Licensing

Indonesian importers must comply with numerous, overlapping import licensing requirements that impede market access. The Ministry of Trade (MOT) requires all importers to obtain an import license as either an importer of goods for further distribution (API-U) or as an importer for their own manufacturing (API-P); importers are not permitted to obtain both types of licenses. An API-P import license allows companies to import finished products for market testing, after sales service purposes, or for "completing a product line", if the goods are new, consistent with the company's business license, and meet import requirements. Under Government Regulation (GR) No. 29/2021, importers must also obtain a business identification number (NIB) through the new Online Single Submission processing system intended to streamline business license issuance. An NIB can also serve as a valid import license.

MOT Regulation No. 20/2021, amended by MOT Regulation No. 25/2022, aims to synthesize all import-related regulations and serve as an "umbrella" regulation for the management of Indonesia's import policies. The regulation also sets forth a requirement that import licenses for certain commodities be issued based on their commodity balance.

Presidential Regulation No. 32/2022 further provides for a commodity balance policy. The commodity balance policy makes the issuance of import licenses subject to an Indonesian Government assessment of supply and demand for a commodity. The policy was initially implemented for 2022 import licenses for five commodities (sugar, rice, fish, meat, and salt) at the end of 2021. The policy was expanded to cover 19 additional commodities in 2023. Stakeholders have expressed concern regarding the Indonesian Government's lack of stakeholder consultation on this policy.

MOT Regulation No. 20/2021, amended by Regulation No. 25/2022, imposes additional burdensome import licensing requirements for cell phones, handheld computers, and tablets. (*For further information, see the Services Barriers section.*)

Under MOT Regulation No. 68/2020, and its amendment, Regulation No. 78/2020, Indonesia requires import approvals for footwear, electronic devices, and bicycles (except such products imported for market

testing or after sales service purposes) with the stated goal of reducing the volume of consumer goods entering Indonesia in favor of local production.

Import Licensing for Agricultural Products

Despite amending its import licensing regimes several times, Indonesia continues to maintain unjustified licensing regimes for the importation of horticultural products, animals, and animal products. In 2013, the United States challenged Indonesia's restrictions under the WTO's dispute settlement procedures because Indonesia repeatedly failed to address U.S. Government concerns. On December 22, 2016, the WTO issued the panel report, finding for the United States and co-complainant New Zealand on all 18 claims and finding that Indonesia was applying import restrictions and prohibitions that were inconsistent with WTO rules. The WTO Appellate Body subsequently upheld the panel's findings.

Since the Appellate Body report, Indonesia has amended its import licensing requirements several times. Through the issuance of Minister of Agriculture (MOA) Regulation No. 2/2020, imports of horticultural products from countries with a food safety system recognized by the MOA are exempt from the requirement to provide certain quality and safety certificates. This regulation also extends the validity of horticultural product import licenses for 60 days into the following calendar year. MOA Regulation No. 5/2022 affirms the requirement for imported horticultural products to have an import recommendation (RIPH). However, MOT Regulation No. 25/2022 provides that the issuance of import licenses does not require RIPH and will instead be issued on the basis of available supply and demand data if the commodity balance has not been determined.

In 2023, imported agricultural products subject to licensing requirements by government-determined commodity balances include sugar, rice, fish, meat, salt, and corn. Indonesia has not provided a comprehensive list of agricultural products that will be subject to this policy in the future. U.S. stakeholders report that they need to adapt constantly to changing, and often conflicting, implementing regulations from numerous ministries. The United States remains concerned about the lack of transparency in Indonesia's import licensing system for agricultural products and the repeated delays in importers receiving licenses, especially at the start of each calendar year.

Pharmaceutical Market Access

The U.S. pharmaceutical industry has raised concerns regarding the opportunity for meaningful stakeholder engagement in the Indonesian pricing and reimbursement system. Stakeholders report a lack of clarity regarding: how pharmaceutical products are selected for listing on the Indonesian online public procurement catalog system; how price caps are determined; and, whether, and for how long, such products will remain listed.

MOH Regulation No. 1010/2008 requires a foreign pharmaceutical company either to manufacture locally or to entrust another company that is already registered as a manufacturer in Indonesia to obtain drug approvals and import permits on its behalf.

Presidential Regulation No. 10/2021 limits traditional medicine to domestic ownership only. MOH Regulations No. 1010/2008 and No. 1120/2008 state that all foreign pharmaceutical companies operating in the country must manufacture medicines locally or form a partnership with a local manufacturer in order to register or trade their own products.

In January 2023, the Indonesian Government issued Presidential Decree No. 6/2023, requiring medicines, biological products, and medical devices sold in Indonesia and their manufacturing methods (including associated materials, manufacturing processes, storage, and packaging) to be halal certified. The regulation

requires Class D medical devices to be halal certified by October 2039. Stakeholders have expressed concern over the administration of the system, which they contend has lacked adequate consultative processes and does not follow internationally negotiated halal systems.

Import Bans and Other Restrictions

Indonesia tightly controls and regulates imports of sugar and other food commodities, including through annual quantitative import limits based on domestic production and consumption forecasts. Sugar refineries are permitted to import raw sugar based on annual allocations intended to offset idle refining capacity. Some food and beverage companies are permitted to import limited volumes directly, but there remains an expectation to first utilize refined domestic sugar. These import restrictions increase the price of sugar (and other commodities) across the domestic economy. As noted in the import licensing section above, sugar is one of the five commodities subject to the commodity balance policy initially implemented in 2022 per Presidential Regulation No. 32/2022.

State Trading

Presidential Regulation No. 66/2021 established Indonesia's National Food Agency (BAPANAS). BAPANAS is a minister-level institution that directly reports to the Indonesian President and has the authority to coordinate all food- and agriculture-related ministries and agencies, such as the MOA, MOT, Ministry of Industry (MOI), and the state-owned procurement body the Bureau of Logistics (BULOG).

Indonesia imposes restrictions on feed corn imports, limiting the right to import to BULOG. However, some corn imports intended for starch manufacturing are allowed. As Indonesia's sole importer of feed corn, BULOG prioritizes corn distribution to small-holder poultry farmers. The import volume is set based on the level of domestic feed production. Feed millers other than the small-holders who receive corn from BULOG are obligated to use locally-produced feed corn. They have expressed concern that they are unable to obtain feed corn in quantities sufficient to maintain the poultry industry's growth.

BULOG also maintains exclusive authority to import standard unbroken rice. Indonesia has cited food security and price management considerations as the principal objectives of this policy. BULOG is not allowed to import rice before, during, or immediately after the main harvest period. Private firms are only allowed to import broken rice for processing or specialty rice varieties, such as basmati and jasmine rice, for retail and food service. Importers of broken and specialty rice must obtain a special MOA importer identification number. Since 2014, MOA has refused to issue import recommendations for japonica rice to private traders.

Presidential Regulation No. 125/2022 on Government Food Reserves states that BULOG is appointed as Indonesia's sole importer of rice, feed corn, and soybean for government food reserves. Additionally, through MOT Regulations No. 57/2017 and No. 7/2020, and BAPANAS Regulation No. 5/2022, the Indonesian Government sets farmer-level and consumer-level reference prices for corn, soybeans, sugar, shallots, beef, chicken, eggs, and cooking oil, respectively. According to these regulations, BULOG and other state-owned enterprises can intervene in the market when prices are above or below threshold targets. In 2023, BAPANAS tasked BULOG with importing 500,000 metric tons (MT) of feed corn, of which 20,000 MT arrived mid-November 2023. BAPANAS also tasked BULOG to import soybeans for 2024 government soybean reserves.

Customs Barriers and Trade Facilitation

Indonesia notified its customs valuation legislation to the WTO in 2001, but has not responded to the Checklist of Issues describing how the WTO Customs Valuation Agreement (CVA) is being implemented.

U.S. firms continue to report that Indonesian customs officials rely on a schedule of reference prices to assess duties on some imports. Rather than using transaction values as the primary basis of valuation, as required by the CVA, Indonesia's Directorate General of Customs and Excise reportedly makes a valuation assessment based on the perceived risk status of the importer and the average price of the same or a similar product imported during the previous 90 days, rather than based on the transaction value of the good.

MOT Regulation No. 20/2021, amended by MOT Regulation No. 25/2022, requires preshipment verification by designated companies (known in Indonesia as surveyors) for a broad range of products. These include: electronics; textiles and footwear; toys; food and beverage products; and, cosmetics. As of December 31, 2023, Indonesia had yet to notify these measures to the WTO pursuant to the WTO Agreement on Preshipment Inspection.

On December 14, 2022, Indonesia published MOF Regulation No. 190/PMK.04/2022, The Transfer of Self-Consumed Goods, which establishes customs operations for intangible goods, including procedural requirements and classification under Chapter 99 of the Indonesian tariff schedule. The regulation has been in force since January 14, 2023. Stakeholders report that the regulation creates significant administrative burdens on U.S. industries by imposing a new paperwork retention requirement that is undefined and uncertain. The United States raised its concerns about this measure at the WTO Committee on Trade Facilitation in June and October 2023.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

Standards and Testing Requirements

MOI Regulation No. 24/2013, as amended by MOI Regulations No. 55/2013 and No. 29/2018, requires that imported toys be tested by a laboratory with a mutual recognition agreement (MRA) with one of Indonesia's product certification bodies. The United States is not aware of any existing MRAs, leaving imported toys subject to mandatory testing in Indonesia in order to obtain certification. U.S. stakeholders have expressed concern about the discriminatory frequency of testing under these regulations, which is required on a per-shipment basis for imports, but only every six months for domestically produced products. MOI Regulation No. 29/2018 introduced an alternative procedure that allows importers to obtain a certification through product testing and an audit of production processes. Indonesia notified this measure to the WTO in November 2018. U.S. manufacturers remain concerned by the lack of clarity about how products can enter the market under the alternative procedure.

In February 2021, Indonesia issued GR No. 28/2021, which requires in-country conformity assessment testing for a wide variety of consumer goods including toys, electronics, and home appliances. GR No. 28/2021 requires that all steps of product testing be conducted by an Indonesian national residing in Indonesia, further complicating product sample collection for products that use a per-shipment testing scheme. The implementing regulation to GR No. 28/2021, MOI Regulation No. 45/2022, entered into force in November 2022, two months prior to its notification to the WTO in January 2023. U.S. stakeholders have reported that the requirements under GR No. 28/2021 have made conformity assessment processes more difficult.

Halal Import Requirements

Under Law No. 33/2014, on Halal Product Assurance, halal certification is mandatory for food, beverages, pharmaceuticals, cosmetics, medical devices, biological products, genetically engineered products, consumer goods, and chemical products sold in Indonesia. All business processes, including production, storage, packaging, distribution, and marketing, are required to comply with this law, which also requires non-halal information to be placed on packaging for non-halal products. The Halal Product Assurance Organizing Agency (Badan Penanggulangan Jaminan Produk Halal, or BPJPH), under the Ministry of Religious Affairs (MORA), leads the implementation of halal certification.

As Indonesia continues to develop regulations to implement Law No. 33/2014, U.S. stakeholders are concerned that Indonesia finalized many of these regulations before notifying the draft measures to the WTO and taking stakeholder comments into account, as required under the WTO Agreement on Technical Barriers to Trade, and as more specifically recommended by the WTO Committee on Technical Barriers to Trade (WTO TBT Committee). MORA Regulation No. 26/2019, which initially set out the transition period for halal requirements, was notified to the WTO in October 2019. MORA Decree No. 748/2021, which outlines a broad range of products requiring halal certification, was notified to the WTO in July 2021, after it had already been adopted in June 2021. Indonesia notified MORA Decree No. 1360/2021 to the WTO in January 2022, but the measure had already entered into force in December 2021.

In November 2023, Indonesia notified to the WTO additional halal regulations that had already been finalized, failing to provide its trading partners the opportunity to provide comments. BPJPH Decree No. 20/2023 enumerates the criteria for Indonesia's halal product assurance system; however, the WTO notification did not provide an effective date. BPJPH Decree No. 77/2023, which states the guidelines for ruminant and poultry slaughter, had already entered into force in September 2023. BPJPH Decree No. 78/2023, which outlines the guidelines for the halal certification of processed food and beverages for direct consumption at restaurants and catering services and requires companies to secure halal certification for products containing non-haram ingredients, also had already entered into force in September 2023. An amendment to BPJPH Decree No. 141/2021, on the determination of service rates for the BPJPH public service agency, had entered into force two years prior, in December 2021.

In addition, Indonesia notified to the WTO in November 2023 two draft regulations concerning guidelines for the accreditation of foreign halal certifying bodies (HCBs) and/or conformity assessments, and the establishment of an HS codification of food and beverage product types required to be halal certified. The United States is concerned that the proposed accreditation regulations create redundant document requests, increasingly onerous requirements for auditors to qualify for scopes, and a new scope-to-auditor ratio policy, all of which are increasing costs and unnecessarily delaying accreditation procedures for U.S. HCBs.

GR No. 39/2021, a revision to the implementing regulations first published in 2019, maintains the original timeline for phasing in mandatory halal certification, including for: food and beverage products (by October 2024); traditional medicines and food supplements, cosmetics, chemical products, and genetically modified organisms, wearable clothing items, household appliances, office products, and class A medical devices (by October 2026); for over-the-counter medicines and class B medical devices (by October 2029); and, for prescription medicines and class C medical devices (by October 2034). In January 2023, Presidential Decree 6/2023, on Halal Certification of Medicines, Biological Product, and Medical Devices, was issued, requiring class D medical devices to be halal certified by October 2039. Also known as the halal positive list, MORA Decree No. 1360/2021 is a living document that includes ingredients or materials that are not required to obtain halal certification.

In accordance with MORA Regulation No. 2/2022, on International Cooperation on Halal Product Assurance, U.S.-based HCBs are eligible to apply directly to BPJPH for recognition, which is required for

HCBs to issue halal certificates for U.S. exports. As of December 31, 2023, BPJPH officials had assessed five U.S. HCBs. The final step to obtaining recognition is for each HCB to conclude an MRA with BPJPH and receive a certificate of accreditation. As of December 31, 2023, BPJPH had accredited one U.S. HCB. Four others are in the process of completing BPJPH's final requirements for recognition.

The United States continues to raise concerns with the implementing regulations for Law No. 33/2014 at the WTO TBT Committee.

Product Testing

Indonesia's National Agency of Drug and Food Control (BPOM) sets out requirements for testing of heavy metals in cosmetics in its Regulation No. 12/2019 which replaced Regulation No. 17/2014. A 2016 BPOM Circular Letter provided additional guidance on the requirements, which are fulfilled through a certificate of analysis that is valid for one year. In practice, Indonesia's Directorate General of Customs and Excise requires each shipment to provide a separate test in addition to the certificate of analysis. These measures appear to be intended to limit imports.

Sanitary and Phytosanitary Barriers

Facility Registration for Animal-Derived Products

Indonesia's animal health and husbandry law (Law No. 18/2009, as amended by Law No. 41/2014) requires companies that export to Indonesia animal-derived products, such as meat, dairy and eggs, to complete a pre-registration process with the MOA. The law allows imports of these products only from facilities that Indonesian authorities have individually approved. MOA Regulation No. 15/2021 maintains this requirement and adds a new provision requiring raw materials used for the manufacturing of animal-derived products to originate from facilities that have already been approved by Indonesia.

Under MOA Regulation No. 15/2021, all establishments seeking to export animal products to Indonesia must undergo inspections to obtain eligibility certificates. As part of this process, and based on GR No. 28/2023, the MOA charges fees for a desk audit of application materials, an on-site facility inspection, and a post-audit desk review. Dairy production facilities are required to pass lengthy technical desk audits. Among all trading partners' registration requirements, U.S. exporters identify Indonesia's as the most burdensome. Other facilities (*i.e.*, meat and rendering) are required to undergo on-site facility inspections and post-audit desk reviews. Indonesia charges fees for transportation and lodging costs for MOA officials conducting inspections in the United States. In total, companies seeking to export to Indonesia could pay more than \$10,000 for each facility's onsite inspection and post-audit desk review. Many of the U.S. companies affected are small businesses that report that the fee is a significant barrier.

GOVERNMENT PROCUREMENT

Indonesia grants special preferences to encourage domestic sourcing and to maximize the use of domestic production in government procurement. It also instructs government departments, institutes, and corporations to utilize domestic goods and services to the maximum extent feasible. Presidential Regulations No. 54/2010 (as amended by Regulation No. 16/2018) and No. 38/2015 both require procuring entities to maximize domestic production in procurement, use foreign components only when necessary, and to designate foreign contractors as subcontractors to local companies. Both regulations provide general minimum requirements for domestic production and service provision. Depending on the sector or nature of the project, ministries with authority over the project may impose additional restrictions or requirements.

Indonesia's 2012 Defense Law and Presidential Regulation No. 76/2014 mandate priority for domestic materials and components and require defense agencies to use domestically produced goods and services whenever available. In addition, when an Indonesian Government entity procures from a foreign defense supplier due to lack of availability from an Indonesian supplier, there is a requirement for trade balancing offsets, including by incorporation of domestic production, production offsets, technology transfer, or a combination thereof.

In June 2021, the Indonesian Government had suspended imports of 79 medical device product categories from the government's electronic-catalog (e-Katalog) with minimal notice and without prior stakeholder consultation. Since that time, U.S. stakeholders have frequently raised concerns about their products being withheld from public hospital purchases under the e-Katalog and requested the Indonesian Government allow a sufficient grace period for the transition to local production, assuring patient access to safe and high-quality medical devices. In response, Indonesia offered limited exceptions to mitigate possible disruptions, but has not issued guidelines that companies can use to request exception.

Indonesia is not a Party to the WTO Agreement on Government Procurement, but has been an observer to the WTO Committee on Government Procurement since October 2012.

INTELLECTUAL PROPERTY PROTECTION

Indonesia remains on the Priority Watch List in the [2023 Special 301 Report](#). Although Indonesia has recently taken steps to improve intellectual property (IP) protection and enforcement, including expanding an IP enforcement task force and increasing efforts to address online piracy, significant concerns remain.

Widespread copyright piracy and trademark counterfeiting (including online and in physical markets) are key concerns. The Mangga Dua Market in Jakarta continues to be listed in the [2023 Review of Notorious Markets for Counterfeiting and Piracy](#) (Notorious Markets List), along with multiple online Indonesian marketplaces. Lack of enforcement remains a problem, and the United States urges Indonesia to utilize the IP enforcement task force to improve enforcement cooperation among relevant law enforcement agencies and ministries. The United States also continues to encourage Indonesia to provide an effective system for protection against the unfair commercial use, in addition to unauthorized disclosure, of undisclosed test or other data generated to obtain marketing approval for pharmaceutical and agricultural chemical products. The United States also remains concerned about Indonesia's law regarding geographical indications.

In March 2023, Indonesia amended its 2016 Patent Law through the Omnibus Law on Job Creation to address certain issues related to local manufacturing and use requirements. Indonesia is in the process of further amending the Patent Law, and the United States continues to urge Indonesia to address remaining concerns, including with respect to the patentability criteria and disclosure requirements for inventions related to traditional knowledge and genetic resources.

The United States also continues to urge Indonesia to fully implement the bilateral Intellectual Property Rights Work Plan and plans continued engagement with Indonesia under the United States–Indonesia TIFA to address these issues.

SERVICES BARRIERS

Audiovisual Services

Indonesia's 2009 Film Law imposes a 60 percent screen quota for Indonesian films. In 2019, the Minister of Education and Culture issued Regulation No. 34/2019, which if enforced, would prohibit dubbing foreign films and prohibit foreign companies from distributing or exhibiting films.

Distribution Services

Logistics services generally are subject to a maximum 49 percent foreign ownership, except for freight forwarding, warehousing and storage services, and distribution, which are capped at 67 percent foreign ownership.

Express Delivery Services

Indonesian law requires that suppliers of intercity courier and express delivery services be majority owned by Indonesians, and that foreign suppliers limit their activities to provincial capitals with international airports and seaports.

Financial Services

Indonesia's central bank, Bank Indonesia (BI), restricts foreign ownership in private credit reporting firms to 49 percent under BI Circular Letter No. 15/49/DPKL.

Under BI Regulation No. 18/40/PBI/2016 on payment transaction processing operations, BI limits foreign ownership of payment companies to 20 percent (but exempts existing investments that exceed this foreign equity limitation).

BI Regulation No. 19/08/2017 on the National Payment Gateway (NPG) requires all domestic retail debit and credit transactions to be processed through NPG switching institutions located in Indonesia and licensed by BI. The regulation imposes a 20 percent foreign equity limitation on firms that wish to obtain a switching license to participate in the NPG, prohibiting the cross-border supply of electronic payment services for domestic retail debit and credit card transactions. BI Regulation No. 19/10/PADG/2017 mandates that foreign firms form partnership agreements with licensed Indonesian NPG switches in order to process domestic retail transactions through the NPG. BI must approve such agreements, and the regulation makes approval contingent on the foreign partner firm supporting development of the domestic industry, including by technology transfer.

Under BI Regulation No. 21/2019, Indonesia established national standards (termed QRIS, or Quick Response Code Indonesian Standard) for all payments using QR codes in Indonesia. U.S. companies, including payment providers and banks, noted concern that during BI's QR code policymaking process, international stakeholders were neither informed of the nature of the potential changes nor given an opportunity to explain their views on such a system, including how it might be designed to interact most seamlessly with existing payment systems.

Indonesia issued BI Regulation No. 22/23/PBI/2020, effective July 2021, to implement BI's 2025 Payment System Blueprint. The umbrella regulation establishes a risk-based categorization of payment system activities and a licensing system. The regulation implemented an 85 percent foreign ownership cap for non-bank payment service operators, also known as front-end payment companies, but foreign investors

may only hold 49 percent of voting shares. The foreign ownership cap for payment system infrastructure operators, or back-end companies, remains at 20 percent. Existing investors are exempted from the old requirements so they may continue to have higher amounts of foreign equity. BI Regulations No. 23/6/PBI/2021 (for front-end payment companies) and No. 23/7/PBI/2021 (for back-end payment companies) went into effect July 2021, and continue to apply foreign ownership rules in accordance with BI Regulation No. 22/23/PBI/2020. Stakeholders have expressed concern regarding BI's lack of consultation prior to issuance of regulations.

In May 2023, BI mandated that government credit cards be processed through the NPG and required the use and issuance of local government credit cards. U.S. payment companies are concerned the new policy will limit access to the use of U.S. electronic payment options.

Health Services

Problematic sectoral regulations remain in place in the healthcare sector, including regulations that require foreign-owned hospitals to have more inpatient beds than is required for domestic hospitals.

Franchising and Retail Distribution Services

Under MOT Regulation No. 71/2019, retail companies are required to prioritize the use of domestic goods and services unless domestic products do not meet a franchisor's quality standards. MOT Regulation No. 23/2021 requires modern shops to set aside promotion areas for products produced by micro-, small, and medium-sized enterprises (MSMEs) and requires business owners with more than 150 stores to franchise their business.

Telecommunications Services

Indonesia has issued a number of measures that make it difficult to import cellular and Wi-Fi equipped products. To support the commodity balance policy, Indonesia issued MOT Regulation No. 20/2021, as amended by MOT Regulation No. 25/2022. Importers are required to become a registered importer to sell directly to retailers or consumers. To qualify for an MOT import license, Indonesia requires importers to provide evidence of contributions to the development of the domestic device industry, or evidence of cooperation with domestic manufacturing, design, or research firms. Companies seeking to import 4G and beyond technology-enabled devices may only do so under a producer's license (API-P), which is generally held by importers of unfinished goods intended for use in the manufacturing process, limiting the ability of foreign producers to sell these devices in Indonesia. Importers are also required to submit product identification numbers and a corresponding certificate from the Ministry of Communications and Information Technology (MCIT). Industry stakeholders have complained that it takes months to get a decision on license requests.

U.S. companies have reported that, in some cases, the MOI is informally limiting import quantities under existing licenses (issued under MOI Regulation No. 108/2012) to protect locally manufactured cell phones, handheld computers, and tablets. Importers of any type of cell phone, handheld computer, or tablet are also subject to MOI Regulation No. 68/2016, which requires importers to obtain an MOI recommendation to establish themselves as registered importers of such devices. A recommendation is only available for local manufacturers, importers in a joint venture with a local manufacturer, or importers of specialized items. Altogether, Indonesia's licensing practices impose significant barriers on the importation of cellphones, handheld devices, and other electronic devices.

BARRIERS TO DIGITAL TRADE

Internet Services

GR No. 71/2019 (GR 71) requires private sector electronic system operators (ESOs) to facilitate supervision by government agencies, including by granting access to electronic systems and data for monitoring and law enforcement purposes. The MCIT issued implementing regulations for GR 71, Regulation No. 5/2020 and Regulation No. 10/2021, which required private sector ESOs, including those providing services on a cross-border basis, to register with the MCIT by July 2022, or be subject to blocking. Failure to comply with government takedown orders for a potentially broad category of prohibited electronic information can also result in blocking. Stakeholders voiced concerns over the lack of clarity of content classifications that fall within the scope of prohibited content, lack of an appeal and adjudication mechanism, and limited turnaround time for ESOs to respond to the MCIT's takedown request. The MCIT intends to impose administrative sanctions under GR 71, which will be further regulated under the draft GR on Non-Tax State Revenue.

MOT Regulation No. 50/2020 requires foreign electronic commerce operators that have either 1,000 transactions in or 1,000 packages delivered to Indonesia per year to appoint a representative in Indonesia and/or register for an electronic commerce foreign business license. Stakeholders have voiced concerns that these requirements, particularly establishing a local representative, create unnecessary burdens for carrying out business operations in Indonesia.

INVESTMENT BARRIERS

Presidential Regulation No. 10/21, as amended by Presidential Regulation No. 49/2021, identifies certain sectors subject to foreign ownership limitations. Foreign investment is limited to 49 percent for enterprises engaged in publishing newspapers and magazines, postal services, and air, land, and sea transportation. Foreign investment is limited to 20 percent for broadcasting service suppliers and certain financial service suppliers. Foreign investment is prohibited for certain activities such as fish processing and shipbuilding.

SUBSIDIES

Indonesia has not submitted a subsidy notification to the WTO since 2019 and has only made one such notification since joining the WTO in 1995.

According to the WTO Secretariat Report on Indonesia's 2020 Trade Policy Review, Indonesia continues to provide fiscal and non-fiscal incentives for manufacturing and exports in connection with its export processing zones and special economic zones programs. These include incentives related to corporate income tax, property tax, import duty, value-added tax, excise and luxury taxes, and local taxes, in addition to assistance on land acquisition, licensing, investment, and labor. Non-tax incentives in the form of loans and interest rate subsidies continue to be available mainly to domestic MSMEs. Additionally, Indonesia provides various forms of official export financing, insurance, and guarantees through the state-owned Indonesia Eximbank and Asuransi Ekspor Indonesia. The United States will continue to urge Indonesia to submit a WTO notification for all of its subsidy programs.

OTHER BARRIERS

Although the Indonesian Government and the Corruption Eradication Commission investigate and prosecute high-profile corruption cases, many stakeholders continue to view corruption as a significant barrier to doing business in Indonesia. Other barriers to trade and investment include: poor coordination

within the Indonesian Government; the slow pace of land acquisition for infrastructure development projects; poor enforcement of contracts; an uncertain regulatory and legal framework; arbitrary tax assessments; and, lack of transparency in the development of laws and regulations. U.S. stakeholders seeking legal relief in contract disputes have reported that they are often forced to litigate spurious counterclaims and have raised growing concern about the criminalization of contractual disputes.

Export Restrictions

As part of the implementation of the 2009 Mining Law, Indonesia prohibits nickel ore exports, one of several recent measures restricting exports of raw materials. The United States has expressed concerns about the impact this measure will have on the stainless steel industry amid ongoing multilateral efforts to address global excess capacity in the steel sector. On December 11, 2019, the United States requested to join consultations initiated by the European Union concerning the consistency of the export ban with Indonesia's WTO obligations and participated in subsequent panel proceedings as a third party. The panel report for this dispute was circulated on November 30, 2022; the panel found Indonesia's export ban on nickel ore to be inconsistent with its WTO obligations. Indonesia filed a notice of appeal on December 12, 2022.

Energy and Mining

In the oil and gas sector, GR No. 79/2010, as amended by GR No. 27/2017, allows the Indonesian Government to change the terms of certain existing production-sharing contracts; eliminate the tax deductibility of certain expenses; change the terms and criteria for cost recovery; and place limits on allowable costs for goods, services, and salaries.

ISRAEL

TRADE AGREEMENTS

The United States–Israel Free Trade Agreement

The United States–Israel Free Trade Agreement (FTA) entered into force on August 19, 1985. Israel implemented phased tariff reductions, culminating in the complete elimination of duties on all non-agricultural products by January 1, 1995. While Israel has eliminated tariffs on non-agricultural goods as agreed, tariff and non-tariff barriers continue to affect a significant number of key U.S. agricultural product exports.

To address the differing views between the two countries over how the FTA applies to trade in agricultural products, in 1996 the United States and Israel signed an Agreement on Trade in Agricultural Products (ATAP), which established a program of gradual and steady market access liberalization for food and agricultural products effective through December 31, 2001. The United States and Israel completed negotiation and implementation of a successor ATAP in 2004, which granted improved access for select U.S. agricultural products. Originally scheduled to last through December 31, 2008, the 2004 ATAP has been extended 16 times, most recently through December 31, 2024, to allow time for the negotiation of a successor agreement. The current ATAP provides U.S. food and agricultural products access to the Israeli market under one of three categories: unlimited duty-free access, duty-free tariff-rate quotas (TRQs), or preferential tariffs, which are set at least 10 percent below Israel’s Most-Favored-Nation (MFN) rates.

The United States and Israel meet regularly to review the implementation and functioning of the FTA and to address outstanding issues. The United States–Israel Joint Committee is the central oversight body for the FTA and last met on May 24, 2023.

IMPORT POLICIES

Tariffs

Israel’s average Most-Favored-Nation (MFN) applied tariff rate was 3.4 percent in 2022 (latest data available). Israel’s average MFN applied tariff rate was 11.7 percent for agricultural products and 2.1 percent for non-agricultural products in 2022 (latest data available). Israel has bound 75.6 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 22.6 percent.

U.S. agricultural exports that do not enter duty free under World Trade Organization (WTO), FTA, or ATAP provisions face barriers, such as high tariffs and a complicated TRQ system. These products include higher-value goods that are sensitive for the Israeli agricultural sector, such as dairy products, fresh fruits, fresh vegetables, almonds, wine, fresh and frozen fish, and some processed foods. In 2022, Israel’s Ministry of Finance issued a decree that began a gradual reduction or elimination of tariffs on many agricultural products, including dairy, meat, fresh fruit, and vegetables as part of the Israeli Government’s agricultural reform. Stakeholders estimate that full market access in agriculture could result in increases in U.S. exports to Israel of a variety of agricultural products.

GOVERNMENT PROCUREMENT

Israel has offset requirements that it implements through international cooperation (IC) agreements. Under IC agreements, foreign companies that have been awarded government contracts are required to offset

foreign goods or services provided under the contracts by agreeing to localization commitments that require one of the following: (1) investment in local industry; (2) co-development or co-production with local companies; (3) subcontracting to local companies; or (4) purchasing from Israeli industry.

Israel is a Party to the WTO Agreement on Government Procurement (GPA).

Since January 1, 2009, the IC offset percentage for procurements covered by Israel's GPA obligations has been 20 percent of the value of the contract, 35 percent for procurements excluded from GPA coverage, and 50 percent for military procurements. Under the revised GPA, which entered into force in 2014, Israel began phasing out offsets in 2020 and will eliminate offsets by 2029.

U.S. suppliers have indicated that they believe that the size and nature of their offset proposals can be a decisive factor in close tender competitions, despite an Israeli court decision that prohibits the consideration of offset proposals in determining the award of a contract. Small and medium-sized U.S. exporters often are reluctant to commit to making purchases in Israel in compliance with the IC agreements. As a result, their participation in Israeli tenders is limited.

The inclusion of unlimited liability clauses in many government tenders discourages U.S. firms from competing. When faced with the possibility of significant legal costs for unforeseeable problems resulting from a government contract, most U.S. firms choose to insure against the risk, which raises their overall bid price and reduces their competitiveness, as compared to bids from Israeli firms.

The United States–Israel Reciprocal Defense Procurement Memorandum of Understanding (MOU) is intended to facilitate defense cooperation, in part by allowing companies from both countries to compete on defense procurements in both countries on as equal a basis as possible, consistent with national laws and regulations. The MOU, which has benefited Israeli defense industries by opening up the U.S. procurement market to Israeli products, has not significantly opened the Israeli market for U.S. suppliers interested in competing for Ministry of Defense procurements. Tenders open to U.S. suppliers require the company to have a local agent or bank account to be able to transact in New Israeli Shekels (NIS).

INTELLECTUAL PROPERTY PROTECTION

The United States remains concerned with certain issues involving Israel's protection and enforcement of intellectual property rights. On copyright protection, although Israel is a signatory to the World Intellectual Property Organization (WIPO) Copyright Treaty and the WIPO Performances and Phonograms Treaty, Israel has not ratified either. U.S. stakeholders have raised concerns regarding the adequacy of the protection Israel provides against the unfair commercial use, as well as the unauthorized disclosure, of undisclosed test or other data generated to obtain marketing approval for pharmaceutical products.

JAPAN

TRADE AGREEMENTS

The United States–Japan Trade Agreement (USJTA) and the United States–Japan Digital Trade Agreement (USJDTA) entered into force on January 1, 2020. The United States and Japan continue to monitor implementation of these agreements.

On March 28, 2023, the United States and Japan signed the Agreement Between the Government of the United States of America and the Government of Japan on Strengthening Critical Minerals Supply Chains (Agreement). The Agreement will strengthen and diversify critical minerals supply chains and promote the adoption of electric vehicle battery technologies. In particular, the Agreement formalizes the shared commitment of the United States and Japan with respect to the critical minerals sector to facilitate trade, promote fair competition and market-oriented conditions for trade in critical minerals, advance robust labor and environmental commitments, and cooperate in efforts to ensure secure, sustainable, and equitable critical minerals supply chains. The Agreement entered into force immediately upon signature.

The United States continues to urge Japan to remove a broad range of barriers to U.S. exports, including barriers at the border, as well as other barriers to entering and expanding the presence of U.S. products and services in the Japanese market. The United States continues to utilize the United States–Japan Partnership on Trade mechanism as an important vehicle for raising bilateral trade concerns.

IMPORT POLICIES

Tariffs

Japan’s average Most-Favored-Nation (MFN) applied tariff rate was 3.9 percent in 2022 (latest data available). Japan’s average MFN applied tariff rate was 13.4 percent for agricultural products and 2.4 percent for non-agricultural products in 2022 (latest data available). Japan has bound 99.7 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 4.6 percent.

While Japan’s average MFN applied tariffs are relatively low for non-agricultural products, certain high tariffs have a negative impact on a range of U.S. industrial goods exports to Japan, such as chemicals, fish, wood products, and jewelry.

Japan is the fourth largest single-country market for U.S. agricultural products, with U.S. exports valued at approximately \$12.0 billion in 2023, despite the existence of tariff and substantial non-tariff market access barriers. While the USJTA removed or reduced tariffs on approximately 90 percent of U.S. food and agricultural exports, there are several important products for which tariffs remain high and limit U.S. market access, including: rice and rice products; certain dairy products; beverages, including mineral waters and fruit juices; processed foods and pet food; table grapes; frozen blueberries; sugar, chocolate, and sweetened cocoa powder.

Fish and Seafood

U.S. fish and seafood exports to Japan totaled \$665 million in 2023. However, tariffs of 3.5 percent to 10.0 percent on several fish and seafood products, such as pollock, herring, salmon, whiting, cod, and fish oil, hamper U.S. exports and reduce margins of Japanese importers who rely on U.S. raw product for their processing operations. Other market access issues include Japan’s import quotas on Alaska pollock and

surimi, cod, Pacific whiting, mackerel, sardines, squid, herring, pollock roe, cod roe, scallops, and kelp. While Japan has reduced tariffs, increased import quota volumes, and eased the administrative burdens associated with those quotas, the remaining import quotas and tariffs continue to present barriers to U.S. exports. U.S. companies report that the process of obtaining quota allocation is expensive and subject to frequent delays. The United States has urged Japan to take further action to reduce and eliminate obstacles to U.S. exports of fish and seafood.

Leather and Footwear

Japan maintains high tariffs on leather, footwear, and travel goods, ranging from 3.5 percent to an *ad valorem* equivalent of approximately 130.0 percent on certain footwear imported from the United States. For example, Japan continues to apply tariff-rate quotas (TRQs) to a limited and tightly controlled volume of leather footwear imports. The tariffs on out-of-quota imports are either 30 percent or ¥ (yen) 4,300 (approximately \$29) per pair, whichever is higher. These tariffs can more than double the cost of imports and negatively affect market access for U.S.-made footwear. Japan also applies TRQs on some raw hides and skins. The United States continues to seek improved market access for U.S. exports in this sector.

Non-Tariff Barriers

Rice

Japan's highly regulated and nontransparent system of importation and distribution for rice limits the ability of U.S. exporters to have meaningful access to Japan's consumers. Japan has established a global TRQ of 682,200 metric tons (on a milled basis) for imported rice. The Grain Trade and Operations Division of the Ministry of Agriculture, Forestry, and Fisheries (MAFF) Crop Production Bureau manages the TRQ through periodic ordinary minimum access (OMA) tenders and through simultaneous-buy-sell (SBS) tenders. Imports of U.S. rice under the OMA tenders are destined almost exclusively for government stocks. The MAFF releases these stocks exclusively for non-table rice uses, such as industrial food processing, animal feed, and re-export as food aid. Under SBS tenders, only a small amount of U.S. rice imported into Japan—still identifiable as U.S. rice—reaches Japanese consumers. In recent years, SBS tenders have not been filled due partly to the non-market-based price markup that the MAFF imposes on TRQ imports.

Although Japan asserts that the markup is set using supply and demand figures and world pricing, it has not changed the markup since 2018. U.S. rice exports currently make up only about 4 percent of all rice consumed in Japan. The United States will continue to monitor Japan's rice import system in light of Japan's WTO import commitments and engage with Japan on its SBS markup for rice.

Wheat

Japan requires food wheat to be imported through the Grain Trade and Operations Division of the MAFF's Crop Production Bureau to secure the lowest tariff rate. The Crop Production Bureau resells the wheat to Japanese flour millers at prices substantially above import prices by imposing a markup. The United States continues to carefully monitor Japan's operation of its state trading entity for wheat and its potential to distort trade.

Pork

U.S. pork exports to Japan are subject to a trade-distorting "gate price mechanism" that functions as a variable levy. To prevent lower-priced imports from competing with Japanese pork, the mechanism levies progressively higher duties on lower-priced imports. For instance, chilled and frozen pork are subject to a specific duty of up to ¥125 per kilogram (approximately \$0.89 per kilogram) based on the difference

between the actual import value and a government-established reference price. This duty is in addition to an *ad valorem* duty that is charged on all chilled and frozen pork, regardless of import value. With the implementation of the USJTA, the variable levy under the pork gate price mechanism is being reduced over time for U.S. pork, but not eliminated.

Ethanol

In April 2023, Japan implemented a revised Biofuels Standard that will allow the United States to provide up to 100 percent of Japan's annual on-road biofuels target of 500 million liters crude oil equivalent. Under the previous standard, the United States was restricted to supplying no more than 66 percent of Japan's annual on-road biofuels target. However, the new Biofuels Standard did not increase the annual biofuels target volume, which has remained unchanged since 2017. The United States continues to urge Japan to increase its annual biofuels target volume to a level that would allow Japan to achieve at least an E3 blend rate (97 percent gasoline and 3 percent bioethanol) and further reduce its greenhouse gas emissions in the transportation sector.

Customs Barriers and Trade Facilitation

Expanding Japan's advance rulings system to address more customs issues would improve transparency and predictability for U.S. exporters. The United States continues to urge Japan to improve the speed of customs processing and to reduce the complexity of customs and border procedures. (*For further information, see the Services Barriers section.*)

SANITARY AND PHYTOSANITARY BARRIERS

Food Safety

Regulatory Oversight

As part of an overall effort to streamline management of issues relating to health and infectious disease, the Government of Japan will shift food safety standard administration (under the Food Sanitation Act) from the Ministry of Health, Labour and Welfare (MHLW) to the Consumer Affairs Agency (CAA). The Diet, Japan's national legislature, passed legislation for this purpose in 2023, and the transfer of responsibility was to occur on April 1, 2024. However, responsibility for monitoring and inspection of domestic and imported foods will remain with the MHLW. The United States will monitor implementation and development of regulations to ensure continued science-based regulatory decision-making and a level playing field for U.S. exports of food products to Japan.

Pre- and Post-Harvest Fungicides

Japan classifies fungicides applied pre-harvest as pesticides and classifies fungicides applied post-harvest as food additives. These different classifications based on the time of application lack a discernable science-based rationale. Because post-harvest fungicides are classified as food additives, Japan requires products treated with them to be labeled at the point of sale with a list of fungicides used. This requirement does not have a significant impact on domestic producers because Japanese farmers selling their produce domestically do not need to treat that produce for long-distance distribution and generally apply fungicides prior to harvest. The requirement may disadvantage U.S. products, however, because it wrongly suggests that competing Japanese products have not been treated with fungicides.

Maximum Residue Limits

Japan's procedures for enforcement of maximum residue limits (MRLs) result in uncertainty for shippers, including those who have never violated Japan's standards. Japan imposes enhanced surveillance on all imports from an exporting country following one MRL violation by one exporter. If a second violation is detected during the enhanced surveillance period, Japan will detain and test all shipments of that product from the exporting country, holding shipments until residue testing proves compliance. A violation by a single producer from one country is not indicative of violations by other producers from that same country. The United States continues to urge Japan to adopt a risk-based approach to addressing individual MRL violations, and apply measures to all shipments from a particular country when evidence indicates a systemic, country-wide program.

Beef and Beef Products

On May 17, 2019, Japan eliminated age-related restrictions on the cattle from which U.S. beef and beef product exports to Japan are derived, thereby allowing use of cattle that are 30 months of age and older. However, Japan maintained the requirement that U.S. exporters must hygienically remove those tissues Japan defines to be specified risk materials (SRMs). Japan's definition of SRMs is more restrictive than the World Organisation for Animal Health (WOAH) guidelines provide for countries with a negligible risk for bovine spongiform encephalopathy (BSE), as well as the U.S. Department of Agriculture Food Safety and Inspection Service (FSIS) regulations. Specifically, Japan requires that all parts of the head, other than tongues, cheek meat (Masseter muscle), and skins, be removed. Notably, this excludes head meat, which is allowed under WOAH guidelines and FSIS regulations. This restriction has necessitated the retention of an extra-regulatory third-party verification program, as FSIS does not verify the removal of the additional tissues. When Japan eliminated its age-related restrictions, the United States pressed Japan to align its SRM definition with WOAH guidelines for countries with a negligible risk for BSE. The United States continues to seek Japan's alignment with international guidelines.

Plant Health

Table-Stock Potatoes

U.S. potato exports to Japan are currently limited to chipping potatoes. In March 2020, the United States submitted an official request to Japan for market access for table-stock potatoes. In September 2023, Japan provided the final pest list for table-stock potatoes. The United States continues to engage with Japan on this market access request.

Apples

In 2017, the United States submitted an official request to export apples to Japan under a systems approach, which would provide Japan with a comparable level of phytosanitary protection to Japan's current regulatory approach and eliminate costly pest-mitigation requirements for U.S. exporters. The United States will continue to engage with Japan and provide capacity building on the requested systems approach.

Stone Fruit

In August 2021, Japan granted market access for U.S.-grown Japanese plum varieties, but Japan continues to impose costly fumigation requirements even though without them an appropriate level of phytosanitary protection can be provided to Japan. The United States will continue to engage with Japan on phytosanitary topics related to U.S. stone fruit, including the U.S. market access request for peaches and revision of the fumigation monitoring requirements for U.S. plums.

GOVERNMENT PROCUREMENT

Japan is a Party to the WTO Agreement on Government Procurement (GPA).

Japan is obligated to open its GPA-covered government procurement tenders to goods, services, and suppliers from the United States and other GPA Parties. U.S. companies in several sectors have expressed concern that the Japanese Government sometimes uses technical specifications that could exclude U.S. products and services and, in some cases, may exert pressure on various entities to select domestic companies for procurement opportunities. The United States has expressed these concerns to Japan as they have arisen and will continue to engage with Japan to address these concerns.

INTELLECTUAL PROPERTY PROTECTION

Japan generally provides strong intellectual property (IP) protection and enforcement, although a number of concerns remain.

In 2023, Japan amended its Copyright Act in a manner that may adversely affect individual creators. Under the amendment, where the copyright holder is not known, users have greater rights to engage in use of those works. For individual creations on the Internet, it is often difficult to contact the copyright holders; therefore, the amendment may facilitate use of those works relative to others by identifiable creators. Under the new system of “unmanaged works arbitration,” Japan will establish a contact organization to respond to user consultations and inquiries. Users will be granted temporary use by paying compensation and fees equivalent to the usage fee of this contact organization. The maximum period of use is three years, renewable by reapplying. Japan will also create a cross-disciplinary database of copyrighted works to allow searching for copyright holders. This new system is not envisioned to come into force until 2026. The United States will continue to monitor developments in this area.

On October 1, 2022, an amendment to Japan’s Trademark Act came into force that addresses concerns over Japan’s personal use exemption for imported goods, which had been used increasingly to send counterfeit items to individuals in Japan via postal and courier services. Pursuant to the amendment, items imported from “overseas vendors” for personal use fall within the scope of the Trademark Act; counterfeits imported in this manner are subject to seizure. The United States is continuing to monitor the implementation and enforcement of the amendment to determine whether it reduces the import of counterfeit goods into Japan.

Japanese and foreign products are eligible for geographical indications (GIs) protection in Japan. Japan also has recognized numerous GIs pursuant to international agreements. Exchanges of lists of terms pursuant to international agreements have resulted in Japan’s granting automatic GI protection to certain terms without sufficient transparency or due process. The United States continues to monitor implementation of Japan’s GI system, as well as implementation of its recent agreements with the European Union and other trading partners with respect to GIs.

SERVICES BARRIERS

Express Delivery

The United States remains concerned by unequal conditions of competition between Japan Post Co. and international express delivery suppliers. Private U.S. express carriers are required to declare all shipments for customs clearance and calculate duties and consumption taxes based on cost. Different procedures apply to Japan Post Co., as duty assessment is based on Express Mail Service (EMS) shipment rules.

Japan Post Co. is regulated by a single agency—the Ministry of Internal Affairs and Communications (MIC), whereas private express delivery companies are subject to rules imposed by various ministries, including the Ministry of Finance; the MHLW; the MAFF; and, the Ministry of Land, Infrastructure, Transport, and Tourism. The United States continues to urge Japan to equalize customs procedures and requirements.

Insurance Services

Postal Insurance and Banking

The United States has longstanding concerns about the negative impact of Japan Post Insurance on competition in Japan’s insurance market and continues to closely monitor the implementation of reforms. The United States continues to urge Japan not to allow Japan Post Bank and Japan Post Insurance to expand the scope of their operations before a level playing field is established.

Insurance Cooperatives

Kyōsai (insurance cooperatives) hold a substantial share of the insurance business in Japan. Some *kyōsai* are regulated by their respective agencies of jurisdiction (*e.g.*, the MAFF or the MHLW) instead of by Japan’s Financial Services Agency (FSA), which regulates all private sector insurance and financial services companies. These separate regulatory schemes create a nontransparent regulatory environment and afford *kyōsai* critical business, regulatory, and other advantages over their private sector competitors. The United States remains concerned about limited FSA supervisory authority over *kyōsai*.

Professional Services

Educational Services

Japan does not treat foreign universities’ Japanese campuses as equivalent to domestic higher education institutions for tax, scholarship, and research grant purposes. This has harmed the ability of such degree-granting campuses to compete for students and faculty and deterred other U.S. universities from launching full four-year degree programs. Despite extensive consultations with authorities, no U.S. university has been able to satisfy all the legal requirements to be granted “educational corporation” (*gakkō hōjin*) status, which would confer the same tax benefits enjoyed by Japanese universities. The requirement that such corporations be “independently administered” (*i.e.*, not subject to direct administration by the parent university in the home country) is a particularly difficult legal hurdle to overcome. Lack of *gakkō hōjin* status also means foreign satellite universities are excluded from participation in Japanese Government grant programs that promote international exchange and provide financial support for study abroad, and their faculties are excluded from applying for government-funded and other research grants on the same basis as faculty at other Japanese universities.

Legal Services

In 2020, the Japan Fair Trade Commission (JFTC) introduced protections for certain attorney-client communications, a departure from Japan’s general absence of such protections. However, the scope of protected confidential attorney-client communications is extremely limited, protecting only legal advice under the Antimonopoly Act regarding alleged antitrust cartels, which involve price-fixing, market allocation, and bid rigging. In principle, only an external lawyer’s advice to a client is protected. An in-house lawyer’s advice might be protected only if the in-house lawyer is working independently from the enterprise itself. In addition, only legal advice by lawyers qualified in Japan is protected. Legal advice

from foreign lawyers (even if they are registered in Japan as a Registered Foreign Lawyer) is not protected. The rules further protect communications only for documents that are carefully segregated from other unprotected documents. The United States will continue to monitor developments and support fuller recognition of attorney-client privilege by the JFTC.

Telecommunications Services

Telecommunications Business Act

U.S. and foreign services operators in Japan, including those offering only streaming and cloud-based services, became subject to regulation under Japan's Telecommunications Business Act (TBA) in April 2021. Businesses that undertake intermediate communications with users in Japan, including providers of cross-border services, must register as telecommunications providers with the MIC, appoint a representative or agent physically domiciled in Japan, and comply with regulations imposed on domestic operators under the TBA, including disclosure and reporting obligations.

Spectrum Auctions

Unlike most advanced economies, Japan does not use auctions to allocate spectrum for commercial mobile services. Allocation decisions are at the discretion of the MIC and are based on consultation with the Radio Regulatory Council and consideration of plans submitted by the operators. The factors that the MIC uses to evaluate applications have raised questions about the fairness of the allocation process. On March 31, 2022, the MIC released an interim report on the use of auctions to allocate spectrum for a limited number of frequency bands. On November 25, 2022, the MIC released a summary of discussions held with an advisory council, laying out a policy direction introducing a "conditional auction" for allocation of then-underutilized millimeter wave bands or frequency bands that need to be shared with other wireless systems, in addition to the current allocation system. The conditional auction would still allow the MIC discretion to account for certain conditions such as area coverage when allocating spectrums. In March 2023, the MIC launched a task force to study the introduction of a spectrum auction system for millimeter wave.

Renewable Energy

Renewable energy growth in some regions of Japan has been constrained by lack of electricity grid capacity. Laws implemented in 2020 require the legal unbundling of the transmission and distribution business from the power generation and retail business, but incumbent utility companies still own and operate most of the transmission and distribution grids in Japan through wholly owned subsidiaries. These utility companies reportedly overstate actual grid usage and understate available capacity to prevent competition from new entrants. Many of the utility companies are also holding unused space on the grid for long-idled nuclear power reactors. Incumbent transmission utilities are required to allow power producers to connect to their power facilities unless they have a justifiable reason to deny the request. Given real grid capacity constraints in some regions, utilities have begun offering renewable generation "non-firm" transmission contracts, which allow generators to connect to the grid and use available grid capacity in exchange for a higher risk of curtailment during times of congestion. In order to ensure that renewable energy is used to the fullest extent possible, the Ministry of Economy, Trade, and Industry is considering changes to the curtailment order that would favor renewable energy generation.

SUBSIDIES

Japan maintains numerous support programs at the national, prefectural, and municipal levels that may favor domestic logs and wood products over imports. To increase the supply of domestic wood products

from 34 million cubic meters in 2021 to 42 million cubic meters in 2030, Japan allocated ¥49.9 billion (approximately \$330 million) for the Emergency Measures to Utilize Domestic Forest Resources and Strengthen the International Competitiveness of the Wood Industry from the 2022 MAFF supplemental budget. Furthermore, in 2023 Japan allocated ¥169 billion (approximately \$1.13 billion) under the Forest Management Project to support domestic thinning and selective logging operations. In addition, Japan has provided funding for local governments to manage unprofitable forestlands. Starting in 2024, Japan will begin to collect the Forest Environment Tax from each Japanese taxpayer to cover the cost of this program (approximately ¥60 billion, or \$400 million, per year). The United States is monitoring the disbursement of these funds and other support programs.

OTHER BARRIERS

Transparency

Advisory Groups

Advisory councils and other government-commissioned study groups enjoy significant power in Japan's regulatory process that sometimes goes beyond providing advice and recommendations. The United States continues to urge Japan to follow good regulatory practices and ensure transparency with respect to the formation and operation of advisory councils by adopting new requirements to ensure ample and meaningful opportunities for those not on advisory councils and study groups to participate in, and directly provide input to, the regulatory process.

Public Comment Procedure

The United States remains concerned about inadequate implementation of public comment procedures by Japanese ministries and agencies. In 2023, stakeholders flagged several instances where comment periods for regulations or guidelines were non-existent, unnecessarily short, or occurred at the same time as major national holidays. In other cases, comments did not appear to have been adequately considered given the brief time between the end of the comment period and the issuance of a final rule or policy. While the United States acknowledges recent instances when Japanese ministries allowed comments to be submitted in English and provided an appropriate amount of time for parties to draft, finalize, and submit their comments, for example METI's Draft Guidelines for Corporate Takeovers, the United States stresses the need for Japan to improve the system, such as by lengthening the standard public comment period for rulemaking, more broadly and consistently.

Automotive

The United States has expressed strong concerns with the overall lack of access to Japan's automotive market for U.S. automotive companies. A variety of non-tariff barriers impede access to Japan's automotive market, and overall sales of U.S.-made vehicles and automotive parts in Japan remain low. Non-tariff barriers include the non-acceptance of U.S. Federal Motor Vehicle Safety Standards certification as providing an equivalent level of protection as the Japanese vehicle safety standards; unique standards and testing protocols; unique spectrum allocation for short-range vehicle communications systems; a lack of opportunities for input by interested persons throughout the process of developing regulations; and hindrances to the development of distribution and service networks.

Japan aims to transition to 100 percent clean energy vehicles, including electric vehicles, hybrid vehicles, and fuel cell electric vehicles (FCVs), sold in Japan by 2035. Japan provides a purchase subsidy of up to ¥850,000 (approximately \$5,700) for traditional battery electric vehicles (BEVs). However, FCVs, which

are primarily produced by Japanese companies, receive a much higher subsidy than BEVs, of up to ¥2.55 million (approximately \$17,000), depending on the size of the vehicle. Until May 2022, Toyota had a 100 percent market share in Japan for FCVs, making this subsidy almost entirely directed toward one Japanese company.

Japan provides another incentive of up to ¥250,000 (approximately \$1,700) for vehicles equipped with power feeding technology that allows vehicles to send stored power back into a home in the event of power outages. This subsidy was implemented in March 2022 with little lead time, but few non-Japanese companies produce vehicles equipped with this specific technology, giving a competitive advantage to Japanese automotive manufacturers. Japan also provides subsidies for vehicle charging stations but requires compliance with CHAdeMO, a charging standard originally developed in Japan and supported by Japanese industry groups. Although this standard was previously used in earlier model electric vehicles in other countries, Japanese automakers in 2023 joined U.S. and European automakers in endorsing other standards for their sales in North America, Europe, and China. This leaves Japan as an outlier on charging technology and disincentivizes foreign automakers and charging suppliers from operating in Japan by requiring outdated technology in order to receive the subsidy.

Japan does not permit use of the global standard of 433.92 MHz radio frequency for Short Range Vehicle Communication Systems, which includes remote keyless entry (RKE) and tire-pressure monitoring systems (TPM). Japan has allocated the frequency primarily to amateur radios and has expressed concern that its use in vehicles will cause interference for the amateur radio community. As a result, U.S. automakers must modify their products for the Japanese market. To address this longstanding concern of U.S. automakers over Japan's spectrum allocation, the MIC launched the 433.92 MHz TPM-RKE System Ad Hoc Group (AH Group) on July 13, 2023, to study potential sharing of the frequency between automakers and amateur radio users.

Medical Devices and Pharmaceuticals

Japan's Price Maintenance Premium (PMP) system, introduced in 2010, adds price premiums to innovative new drugs and protects this price throughout the patent life of a medicine. In the 2018 pricing cycle, Japan made changes to its PMP rules that significantly reduced the number of innovative products and companies that received the full benefit of the PMP. In particular, several of the criteria that were used in PMP calculations appeared to make it easier for Japanese companies to qualify for top premiums and were unrelated to the degree of innovation of the individual product under consideration. However, the fiscal year 2024 National Health Insurance Drug Pricing System Reform Framework that was instituted for the 2024 pricing cycle made several promising adjustments to the PMP rules, including abolishment of these company criteria.

U.S. industry has also raised serious concerns regarding the lack of transparency and predictability in government decision-making. For example, the scope of the pharmaceutical annual price cut policy implemented in 2021 went far beyond any options put forward by the MHLW, and there was no opportunity for public comment prior to its formal announcement. In addition, in recent years, the MHLW has been consolidating medical device product functional categories for price determination with little explanation and little time for key stakeholders to respond. U.S. industry is concerned about the lack of more frequent and meaningful opportunities to provide input regarding Japan's reimbursement rules, as well as other policies of critical importance to the biopharmaceutical and medical device industries.

The United States continues to urge Japan to solicit and consider the input of all stakeholders, including U.S. stakeholders, when developing any measures related to reimbursement policies, and to follow transparent processes in the present and future development of any new policies and measures. The United States also continues to urge Japan to take into account relevant international standards in the development

of its regulations in clinical development, multiregional clinical trials, and risk management. In November 2023, Japan announced it would relax its requirement of “in principle” drug testing on Japanese people before a drug’s release in the domestic market, a policy that is unique to Japan. However, the phase III local testing requirement will remain for some drugs with strong side effects, representing a continuing concern.

Nutritional Supplements

Japan regulates nutritional supplements as a part of a loosely defined “health food” subcategory of foodstuffs, unlike in the United States, where “dietary supplements” are regulated by the U.S. Department of Health and Human Services Food and Drug Administration (FDA) under different regulations than “conventional” foods. Japan has taken steps to streamline import procedures and improve access in this market. U.S. nutritional supplement manufacturers must follow Japanese health claim systems that are often duplicative in nature.

Japan’s CAA establishes three categories for both domestic and imported products under the Food with Health Claims system: Food with Function Claims (FFC); Foods for Specified Health Uses (FOSHU); and Foods with Nutrient Function Claims (FNFC). Most U.S. nutritional supplement products are unable to obtain either FOSHU approval or FNFC designation due to FNFC’s standards and specifications, which limit the range of nutritional ingredients such as vitamins and minerals that can qualify as FNFC. Vitamin and mineral products designated under the FNFC system are excluded from the FFC system.

Quasi-Drugs

Quasi-drugs are defined in Japan’s Act on Securing the Quality, Efficacy and Safety of Products Including Pharmaceuticals and Medical Devices (PMD Act) as products with limited amounts of officially recognized active ingredients and are generally classified in the United States as over-the-counter drugs (for example, anti-acne products) or cosmetic products (for example, anti-aging products). U.S. companies indicate they are experiencing delays in market authorization due to Japan’s delay in the adoption of a well-designed online system to process requirements and updates. Although there have been some improvements in processing time, there continue to be delays in the adoption of a monograph (or product standard) system intended to expedite the registration of such products as quasi-drugs under the PMD Act. As a result, products that contain active ingredients that are approved for specific uses in Japan, such as in anti-dandruff shampoos and skin care, may require up to six months to receive market approval. The MHLW is currently working with industry and local prefectural governments to develop a monograph system (such as “Approval Product Standards for Medicated Cosmetics”), which lists the approved uses for previously reviewed ingredients and claims.

JORDAN

TRADE AGREEMENTS

The United States–Jordan Free Trade Agreement

The United States–Jordan Free Trade Agreement (FTA) entered into force on December 17, 2001. Under the FTA, as of January 1, 2010, Jordan provides duty-free access to nearly all U.S. exports, with exceptions for a few product lines, such as alcoholic beverages. The United States and Jordan meet regularly to review the implementation and functioning of the Agreement and to address outstanding issues.

IMPORT POLICIES

Taxes

Jordan's General Sales Tax law allows the government to impose a special tax at the time of importation in addition to the general sales tax. For example, Jordan imposes a 15 percent special tax on carbonated drinks. Jordan also imposes a special tax on vehicles that varies according to the type of engine which in practice only affects imports as there is no domestic motor vehicle production. Cars with conventional fuel engines are taxed within a range of 67 percent to 94 percent, electric-powered cars are taxed within a range of 10 percent to 15 percent, and hybrid vehicles are taxed at 50 percent. Most U.S.-origin cars sold in Jordan are conventional fuel or hybrid. The United States continues to work with Jordan to promote transparency and predictability.

Non-Tariff Barriers

Import Licensing

Import licenses are required for specific food products by the Ministry of Health and for raw agricultural goods by the Ministry of Agriculture. The approval process can be time-consuming and, at times, lacks transparency. U.S. exporters have raised concerns about the difficulty of obtaining import licenses from the Ministry of Agriculture for U.S.-origin chicken leg quarters and live dairy cattle. The United States continues to engage with Jordanian authorities to address this issue.

Jordan requires that importers of commercial goods be registered traders or commercial entities. The Ministry of Industry, Trade, and Supply occasionally issues directives requiring import licenses for certain goods or categories of goods and products in newly emerging or protected sectors. Jordan requires a special import license prior to the importation of telecommunications and security equipment.

Customs Barriers and Trade Facilitation

Jordan ratified the World Trade Organization (WTO) Trade Facilitation Agreement (TFA) in February 2017. Jordan has not yet submitted four transparency notifications related to: (1) import, export, and transit regulations; (2) the use of customs brokers; (3) customs contact points for the exchange of information; and (4) details on the operation of the single window. Three notifications had been due to the WTO on February 22, 2017, and notification for details on the operation of the single window had been due on December 31, 2022, according to Jordan's self-designated TFA implementation schedule.

TECHNICAL BARRIERS TO TRADE

Corn Import Sampling Procedures

According to U.S. stakeholders, Jordan's Ministry of Agriculture does not comply with the sampling technique guidance for grain issued by the Jordan Standards and Metrology Organization, and Jordan's poor sampling techniques have resulted in the rejection of shipments of U.S.-origin corn. The United States has worked with Jordan to improve sampling and inspection procedures, but problems persist. As a result, U.S. exports of corn to Jordan have decreased significantly compared to 2021 and prior years. In 2023, U.S. corn exports to Jordan were valued at approximately \$148,000. An agreement in principle with the Jordanian Government to accept certificates of inspection from the U.S. Department of Agriculture Grain Inspection Service to assure the quality of corn shipped from the United States expired in June 2023. While applicable Jordanian Government agencies have informally committed to accepting such certificates on an *ad hoc* basis, this mechanism has not been tested. The United States continues to work with Jordan to resolve this issue.

GOVERNMENT PROCUREMENT

In September 2022, the Jordanian Cabinet adopted Government Procurement Bylaw No. 8, which grants priority to a domestic bid over a foreign bid if the bids are equivalent in terms of requirements, specifications, and price. Additionally, Jordan offers domestic companies a preferential rate of 15 percent in all government tenders based on a 2013 cabinet decision, which has been renewed annually.

Jordan is not a Party to the WTO Agreement on Government Procurement (GPA), but has been an observer to the WTO Committee on Government Procurement since March 2000.

In 2002, Jordan began the process of acceding to the WTO GPA with the submission of its initial offer, but negotiations on Jordan's accession have been inactive since 2014.

INTELLECTUAL PROPERTY PROTECTION

Jordan continues to take steps to provide more comprehensive protection of intellectual property (IP) rights. In September 2023, Jordan's new Cyber Crime law went into effect, criminalizing a broad array of digital violations, including pirated content. However, challenges regarding IP protection and enforcement persist. As seen throughout the region, online and physical copyright infringement is widespread. For example, Jordan-based company Spider is listed in the [2023 Review of Notorious Markets for Counterfeiting and Piracy](#) (Notorious Markets List) for supplying Spider-branded piracy devices through online and physical stores across Europe, the Middle East, and North Africa. The National Library, the primary IP authority in Jordan, has noted challenges to combating this online and physical copyright infringement, including a lack of adequate resources. Despite past efforts by law enforcement officials to crack down on pirated and counterfeit products, enforcement efforts need to be strengthened, particularly with respect to using *ex officio* authority to pursue criminal investigations. The U.S. Government continues to engage with the Government of Jordan on these issues.

KENYA

IMPORT POLICIES

Tariffs

Kenya's average Most-Favored-Nation (MFN) applied tariff rate was 14.3 percent in 2022 (latest data available). Kenya's average MFN applied tariff rate was 24.5 percent for agricultural products and 12.7 percent for non-agricultural products in 2022 (latest data available). Kenya has bound 16.3 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 93.8 percent.

Kenya applies the East African Community (EAC) Customs Union's Common External Tariff (CET), with four tariff bands: (1) zero percent duty for raw materials and inputs, (2) 10 percent duty for processed or manufactured inputs, (3) 25 percent duty for finished products, and (4) 35 percent for a list of products the EAC concluded would promote regional integration and domestic industrial sectors. Among the imports that are impacted by the 35 percent fourth tariff band are U.S. exports of secondhand clothing and environmentally cleaner cooking products. Many textiles and agricultural products are classified as "sensitive items" under the EAC and as a result are subject to *ad valorem* tariff rates above 35 percent. This includes rates of 50 percent for textiles, 60 percent for most milk products, 50 percent for corn and corn flour, 75 percent for rice, 60 percent for wheat flour, and 100 percent for sugar.

When deemed necessary, the Kenyan Government has temporarily waived agricultural tariffs to stabilize prices when domestic agricultural prices exceeded certain levels. When the Kenyan Government has taken such action, the EAC has granted an exemption from the CET.

Under its exemptions regime, the EAC had exempted all solar and wind energy products from import duties. In June 2016, the EAC amended its exemptions regime to include only products related to the development and generation of solar and wind energy. The duties were subsequently imposed on spare parts and accessories to solar equipment. Kenya has not uniformly applied the duties, and some stakeholders have voiced concern that this amendment does not adequately define the term "spare parts and accessories."

Non-Tariff Barriers

Import Bans

In October 2023, Kenya's domestic agricultural production exceeded projections. In response, the Kenyan Government issued an import ban on maize and wheat imports and stopped issuing import permits.

Customs Barriers and Trade Facilitation

U.S. companies have raised concerns about the length of time required for Kenyan Customs to release shipments, as well as the use of a complex and inefficient process that involves many steps with uncoordinated offices, despite implementation of a single window system. Many U.S. companies have commented that Kenya's one-stop customs clearance system does not operate as intended and that pre-arrival processing of electronic documents is ineffective. Other U.S. companies have raised concerns about the inconsistent application of classification and valuation decisions, as well as unnecessary transit inspections.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

Verification of Conformity to Standards Procedures

In 2019, Kenya issued the Standards (*Verification of Conformity to Standards and Other Applicable Regulations of Imports*) Regulations, which subjects all imports, except those meeting certain exemption criteria, to the Pre-Export Verification of Conformity (PVoC) program. The PVoC program requires pre-shipment inspection of most imports—in their country of origin—to ensure compliance with applicable Kenyan standards and regulations. Under the PVoC program, an importer must obtain a Certificate of Conformity (CoC) from a PVoC inspection agent in its region designated by the Kenya Bureau of Standards (KEBS). The PVoC inspection agent assesses what, if any, testing is required to meet Kenyan standards and regulations. Kenya asserts that the program is necessary to address health, environmental, and security concerns, but U.S. industry has raised concerns that the program’s testing, certification, and labeling requirements deviate from international standards without providing an additional measure of safety.

Certain products are exempt from the PVoC program, including: raw materials, machines, and spare parts imported by registered local manufacturers; products certified by KEBS under the Diamond Mark of quality product certification; and products waived by the Kenyan Government through the Cabinet Secretary for Investment, Trade, and Industry. Goods exempted from the program are still subject to KEBS destination inspection.

Goods arriving at the port of entry without having undergone an inspection through the PVoC program to obtain a CoC are subject to inspection by KEBS. The cost of this inspection is 5 percent of the customs value of the shipment, and the goods may be rejected. After obtaining a CoC or undergoing inspection at the port of entry, the importer must also purchase from KEBS an Import Standardization Mark label that must be affixed to each imported article or its retail packaging. Additionally, many of the KEBS mandatory standards are not publicly available, which hinders transparency.

Sanitary and Phytosanitary Barriers

Agricultural Biotechnology

On October 3, 2022, Kenya lifted a 10-year ban on the import and commercialization of genetically engineered (GE) products, opening a path to cultivation and import of GE food and feed. However, the lifting of the ban is on hold pending the outcome of one remaining domestic legal challenge before Kenya’s High Court. In October 2023, the Environmental and Land Court dismissed one case against the release and planting of GE products, on the grounds that: 1) there was no evidence to support that the Kenyan Government breached the law while lifting the ban, 2) there was evidence to support Kenya has the proper framework to govern GE activities, and 3) the plaintiffs did not present sufficient evidence of harm to human and environmental health from GE products.

Animal Genetics

In January 2020, Kenya’s Office of the Director of Veterinary Services (DVS) and the U.S. Department of Agriculture Animal and Plant Health Inspection Service agreed on veterinary requirements and certificate attestations for the importation of bovine embryos from the United States. In May 2020, however, the DVS proposed additional requirements that went beyond those previously agreed by the two agencies. Kenya

imposes standards that are overly restrictive for bovine semen imports, precluding actual market access for most U.S. bovine semen for dairy cattle and leaving the largest share of the market to the domestic producers who do not meet the same criteria. Technical work is ongoing.

Import Permits

Kenya maintains complex, nontransparent, and costly requirements for the importation of all meat, dairy, and poultry products, including a “Letter of No Objection to Import Permit” (no-objection letter) from the DVS under the Ministry of Agriculture, Livestock, and Fisheries. Before issuing a no-objection letter, which requires several attestations, including animal and public health statements, the DVS requires an importer to explain the reason for importation through a “Letter of Application to Import” and to specifically address the market need the import would meet. The DVS issues the no-objection letter for meat, dairy, and poultry products at its discretion on a case-by-case basis. Importers have reported that the DVS has at times provided them with non-sanitary-related grounds for denying permits, such as the local availability of a similar product. The DVS does not always provide written justification for not issuing the letter.

Plants and Plant Products

Kenya subjects imported and domestically produced corn to a total aflatoxin limit of 10 parts per billion and a 13.5 percent maximum moisture content. The aflatoxin limit in Kenya is lower than the U.S. Department of Health and Human Services Food and Drug Administration’s action level for aflatoxin in corn in the United States, is lower than the standard established by the Codex Alimentarius, and does not appear to be based on a risk assessment. As a result, most U.S. exports are denied permits for importation. Under special circumstances—such as food shortages—Kenya has allowed higher moisture content for imported corn, which must then be dried and milled immediately upon arrival to reduce the risk of aflatoxin contamination. For U.S. corn exports that are permitted under special circumstances, the costs associated with the additional processing requirements make U.S. corn exports largely uncompetitive.

GOVERNMENT PROCUREMENT

Since May 2015, an initiative dubbed “Buy Kenya Build Kenya” has required Kenyan state ministries, departments, and agencies to procure at least 40 percent of their supplies locally. For example, government entities are required to give an exclusive procurement preference to motor vehicles and motorcycles produced by companies that have assembly plants in Kenya.

The 2016 Public Procurement and Asset Disposal Act (PPADA) reserves procurement preferences for Kenyan-owned firms and goods manufactured or mined in Kenya. For tenders funded entirely by the government with a value of less than KES 50 million (approximately \$333,333), the preference for Kenyan firms and goods is exclusive. If the procuring entity seeks to contract with non-Kenyan firms or procure foreign goods, the PPADA requires a report detailing evidence of an inability to procure locally. In April 2020, the National Treasury issued implementing regulations for the PPADA, which mandate that tender proposals include skills and knowledge transfer to Kenyan citizens, a 75 percent set-aside of employment opportunities for Kenyans, and a plan relating to domestic sourcing.

U.S. firms have had very limited success bidding on Kenyan Government tenders, and corruption remains a significant concern. Many of these tenders are challenged in the courts. Foreign firms, some without proven track records, have won government contracts when partnered with well-connected Kenyan firms or individuals. As of January 2019, all tenders and procurements are required to be undertaken through the Kenyan Government’s electronic procurement system, the Integrated Financial Management Information System (IFMIS). U.S. companies have expressed concerns about IFMIS due to insufficient connectivity

and technical capacity in county government offices, apathy from county government officials, central control shutdowns, and security gaps that render the system vulnerable to manipulation and hacking.

Kenya is neither a Party to the WTO Agreement on Government Procurement nor an observer to the WTO Committee on Government Procurement.

INTELLECTUAL PROPERTY PROTECTION

Kenya's complex customs recordation system continues to raise concerns about the ability of U.S. importers to bring products containing intellectual property into Kenya. Widespread availability of counterfeit and pirated goods remains an issue. Stakeholders also have raised concerns regarding distribution of copyright-infringing content online and the need for Kenya to join the World Intellectual Property Organization (WIPO) Internet treaties, which deal particularly with copyright and related rights in the digital environment.

SERVICES BARRIERS

Insurance Services

Kenya requires that a minimum of one-third of the equity of an insurance company be held by Kenyan persons or citizens of another EAC Member State. In addition, Kenya requires that local insurers offer at least 20 percent of their treaty reinsurance contracts to the state-owned Kenya Reinsurance Corporation (Kenya Re). Although regulatory approval can be sought, Kenya generally prohibits cross-border Difference-in-Conditions and Difference-in-Limits insurance, which is an important type of insurance for facilitating U.S. investment in countries such as Kenya because it covers unique risks faced by U.S. firms.

Telecommunications Services

Foreign participants in the telecommunications services market report long delays in the licensing process, creating an unpredictable regulatory environment.

BARRIERS TO DIGITAL TRADE

Cross Border Data Flows

Kenya's 2019 Data Protection Act (DPA) includes unclear provisions governing the cross-border transfer of personal information. The DPA requires that data controllers provide proof that personal data will be secure as a condition for transferring the data outside Kenya but does not describe what would constitute acceptable proof.

Digital Services Taxation

Kenya applies a 1.5 percent digital services tax (DST) to nonresident businesses and persons. The DST taxes gross transaction value through any "digital marketplace," defined as "an online platform which enables users to sell or provide services, goods, or other property to other users."

INVESTMENT BARRIERS

Limitations on Foreign Equity Participation

Kenya imposes foreign ownership limitations in several sectors. For example, the 2016 Private Security Regulation Act restricts foreign participation in the private security sector by requiring at least 25 percent Kenyan ownership of private security firms. Additionally, since 2015, Kenya has imposed regulations requiring that Kenyans own at least 15 percent of the share capital of derivatives exchanges.

The 2016 Mining Act imposes a variety of restrictions on foreign participation in the mining sector. Among other restrictions, the Mining Act reserves acquisition of mineral rights for Kenyan companies, requires 60 percent Kenyan ownership of both mineral dealerships and artisanal mining companies, and requires large-scale mining operations to list a minimum of 20 percent of their shares on the Nairobi Securities Exchange within three years of commencing operations, while also offering 10 percent “free-carried interest” (free equity stake) to the Kenyan Government.

In August 2023, Kenya lifted the 30 percent domestic ownership requirements in the Information and Communications Technology sector, which stimulated new foreign investments in the sector.

Real Estate Restrictions

The 2010 Kenyan Constitution prohibits foreigners from holding freehold land title anywhere in the country, permitting only leasehold titles of up to 99 years. The process for leasing developed land and property is clear and established, but the process for obtaining clear title of undeveloped land is opaque and unreliable. For undeveloped land, investors risk receiving fake title deeds or leasing a plot with multiple titles and unauthorized sales.

STATE-OWNED ENTERPRISES

The Kenyan Government wholly owns the National Oil Corporation and the Kenya Pipeline Corporation, which limits competition in this sector. Other state-owned enterprises (SOEs), including Kenya Electricity Generating Company, Kenya Electricity Transmission Company, Kenya Power, and the Geothermal Development Company, dominate the electricity generation, transmission, and distribution segments of the energy sector. Kenya Power’s internal procurement rules require that 80 percent of supplies be sourced from Kenyan-registered companies to encourage foreign suppliers to establish manufacturing facilities in the country.

Certain SOEs have enjoyed preferential access to markets. Examples include Kenya Re, which enjoys a guaranteed re-insurance market share; Kenya Seed Company, which has fewer marketing barriers than its U.S. competitors; and the National Oil Corporation, which benefits from retail market outlets developed with government funds. Some SOEs have also benefited from easier access to government loan guarantees, subsidies, and credit at favorable interest rates. The Kenyan Government announced in November 2023 that it would privatize several SOEs.

OTHER BARRIERS

Disputes over tariffs and taxation are resolved through the judicial system, which is subject to delays and uncertainty. Since June 2015, the Kenya Revenue Authority has offered an alternative dispute resolution mechanism to help taxpayers resolve some tax disputes more quickly. U.S. companies have expressed concerns with the delay experienced in tax dispute resolutions through this established mechanism.

Bribery and Corruption

Corruption remains a substantial barrier to doing business in Kenya. U.S. firms continue to report challenges competing against foreign firms that are willing to ignore legal standards or engage in bribery and other forms of corruption. Corruption is widely reported to affect government procurements at the national and county levels. Kenya has not effectively implemented its anticorruption laws. U.S. firms routinely report direct requests for bribes from all levels of the Kenyan Government.

Despite efforts to increase efficiency and public confidence in the judiciary, the backlog of cases and continued corruption undermine the judicial system's credibility and effectiveness. While judicial reforms are moving forward, bribes, extortion, and political considerations continue to influence court cases. As such, foreign and local investors risk lengthy and costly legal procedures.

Export Ban

The 2013 Agriculture, Fisheries and Food Authority Act prohibits exports of raw agricultural produce such as macadamia nuts, Bixa, cashew nuts, and pyrethrum without authorization from the Kenyan Cabinet Secretary for Investment, Trade, and Industry.

KOREA

TRADE AGREEMENTS

United States–Korea Free Trade Agreement

The United States–Korea Free Trade Agreement (KORUS) entered into force on March 15, 2012. Korea immediately eliminated duties on nearly 80 percent of bilateral trade in industrial and consumer goods. Duties on most other such goods were phased out in stages over 10 years and have been eliminated as of January 1, 2021. Tariffs continue to be phased out for certain seafood products, which are scheduled to be eliminated in 2026. Korea has eliminated tariffs on the majority of U.S. agricultural products, while maintaining tariff-rate quotas (TRQs) on a handful of U.S. agricultural exports.

The United States and Korea reached agreement in 2018 to modifications and amendments to KORUS and a related letter exchange. The United States and Korea meet regularly to review the implementation and operation of KORUS and to address outstanding issues.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

Chemicals

Four laws and their respective implementing regulations form the basis of Korea’s chemical management system: the Act on the Registration and Evaluation of Chemicals (last revised in April 2021); the Occupational Safety and Health Act (last revised in August 2021); the Consumer Chemical Products and Biocides Safety Control Act (last revised in May 2021); and the Chemical Substances Control Act (last revised in August 2021). U.S. chemicals exporters regularly raise concerns with aspects of all of these laws and their implementing regulations, including: lack of guidance from the regulators on how to implement the regulations; insufficient protection for confidential business information; and, inadequate transparency regarding the selection of chemicals to be tested and the testing methodology.

Packaging Materials and Labeling Regulations

U.S. stakeholders remain concerned about the lack of clarity relating to the calculation method for packaging space ratios used by Korean Government authorities under the Act on the Promotion of Saving and Recycling of Resources (Recycling Act). While not yet passed, proposed amendments to the Recycling Act in August 2020 and November 2020 would mandate pre-launch testing of packaging materials and labeling of small electronic products to ensure compliance with specified packaging requirements. Stakeholders have raised concerns that the amendments would delay product releases, particularly when not provided with sufficient time to find alternative solutions to adapt to new requirements.

Sanitary and Phytosanitary Barriers

Agricultural Biotechnology

Korea’s regulatory system for agricultural biotechnology continues to present challenges to U.S. agricultural exports. The approval process for new biotechnology products is onerous and protracted due

to inefficiencies, which include redundant reviews and excessive data requests. The regulatory approval is managed across five different agencies, each with its own process and data submission requirements. While there is no clear mechanism to address the inefficiencies of Korea's regulatory process, Korea has indicated a willingness to continue discussing potential reforms to its regulatory process. The United States and industry stakeholders have provided ideas on how to improve the process and developed pilot projects to test a streamlined process for biotechnology product reviews. These initiatives have had little impact, however, because Korea's Living Modified Organisms (LMO) Act mandates participation by the five agencies, limiting the potential for streamlining the system without legislative changes.

In 2022, Korea's Ministry of Trade, Industry and Energy (MOTIE) proposed a draft revision of the LMO Act to include a policy on products of innovative biotechnologies (*e.g.*, genome editing). Korea proposed to classify genome-edited products as LMOs, but also introduced a pre-review system to exempt certain products from a full risk assessment under certain conditions. Once the LMO Act revision is finalized, Korea will develop regulations to implement the pre-review system and establish approval procedures for products that are not exempted. The United States discussed concerns with Korea's approval process for agricultural biotechnology products during the August 2023 meeting of the KORUS Committee on Sanitary and Phytosanitary Measures (KORUS SPS Committee).

Beef and Beef Products

Prior to 2008, Korea restricted the importation of U.S. beef and beef products, citing concerns related to bovine spongiform encephalopathy (BSE). In 2008, the United States and Korea reached a bilateral agreement to fully reopen Korea's market to U.S. beef and beef products. However, as a transitional measure, U.S. beef and beef products imported into Korea had to be derived from animals less than 30 months of age. This "transitional measure" has remained in place for sixteen years. In addition, imports of processed beef products, including ground beef patties, beef jerky, and sausage, are still prohibited.

Market Access for Pet Food Containing Ruminant Ingredients

In May 2018, the United States sent a formal request to Korea's Ministry of Agriculture, Food, and Rural Affairs (MAFRA) for market access for pet food containing U.S.-origin ruminant ingredients, as well as any ruminant ingredients imported from countries that, like the United States, are deemed by the World Organisation for Animal Health as having a negligible risk for BSE. In July 2018, the MAFRA indicated that it was drafting import health requirements for pet food. The United States reiterated the request in the KORUS SPS Committee in August 2023. As of December 2023, Korea's revised pet food import health requirements remain unpublished.

Horticultural Products

Several U.S. market access requests remain pending with the MAFRA Animal and Plant Quarantine Agency (APQA). Among these are expanded access for blueberries from U.S. states other than Oregon; improvement in the cherry import program; and access for apples, pears, Texas grapefruit, and California stone fruits. The United States requested that the APQA expedite the approval process for these products. The United States and Korea continued efforts to establish access for U.S. exports and discussed these issues during the KORUS SPS Committee in August 2023 and at a bilateral plant health technical meeting in November 2023.

Maximum Residue Limits

Korea's Positive List System (PLS) requires the establishment of new import tolerances for agrochemical residues that were previously permitted but not officially registered for use in Korea, as well as for new

substances that do not have any maximum residue limits (MRLs) in Korea. As of January 2022, U.S. agricultural exports are required to comply with Korea's domestic MRLs, import tolerance, or a default of 0.01 parts per million (ppm).

Korea plans to introduce a PLS for meat, poultry, and other animal products. Like the PLS for agrochemical residues, Korea began a phased implementation of the PLS for veterinary drugs. Starting in January 2022, Korea lowered the default limit for antimicrobial residues from 0.03 ppm to 0.01 ppm, in the absence of Korean or Codex Alimentarius Commission MRLs. Under the second phase, expected to begin in January 2024, in the absence of a Korean MRL or import tolerance, Korea will apply a default of 0.01 ppm for veterinary drugs in six major product categories, including: beef; pork; chicken; milk; eggs; and, fishery products.

GOVERNMENT PROCUREMENT

Korea is Party to the WTO Agreement on Government Procurement (GPA). Korea has made commitments to open its government procurement to U.S. suppliers under the revised GPA and under KORUS. KORUS provides U.S. suppliers significantly expanded access to central government procurements through a substantially lower threshold for eligible central government procurement contracts of goods and services than what exists in the WTO GPA (\$100,000 versus the current GPA threshold of \$182,000). While KORUS does not cover procurement by Korean sub-central government entities and government enterprises, the GPA provides U.S. businesses with access to procurement conducted by most Korean provinces, cities, and government enterprises.

Encryption and Security Requirements for Public Procurement of Information and Communication Technology Equipment

Korea and the United States are both members of the Common Criteria Recognition Arrangement (CCRA), under which products certified at any CCRA-accredited laboratory in any member country should be accepted as meeting the certification requirements in any other member country. Korea's National Intelligence Service (NIS), however, has imposed additional domestic cybersecurity certification requirements through its Security Evaluation Scheme (SES) since October 2014. Korea has broadly imposed the SES for common criteria (CC)-certified information technology products to be sold to the public sector. In October 2022, the NIS introduced a three-tiered scheme dividing all public institutions into three sensitivity tiers. The NIS now allows institutions in the middle and lower tiers, such as universities and public schools, to use CC-certified information and communication technology products without additional domestic security verification. However, the SES still applies to most major public institutions, which account for over 90 percent of the public sector market, including all central administrative institutions such as ministries and metropolitan local governments. The United States has urged Korea to abide by its obligations as a CCRA member.

Korea requires network equipment procured by public sector agencies (*i.e.*, government agencies and quasi-government agencies) to incorporate encryption functionality certified by the NIS. However, the NIS only certifies encryption modules based on the Korean-developed ARIA and SEED encryption algorithms (which, although they align with ISO standards, are in practice primarily used in Korea), rather than the internationally standardized Advanced Encryption Standard (AES) algorithm in widespread use worldwide. This restriction has *de facto* significantly limited U.S. suppliers' access to this market as it requires the development of a Korea-specific product line, which may not be commercially viable. The United States has urged Korea to ensure that equipment based on widely used standards has full access to Korea's public sector market.

Cloud Security Certification for Public Sector Cloud Service Procurement

The Cloud Security Assurance Program (CSAP) was created by the Korea Internet and Security Agency in 2016 and elevated from administrative guidance to a legal requirement through a March 2022 revision to the Cloud Computing Promotion Act. The CSAP, which applies to Korea's central, provincial, and local public sector with very limited exceptions, creates significant barriers to foreign cloud service providers (CSPs) seeking to sell to Korea's public sector. CSPs are required to create physically segregated facilities for exclusive use by government-owned customers, comply with data localization of cloud systems, create backup systems and data, and ensure that operations and management personnel of cloud service providers are located within the territory of Korea to obtain the low-tier certification. CSPs must also use only NIS-certified encryption algorithms (ARIA or SEED).

The potential market from which U.S. providers are being excluded is large and growing. In August 2022, Korea began a review of the CSAP with a view to reform it in a way that would open market access possibilities for foreign service providers, indicating it would benchmark the U.S. Federal Risk and Authorization Management Program (FedRAMP). In January 2023, Korea revised the Notification of the Security Certification for Cloud Computing Services to introduce a three-tiered scheme dividing all public networks into three risk tiers under the CSAP, which still creates significant barriers to U.S. CSPs seeking to sell to Korea's public sector. Only those CSPs that have at least the mid-tier CSAP certification can effectively participate in the government's digital transformation initiative. The United States raised this issue in June 2023 and in November 2023 and urged Korea to align its cloud security certification requirements with other internationally accepted standards.

INTELLECTUAL PROPERTY PROTECTION

In general, Korea has a strong regime of intellectual property (IP) protection and enforcement. Under KORUS, Korea agreed to strong enforcement provisions for various types of IP rights and agreed to join key multilateral IP agreements. Moreover, the Korean Government prioritizes IP protection, as Korea is a significant creator of IP. Nevertheless, some IP-related concerns remain, including with respect to: the transshipment of counterfeit goods, especially via small express-shipped parcels; geographical indications; and, a lack of civil and criminal penalties sufficient to deter IP violations. The United States continues to work with Korea to improve these areas.

SERVICES BARRIERS

Audiovisual Services

Notwithstanding KORUS commitments not to impose new restrictions, multiple Korean Government agencies and the National Assembly have been discussing ways to incorporate online media streaming platforms into the existing restrictive regulatory framework for legacy media, including potential Korean content requirements for U.S. over-the-top platforms.

Financial Services and Insurance Services

Cross-Border Data Transfer by Reinsurance Institutions

Reinsurance firms are not able to transfer information outside Korea as required in their ordinary course of business and as they should be able to do under Korea's KORUS obligations. Korea's Financial Services Commission (FSC) informed the U.S. Government in 2021 and in 2022 that it changed its interpretation of relevant rules under the User Protection and Credit Information Act such that U.S. reinsurance companies

can send personal information of primary insurance policy holders outside Korea for purposes of data processing, risk management, and underwriting. However, U.S. reinsurance companies reported in 2022 that they had not seen such a change in practice, and, absent sufficient legal certainty, they have not been able to send information cross-border. In October 2022, progress was made in clarifying important outstanding questions, including: the allowable purposes for such information transfers; the locations to which information may be sent; and, the interaction of the User Protection and Credit Information Act and the Insurance Business Act, both of which regulate the insurance industry. These clarifications indicated that the transfer of such information by reinsurance companies would be allowed in most cases; however, there is no public written documentation of this upon which industry could rely for legal certainty.

Professional Services

Since 2013, Korea has taken steps to open its legal services market, as outlined in KORUS. The amended Foreign Legal Consultants Act now allows foreign law firms to open foreign legal consultant offices in Korea and to enter into “cooperative agreements” with Korean firms to handle cases jointly where domestic and foreign legal issues are mixed. Foreign-licensed lawyers and firms have been able to establish joint ventures and hire Korean-licensed lawyers since 2017; but, several requirements that are unique to Korea discourage U.S. companies from doing so. The Act limits a foreign law firm’s ownership of the joint venture to 49 percent and requires that the firms composing the joint venture have been in operation for at least three years. The Act also requires foreign and Korean law firms participating in a joint venture to establish a new separate legal entity under Korean law. In addition, the Act limits the scope of practice of joint ventures. These provisions undermine the legislation’s purpose of facilitating trade in legal services between the two countries.

BARRIERS TO DIGITAL TRADE

Network Usage Fees

Since 2021, a number of bills have been introduced in the National Assembly that would require foreign content providers to pay network usage fees to Korean Internet service providers (ISPs). Because some Korean ISPs are also themselves content providers, fees paid by U.S. content providers could benefit a Korean competitor. Furthermore, such a mandate could be anticompetitive by further strengthening Korea’s ISP oligopoly of three major providers to the detriment of the content industry. The United States raised this issue with Korea on several occasions throughout 2023.

Location-Based Data

Korea’s restrictions on the export of location-based data have led to a competitive disadvantage for international suppliers seeking to incorporate such data into services offered from outside Korea. For example, foreign-based suppliers of interactive services incorporating location-based functions, such as traffic updates and navigation directions, cannot fully compete against Korean companies because locally-based competitors typically are not dependent on foreign data processing centers and do not need to export location-based data. Korea is the only significant market in the world that maintains such restrictions on the export of location-based data. While there is no general legal prohibition on exporting location-based data, exporting such data requires a license. As of December 2023, Korea had never approved a license to export cartographic or other location-based data, despite receiving numerous applications from foreign suppliers.

INVESTMENT BARRIERS

Korea maintains various restrictions on foreign investment in the telecommunications and media sectors. Korean law prohibits foreign investment in radio and terrestrial broadcasting operations; limits foreign ownership to 25 percent in news agency activities; and limits foreign ownership to 49 percent in television programming and content distribution, cable and satellite broadcasting services, and wired, wireless, satellite, and other telecommunications. Since March 2015, Korea has permitted U.S. investors to hold up to 100 percent ownership of a television program provider not engaged in news reporting, multi-genre programming, or home shopping, but foreign cable and satellite retransmission channels are limited to 20 percent of the total number of operating channels.

In addition to the restrictions in the telecommunications and media sectors, Korea limits foreign ownership to 30 percent in hydroelectric, thermal, solar, and other forms of power generation, and limits foreign ownership to 50 percent for enterprises engaged in raising beef cattle, meat wholesaling, electric power sale, transmission, and distribution, coastal passenger and freight transport, domestic and small air transport, and newspapers, magazines, and periodicals.

OTHER BARRIERS

Motor Vehicles

Increased access to Korea's automotive market for U.S. automakers remains a key priority for the United States.

The U.S. Government has raised concerns about Korea's emission-related components (ERC) regulations under Korea's Clean Air Conservation Act. Vehicle manufacturers and importers are required to obtain either a modification certification (for a substantial modification of ERCs) or prepare modification reports for insignificant changes. However, the automobile industry has expressed concern about lack of clarity over what types of modifications fall under which category. Automakers also have noted that violations with respect to imports could be subject to criminal prosecution by Korea's customs authorities, which lack authority to investigate domestically manufactured vehicles.

In August 2022, U.S. automotive industry stakeholders raised concerns around the Ministry of Environment's verification test procedure, conducted by the National Institute of Environment Research, on randomly selected new models imported to Korea. These tests have caused delays in manufacturers' product launches.

Pharmaceuticals and Medical Devices

The U.S. pharmaceutical and medical device industries continue to report concerns regarding a lack of transparency in Korea's pricing and reimbursement policies and a lack of substantive opportunities for stakeholder input into proposed policy changes. Industry has raised similar transparency concerns regarding Korea's Innovative Pharmaceutical Company (IPC) Accreditation policy, under which the Ministry of Health and Welfare designates certain companies as IPCs that can receive tax credits, research and development support, and more favorable premiums, but does not offer an explanation to companies who are denied the accreditation.

The United States continues to urge Korea to improve its engagement with this sector by enhancing transparency and providing meaningful opportunities for stakeholder input.

LAOS

TRADE AGREEMENTS

The United States–Laos Trade and Investment Framework Agreement

The United States and Laos signed a Trade and Investment Framework Agreement (TIFA) on February 17, 2016. The Agreement is the primary mechanism for discussions of trade and investment issues between the United States and Laos. The United States signed a bilateral trade agreement with Laos on February 4, 2005.

IMPORT POLICIES

Tariffs and Taxes

Tariffs

Laos' average Most-Favored-Nation (MFN) applied tariff rate was 8.6 percent in 2022 (latest data available). Laos' average MFN applied tariff rate was 11.2 percent for agricultural products and 8.1 percent for non-agricultural products in 2022 (latest data available). Laos has bound 100 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound MFN tariff rate of 19.2 percent, as all of its WTO accession commitments came into force in 2023.

Taxes

In October 2023, a Laos presidential decree raised excise taxes on six categories of products including gasoline vehicles, with progressively higher tax rates aligned with engine size, such that vehicles with engines over 5,000 cubic centimeters would be subject to a tax rate of 220 percent. U.S. automobile brands dominate the market for larger engines. Stakeholders have raised concerns that the decree was issued without adequate consultation.

Non-Tariff Barriers

Import Licensing and Restrictions

Laos has gradually removed license requirements for some imports. Certain products are still subject to import licensing requirements, including motor vehicles, refined petroleum fuels and oil, and natural gas products.

Customs Barriers and Trade Facilitation

Laos notified its customs valuation legislation to the WTO in June 2013, but has not yet responded to the Checklist of Issues that describes how the Customs Valuation Agreement is being implemented.

TECHNICAL BARRIERS TO TRADE

Vehicles

Laos' Government Decree No. 470 of 2019 on the management of land vehicles requires that imported vehicles, registered and used in Laos, meet regional and international standards and are in accordance with the international obligations of Laos. Under the Association of Southeast Asian Nations (ASEAN) Mutual Recognition Agreement on Type Approval for Automotive Products, the ASEAN members established a procedure for accepting or recognizing conformity assessment results with reference to the United Nations Economic Commission for Europe (UNECE) 1958 Agreement regulations. Further regulations are anticipated, and the United States will continue to monitor the development of proposed regulations in 2024 to promote acceptance of imported vehicles that meet demonstrated high standards such as the U.S. Federal Motor Vehicle Safety Standards.

INTELLECTUAL PROPERTY PROTECTION

Laos continues to improve its intellectual property (IP) regime, including by issuing regulations to implement its Law on Intellectual Property, and also continues to increase public awareness and media coverage of the harm caused by counterfeit goods and the impact of copyright piracy on local content industries. With U.S. Government assistance, Laos also continues to work to establish an effective system for civil and criminal enforcement of IP. However, counterfeit and pirated goods continue to be available in Lao marketplaces.

MALAYSIA

TRADE AGREEMENTS

The United States–Malaysia Trade and Investment Framework Agreement

The United States and Malaysia signed a Trade and Investment Framework Agreement on May 10, 2004. This Agreement is the primary mechanism for discussions of trade and investment issues between the United States and Malaysia.

IMPORT POLICIES

Tariffs and Taxes

Tariffs

Malaysia's average Most-Favored-Nation (MFN) applied tariff rate was 5.6 percent in 2022 (latest data available). Malaysia's average MFN applied tariff rate was 7.9 percent for agricultural products and 5.3 percent for non-agricultural products in 2022 (latest data available). Malaysia has bound 83.8 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 21.2 percent. Malaysia's maximum WTO bound tariff rate varies significantly by product group, for example, from 5 percent for petroleum to 257 percent for dairy products.

Duties for tariff lines where there is significant local production are often higher. In general, tariffs are lower for raw materials than for value-added goods.

Taxes

Malaysia continues to assess a higher excise tax on imported distilled spirits than on spirits that are predominantly produced domestically. Malaysia maintains very high excise taxes on motor vehicles, ranging from 60 percent to 105 percent, based on vehicle type and engine size.

Non-Tariff Barriers

Import Restrictions on Motor Vehicles

Malaysia imposes import restrictions on automobiles under the Malaysian National Automotive Policy, which makes a fundamental distinction between “national” cars (*e.g.*, domestic automakers Proton and Perodua) and “non-national” cars, which include other vehicles produced or assembled in Malaysia, as well as imports. The Malaysian system of “national approved permits” confers on permit holders the right to import and distribute cars and motorcycles. The national approved permits system is administered in a non-transparent manner and is used to implement a cap on the total number of vehicles that can be imported in a given year, currently set at 10 percent of the domestic market. In addition, Malaysia applies high tariffs in the automobile sector, and has traffic restrictions and noise standards that affect the usage of large motorcycles.

In its 2024 federal budget, the Malaysian Government proposed import and excise duty exemptions for imported electric vehicles (EVs) through December 31, 2025. Only locally assembled EVs would benefit from these exemptions through December 31, 2027.

Cabotage Policy on Submarine Cable Repairs

In 2019, the Malaysian Ministry of Transport issued an exemption to the Merchant Shipping Ordinance of 1952 that allowed non-Malaysian ships to conduct submarine cable repairs in Malaysian waters. The exemption reduced the time required to conduct submarine cable repairs critical for continued internet, voice, and data traffic. In November 2020, the new Minister of Transport suddenly revoked the exemption. The United States and industry groups continue to raise concerns with the revocation and have called on the Malaysian Government to restore the exemption.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

Halal Import Requirements

Malaysia's halal requirements are more prescriptive than relevant internationally recognized guidelines on labeling food as halal. Specifically, Malaysia requires slaughter plants to maintain dedicated halal production facilities and to ensure segregated storage and transportation facilities for halal and non-halal products. In contrast, relevant international practices allow for halal food to be prepared, processed, transported, or stored using facilities that have been previously used for non-halal foods, provided that Islamic cleaning procedures have been observed. U.S. industry has expressed concerns regarding the costs of creating new, segregated production facilities to access Malaysia's market.

Prior to exporting to Malaysia, the halal practices at each individual U.S. meat and poultry plant must be inspected by Malaysia's Department of Islamic Development (JAKIM) and certified by a JAKIM-accredited Foreign Halal Certification Body (FHCb). Malaysia's Department of Veterinary Services (DVS), in conjunction with JAKIM, has approved only one U.S. beef plant and one U.S. turkey plant to export halal products to Malaysia. In October 2023, the DVS delisted the single approved U.S. beef plant, alleging violations of Malaysian halal requirements identified during a June 2023 plant audit. In addition to plant inspection requirements, all meat, poultry, and dairy products exported to Malaysia must be certified by a JAKIM-approved FHCb.

As of December 2023, Malaysia's Attorney General was still reviewing JAKIM's draft Procedure for the Recognition of Foreign Halal Certification Bodies, which sets out the new requirements for recognizing a FHCb and their post-recognition obligations. The United States will continue to engage with JAKIM on its draft procedure.

Facility Registration Requirements for Export

Malaysia requires that all meat, poultry, and dairy facilities that export to the country be registered by the DVS. This process requires submission of an application with supporting documentation for DVS review, which can take several months. Following the application review, meat and poultry products (with the exception of pork products) are subject to on-site inspection by the DVS and JAKIM. For all products subject to registration, the DVS requires a new application for any adjustment to registration parameters (e.g., introduction of a new product in an approved plant and clerical changes to plant numbers or addresses). Updating the registration can involve additional delays of weeks to months. Minor differences between export certificate details and plant details in the registration system can result in detained shipments that often take several days to clarify.

Restrictive Regulations on Alcoholic Beverages

The definitions for a number of alcoholic beverage products in Malaysia's Food Regulations of 1985 are very narrow and do not provide for the sale of new products that do not fit neatly within the product categories. As a result, Malaysia prohibits the importation of products that do not meet a defined category. The United States is concerned that malt-based and spirit-based ready-to-drink products are not permitted in Malaysia, even though similar wine-based beverages are allowed. The United States continues to engage with Malaysia on its regulations for alcoholic beverage products, including potentially trade-restricting definitions for alcoholic beverages.

GOVERNMENT PROCUREMENT

Malaysia generally invites international tenders only when domestic goods and services are not available. In those cases, foreign companies often find they need to take on a local, Bumiputera (indigenous ethnic Malay) -qualified partner before their tenders will be considered.

Malaysia is not a Party to the WTO Agreement on Government Procurement, but has been an observer to the WTO Committee on Government Procurement since July 2012.

INTELLECTUAL PROPERTY PROTECTION

Malaysia has been in the process of reforming its intellectual property (IP) laws, including laws governing copyrights, patents, and trademarks. Malaysia has adopted the Copyright (Amendment) Act of 2022, which contains provisions that create a new criminal offense for committing copyright infringement with streaming. The amendment entered into force in March 2022. Malaysia also continues to take steps to enhance its IP enforcement regime.

However, concerns remain in a number of areas. Counterfeit goods are widely available, as highlighted by the continued inclusion of Petaling Street Market in Kuala Lumpur in the [2023 Review of Notorious Markets for Counterfeiting and Piracy](#) (Notorious Markets List). In addition, online, book and journal piracy remain as challenges for right holders. The United States urges Malaysia to continue its efforts to improve protection against unfair commercial use, as well as unauthorized disclosure, of undisclosed test or other data generated to obtain marketing approval for pharmaceutical products, and to enhance criminal sanctions for trade secret theft and misappropriation.

SERVICES BARRIERS

Financial Services

Best Interest Test

Under the Financial Services Act, Bank Negara Malaysia (Malaysia's central bank) evaluates potential investments in financial institutions based on whether the investment serves the "best interests of Malaysia," the criteria for which include evaluating the level of Malaysian participation in the sector.

Bank Negara Malaysia continues to limit foreign banks to eight physical branches in Malaysia, and imposes certain other restrictions. For example, foreign banks cannot set up new branches within 1.5 kilometers of an existing local bank; and Bank Negara Malaysia considers ATMs as equivalent to separate branches. In

addition, Bank Negara Malaysia has conditioned foreign banks' ability to offer some services on commitments to undertake certain back-office activities in Malaysia.

As of December 31, 2023, Bank Negara Malaysia had issued digital bank licenses to five consortiums of banks, investment banks, and businesses.

Malaysia maintains some restrictions on the business of reinsurance, requiring that Malaysian insurers first seek reinsurance from local reinsurers, and then from reinsurers based in the Labuan territory, before obtaining cross-border reinsurance. Also, primary insurers must offer Malaysian Re, the national reinsurer, up to 15 percent of certain lines of both proportional and non-proportional treaty reinsurance, and for facultative and engineering reinsurance up to a certain amount.

BARRIERS TO DIGITAL TRADE

Cloud Services

As of April 2022, the Minister of Communications and Multimedia has mandated that the Malaysian Communications and Multimedia Commission subject cloud service providers, and data centers hosting cloud service applications, to licensing obligations under the Communications and Multimedia Act of 1998, which are vague and can result in unnecessary administrative burdens when operating in Malaysia. Cloud service providers with a local presence are required to apply for an "Application Service Provider's (ASP) license" and can remain 100 percent foreign-owned; cross-border suppliers of cloud services without a local presence do not need to register or obtain ASP licenses.

INVESTMENT BARRIERS

Limitations on Foreign Ownership

Foreign investment in certain sectors is subject to local participation requirements that take the form of joint ventures with mandated minimum ownership interests held by ethnic Malaysian individuals or entities. When applying for certain operating licenses, permits, and approvals, entities with foreign ownership most commonly comply with the local participation requirements through a 70–30 equity split between the foreign investors (who are limited to a maximum of 70 percent ownership) and ethnic Malaysian individuals or entities (which must have a minimum 30 percent stake). Sector-specific regulators set the applicable local participation requirements, including in banking and insurance, education, freight forwarding and logistics, power generation, and cable and satellite telecommunications. In the oil and gas industry, non-Malaysian firms are permitted to participate in oil services in partnership with local firms, and are restricted to the maximum 49 percent equity stake if the foreign partner is the principal shareholder.

SUBSIDIES

Export Subsidies

Malaysia maintains several programs relating to exports, distinct from the pioneer status and investment tax allowance programs listed in Malaysia's subsidies notifications to the WTO. For example, the normal and enhanced allowance for increased exports programs provide for tax deductions of up to 70 percent of statutory income for increased exports. Malaysia has not included these measures in its WTO subsidies notifications. The United States continues to raise concerns with Malaysia about these and other policies.

MEXICO

TRADE AGREEMENTS

The United States–Mexico–Canada Agreement

The United States–Mexico–Canada Agreement (USMCA) entered into force on July 1, 2020. The USMCA maintains the zero tariffs that were in place among the three countries under the North American Free Trade Agreement and modernized the agreement to include strong, enforceable labor and environmental obligations, ground-breaking provisions to combat non-market practices, and provisions covering small and medium-sized enterprises (SMEs).

IMPORT POLICIES

Non-Tariff Barriers

Customs Barriers and Trade Facilitation

Mexico continues to provide insufficient prior notification of procedural changes, inconsistent interpretation of regulatory requirements at different border posts, and uneven border enforcement of Mexican standards and labeling rules. Some goods are still not allowed to be imported at all ports of entry. Restricting goods to certain ports has made it difficult for U.S. exporters to arrange for transportation and logistics, especially for electronic commerce purchases from U.S. SME exporters.

The USMCA prohibits arbitrary limits on the number of ports at which a customs broker may operate. Yet, Article 161 of Mexico’s Customs law limits a broker to operate at four ports if the broker is not part of a customs agency. The United States continues to urge Mexico to amend the law to allow brokers to operate at any port where the broker is able to perform its duties.

The USMCA also requires that Mexico implement a periodic payment option for express delivery shipments, which Mexico had not done as of December 2023.

On January 1, 2022, Mexico imposed a new requirement for a “complement” to the existing electronic waybill requirement on transportation services. Any shipment transported within Mexico over federal roads must be accompanied by an electronic waybill “complement” that contains up to 140 data elements about the shipment. On December 31, 2023, Mexico began enforcing the requirement. The United States continues to monitor Mexico’s implementation of this requirement.

Medical Devices, Supplies, and Pharmaceuticals

Industry continues to report delays of 18 months to 24 months for adjudication of sanitary registrations and import permit applications. Overall, the regulatory environment has shown minor improvements, but more structural changes need to be made to facilitate registration in Mexico. Although the Federal Commission for Protection Against Sanitary Risks (COFEPRIS) continues to work through its backlog, companies that try to register U.S. Health and Human Services Food and Drug Administration (FDA)-approved products in Mexico continue to report delays of more than a year. Regulatory delay remains a primary barrier to entering the Mexican market for medical devices and pharmaceuticals. COFEPRIS reportedly continues to be understaffed, with insufficient capacity to grant sanitary registrations and conduct factory inspections to issue good manufacturing practices certifications within the established timeframes. COFEPRIS is in

the process of implementing reliance mechanisms for approvals and inspections and, as part of these efforts, continues to hold technical regulatory discussions with the FDA to identify opportunities to improve its review process.

Glyphosate

Mexico's Secretariat of the Environment and Natural Resources has rejected import permits for glyphosate-containing chemical products. Mexico has not provided an opportunity for public comment, submitted notifications to the World Trade Organization (WTO), or provided scientific evidence for the rejections. Glyphosate remains registered for use in Mexico.

Separately, on January 1, 2021, a decree that called for the phaseout of the use of glyphosate and glyphosate-containing products by January 31, 2024, entered into force. A subsequent decree, published on February 13, 2023, extended the phaseout deadline to March 31, 2024. During the phaseout period, Mexico's National Council of Humanities, Sciences and Technology has been tasked with studying, developing, and promoting alternatives to glyphosate. Furthermore, the decree prohibits Mexico from using glyphosate in any government-sponsored programs during the phaseout period. Mexico is implementing import quotas for glyphosate and glyphosate-containing products. On March 1, 2023, COFEPRIS reduced the quota for imports of glyphosate by 50 percent, to 4,131 tons of formulated glyphosate and 314 tons of technical glyphosate.

The United States continues to press Mexico to grant import permits for glyphosate and glyphosate-containing products, consistent with the fact that glyphosate remains registered for use in Mexico.

Pesticides and Agricultural Chemicals

U.S. companies continue to report significant delays in receiving the necessary registration and marketing approvals from COFEPRIS for certain pesticides and agricultural chemicals. These delays appear to impact both applications for registration and applications for reregistration, sometimes involving only administrative updates such as changing the company's address. Companies report COFEPRIS is not granting registration renewals for many pesticide molecules. Consequently, some license holders have lost their registrations and the ability to import pesticides and agricultural chemicals.

Chemical and Petrochemical Products

On October 23, 2023, Mexico issued a decree that immediately placed new import restrictions on over 60 chemical and petrochemical products. On June 6, 2023, Mexico published a separate measure expanding the scope of coverage of certain existing import and export requirements to 58 new chemical and petrochemical products and creating additional requirements for companies importing or exporting in scope products. The United States continues to monitor Mexico's implementation of these new requirements.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

Dairy Products

The United States continues to be concerned about Mexico's proposed modifications to Mexican Official Standard NOM-223 on cheese conformity assessment procedures, NOM-222 on milk powder, and NOM-

181 on yogurt. The United States has requested that Mexico consider changes to its overly burdensome informational requirements and conformity assessment scheme, including by basing them on international standards. In 2023, the United States once again raised concerns regarding the cheese conformity assessment procedures in the WTO at every meeting of the WTO Committee on Technical Barriers to Trade (WTO TBT Committee) and the WTO Council for Trade in Goods.

Local Specific Absorption Testing Requirements

The United States continues to express concerns with regulations that Mexico's telecommunications regulator, the Federal Telecommunications Institute (IFT), published in 2020 pursuant to Technical Provision IFT-012-2019 that pose a barrier to trade for mobile telecommunications products by requiring in-country testing for Specific Absorption Rates and reference out-of-date standards from the International Electrochemical Commission/Institute of Electrical and Electronics Engineers and the International Commission on Non-Ionizing Radiation Protection. The requirements include duplicative testing and may cause delays, as Mexico has a limited number of accredited facilities able to perform the required tests. The United States continued to press Mexico, including on the margins of the 2023 WTO TBT Committee meetings, to use the latest testing standards and to include testing to these standards in the scope of the Mutual Recognition Agreement between the Government of the United States of America and the Government of the United Mexican States for Conformity Assessment of Telecommunications Equipment.

Sanitary and Phytosanitary Barriers

Fresh Potatoes

Since 2003, the United States has sought access for fresh potatoes to all of Mexico, beyond a 26-kilometer zone along the U.S.–Mexico border outside of which imports were not permitted. In April 2021, the Supreme Court of Mexico affirmed the authority of Mexico's regulatory agency to expand access for U.S. fresh potatoes. Subsequently, in 2021, Mexico completed the regulatory steps necessary for access for U.S. fresh potatoes to cities with populations over 100,000 people. In May 2022, the United States began shipping fresh potatoes to Mexico beyond the 26-kilometer zone. The United States is monitoring the situation to ensure transparent and predictable access for U.S. exporters and that requirements are based on science.

Products of Agricultural Biotechnology

Mexico's Biosafety Law requires COFEPRIS to decide on a complete application for authorization covering the importation and sale of genetically engineered (GE) products within six months of receipt. The United States has expressed serious concerns that certain decisions on applications were not based on science and were subject to significant delays.

On February 13, 2023, the Mexican Government published a decree that bans the use of GE corn in tortillas and dough and instructs Mexican Government agencies to gradually substitute—*i.e.*, restrict and eventually ban—the use of GE corn in all products for human consumption and for animal feed. In March 2023, the United States requested and held technical consultations with Mexico regarding its measures concerning GE products under the USMCA Sanitary and Phytosanitary Measures Chapter, but the consultations did not resolve the matter. In June 2023, the United States requested and held dispute settlement consultations with Mexico regarding its measures under the USMCA Dispute Settlement Chapter, but these consultations also failed to resolve the matter. On August 17, 2023, the United States established a USMCA dispute settlement panel challenging the aforementioned measures reflected in Mexico's February 13, 2023 decree on the basis that these measures are not based on science and undermine the market access Mexico agreed to provide in the USMCA. A final panel report is expected at the end of 2024.

Genetically Engineered Cotton

Mexico rejected applications for cultivation of GE cotton in 2019 and 2020. No applications were submitted in 2021 and 2022. In 2023, companies submitted three applications for experimental field trials of new GE cotton varieties. Mexico had not decided on these applications as of December 2023. GE cotton has been cultivated in Mexico for 25 years with no evidence of adverse impact on the environment, biodiversity, or animal or plant health. The United States continues to press Mexico to reconsider rejected applications, complete its approval procedure without undue delay, and use a science- and risk-based approval process.

INTELLECTUAL PROPERTY PROTECTION

Mexico was listed on the Watch List in the [2023 Special 301 Report](#). Obstacles to U.S. trade in intellectual property (IP) intensive goods and services include the wide availability of pirated and counterfeit goods, via both physical and online markets. As broadband access increases, so has online piracy, and stakeholders report that Mexico has one of the highest rates of music and video game piracy in the world. Overall criminal enforcement of IP rights, including online, continues to be characterized by weak coordination among federal, state, and municipal officials; limited resources for prosecutions; the lack of sustained investigations targeting suppliers of counterfeit and pirated goods and services; and the lack of sufficient penalties to deter violations. Brand owners also face bad faith trademark registrations, making it important for companies to register their trademarks early. Moreover, rights holders continue to express concern about the length of administrative and judicial patent and trademark infringement proceedings and the persistence of continuing infringement while cases remain pending. The Tepito market in Mexico City, the La Cuchilla market in Puebla, and the La Pulga Río market in Monterrey are listed in the [2023 Review of Notorious Markets for Counterfeiting and Piracy](#) (Notorious Markets List) for selling pirated and counterfeit goods.

With respect to geographical indications (GIs), in 2020, Mexico and the European Union (EU) concluded negotiations on a free trade agreement in which Mexico agreed to protect 340 names for foodstuffs, wines, and beers. The United States remains concerned about the EU practice of negotiating product-specific IP outcomes as a condition of market access and reiterates the importance of each individual IP right being evaluated on its individual merit in Mexico. In a USMCA side letter, Mexico confirmed that market access of U.S. products is not restricted in Mexico due to the mere use of certain individual cheese terms. Mexico has a *sui generis* system of protection for GIs that includes certain elements aimed at improving and respecting due process and transparency.

In 2020, Mexico enacted a new Federal Law for the Protection of Industrial Property and amended its Federal Copyright Law and Federal Criminal Code with a view to complying with various provisions of the USMCA and strengthening IP protection. Mexico is still in the process of drafting regulations for both the Federal Law for the Protection of Industrial Property and the Federal Copyright Law amendments, and the lack of regulations is creating uncertainty for the creative and innovative sectors looking to protect and enforce their IP.

SERVICES BARRIERS

Electronic Payments Services

The United States continues to closely monitor developments with respect to Mexico's evolving policy framework for electronic payment service suppliers. Aspects of the existing policy framework limit the

ability of U.S. electronic payment service suppliers to supply their complete suite of value-added services, including fraud protection, and differentiate themselves in the marketplace. On September 14, 2023, Mexico's Federal Economic Competition Commission identified barriers to competition in the card payment processing market and issued recommendations to Mexico's Central Bank—Banxico—and the National Commission for Banking and Securities to restore conditions for competition. As Mexico considers updating its regulations, the United States continues to urge Mexico to facilitate a competitive market and level playing field for U.S. electronic payment service suppliers, aligned with Mexico's USMCA obligations.

Mexico issued regulations in 2021 relating to the use of cloud service suppliers by electronic payment fund institutions. The United States continues to be concerned by the length, complexity, and uncertainty of the approval process for electronic payment fund institutions that seek to use secure, U.S.-based cloud computing services, raising questions about the extent to which the approvals are tacitly being conditioned on using local computing facilities.

Telecommunications Services

Notwithstanding the sweeping reforms of the telecommunications sector in 2013 and 2014, new market entrants still must compete with the traditional dominant supplier, which has maintained a market share well above 60 percent and was designated as a “preponderant economic agent” by the IFT. The entrenched position maintained by this dominant supplier, particularly regarding the mobile services market, demonstrates the continued need for vigilant enforcement by the IFT of the regulations it adopted to address that supplier's status as a preponderant economic agent. Statements by the Mexican President concerning the intention to eliminate the IFT raise significant concerns regarding Mexico's continued compliance with its USMCA obligations.

The cost of spectrum in Mexico is one of the highest in Latin America. Although Mexico assigns spectrum licenses through competitive auctions, it imposes a substantial annual fee based on the amount of spectrum held by each licensee. This approach is out of sync with international best practices and is in part responsible for the relative failure of Mexico's most recent auction (IFT-10), where only 3 of 41 blocks of spectrum received any bids. It also appears that the structure of Mexico's annual spectrum fee may advantage the dominant supplier and has led another supplier to return to the Government of Mexico all the spectrum it had been awarded. The Government of Mexico dismissed several proposals to lower the costs made by the IFT and the private sector. The United States continues to press Mexico to consider changes to its rules that would lower overall costs for spectrum and address the market power of the dominant supplier.

INVESTMENT BARRIERS

Energy Sector

Since December 2018, Mexico has pursued an energy policy centered on reinstating the primacy of its state-owned electric utility, the Federal Electricity Commission (CFE), and oil and gas company, Mexican Petroleum (PEMEX). Mexico has undertaken various measures to achieve this aim. For example, in March 2021, Mexico amended its Electric Power Industry Law so that its grid operator will prioritize for dispatch to Mexico's grid CFE-generated electricity over electricity generated by all private competitors, irrespective of cost or environmental impact.

Certain actions or inactions by Mexico have also been curtailing the ability of private companies to participate effectively, if at all, in Mexico's energy sector. They include delaying, denying, or failing to

act on applications for new permits or permit modifications; suspending or revoking existing permits; and otherwise blocking private companies' ability to operate renewable energy facilities (such as wind and solar installations), import and export electricity and fuel, store or transload fuel, and build or operate retail fuel stations.

In addition, in December 2019, Mexico's energy regulator granted PEMEX—but not other companies, including U.S. companies—a five-year extension to comply with maximum sulfur content requirements under its fuel standard in certain parts of Mexico, which otherwise require the sale of ultra-low sulfur diesel fuel throughout the country. Without the extension, PEMEX would have had to purchase ultra-low sulfur diesel imported from the United States or upgrade its facilities to produce ultra-low sulfur diesel in sufficient quantities.

In June 2022, Mexico's Secretary of Energy notified the Energy Regulatory Commission and the National Natural Gas System Operator of a change in policy that would require, among other things, that users of Mexico's gas transportation network demonstrate that they source natural gas from PEMEX or CFE.

Multiple U.S. companies have reported exiting Mexico's energy market as a direct consequence of these measures.

In July 2022, the United States requested consultations with Mexico under USMCA Chapter 31 regarding these measures. In 2023, the United States engaged with Mexico in these consultations on specific and concrete steps Mexico must take to address the concerns set out in the consultations request.

Mining Sector

The Government of Mexico passed legislation in April 2022 amending the national mining law to establish greater state control over the country's lithium resources. The amendments place responsibility for the exploration, exploitation, and utilization of Mexico's lithium under the exclusive control of a newly created state-owned lithium company, LitoMx, and prohibit concessions, licenses, contracts, permits, and authorizations to nonpublic entities to undertake those activities. The amendments also open the door to declaring other minerals as "strategic resources" that would require greater state control in the future. The Mexican Government was still drafting implementing measures for the amendments as of December 2023. The United States continues to monitor Mexico's implementation of these amendments.

Restricted Sectors

Mexico restricts foreign investment in certain sectors under the Foreign Investment Law. Foreign ownership is capped at 49 percent for express delivery companies and land for agricultural, livestock, and forestry purposes, as well as port administration services. Certain other sectors, such as transportation infrastructure, are closed to foreign participation.

SUBSIDIES

Export Subsidies

On October 11, 2023, Mexico issued a decree that establishes nationwide tax benefits for investment in certain export sectors. Specifically, the decree provides for the accelerated deduction of expenditures in certain new fixed assets and the additional deduction of training expenses. The United States has expressed concerns about the provision of benefits that are contingent upon the export or sale for export of products.

MOROCCO

TRADE AGREEMENTS

The United States–Morocco Free Trade Agreement

The United States–Morocco Free Trade Agreement (USMFTA) entered into force on January 1, 2006. Morocco immediately eliminated duties on 95 percent of industrial and consumer goods. Morocco implemented phased tariff reductions culminating in the complete elimination of duties on most goods by 2016. Some sensitive agricultural products have longer periods for duty elimination and may be subject to other provisions, including tariff-rate quotas (TRQs). Goods from key U.S. export sectors such as information technology, machinery, construction equipment, chemicals, and textiles receive either duty-free or other preferential duty treatment when entering Morocco. The United States and Morocco consult regularly to review the implementation and functioning of the Agreement and to address outstanding issues. The United States–Morocco Joint Committee is the central oversight body for the USMFTA.

IMPORT POLICIES

Tariffs

On January 1, 2024, as prescribed in the USMFTA, Morocco published Circular 6519/222, announcing tariff changes for calendar year 2024. The circular includes a list of products for which tariffs have been phased out in 2024, products for which tariffs are not yet fully liberalized, and updated agricultural TRQs and agricultural safeguard measures for the period from January 1 through December 31, 2024. A notable change includes the imposition of additional safeguard measures on frozen, fresh, or chilled chicken legs and wings.

TECHNICAL BARRIERS TO TRADE

Technical Barriers to Trade

In 2023, Morocco adopted Decree No. 2.10.421 of Ramadan 5, 1445 which stipulates that starting in January 2024, vehicles that are not aligned with the Euro 6b standard for emissions may no longer be registered in the country. Heavy vehicles have an additional 24 months to comply. Morocco generally only allows the importation of automobiles meeting the United Nations Economic Commission for Europe (UNECE) 1958 Agreement vehicle standards, effectively barring many automobiles produced in the United States from entering the Moroccan market. Although the Moroccan Government has officially allowed for the importation of automobiles that meet the U.S. Federal Motor Vehicle Safety Standards since 2016 (under Decree No. 2-15-89 of Ramadan 3, 1437), U.S. companies continue to report that Moroccan customs has still not adopted a procedure to regularize this process.

INTELLECTUAL PROPERTY PROTECTION

Inadequate intellectual property protection and enforcement in Morocco continues to be an area of concern. Although the United States acknowledges the efforts of Morocco to combat piracy and trade in counterfeit goods, Morocco faces challenges with digital piracy and continues to be a thriving market for counterfeit products.

The United States and Morocco continue to engage on matters related to Morocco's policy toward geographical indications (GIs). The United States remains concerned that the European Union (EU) has pursued negotiations with Morocco and other countries that would require partner countries to adopt overly broad protection of EU GIs as a condition of market access into the EU. The United States continues to reiterate to Morocco the importance of each GI being independently evaluated on its individual merits, with adequate due process requirements.

SERVICES BARRIERS

Although Morocco's insurance regulations do not appear to make formal distinctions based on national origin, U.S. insurance suppliers have reported that, in practice, the Moroccan regulatory body (part of the Ministry of Economy and Finance) applies an authorization process that has impeded U.S. insurance companies from introducing products that compete with Moroccan firms.

OTHER BARRIERS

U.S. firms have cited irregularities with regard to certain government procedures, including a lack of clear and accessible information about new regulations and certifications relating to imports into the country, as among the greatest obstacles to investment with Morocco. In particular, U.S. companies have pointed to difficulties they encounter in processes for obtaining permits, land use approvals, and other government permissions. U.S. companies also have noted the challenges created by rigid protocols and excessive bureaucracy, which can lead to long wait times for decisions and permissions, particularly when dealing with public sector entities. Morocco's property registration procedures also continue to impede business.

In an effort to avoid an excessive drain on foreign exchange, Moroccan authorities allow Moroccan companies to prepay only up to 30 percent of a shipment's total value in advance of importation. These restrictions on purchasers are often problematic for U.S. exporters that require 100 percent advance payment. Some U.S. exporters use letters of credit to mitigate the effect of these limitations, but these are costly and many U.S. exporters report lengthy payment delays. While Moroccan officials had indicated in 2019 that the 30 percent limit would be phased out over an indefinite timeline, it remained in effect as of December 31, 2023. The United States continues to press for removal of the limitation.

NEW ZEALAND

TRADE AGREEMENTS

The United States–New Zealand Trade and Investment Framework Agreement

The United States and New Zealand signed a Trade and Investment Framework Agreement on October 2, 1992. This Agreement is the primary mechanism for discussions of trade and investment issues between the United States and New Zealand.

IMPORT POLICIES

Tariffs

New Zealand's average Most-Favored-Nation (MFN) applied tariff rate was 1.9 percent in 2022 (latest data available). New Zealand's average MFN applied tariff rate was 1.4 percent for agricultural products and 2.0 percent for non-agricultural products in 2022 (latest data available). New Zealand has bound 100 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 9.6 percent.

As of 2022, New Zealand applied a zero percent duty on an MFN basis on 72.5 percent of its tariff lines in agricultural goods and on 65.0 percent of its tariff lines in non-agricultural goods.

SANITARY AND PHYTOSANITARY BARRIERS

Animal Health

New Zealand maintains restrictions on imports of pork from the United States related to concerns that certain pork products may transmit animal diseases, which do not appear to be grounded in science and risk. Imports of U.S. frozen or chilled pork products weighing more than three kilograms must be cooked, canned, or undergo further processing within New Zealand.

INTELLECTUAL PROPERTY PROTECTION

The United States continues to monitor developments to amend the Medicines Act 1981, any developments regarding the Geographical Indications (Wine and Spirits) Registration Act 2006, and proposed amendments to the Patent Act 2013. The United States will continue to work with New Zealand to address any intellectual property issues.

NICARAGUA

TRADE AGREEMENTS

Dominican Republic–Central America–United States Free Trade Agreement

The Dominican Republic–Central America–United States Free Trade Agreement (CAFTA–DR) entered into force for the United States, El Salvador, Guatemala, Honduras, and Nicaragua in 2006; for the Dominican Republic in 2007; and for Costa Rica in 2009. The United States and the other CAFTA–DR countries meet regularly to review the implementation and functioning of the Agreement and to address outstanding issues.

IMPORT POLICIES

Tariffs and Taxes

Tariffs

As a member of the Central American Common Market, Nicaragua applies a harmonized external tariff on most items (approximately 95 percent of Nicaragua’s tariff lines) at a maximum of 15 percent, with some exceptions. However, under the CAFTA–DR, as of January 1, 2015, non-agricultural goods enter Nicaragua duty free.

In addition, nearly all U.S. agricultural exports enter Nicaragua duty free under the CAFTA–DR. Nicaragua eliminated its remaining tariffs on rice and chicken leg quarters on January 1, 2023, and is scheduled to eliminate tariffs on dairy products by 2025. For certain agricultural products, tariff-rate quotas (TRQs) permit duty-free access for specified quantities during the tariff phase-out period, with the duty-free amount expanding during that period. Nicaragua will liberalize trade in white corn through annual expansion of a TRQ that reaches a maximum of 7,000 metric tons in 2025. Nicaragua is required under the CAFTA–DR to make TRQs available on January 1 of each year. Nicaragua monitors its TRQs through an import licensing system, which the United States carefully tracks to ensure the timely issuance of these permits.

Taxes

The Nicaraguan Government levies a consumption tax of 15 percent to 42 percent on certain luxury items. Since 2019, Nicaraguan customs officials have calculated this tax based on a unilaterally devised purchase price that often seems to be inflated. Other products, such as alcoholic beverages, are also taxed on the basis of a presumed purchase price. The selective consumption tax may disadvantage foreign suppliers because domestic products pay the tax only on the actual purchase price. In addition, businesses report being unable to secure tax refunds, with some stating that filing for a refund has resulted in audits, additional taxes, and penalties. The National Institute of Information and Development has provided a schedule of retail prices that is supposed to serve as a baseline for this tax, but businesses report that customs authorities often do not use the schedule.

Non-Tariff Barriers

Customs Barriers and Trade Facilitation

Businesses report that Nicaraguan customs officials routinely delay customs inspections and levy arbitrary fines for minor paperwork problems such as typographical errors. These fines reportedly often represent up to three times the value of the shipment. Businesses also continue to report that nearly all shipments are subject to physical inspection. Some businesses express concern that customs officials might target shipments for further scrutiny for political reasons.

In addition, six government institutions are involved in processing import paperwork. Many services, such as lab testing for food safety, are available only in the capital city of Managua, creating delays and additional costs if goods must be stored while testing is completed. Some businesses report that customs officials arbitrarily hold or open containers that contain perishable items, such as refrigerated or frozen goods.

Starting in 2019, Nicaragua's Customs Authority (DGA) began systematically seeking proof of country of origin for various types of products that had previously been established as originating under the CAFTA-DR, including through a comprehensive questionnaire to importers seeking detailed information about the products. Multiple businesses have reported that the requested information includes proprietary business data or trade secrets. Businesses have sought to make arrangements with the DGA to provide proof of origin without publishing trade secrets in questionnaires, such as through site visits to production plants and staff interviews. However, DGA has rejected those proposals and in multiple cases has initiated administrative processes to remove preferential treatment under the CAFTA-DR and has sought retroactive tariffs for the time that the product was imported with preferential treatment. The DGA's increased scrutiny of the proof of origin of imports has led to delays at customs and arbitrary fines for businesses. In multiple cases, the DGA has also levied a separate fine that doubles the amount owed.

U.S. exporters report that the DGA has ignored certifications of origin for various products provided by U.S. Government or local government agencies as proof of origin for agricultural commodities and that submission of additional documents requested by the DGA, such as questionnaires, has not resulted in approval of a claim for preferential treatment and has not appeared to be part of a good faith process.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

U.S. industry has raised concerns that food product registration in Nicaragua can be complicated and arbitrary. The Nicaraguan Ministry of Health requires a Certificate of Free Sale for product registration. Such documents are not issued at a national level in the United States and are not uniformly available to U.S. exporters. In some cases, U.S. companies have satisfied the requirement by submitting documents that are issued by some U.S. states or local government authorities or trade organizations. However, not all U.S. manufacturers are located in jurisdictions or affiliated with institutions that issue such documents and therefore cannot gain approval to sell in the Nicaraguan market as they are unable to submit such documents.

U.S. food companies have expressed concern regarding Law 842 (2013), which requires that all processed food products be marked with an expiration date. Nicaraguan officials have at times interpreted "Best By" dates, which indicate food quality or freshness rather than food safety, as expiration dates, and have destroyed products exceeding those dates. Nicaraguan importers of U.S. products have complained that

the law imposes costs on food importers, especially for products that do not typically have expiration dates. Nicaraguan importers continue to work with suppliers to include expiration dates in the translated Spanish label as required by the Central American Technical Regulation on General Labeling of Prepackaged Food Products (RTCA 67.01.07:10).

Sanitary and Phytosanitary Barriers

U.S. exporters have faced multiple container rejections since 2021 as a result of Nicaragua's interpretation of a Central American Technical Regulation for fresh/chilled/frozen meat (RTCA 67.04.50:17). Among the Central American countries applying the regulation, only Nicaragua applies a 20 percent threshold requirement for the presence of Salmonella on raw chicken. Additionally, Nicaragua enforces a 'zero tolerance' standard for Salmonella on raw pork meat. Most of the shipments rejected by Nicaragua have been successfully returned to the United States, passed subsequent food safety inspections by U.S. regulators, and were re-exported to other Central American countries that operate under the same Central American regional regulation.

GOVERNMENT PROCUREMENT

Significant hurdles inhibit the ability of U.S. suppliers to compete for sales to Nicaraguan Government entities. Existing law provides that all government purchases must be planned and approved by procurement committees within each public entity and published in Annual Procurement Plans. The law also requires a minimum of 30 days from publication of a bid to the due date for submissions. However, these requirements are not always followed. Industry reports that the Nicaraguan Government limits transparency on public procurement, publishes public procurements too late to ensure fair competition, creates terms of reference and technical specifications that are frequently unclear, and includes requirements for financial guarantees and local legal representation that create significant challenges for U.S. firms. Moreover, U.S. businesses report that the rule of law is weak and that outside actors can influence the judicial process and hamper due process.

Nicaragua is neither a Party to the World Trade Organization (WTO) Agreement on Government Procurement nor an observer to the WTO Committee on Government Procurement. However, the CAFTA–DR contains disciplines on government procurement.

INTELLECTUAL PROPERTY PROTECTION

Despite a strong legal framework to implement CAFTA–DR commitments on intellectual property (IP) protection and enforcement, concerns remain, including optical disc and broadcast media piracy and the use of unlicensed software in Nicaragua. Furthermore, the sale of counterfeit and pirated goods is reportedly on the rise throughout Nicaragua. The United States has expressed concern to the Nicaraguan Government about inadequate IP enforcement, as well as the need to ensure transparency in procedures relating to the protections for geographical indications. The United States will continue to monitor Nicaragua's implementation of its IP obligations under the CAFTA–DR.

NIGERIA

IMPORT POLICIES

Tariffs

Nigeria's average Most-Favored-Nation (MFN) applied tariff rate was 12 percent in 2022 (latest data available). Nigeria's average MFN applied tariff rate was 15.9 percent for agricultural products and 11.4 percent for non-agricultural products in 2022 (latest data available). Nigeria has bound 19.7 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 120.5 percent.

Consistent with the Economic Community of West African States (ECOWAS) Common External Tariff (CET), Nigeria applies five tariff bands: (1) zero percent duty on essential social goods (*e.g.*, medicine); (2) 5 percent duty on essential commodities, raw materials, and capital goods; (3) 10 percent duty on intermediate goods; (4) 20 percent duty on consumer goods; and, (5) 35 percent duty on certain goods that the Nigerian Government elected to afford greater protection. The CET was slated to be fully harmonized by 2020, but, in practice, some ECOWAS Member States have maintained deviations from the CET beyond the January 1, 2020 deadline.

Nigeria maintains a number of supplemental levies and duties on imports of certain goods, which significantly raises the effective tariff rate paid by importers. For example, Nigeria maintains a combined effective duty (tariff plus levy) of 50 percent or more on 156 tariff lines. These include 15 tariff lines on which the combined effective duty exceeds the 70 percent limit set by ECOWAS, covering products including rice (120 percent), wheat flour (100 percent), and sugar (80 percent).

Non-Tariff Barriers

Import Bans

The Nigeria Customs Service continues to ban the import of 45 different product categories. The list of prohibited imports currently includes: bird eggs; cocoa butter, powder, and cakes; pork; beef; live or dead birds; frozen poultry; refined vegetable oil and fats; bottled water; spaghetti and other noodles; fruit juice in retail packs; tomatoes, tomato ketchup, and tomato sauces; nonalcoholic beverages (excluding energy drinks); bagged cement; beer and stout; all medicaments falling under Harmonized System headings 3003 and 3004; soaps and detergents; mosquito repellent coils; paper board; telephone recharge cards and vouchers; used motor vehicles more than 12 years old; ball point pens; pistols and air pistols; cartridge reloading implements; used clothing; and, certain spirits and alcohols.

Customs Barriers and Trade Facilitation

Nigeria ratified the WTO Trade Facilitation Agreement (TFA) in January 2017. Nigeria's notification on the use of customs brokers was due to the WTO in December 2020, according to Nigeria's self-designated TFA implementation schedule. Nigeria submitted an incomplete notification with respect to the use of customs brokers on November 25, 2022, and the United States will seek further information and encourage Nigeria to submit a revised notification with complete information.

The Nigeria Customs Service's practices continue to present major obstacles to trade. Importers report inconsistent application of customs regulations; lengthy clearance procedures, often due to outdated manual

processing systems; and, corruption. These factors sometimes contribute to product deterioration and result in significant losses for importers of perishable goods. Disputes among Nigerian Government agencies over the interpretation of regulations often cause delays, and frequent changes in customs guidelines slow the movement of goods through Nigerian ports. The customs authority has attempted to automate its processes, but many basic customs procedures are still paper-based and require an unreasonably long time to complete. In September 2020, the Nigerian Government approved a \$3.1 billion customs modernization project that would include the automation of paper-based customs processes. The project was to be completed in 36 months and executed via a public-private partnership through a 20-year concession. This project has experienced implementation delays and is the subject of domestic litigation. While the project is delayed, the Nigerian Customs Service announced in 2023 a partnership with the World Customs Organization to deploy geospatial intelligence at the nation's border, which will enhance enforcement.

While the Nigerian Government has undertaken efforts to implement access road improvement projects, traders continue to report that infrastructural limitations in and around Nigeria's ports contribute to long queues of both trucks and ships, resulting in delays and increased costs.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

Transparency

Transparency of the regulatory system in Nigeria is a concern. U.S. companies have raised concerns that some regulations are issued as final measures without a clear process or period for public comment on draft regulations. Nigeria has not consistently notified draft technical regulations to the WTO Committee on Technical Barriers to Trade. Additionally, Nigeria is not consistent in the implementation of technical regulations, which can create confusion and undermine compliance.

Sanitary and Phytosanitary Barriers

Import bans

Nigeria continues to prohibit imports of beef, poultry, pork, sheep, goat meat, and edible offal. Nigeria has indicated that the import prohibitions are in place to prevent the spread of animal diseases or threats to human health, but the prohibitions apply to products from all countries regardless of animal disease status. Nigeria also prohibits the import of live poultry (with the exception of day-old chicks) due to alleged concerns about avian influenza that do not appear to be based on scientific approaches. The United States continues to press Nigeria to use science- and risk-based approaches to prevent the spread of animal disease.

Import Certificates

Nigeria requires that all food, drug, cosmetic, and pesticide imports be accompanied by certificates from manufacturers, third-party certifiers, or exporters' national authorities, depending on the product. These certificates must attest that the product is safe for human consumption, even though certificate-issuing authorities do not inspect every shipment of exported food product. However, Nigeria's limited capacity to review certificates, carry out inspections, and conduct testing has resulted in delays in the clearance of food imports and has diverted imports to informal channels. Since 2019, the United States has sought to negotiate import permits for the export of several categories of U.S. food and agricultural products. Nigeria has been slow to approve these requests.

GOVERNMENT PROCUREMENT

U.S. companies have expressed concerns about corruption and a lack of transparency in procurement processes in Nigeria.

The Public Procurement Act of 2007 established the Bureau of Public Procurement (BPP) as the regulatory authority responsible for the monitoring and oversight of public procurement in Nigeria. Nigeria only requires government entities to engage in competitive bidding for any procurement worth more than ₦2.5 million (approximately \$5,747). Only majority Nigerian-owned companies may bid on procurements above ₦2.5 million, up to ₦100 million (approximately \$229,885) for goods, and up to ₦1 billion (approximately \$2.3 million) for services and works. Above those thresholds, both majority foreign-owned and majority Nigerian-owned companies may engage in competitive bidding. Nigerian Government agencies do not always follow procurement guidelines, despite the requirement that no procurement proceedings are to be formalized until the procuring entity has ensured that funds are available to meet the obligations and has obtained a “Certificate of ‘No Objection’ to Contract Award” from the BPP.

Executive Order 5 of 2018 added restrictions and obligations for public procurement related to science, engineering, and technology. The order is designed to bolster the Public Procurement Act of 2007 and directs government offices to grant preference to Nigerian professionals.

Foreign companies may be subject to requirements to, for example, use a local partner firm or join a consortium. In 2013, the National Information Technology Development Agency (NITDA), an agency of the Federal Ministry of Communication Technology, issued the “Guidelines for Nigerian Content Development in Information and Communications Technology” (NITDA Guidelines). The NITDA Guidelines require ministries and development agencies to source and procure all computer hardware only from NITDA-approved original equipment manufacturers. The Nigerian Oil and Gas Industry Content Development Act also mandates a maximum quota of 5 percent of all positions that can be allotted to foreign nationals.

Nigeria has made modest progress on its pledge to conduct open and competitive bidding processes for government procurement. The BPP has made a variety of procurement procedures and bidding information publicly available on its website. However, Nigeria’s National Assembly operates its own procurement process that is not subject to BPP oversight and lacks transparency. Although U.S. companies have won contracts in various sectors, difficulties in receiving payments are common and can discourage firms from bidding. Supplier or foreign government-subsidized financing arrangements appear in some cases to be a crucial factor in the award of government procurements.

Nigeria is neither a Party to the WTO Agreement on Government Procurement nor an observer to the WTO Committee on Government Procurement.

INTELLECTUAL PROPERTY PROTECTION

Nigeria has taken steps to improve its legal framework for intellectual property (IP) protection. In 2019, Nigeria enacted the Federal Competition and Consumer Protection Act, which includes provisions designed to combat trademark counterfeiting, and in 2021, Nigeria enacted the Plant Variety Protection Act, creating a legal framework and administrative structure for the protection of plant varieties. In March 2023, the Nigerian President signed the Copyright Act 2022 into law. The Copyright Act 2022 includes provisions addressing technological protection measures, remuneration, and broadcasting rights and provides anti-piracy penalties, with a view toward implementing the World Intellectual Property Organization (WIPO)

Copyright Treaty; the WIPO Performances and Phonograms Treaty; the Beijing Treaty on Audiovisual Performances; and the Marrakesh Treaty to Facilitate Access to Published Works for Persons Who Are Blind, Visually Impaired, or Otherwise Print Disabled. The United States has urged Nigeria to consider whether additional amendments are needed to ensure Nigerian copyright law is in compliance with all IP treaties to which Nigeria is a party.

Pirated and counterfeit goods remain widely available in Nigeria and often threaten the health and safety of consumers. Counterfeit pharmaceuticals, automotive parts, and other consumer goods, as well as online infringements and pirated software, music, and video recordings are prevalent. IP enforcement remains inadequate due to chronically insufficient resources for enforcement agencies, porous borders, entrenched trafficking systems that make enforcement difficult, and corruption. Public awareness is low regarding the role of IP in Nigeria's economy, despite the benefits Nigeria is seeing with its growth as a regional hub for the African film, music, and fashion industries and the harm to consumers from counterfeit products. The Nigerian Copyright Commission and the Federal Competition and Consumer Protection Commission, often in partnership with the U.S. Embassy, have taken steps to raise awareness about IP.

SERVICES BARRIERS

Nigeria prohibits foreign firms from participating in reinsurance of risks in the oil and gas sector. Although the regulator may waive this prohibition, all local reinsurance capacity must be fully exhausted. Nigeria also imposes 5 percent mandatory reinsurance cession requirements in favor of the Africa Reinsurance Corporation and the WAICA Reinsurance Corporation.

In June 2022, the National Assembly passed the Advertising Regulatory Council of Nigeria Act, which entered into force on July 25, 2022. The Act replaced the Advertising Practitioners Council of Nigeria, which functioned like a trade association, with the Regulatory Council, which has sweeping regulatory and enforcement powers. The Act prescribes mandatory registration for any person or company engaging in any form of advertising in Nigeria and requires all advertisements to be approved before publication.

BARRIERS TO DIGITAL TRADE

The NITDA Guidelines require all foreign and domestic businesses to store all data concerning Nigerian citizens within Nigeria. The NITDA Guidelines further require that businesses host all government data locally, unless officially exempted. However, the requirements do not seem to be rigorously enforced.

The NITDA Guidelines also require information and communications technology companies to use Nigerian businesses for the provision of at least 80 percent of all value-added services on their networks. The NITDA Guidelines define “value-added service” vaguely, creating uncertainty for businesses seeking to comply with the measure. Though Nigeria has largely declined to enforce the NITDA Guidelines, periodic threats of repercussions for non-compliance remain a concern.

In October 2022, NITDA issued a “Code of Practice for Interactive Computer Service Platforms/Internet Intermediaries,” which came into force on December 26, 2022. It also requires digital service platforms with more than 1 million users in Nigeria to incorporate in and have a physical contact address in Nigeria.

OTHER BARRIERS

Bribery and Corruption

Corruption remains a substantial barrier to trade and investment in Nigeria. Corruption and lack of transparency in tender processes have been great concerns to U.S. companies. U.S. firms experience difficulties in day-to-day operations as a result of inappropriate demands from officials for “facilitative” payments. Efforts to strengthen anticorruption measures have been hampered by inter-ministry infighting and partisan politics. Questions also remain regarding the Nigerian justice system’s capacity to achieve convictions and appropriate sentencing for corruption-related crimes.

Foreign Exchange Controls

Foreign exchange limitations have negatively impacted investment as well as trade. Restrictive measures have hampered some U.S. companies’ abilities to import finished or semi-finished goods for use in their Nigerian operations. Moreover, Nigeria’s policies have increased challenges for projects developed with international financing that include U.S. dollar-denominated debt obligations, as borrowers have struggled to secure the necessary foreign exchange to meet those obligations.

In addition, Nigerian importers report they sometimes must agree to schemes to produce domestically in order to be allocated import permits by the government and to access foreign exchange through the Nigerian Foreign Exchange Market to source similar products from abroad.

However, the Nigerian Government has taken steps to address these limitations. On June 14, 2023, the Central Bank of Nigeria (CBN) introduced a market-based foreign exchange regime, collapsing its multiple official exchange rates into one, the “Nigerian Foreign Exchange Market.” On October 13, 2023, the CBN reversed its eight-year-old restriction on access to U.S. dollars for the importation of 43 items such as rice, meat, poultry, vegetable oil, fertilizer, dairy products, maize, sugar, and several steel products. Despite these moves, many products remain restricted by Nigerian import prohibitions and the foreign exchange shortage persists. U.S. companies report they are unable to obtain dollars for imports or repatriation purposes.

Maritime Trade

Delays caused by congestion and the poor condition of access roads, combined with corruption issues and an insufficient number of digital cargo scanners, make operations at Nigerian ports among the most expensive in the world. According to shipping industry reports, the 30-day average delay to clear a container ship makes Apapa in Lagos among the most expensive ports for shipments from the United States. Lagos ports also lack adequate space, and ships often wait for days—in some cases weeks and months—before being able to berth and discharge their contents. The \$1.5 billion Lekki Deepsea port commissioned in Lagos in January was expected to reduce the pressure on the inefficient Apapa and Tin Can ports but is yet to attract enough traffic. Nigeria continues to lose tens of millions of dollars daily because of traffic gridlock at the Apapa main port in Lagos. Maritime crime in the Gulf of Guinea emanating from Nigeria diminished in 2022 but still has a deleterious effect on maritime trade. To help address some of these challenges, in August 2023 the Tinubu administration created the Ministry of Marine and Blue Economy, which has encouraged the use of technology in Nigerian ports, including cargo tracking to promote efficiency and ease of doing business.

Export Ban

The Nigeria Customs Service prohibits enforces an export ban on a number of products, including maize, timber, raw hides and skin, scrap metals, and unprocessed rubber latex. The export ban list can be found on the Nigerian Customs Authority's [Export Prohibition List](#).

NORWAY

TRADE AGREEMENTS

Norway participates in the European Union (EU) single market through the European Economic Area (EEA) Agreement. As an EEA Agreement signatory, Norway assumes most of the rights and obligations of EU Member States, except in the agricultural and fishery sectors. Norway has implemented or is in the process of implementing most EU trade policies and regulations. Norway grants preferential tariff rates to EEA Members.

IMPORT POLICIES

Tariffs

Norway's average Most-Favored-Nation (MFN) applied tariff rate was 5.2 percent in 2022 (latest data available). Norway's average MFN applied tariff rate was 35.5 percent for agricultural products and 0.4 percent for non-agricultural products in 2022 (latest data available). Norway has bound 100 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 22.3 percent. Norway continues to reduce tariffs on industrial products on a unilateral basis.

Although Norway is less than 50 percent self-sufficient in agricultural production, it maintains tariff rates on agricultural products as high as several hundred percent to protect domestic agricultural interests. Domestic agricultural shortages and price surges are offset by temporary tariff reductions. However, a lack of predictability in tariff adjustments and insufficient advance notification of these adjustments, generally only two days to five days before implementation, make the export of products from the United States, especially fruits, vegetables, and other perishable horticultural products, very difficult. For some processed food products, tariffs are applied based on a product's ingredients, requiring the Norwegian importer to provide a detailed disclosure of product contents. Many exporters to the Norwegian market refuse to provide all requested details and, as a result, their products are subject to maximum tariffs.

Non-Tariff Barriers

Agricultural Support

Although agriculture accounts for only 0.5 percent of Norway's gross domestic product, support provided by Norway to its agricultural producers was 51.0 percent of total farm receipts between 2020 and 2022 (latest data available), the second highest among Organization for Economic Cooperation and Development (OECD) Member States, and more than three times the OECD average.

Norway maintains a price reduction regime that includes subsidies for using certain domestically-produced raw materials in processed foods. Products for which such subsidies are paid include chocolate, ice cream (for milk and glucose), pizza (for cheese and meat), and sweets. The purpose of the system is to help compensate the domestic food processing industry for the high costs of domestically-produced raw materials.

SANITARY AND PHYTOSANITARY BARRIERS

Transparency

Under the EEA Agreement, Norway applies certain EU sanitary and phytosanitary (SPS) regulations that may unnecessarily restrict trade without furthering safety objectives, because they appear to be applied beyond the extent necessary to protect human, animal, or plant life or health; are not based on science; or are maintained without sufficient scientific evidence. On plant health, the Norwegian Food Safety Authority provides measures to eradicate, prevent, or limit the spread of regulated pests independent of the EU. However, Norway's maximum residue limits for pesticides were adopted under the EEA Agreement and are updated when new EU regulations are adopted.

Agricultural Biotechnology

Norway has implemented extremely restrictive policies for crops derived from agricultural biotechnology, with limited exceptions. The restrictions include prohibiting farmers from cultivating biotechnology crops and using biotechnology feed for farm animals. The United States continues to press Norway to recognize the applicable science on the safety of such products and, accordingly, to open its market to U.S. exports of such products. The advent of innovative biotechnology research approaches, such as genome editing, has led Norway to reconsider its stance on agricultural biotechnology.

In December 2018, the Norwegian Biotechnology Advisory Board published a proposal on a forward-looking regulatory framework for genetically modified organisms that was developed in close dialogue with the public. The proposal recommends basing risk assessment and approval for new breeding techniques on a tiered system related to the genetic change(s) that have been made, from level 1 to level 3 based on contribution to societal benefit, sustainability, and ethics. An expert committee on biotechnology was appointed by the Norwegian Government in 2020 to gather updated scientific information on new biotechnologies for use in formulating new policies and to assess whether to adjust the existing legal framework to ensure that technological advancements benefit society without harming health or the environment. The committee delivered its recommendations on June 6, 2023, and concluded that current regulations and their implementation create obstacles to realizing the full potential of these technologies. The committee proposed streamlining public administration, harmonizing regulations with EU legislation, and taking concrete measures to stimulate more socially beneficial innovation.

Beef

Norway applies regulations developed by the EU that ban imports of beef from animals treated with hormones, despite the absence of scientific evidence demonstrating that beef from animals treated with hormones not exceeding the regulatory limit poses any risk to human health.

GOVERNMENT PROCUREMENT

U.S. pharmaceutical companies active in Norway have raised concerns regarding government procurement procedures for pharmaceuticals, including a lack of detailed information on the selection process for winning bidders and unauthorized disclosures of confidential pricing data. Tenders in the pharmaceutical sector in Norway have been unpredictable and nontransparent, and companies have sought more direct communication with the body responsible for final procurement decisions on behalf of regional health authorities (the Norwegian Decision Forum).

Norway is a Party to the WTO Agreement on Government Procurement (GPA).

INVESTMENT BARRIERS

Direct foreign ownership of hydropower resources is prohibited in Norway, except in rare instances in which the government allows foreign investors up to 20 percent equity ownership.

PAKISTAN

TRADE AGREEMENTS

United States–Pakistan Trade and Investment Framework Agreement

The United States and Pakistan signed a Trade and Investment Framework Agreement (TIFA) in June 2003. This Agreement is the primary mechanism for discussions of trade and investment issues between the United States and Pakistan.

IMPORT POLICIES

Tariffs

Pakistan's average Most-Favored-Nation (MFN) applied tariff rate was 10.3 percent in 2022 (latest dates available). Pakistan's average MFN applied rate was 13.1 percent for agricultural products and 9.9 percent for non-agricultural products in 2022 (latest data available). Pakistan has bound 98.6 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 60.8 percent. For agricultural products, the average WTO bound rate is 96.2 percent. The average WTO bound rate for non-agricultural products is lower at 55.2 percent.

Despite the reduction of applied tariff rates since 2013, U.S. companies have cited concerns that Pakistan has been imposing high tariff rates and, in some cases, additional duties, on products such as automobiles and finished goods. In addition, Pakistan grants sector and product-specific import duty exemptions, concessions, and protections through the promulgation of statutory regulatory orders (SROs). SROs may be issued without providing for stakeholder consultations or allowing importers time for implementation and compliance. Under previous International Monetary Fund (IMF) programs, Pakistan pledged to limit the use of SROs to genuine emergencies. However, SROs continue to be issued, and Pakistan has not provided a timeline for their removal.

Non-Tariff Barriers

Pakistan permits the importation of certain goods only by the public sector or industrial consumers (*e.g.*, active ingredients for the formulation or manufacturing of pesticides). Some imports require approvals from federal-level ministries such as the Ministry of Climate Change (MOCC) and the Ministry of National Health Services, Regulations and Coordination. Imports of certain products, including food colors, waste, parings, and scrap plastics, must receive official certification by the exporting country or by a specialized pre-shipment inspection company.

Customs Barriers and Trade Facilitation

U.S. food and consumer product exporters have expressed concerns regarding a lack of uniformity in customs valuation in Pakistan that negatively affects U.S. stakeholders. Similarly, in the machinery and materials sectors, there are reports that customs officials have erroneously assessed goods based on a set of minimum values rather than the declared transaction value.

Some U.S. companies have reported being adversely affected by Customs Rules 389 and 391. Customs Rule 389 requires the placement of a physical invoice and packing list in the shipping container, while Customs Rule 391 places the responsibility of including such documents, and liability for failure to comply,

on the owner of the goods and the carrier. Such rules pose compliance challenges for companies that use intermediaries, re-invoicing, or the storage of goods at various points during transit in order to insert paper documents into the shipping container. They also create additional burdens for shippers who are required by other countries' customs requirements to provide this information only through electronic filings and may, therefore, not have paper documentation available. Many companies' invoicing, accounting, and shipping systems do not permit the generation of invoices and packing lists prior to the departure of the goods from the company's production or storage facilities. Customs officials impose penalties on companies lacking invoicing systems or incapable of producing paper documentation. While Pakistan has shown openness to addressing the issue, and U.S. authorities have worked with Pakistan's Federal Board of Revenue (FBR) to that end, the rules remain formally in place and customs officials can implement them at any time.

Pakistan notified its customs valuation legislation to the WTO in May 2001, but has not yet responded to the WTO Checklist of Issues that describes how the Customs Valuation Agreement is being implemented.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

Pakistan generally accepts imported food as packaged in the exporting country. A notable exception, however, is food packaging for vegetable oil. Pakistan requires refined vegetable oil to be imported in bulk for re-packaging.

In July 2019, Pakistan issued SRO 237, which was not notified to the WTO Committee on Technical Barriers to Trade (WTO TBT Committee) for comment. This measure mandates that each food and beverage shipment include a halal certificate and prohibits the use of stickering, overprinting, or stamping to meet the requirements, even on an interim basis. Although Pakistan resolved the issue for wholesale bulk food items by permitting the use of stickers, the issue remains for retail sales. SRO 237 also requires all products to have 50 percent shelf-life remaining from the date of filing of the Import General Manifest, and 66 percent shelf-life remaining from the date of manufacture. When taken together, manufacturers report that these requirements introduce significant uncertainty and operational barriers. After notification requests from the United States, Pakistan eventually notified SRO 237 to the WTO TBT Committee in May 2020. The United States raised concerns with Pakistan's requirements at WTO TBT Committee meetings between November 2019 and May 2020. The United States continues to monitor updates to SRO 237. During the February 2023 TIFA meeting, the Ministry of Commerce and the Ministry of National Food Security and Research (MNFSR) indicated a willingness to amend SRO 237 to allow for stickering. The United States continues to engage on this issue.

Sanitary and Phytosanitary Barriers

Pakistan continues to ban imports of all beef and beef products from the United States. However, during the February 2023 TIFA Council meeting, Pakistan and the United States reached an agreement in principle on an export certificate that would re-open the market for U.S. beef. Finalization of the agreement was still pending as of December 2023.

In October 2022, Pakistani customs authorities detained two shipments of U.S. genetically engineered (GE) soybeans. The MNFSR reiterated the requirement to apply for an import license for GE products, a process currently stymied by a lack of implementing regulations for approval of GE soybeans for food, feed, and processing (FFP). In December 2022, Pakistan formed a committee to evaluate the issue. On November

24, 2023, Pakistan's cabinet passed amendments to the Biosafety Rules aimed at restarting the importation of GE commodities for FFP purposes. Based on the approved amendments, Pakistan's National Biosafety Committee is working on developing an import license regime to allow future imports of GE commodities. During 2023, the United States routinely engaged the Government of Pakistan on re-opening the market for U.S. GE soybeans.

GOVERNMENT PROCUREMENT

Since 2014, Pakistan has relied more on technical qualifications in its procurements relative to prices, though U.S. suppliers continue to struggle with pricing issues. Some U.S. companies report instances in which the procuring agency used a U.S. bid as a basis for, and to incentivize, further negotiations with other competitors, rather than accepting the lowest-priced and technically superior bid as outlined and required by applicable bidding guidelines. Most notably, this has occurred with competing firms based in the People's Republic of China. There is concern that Pakistan's practice rewards anticompetitive behavior, in that it may facilitate the use of lower bids in an effort to negotiate lower prices from U.S. and other foreign companies, thereby procuring goods at below-market pricing.

Pakistani authorities have worked with international financial institutions on improving the transparency of their procurement regime, including a structural benchmark in Pakistan's current IMF program, which requires publication of beneficial ownership information for companies awarded contracts above \$178,000. Pakistan is also receiving World Bank support for the development of an electronic procurement system that will publish information on procurement contracts and bid winners across federal and provincial authorities. According to the IMF, the Public Procurement Regulatory Authority in March 2023 piloted the electronic procurement system with the ministries responsible for health and education. A complete roll out at all federal and provincial levels was not completed as of December 2023.

Pakistan is not a Party to the WTO Agreement on Government Procurement, but has been an observer to the WTO Committee on Government Procurement since February 2015.

INTELLECTUAL PROPERTY PROTECTION

Pakistan remained on the Watch List in the [2023 Special 301 Report](#). Intellectual property (IP) concerns in Pakistan were raised during the February 2023 TIFA Ministerial meeting. However, serious concerns remain, particularly in the area of IP enforcement.

Although Pakistan has maintained a positive dialogue with the United States on IP, as noted in the 2023 Special 301 Report, Pakistan must do significantly more to overcome challenges with respect to adequate and effective IP protection and enforcement. A new IP Policy Board was constituted at the federal level in January 2023, but a lack of public awareness, as well as budgetary and human resource constraints, are also challenges for IP enforcement. For example, while Pakistan's establishment of IP tribunals in three cities in 2016 and the addition of tribunals in two more cities in 2023 were welcome developments, litigants with experience in Pakistan's tribunals have raised concerns over lack of capacity, inconsistency of rulings, nominal fines, a general lack of expertise among tribunal judges, confusion over standards by which courts review tribunal decisions, and large case backlogs. Additionally, Pakistan's ongoing but unfinished efforts to align its patent, trademark, and copyright laws, and IP regulations and enforcement regimes, with international standards continues to be an area for further progress. Moreover, counterfeiting and piracy in Pakistan remain high, particularly in the areas of pharmaceuticals; consumer goods such as food and beauty products; printed works; digital content; and, software.

SERVICES BARRIERS

Insurance Services

The National Insurance Company, a majority state-owned enterprise, has the exclusive authority to underwrite and insure public sector firms, assets, and properties. Pakistan has the discretion to grant exemptions to this requirement. Private sector firms may use foreign reinsurance companies to meet only up to 65 percent of their treaty re-insurance needs, but the remainder of reinsurance must be ceded locally. In the case of facultative reinsurance, there is a system of mandatory cession; business must initially be offered to the state-owned Pakistan Reinsurance Company, which may choose to accept the business or not.

BARRIERS TO DIGITAL TRADE

Data Localization

As of December 31, 2023, Pakistan was finalizing the Personal Data Protection Bill. Although there was an initial stakeholder consultation on an early draft of the bill in 2021, the Pakistani Government has not offered formal comment periods on subsequent drafts. The latest draft bill would require platforms to store all personal data on servers within the territory of Pakistan and prohibit the cross-border transfer of “critical” personal data. The scope of what information is considered “critical” personal data is not clearly defined.

Internet Services

Pakistan routinely blocks access to Internet services for hosting content deemed to be blasphemous or immoral, or on grounds that such services can be used to “undermine national security.” The Pakistan Telecommunications Authority (PTA) has also sent notices to U.S.-based social media platforms threatening adverse action if those platforms did not remove objectionable content. Pakistan has repeatedly suspended access to mobile data and certain online services in major cities in response to perceived unrest. In September 2022, the PTA inhibited the live streaming of a former prime minister’s speeches, and the Pakistan Electronic Media Regulatory Authority (PEMRA) suspended transmission of multiple television broadcasters in response to their airing of the speeches. In November 2022, PEMRA briefly blocked all broadcasting of a former prime minister’s speeches across all channels. On March 5, 2023, PEMRA imposed a blanket ban on broadcasting of live or recorded speeches of a former prime minister.

In October 2021, Pakistan adopted the Removal and Blocking of Unlawful Online Content (Procedure, Oversight, and Safeguards) Rules. The Rules authorize the removal and blocking of online content on a “social media or social network service” that is deemed unlawful. Several provisions would pose significant barriers to foreign firms operating in Pakistan, including content restrictions and requirements that companies maintain a physical presence in Pakistan. These Rules may also expand authorities’ ability to censor online content and enable government access to encrypted data. The Ministry of Information Technology and Telecommunication (MOITT) and the PTA consulted with foreign and domestic firms and other stakeholders, but did not circulate a revised version of the rules for further public consultation before sending it to the Pakistani cabinet for final approval. In April 2022, the prime minister instructed the MOITT to review the Prevention of Electronic Crimes Act (PECA) 2016 and the Removal and Blocking of Unlawful Online Content Rules, soliciting feedback from all stakeholders to identify and address issues. The MOITT started its deliberations but was not able to finalize the revised drafts of PECA and Rules by the end of the government’s tenure.

Pakistan drafted an Electronic Commerce Policy Framework in August 2018, with the aim of increasing exports and strengthening the digital economy. The framework, adopted in January 2022, contains some restrictive requirements. For example, the policy contains licensing, registration, and local presence requirements, as well as broad restrictions on cross-border data flows.

INVESTMENT BARRIERS

Pakistan generally permits foreign investment, subject to equity caps in certain sectors including agriculture, aviation, banking, media, insurance, securities, and railways. Ostensibly to combat tax evasion, in which companies report operating losses but remit royalties, Pakistan has limited foreign investors' remittance of royalty payments to a maximum of \$100,000 for the first payment, with subsequent payments capped at 5 percent of net sales for the following 5 years.

Although Pakistani law allows 100 percent repatriation of profits, subject to restrictions listed in Chapter 14, section 15 of the SBP Foreign Exchange Manual, U.S. and other companies continue to face bureaucratic hurdles repatriating profits and assets from Pakistan, generally coinciding with the government's focus on stemming dollar outflows. Local franchises of U.S. brands report limitations and extended delays in remitting funds to the United States as a result of SBP policies. Payment repatriation delays were further exacerbated by balance of payments challenges in 2022 and 2023. U.S. and other foreign investors saw a slight increase in successful repatriations in the final quarter of 2023 following concerted U.S. and other foreign governments' advocacy.

U.S., global, and domestic firms also continue to face arbitrary restrictions on letters of credit (LCs) due to the balance of payments situation. Stakeholders report long delays in banks' issuance of LCs, a lack of clarity from SBP on which items may qualify for exemption, granting of priority status to favored firms, and expedited approvals only for imported inputs destined for export-oriented industries.

Industry reports that contract enforcement can be difficult for U.S. and other foreign investors in Pakistan due to significant delays and lack of enforcement of court rulings.

Taxes

Pakistan has one of the lowest tax compliance and tax-to-Gross Domestic Product ratios in the world, 9.4 percent in FY2023. Pakistan relies heavily on multinational corporations for the revenue generated by tax collection. Foreign investors in Pakistan regularly report that both federal and provincial tax regulations are difficult to navigate, frequently citing the lack of transparency in the assessment of taxes.

Improving and broadening tax collection is a key focus of the IMF's Standby Agreement program for Pakistan, agreed to in July 2023. Under the program, the target is for Pakistan to increase its tax revenues to PKR 9.4 trillion (approximately \$33.6 billion) in 2024, an increase of PKR 2.2 trillion (approximately \$7.8 billion) from the collections made during FY2023. However, Pakistani authorities have long delayed key politically sensitive tax reforms under the previous program signed in July 2019. U.S. companies have experienced increased pressure from the FBR to prepay anticipated tax liabilities and have expressed concern that many of their local competitors still do not pay taxes at all or engage in tax evasion. The U.S. Government has repeatedly engaged Pakistani Government officials on issues involving unfair and disproportionate taxation of U.S. companies and continues to reinforce the importance of Pakistan broadening its tax base.

OTHER BARRIERS

Bribery and Corruption

U.S. companies cite corruption and a weak judicial system as substantial disincentives to foreign investment in Pakistan. Pakistan's federal anticorruption agency, the National Accountability Bureau (NAB), provides a legal framework to combat corruption. However, business and civil society stakeholders have expressed reservations about the body's effectiveness. The NAB's broad exercise of its remit to investigate government operations and business dealings have led to a number of cases where it reopened established policies and targeted reputable businesses, potentially dissuading foreign investors and making officials reticent to exercise authority.

PANAMA

TRADE AGREEMENTS

The United States–Panama Trade Promotion Agreement

The United States–Panama Trade Promotion Agreement (the Agreement) entered into force on October 31, 2012. The United States and Panama continue to work closely together to review the implementation and functioning of the Agreement and to address outstanding issues.

IMPORT POLICIES

Tariffs

Tariff reduction under the Agreement began on October 31, 2012, and all U.S. non-agricultural products have been duty free since January 1, 2021. Remaining duties on the most sensitive agricultural products will phase out between 2026 and 2031, 15 years to 20 years after entry into force of the Agreement.

Since August 2020, Panama has imposed volume restrictions on U.S. onion imports outside of the Agreement tariff-rate quota (TRQ) quantities. Panamanian authorities have also designated approved importers and specified volumes per importer. The United States has since raised concerns regarding these issues at the World Trade Organization (WTO) Committee on Import Licensing and discussed them with Panamanian authorities in light of the Agreement commitments.

On December 19, 2023, Panama held its auction for rough rice TRQ volumes for 2024 after notifying the United States that the volume of the 2024 milled rice quota allocation would be converted to rough rice and added to the rough rice quota allocation. The United States is discussing this issue with Panamanian authorities in light of the Agreement commitments.

In early 2023, Panama’s Ministry of Commerce and Industry (MICI) enacted safeguards for a number of U.S. agricultural products. In the case of cheddar, other cheeses, and butter, it appears MICI miscalculated imported volumes in making its safeguard determination. The United States continues to discuss the issue with Panama to ensure proper application of safeguard measures.

Non-Tariff Barriers

Customs Barriers and Trade Facilitation

Panama ratified the WTO Trade Facilitation Agreement (TFA) in November 2015. Panama submitted its transparency notification related to the operation of its single window on March 14, 2023. This notification had been due to the WTO on January 1, 2022, according to Panama’s self-designated TFA implementation schedule. Panama has not yet submitted its transparency notification related to import, export, and transit regulations. This notification had been due to the WTO on June 1, 2022, according to Panama’s self-designated TFA implementation schedule.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

Since February 2017, the United States has raised concerns with Panama's quality requirements for fresh onions and, since March 2019, its quality requirements for fresh potatoes. Both measures establish mandatory harvest date requirements, sprouting limits, and temperature and storage criteria, raising concerns regarding their consistency with international standards. Since October 2020, the United States has raised these issues at the WTO Committee on Technical Barriers to Trade (WTO TBT Committee) and elevated the concerns to the WTO Council for Trade in Goods. U.S. concerns regarding the measures continue to go unaddressed, and U.S. onion and potato producers continue to be negatively affected. After a number of delays, in December 2021, Panama issued Resolution 235, which finalized quality requirements on fresh potatoes, and began implementing the measure on February 19, 2022. The United States has raised this issue with Panama and will continue to raise concerns regarding these regulations.

In August 2022, the United States submitted comments on Panama's draft technical regulations on grains and cereals, including requirements for paddy rice and milled and white rice. The United States raised concerns regarding Panama's creation of a unique grading system for rice, and bagging requirements for paddy rice that needs further processing. Panama's draft technical regulations contain unreasonable requirements for bagging paddy rice prior to export. Paddy rice cannot be consumed directly and must be milled after export before being bagged for retail, and thus the requirement poses a barrier to trade. As of December 2023, Panama was still reviewing these comments. Also, Panama does not accept U.S. Department of Agriculture (USDA) grading standards, despite the fact that Panama is required to give favorable consideration to sector-specific regulatory cooperation in the Agreement.

On January 22, 2020, Draft Bill 265 was presented in Panama's National Assembly. If passed, the bill would establish a front-of-package nutritional warning labeling scheme. The United States provided its formal comments to Panama in October 2021 and requested that it notify the proposed implementing measure to the WTO TBT Committee. As of December 2023, Panama had not yet notified this draft bill. A National Assembly commission was created in 2022 to address the labeling program, but, as of December 2023, the bill had not been approved. The United States will continue to monitor the status of the draft bill and engage with Panama.

Sanitary and Phytosanitary Barriers

In 2023, Panama adopted its Agri-Food State Policy Law No. 352 (PADE), as well as implementing regulations. The measures contain restrictions on sales of imported products at national traditional markets, import restrictions based on local harvest dates, and the creation of private customs observers. The USDA has engaged with Panama to ensure PADE and its implementing regulations do not unnecessarily affect U.S. exports.

In August 2020, the Panamanian Food Safety Authority began implementing Ministry of Health (MINSA) Decree 255, which requires registration of establishments involved in the storage, display, distribution, and sale of raw meat and raw meat products. These products were previously only subject to routine registration, a process that could be completed in 24 hours. The process under Decree 255 takes 180 days, resulting in delays of U.S. exports, including U.S. beef, pork, and poultry that supply the hotel, restaurant, and institutional market, as well as products destined for supermarkets. The United States is monitoring the implementation of Decree 255 to ensure that the registration requirements for raw meat are consistent with the basic product information requirements in the 2006 United States–Panama Agreement Regarding

Certain Sanitary and Phytosanitary Measures and Technical Standards Affecting Trade in Agricultural Products.

On August 25, 2022, MINSA shared draft revisions of Decree 255, and in October 2022 the United States shared comments on the proposed draft. The August 2022 revision separated out regulations for poultry products and proposed a draft regulation (Decree 147). While the United States reviewed the draft measure and provided comments, it was published unchanged in December 2022. In January 2024, Panama issued Executive Decree 71 of 2023, which further clarified beef slaughter and handling practices for domestic and imported beef. The United States will continue to monitor developments and seek to engage with Panama on concerns with certain aspects of these decrees, particularly regarding labeling, end-use attestations, and bans on the sale of thawed, previously frozen product.

In October 2022, the Animal Health Directorate of Panama's Ministry of Agriculture issued two decrees that clarified import procedures for U.S. pet food and poultry products from U.S. counties in which Highly Pathogenic Avian Influenza has been detected in commercial flocks. These decrees clarified trade issues related to these products and are in line with World Organisation of Animal Health (WOAH) guidance, as well as regulations under the Agreement.

INTELLECTUAL PROPERTY PROTECTION

Panama still must develop a system for Internet service provider notice-and-takedown procedures and preestablished damages for copyright infringement and trademark counterfeiting, as required by the Agreement. An interagency committee, which is led by the Panama Customs Authority and includes the Ministry of Commerce and Industry, the Ministry of Economy and Finance, the District Attorney for Intellectual Property Rights (IPR), and the Ministry of Health, has held discussions on modifying the current decree for IPR enforcement in customs and providing for preestablished damages. The committee last met in April 2020 to discuss customs-related fines, but the initiative has not advanced since then. Challenges also remain in the areas of trademarks as well as pirated and counterfeit goods. The United States continues to engage closely with Panama to ensure its effective implementation of all obligations under the Agreement.

PARAGUAY

TRADE AGREEMENTS

The United States and Paraguay signed a Trade and Investment Framework Agreement on January 13, 2017. This Agreement is the primary mechanism for discussions of trade and investment issues between the United States and Paraguay.

IMPORT POLICIES

Tariffs

Paraguay's average Most-Favored-Nation (MFN) applied tariff rate was 9.6 percent in 2021 (latest data available). Paraguay's average MFN applied tariff rate was 10.0 percent for agricultural products and 9.5 percent for non-agricultural products in 2021 (latest data available). Paraguay has bound 100 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 33.4 percent.

Paraguay is a founding member of the Southern Common Market (MERCOSUR), formed in 1991, which also comprises Argentina, Brazil, and Uruguay. MERCOSUR's Common External Tariff (CET) ranges from zero percent to 35.0 percent *ad valorem* and averages 11.7 percent. In July 2022, MERCOSUR countries agreed to a 10 percent reduction of the CET for over 80 percent of tariff lines. The decision reduced the block's average CET to 10.3 percent. Any good imported into Paraguay (not including free trade zones) is subject to the payment of the CET to Paraguay's customs authority. If the product is then re-exported to another MERCOSUR country, the CET must be paid again to the second country. MERCOSUR approved a Common Customs Code (CCC) in 2010 and launched a plan to eliminate the double application of the CET within MERCOSUR in 2021. However, only Argentina has ratified the CCC, and it has not yet taken effect.

Non-Tariff Barriers

Import Licensing

Paraguay requires import licenses on a variety of products. Import licenses, once issued, are only valid for 30 days. Importing goods within this 30-day window can be difficult if there are shipment delays, which are fairly common in Paraguay, a landlocked country largely dependent on riverine shipment that can slow during dry seasons. Due to those delays, importers may need to reapply for an import license.

Customs Barriers and Trade Facilitation

Paraguay ratified the WTO Trade Facilitation Agreement (TFA) in March 2016. Paraguay submitted its transparency notification related to import, export, and transit regulations on December 20, 2023. This notification had been due to the WTO on September 1, 2021, according to Paraguay's self-designated TFA implementation schedule.

Paraguay passed Law 7196/23 on November 2, 2023, eliminating its trade-related consular fees, payment of which required specific documentation for each import shipment (*e.g.*, commercial invoice, certificate of origin, and cargo manifest). These consularization requirements had been burdensome for U.S. exporters and imposed additional costs for each set of commercial documents.

INTELLECTUAL PROPERTY PROTECTION

Paraguay was listed on the Watch List in the [2023 Special 301 Report](#). The United States is concerned with the lack of enforcement action in Paraguay. Ciudad del Este is listed in the [2023 Review of Notorious Markets for Counterfeiting and Piracy](#) (Notorious Markets List) as one of the main distribution and sales hubs for counterfeit goods in the region, and has reportedly become a home to manufacturing and “finishing” facilities for counterfeit goods. The United States urges Paraguay to ensure transparency and due process in the protection of geographical indications (GIs) and to ensure that the grant of GI protection does not deprive interested parties of the ability to use common names, particularly as Paraguay proceeds with the European Union–MERCOSUR Trade Agreement. The United States and Paraguay agreed on an Intellectual Property Work Plan in September 2022 that serves as a roadmap for Paraguay to address a number of these outstanding issues.

PERU

TRADE AGREEMENTS

The United States–Peru Trade Promotion Agreement

The United States–Peru Trade Promotion Agreement (the Agreement) entered into force on February 1, 2009. Under the Agreement, Peru currently provides duty-free access to nearly all U.S. exports. The United States and Peru meet regularly to review the implementation and functioning of the Agreement and to address outstanding issues.

IMPORT POLICIES

Tariffs

All duties for U.S. non-agricultural goods exported to Peru have been eliminated, while a small number of Peruvian tariffs apply to select U.S. agricultural products. These are scheduled to be phased out by 2026. In accordance with the Agreement commitments, Peru has ceased applying its price band system to U.S. agricultural products.

Non-Tariff Barriers

Under Peru’s Customs Crime Law No. 28008 of 2003, express delivery managers and legal representatives are subject to criminal investigations and penalties for minor discrepancies in the value of invoices of low value shipments. The same law also allows for concurrent administrative sanctions against the express courier companies for the same violations. Express delivery carriers are subject to the same fixed monetary penalty as containerized cargo, regardless of the differences in shipment size or value.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

A variety of stakeholders have continued to note inconsistencies in the application and enforcement of regulatory processes in Peru. Peru’s Congress approved Decree No. 063-2021 on regulatory quality improvement and the application of regulatory impact analysis (RIA) in 2021. The United States is working with Peru on its whole-of-government initiative to integrate the RIA with public consultation for future regulatory actions.

Sanitary and Phytosanitary Barriers

Agricultural Biotechnology

In January 2021, the Peruvian Congress passed Law No. 31111, which extended Peru’s moratorium on the cultivation and import for cultivation of genetically engineered crops and the import of genetically engineered seeds for 15 years. Peru has not supported its biotechnology moratorium with a risk assessment or otherwise put forward a scientific justification for it. The United States has raised its concerns regarding the moratorium with government officials from Peru at each annual meeting of the Agreement’s Standing Committee on Sanitary and Phytosanitary Measures from 2012 through 2022. The United States will

continue urging Peru in this forum and at other opportunities to address the United States' concerns and to notify its moratorium and its implementing regulations to the WTO Committee on Sanitary and Phytosanitary Measures.

Agricultural Product Certification

In January 2018, Peru's Ministry of Foreign Trade and Tourism created new sanitary import requirements for U.S.-processed meat and egg products. As of 2018, a Single Export Sanitary Certificate (SESC) containing both human and animal sanitary requirements from Peru's National Sanitary Authority and the National Agrarian Health Service (SENASA) must accompany shipments of processed products of animal origin, including processed meat and egg products. In October 2022, Peru clarified some requirements and added a few additional requirements to the certificate. As of December 1, 2023, Peru had not notified the certificate requirement to the WTO Committee on Sanitary and Phytosanitary Measures. The United States continues to engage with Peru to finalize a certificate that includes Peru's SESC attestations.

In November 2022, SENASA published a resolution requiring additional food safety requirements for corn, beef, pork, and poultry. This resolution requires that each shipment of these products be accompanied by a health certificate or undergo testing in a local laboratory. Following U.S. Government engagement, SENASA agreed to delay implementation of the resolution until after it is notified to the WTO, which had not occurred as of December 2023.

GOVERNMENT PROCUREMENT

Legislative Decree 1444 issued in September 2018 modified the public procurement law to allow government agencies to use government-to-government (G2G) agreements in procurement processes. Following the execution of recent infrastructure tenders using the G2G model in 2019, an increasing number of ministries and government entities require foreign companies, including U.S. firms, to obtain sponsorship by their respective governments to compete for major procurements. The U.S. Government is not permitted to sign such contracts, making Peru's use of G2G procurements a barrier for U.S. domiciled companies to compete in some relevant government tenders.

Peru is neither a Party to the WTO Agreement on Government Procurement nor an observer to the WTO Committee on Government Procurement. Peru does open procurement to U.S. goods, services, and suppliers covered under the Agreement.

INTELLECTUAL PROPERTY PROTECTION

Peru remained on the Watch List in the [2023 Special 301 Report](#).

Pirated and counterfeit goods continue to remain widely available in Peru, and right holders cite particular concerns with respect to counterfeit medicines, internet piracy, and illicit recordings in cinemas. The Gamarra market in Lima is listed in the [2023 Notorious Markets for Counterfeiting and Piracy](#) (Notorious Markets List).

The United States continues to call for Peru to fully implement the Agreement's intellectual property (IP) obligations, including enacting statutory damages for copyright and trademark infringement. The United States also calls on Peru to undertake IP reforms that include increasing and enhancing enforcement efforts such as expanding the imposition of deterrent-level fines and penalties for counterfeiting and piracy, border measures, and building the technical IP-related capacities among enforcement agencies.

LABOR

A review of Peru's progress on implementing specific recommendations to improve worker rights practices in Peru's nontraditional export sectors has been ongoing since the issuance of a U.S. Department of Labor (DOL) [report in 2016](#). The DOL report, published in response to a submission from the public under the Agreement, raised significant concerns regarding the right to freedom of association in certain sectors, including textiles, apparel, and certain agricultural sectors. The DOL report also noted concerns regarding labor law enforcement in Peru.

THE PHILIPPINES

TRADE AGREEMENTS

The United States–Philippines Trade and Investment Framework Agreement

The United States and the Philippines signed a Trade and Investment Framework Agreement (TIFA) on November 9, 1989. This Agreement is the primary mechanism for discussions of trade and investment issues between the United States and the Philippines.

IMPORT POLICIES

Tariffs

The Philippines' average Most-Favored-Nation (MFN) applied tariff rate was 6.1 percent in 2022 (latest data available). The Philippines' average MFN applied tariff rate was 9.8 percent for agricultural products and 5.5 percent for non-agricultural products in 2022 (latest data available). The Philippines has bound 67.6 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 24.9 percent.

Products with unbound tariffs include certain automobiles, chemicals, plastics, vegetable textile fiber, footwear, headgear, fish, and paper products. MFN applied tariffs on fresh fruit, such as grapes, apples, oranges, lemons, grapefruits, and strawberries, as well as on processed potato products (including frozen fries), range between 7 percent and 15 percent. Exceptions include dates and figs, which carry a 3 percent MFN applied tariff. WTO bound rates are much higher, ranging between 35 percent and 50 percent, with fresh potatoes subject to a 40 percent tariff.

U.S. agricultural exports are significantly inhibited by the high in-quota tariffs for agricultural products under the Philippines' tariff-rate quota (TRQ) program, known as the Minimum Access Volume (MAV) system. Under the MAV system, the Philippines has scheduled TRQs on select agricultural products, including sugar, corn, coffee and coffee extracts, potatoes, pork, and poultry products, with in-quota tariffs ranging from 30 percent to 50 percent.

The Department of Agriculture (DA) Administrative Order No. 52 (2000) amended the Rules and Regulations for the Implementation of the MAV, which canceled penalties for underutilization if the MAV licensee purchased local supply. This provision effectively allows existing MAV license holders to keep their full allocation for next year without having to import.

The Philippine President signed Executive Order No. 171 on May 17, 2022, reestablishing the uniform tariff on rice at 35 percent, reducing tariffs on pork to 15 percent in-quota and 25 percent out-of-quota, and reducing tariffs on corn to 5 percent in-quota and 15 percent out-of-quota until December 31, 2022. To temper continuing inflation, through Executive Order No. 10, the Philippines extended the validity of temporary duty reductions on rice, corn, and pork through the end of 2023. On January 13, 2023, the Philippine President signed Executive Order No. 13, extending the tariff reduction on mechanically deboned meat until the end of 2024. On December 22, 2023, through Executive Order No. 50, the Philippines extended its tariff reductions on rice, pork, and corn until December 31, 2024.

The Philippines continues to apply high tariffs on finished automobiles and motorcycles. A 30 percent tariff is imposed on completely built passenger vehicles with capacity of less than 10 persons (*i.e.*,

automobiles), as well as motorcycles. Passenger vehicles with a capacity of 10 or more (*i.e.*, buses) and commercial vehicles (*i.e.*, trucks) both incur a 20 percent tariff. The Philippines continues to extend duty-free treatment to imports of capital equipment, spare parts, and accessories by motor vehicle manufacturers and other enterprises registered with the Board of Investments under Executive Order No. 226.

On January 13, 2023, the Philippine President signed Executive Order No. 12, eliminating tariffs for completely built-up units of certain electronic vehicles (EVs), including passenger vehicles, buses, minibuses, vans, trucks, motorcycles, tricycles, scooters, and bicycles. The Executive Order, however, does not include hybrid EVs. Tariffs on certain EV parts and components were also reduced to 1 percent from 5 percent. Executive Order No. 12 is set to expire in 2028.

Non-Tariff Barriers

Quantitative Restrictions

The Philippines prohibits the importation of used motor vehicles, except in certain cases, which require prior authority to import from the Department of Trade and Industry. Importation of used motor vehicle parts is also regulated.

The Philippine DA regularly uses the Certificate of Necessity to Import (CNI), the Sanitary-Phytosanitary Import Clearance (SPSIC) system, or both to enact unscheduled quantitative restrictions to increase prices of sensitive agricultural and fishery products, especially during and near harvest periods. (*For further information on the SPSIC system, see the Technical Barriers to Trade / Sanitary and Phytosanitary Barriers section*).

The Philippine Secretary of Agriculture may prescribe the species type of fish to be imported and the volume to be imported. Importers must obtain a CNI to import these products.

The DA's Sugar Regulatory Administration sets the allowable import quota of sugar, typically at the beginning of each marketing year. The allowable volume applies to all sources, whether imported from an ASEAN or an MFN trading partner.

Customs Barriers and Trade Facilitation

The Philippine Bureau of Customs launched its modernization program in 2021 to address customs and corruption concerns. However, reports of corruption and irregularities in customs processing are widespread, including incidents of undue and costly delays, irregularities in the valuation process, 100 percent inspection and testing of some products, and inconsistent assessment of fees.

In 2020, the Bureau of Customs implemented the Enhanced Value Reference Information System, which is a database of information on the value and classification of imports for reference purposes in support of the implementation of the WTO Customs Valuation Agreement (CVA). Despite the submission of documentary evidence of payments (*e.g.*, contracts, purchase orders, telegraphic transfers, and letters of credits), some importers still report that the Bureau of Customs continues to use reference prices for the valuation of meat and poultry products.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

Vehicle Standards

In conjunction with ASEAN harmonization efforts, the Philippines is working to align domestic motor vehicle standards and regulations with those set under the United Nations Economic Commission for Europe (UNECE) 1958 Agreement. Under the October 2018 United States–Philippines Joint Statement, both governments pledged to cooperate to implement a U.S. work program on automotive standards issues in the context of the TIFA. The United States also recognized the Philippines’ commitment to the continued acceptance of vehicles that meet multiple high-standard automotive standards, including U.S. Federal Motor Vehicle Safety Standards. However, as of December 31, 2023, the Philippines had not yet issued regulations to implement that commitment.

Meat Labeling

Following a surge in imports, the Philippines in July 2021 abruptly began enforcing meat and poultry labeling requirements without notice, resulting in many detained containers of U.S. products and delays of other container shipments enroute. The Philippine Government issued policy clarifications in November 2021 granting labeling flexibilities until the policies can be reviewed and revised, thereby allowing continued exports of U.S. meat and poultry. On November 25, 2022, the Philippines established the Philippine National Standard for Labeling of Prepackaged Fresh Chilled and Fresh Frozen Meat. The Philippines plans to draft revised labeling requirements based on this standard and to make them available for public comment.

Utilization Report

On June 25, 2022, the Philippine DA’s Bureau of Animal Industry (BAI) informed domestic stakeholders that it will enforce BAI Memorandum Circular No. 26 (MC 26), dated August 2021. MC 26 requires importers to submit a utilization report concerning their importation of ingredients used in the manufacture of animal feed to ensure such ingredients imported for animal feed are not diverted for human consumption or for other purposes. Stakeholders have expressed concern regarding the burdensome nature of this requirement. The measure has not been notified to the WTO.

The DA extended similar requirements to importation of fishery products in December 2022, through the issuance of DA Administrative Circular 11, Suspension of Issuance of SPS Import Clearance for Importation of Certain Fish Species under Fisheries Administrative Order No. 195.

Sanitary and Phytosanitary Barriers

Import Permits

The DA requires that importers obtain an import permit, known as an SPSIC, and transmit the permit to the exporter prior to shipment of any agricultural product. Each import permit is valid for only one shipment and has a limited validity period of 15 days to 90 days, depending on the commodity. Requiring one SPSIC per shipment with a limited validity period adds costs, complicates the timing of exports, and prevents the rerouting to the Philippines of products intended for other markets but not sold there for commercial reasons. It also prevents an exporter from reselling an imported product if the importer refuses to accept

delivery or abandons the shipment. The length of validity and issuance appear to be based on the political sensitivity of the products, rather than on sanitary and phytosanitary risk. In 2019 and 2020, the Philippines stopped issuing SPSICs for certain imported agricultural products, including U.S. table grapes, chipping potatoes, and whole birds, along with products not currently supplied by the United States, such as feed wheat, rice, and corn. The DA continues not to issue SPSICs for whole birds.

DA Administrative Circular 6, issued on June 23, 2022, made permanent the 90-day validity of SPSICs for meat and poultry. Meanwhile, must-ship-out requirements for garlic, onions, rice, wheat, corn, and fresh/chilled fruits and vegetables remain limited to 20 days. SPSICs for frozen fish expire within 30 days of issuance to institutional buyers and expire within 45 days of issuance to retail buyers. SPSICs for other plant, animal, and aquatic products are also still generally subject to 60-day validity.

The DA BAI issued Memorandum Circular No. 25 (2023), which reiterates that SPSICs are no longer needed for cured processed meat products from eligible countries, including the United States, provided they comply with the World Organisation for Animal Health (WOAH) standards for the inactivation of viruses. However, SPSICs are still required for uncooked/not-fully-cooked/non-heat-treated processed animal products.

Local Government Regulations

Since the onset of African Swine Fever in 2019, and the return of avian influenza in 2022, a number of local government units (LGUs) have maintained restrictions on the import and export of live pigs and birds, and products thereof, that exceed both international and national recommendations. LGU measures are not notified to the WTO.

However, to streamline regulatory processes among LGUs and align with WOH recommendations, the DA BAI issued Memorandum Circular No. 45 (2023) that enumerates requirements for the local movement of meat and processed meat products.

Cold Chain Regulations

The Philippines has long maintained a two-tiered system for regulating the handling of frozen and freshly slaughtered meat for sale in local wet markets. This system imposes more burdensome requirements on the sale of frozen meat, including imported meat, compared to the sale of freshly slaughtered meat, which is sourced predominantly from domestically raised animals. A U.S. Department of Agriculture Food for Progress project includes a cold chain component in its overall mission to improve Philippine sanitary and phytosanitary measures and facilitate agricultural trade.

In June 2020, the DA issued Administrative Order (AO) 24 to add conditions to approve SPSIC permits by requiring importers to obtain certificates of availability of space at accredited cold storage warehouses and usage reports for imported meat and poultry. While the DA subsequently suspended implementation of AO 24, this measure has not been repealed. In September 2020, the Philippines reinterpreted its existing regulations to expand its longstanding ban on the sale of imported frozen fishery products in traditional “wet” markets to include modern supermarkets and electronic commerce. As a result, the sale of frozen fish products is limited to institutional buyers, such as food processors and hotel and restaurant chains.

GOVERNMENT PROCUREMENT

The government procurement system in the Philippines generally favors Philippine nationals or Filipino-controlled enterprises for procurement contracts. Republic Act (RA) No. 9184, or the Government

Procurement Reform Act, specifies a minimum Filipino ownership requirement of at least 60 percent in the procurement of goods, consulting services, and infrastructure projects. Domestic goods are also given preferential treatment over imported products in the bid evaluation process. Additionally, Executive Order No. 120, issued in 1993, directs government departments and agencies, including government-owned and controlled corporations, to exert best efforts to negotiate countertrade equivalent to at least 50 percent of the value of contracts on foreign capital equipment, machinery, products, goods, and services worth at least \$1 million. Government Procurement Policy Board Resolution 14-2005 states that a government agency must comply with the provisions of RA 9184 if it decides to adopt countertrade as an internal procurement policy.

While U.S. cloud service providers are active in the Philippine market, they continue to face constraints that limit their participation, particularly in competing for government projects. The Philippines requires government agencies to procure cloud computing services from the Government Cloud (also known as GovCloud), a cloud infrastructure set up by the Department of Information and Communications Technology.

The Philippines is not a Party to the WTO Agreement on Government Procurement, but has been an observer to the WTO Committee on Government Procurement since June 2019.

INTELLECTUAL PROPERTY PROTECTION

While the Philippines has made progress in intellectual property (IP) protection and enforcement since its removal from the Watch List in the 2014 Special 301 Report, the United States continues to have concerns, including limited enforcement activities. Stakeholders report issues with online piracy and sales of counterfeit goods, including apparel, shoes, watches, jewelry, perfume, and electronics. Such counterfeiting and piracy concerns led to the continued inclusion of Manila's Greenhills Shopping Center in the [2023 Review of Notorious Markets for Counterfeiting and Piracy](#) (Notorious Markets List). Other stakeholder concerns include slow prosecution and conviction of cases. The government is reportedly considering amending the IP Code to adapt to new technological changes and improve IP protection and enforcement.

The United States will continue to monitor the implementation of new regulations related to geographical indications (GIs) that entered into force in November 2022, including their potential impact on market access for U.S. products. As part of the October 2018 Joint Statement, the United States recognized that the Philippines committed “to protect GIs in a manner mutually beneficial to both countries by ensuring transparency, due process, and fairness in the laws, regulations, and practices that provide for the protection of GIs, including by respecting prior trademarks and no restriction of the use of common names.” In addition, the Joint Statement includes confirmation by the Philippines that it will not provide automatic GI protection, including to terms exchanged as part of a trade agreement. The United States will continue to monitor the implementation of this and other commitments related to GIs, including through engagement under the TIFA.

SERVICES BARRIERS

Audiovisual Services

The Philippine Constitution prohibits foreign ownership in mass media, including cable television and broadcasting, as well as film distribution and pay-television. Additionally, foreign ownership in private radio communications networks is limited to 40 percent under 2022 changes to the Foreign Investment Negative List (FINL).

Financial Services

Qualified foreign banks may own up to 100 percent of domestically incorporated banks, or enter the market as foreign branches. However, ownership restrictions apply to nonbank investors, regardless of their nationality. Nonbank foreign individuals and enterprises, like nonbank Filipino investors, are restricted from owning more than 40 percent of the total voting stock in a domestic commercial bank and more than 60 percent of the voting stock in a thrift or rural bank.

Banks that seek entry as foreign branches cannot open more than five subbranch offices. The Philippine Central Bank ensures that majority Filipino-owned banks control at least 60 percent of the total banking system assets.

Insurance Services

The Insurance Code provides that all insurance companies operating in the Philippines must seek to cede risks to reinsurance companies authorized to conduct business in the country before entering outward foreign reinsurance arrangements. Moreover, insurance companies operating in the country must cede 10 percent of outward reinsurance placements to the state-controlled National Reinsurance Corporation of the Philippines.

Generally, only the state-owned Government Service Insurance System may provide insurance for government-funded projects and coverage for all government properties, assets, contracts, rights of action, and other insurable risks to the extent of the government's interest.

Professional Services

The Philippine Constitution limits the practices of certain professions to Philippine citizens. However, various laws and regulations offer exceptions on a reciprocal basis, such as medicine, pharmacy, nursing, dentistry, accounting, teaching, architecture, and engineering. The practice of law is still reserved for Philippine citizens.

Advertising Services

The Philippine Constitution limits foreign ownership of advertising agencies to 30 percent. All executive and managing officers must be Philippine citizens.

Retail Services

Philippine law restricts foreign investment in certain retail ventures to Philippine nationals; however, amendments to its Retail Trade Liberalization Act, enacted in December 2021, open the retail sector to greater foreign participation. These amendments lower the minimum investment required for foreign retailers from \$2.5 million to \$500,000 and lower the per-store investment requirement from \$830,000 to \$200,000. Foreign retailers remain prohibited from engaging in trade outside their accredited stores, such as through the use of carts, sales representatives, or door-to-door selling.

The March 2, 2022 amendments to the Foreign Investment Act reduced capitalization requirements for foreign-owned micro and small domestic enterprises from \$200,000 to \$100,000, if the business involves advanced technology, is registered as a startup or startup enabler, or the majority of its direct employees are Filipino (assuming the firm has at least 15 Filipino employees).

Telecommunications Services

Under the amended Public Services Act (PSA) which took effect in April 2022, public services engaged in the provision of telecommunications services are considered critical infrastructure. Foreign nationals may own more than 50 percent of public services engaged in the operation and management of critical infrastructure, subject to reciprocity requirements.

The Philippines allocates and manages spectrum through the Radio Control Law of 1931 (RA 3846 and its amendment, RA 584), Executive Order No. 546 1979, and the Public Telecommunications Policy Act of 1995 (RA 7925). These laws and directives provide the country's legal framework for spectrum enfranchisement, operation, and permitting in line with International Telecommunication Union requirements, and general provisions on the allocation and assignment of radio spectrum. While RA 7925 requires the conduct of open tenders in allocating spectrum, no public bidding has ever been carried out to allocate spectrum (*e.g.*, spectrum auctions). Evaluation of applications typically involves the submission by an applicant of a letter of request to the National Telecommunications Commission for its spectrum needs. This model is inherently non-transparent, constituting an administrative approach by which applicants are chosen based on the government's prioritization of certain criteria (like financial or technical capacity).

The proposed Open Access in Data Transmission bill, pending full congressional approval in the Philippines as of December 31, 2023, seeks to lower barriers to market entry, lower the cost of deploying broadband facilities, and make more spectrum available for Internet service.

INVESTMENT BARRIERS

Limitations on Foreign Ownership

The FINL, which is published every two years and was last updated in June 2022, enumerates foreign investment restrictions. Foreign investment in FINL-listed sectors may be prohibited outright (*e.g.*, mass media, marine resources, and small-scale mining cooperatives) or subject to limitation (*e.g.*, up to 40 percent foreign ownership in natural resource extraction; educational institutions; private radio communication networks; companies participating in government procurement; and public utilities such as electricity transmission and distribution, water and petroleum pipelines, seaports, and public utility vehicles). The 2022 FINL reflects amendments to the Retail Trade Liberalization Act, the PSA, and the Foreign Investment Act.

SUBSIDIES

Export Subsidies

The Philippines offers a wide array of fiscal incentives for export-oriented investments, particularly investments related to manufacturing. These incentives are available to qualified firms located in designated export processing zones, free port zones, and other special industrial estates registered with the Philippine Economic Zone Authority (PEZA). The available incentives include: income tax holidays or exemptions from corporate income tax for up to seven years; an option for either special corporate income tax or enhanced deductions for up to 10 years after the income tax holiday period; payment of a 5 percent special tax on gross income less allowable deductions in lieu of all national and local taxes; exemption from duties and taxes on imported capital equipment, machinery, spare parts, and raw materials; exemption from wharfage dues, imposts, and fees; and a zero percent value-added tax (VAT) rate on local purchases (including telecommunications, electricity, water, and building lease) directly and exclusively used in the

registered project or activity. The PEZA approves incentives for projects with investment capital of \$20 million and below, and the Fiscal Incentives Review Board (FIRB) approves incentives for projects above a \$20 million investment capital threshold.

The Corporate Recovery and Tax Incentives for Enterprises (CREATE) Act introduced a sunset provision on the aforementioned preferential tax rates and benefits provided to activities currently registered with Philippine investment promotion agencies, including the PEZA. The CREATE Act grants a 10-year transition period to export enterprises registered prior to its enactment, with the option to reapply for special corporate income tax treatment subject to the conditions set in the Strategic Investment Priority Plan and a performance review by the FIRB. In response to VAT-related issues experienced by firms, the Philippines amended the CREATE Act's implementing rules and regulations on August 11, 2023, to clarify the applicability of VAT exemptions and refunds. Also in August 2023, a new tax reform bill, known as the CREATE More Act, was introduced to further lower corporate income tax from 25 percent to 20 percent and to harmonize VAT incentives in special economic zones. As of December 31, 2023, the CREATE More Act was pending congressional approval.

OTHER BARRIERS

Bribery and Corruption

Corruption is a pervasive and longstanding problem in the Philippines. National and local government agencies, particularly the Bureau of Customs, are beset with various corruption issues. Both foreign and domestic investors have expressed concern about the lack of transparency in judicial and regulatory processes. Investors have also raised concerns about courts being influenced by bribery and improperly issuing temporary restraining orders to impede legitimate commerce.

RUSSIA

SANCTIONS AND COUNTERSANCTIONS

In response to Russia's March 2014 invasion of Ukraine and self-proclaimed annexation of Crimea, the United States imposed sanctions on Russian Government officials, individuals who supported the annexation policy, and critical sectors of the Russian economy. In response, Russia enacted a variety of measures in retaliation. The initial measures banned the importation of a variety of agricultural and seafood products from the United States and other countries.

As a result of Russia's full-scale invasion of Ukraine beginning in February 2022, the United States imposed unprecedented further sanctions on Russia in 2022, ceased virtually all bilateral engagement on trade and investment issues with Russia, and continues to take steps to isolate Russia from the global economy and hold President Putin accountable for his war against Ukraine. Those measures include: withdrawal of Most-Favored-Nation (MFN) status for Russian goods; increased tariffs on certain imports from Russia; import and export bans and restrictions; financial and investment restrictions in certain industries; and, blocking measures against certain entities and individuals. In response, Russia has expanded its retaliation, imposing or proposing measures to impact financial transactions, protection and enforcement of intellectual property, exports and re-exports of certain goods, and foreign direct investment, which may extend to nationalization of foreign-owned assets. Russia has also accelerated and expanded its efforts to replace imports with domestic goods and services. As a result of the increased geopolitical tensions, hundreds of U.S. companies have withdrawn from or significantly reduced their presence in Russia.

Bilateral trade in goods has fallen from \$38.2 billion in 2013 to \$5.2 billion in 2023. While some of the decline in trade is undoubtedly due to the overall decline in global trade because of the COVID-19 pandemic, the decline also reflects the geopolitical tensions and Russia's increasingly inward-looking industrial and trade policies, as well as the impact of U.S. sanctions and export controls applied to Russia.

This chapter of the National Trade Estimate reports primarily on the significant trade and investment barriers in Russia before the full-scale invasion of Ukraine that began in February 2022. The United States continues to engage with U.S. stakeholders to analyze and assess the impact of the sanctions and counter sanctions on trade in the broader context of U.S. national interests. However, due to the near total cessation of engagement with Russia, engagement on significant trade barriers in Russia is severely limited.

TRADE AGREEMENTS

Membership in the World Trade Organization

On August 22, 2012, Russia became the 156th Member of the World Trade Organization (WTO). On December 14, 2012, following the termination of the application of the Jackson-Vanik Amendment to Russia, the United States and Russia consented to the application of the WTO Agreement between the two countries. Russia's accession to the WTO signaled its movement to adopt key WTO principles, including transparency. Despite its WTO commitments, as noted in the [2023 Report on the Implementation and Enforcement of Russia's WTO Commitments](#), the Russian Government has maintained restrictive at-the-border measures, instituted behind-the-border measures to inhibit trade, and pursued principles of import substitution and forced localization, taking it on a comprehensive trajectory away from the guiding principles of the WTO.

Eurasian Economic Union

Russia is a member of the Eurasian Economic Union (EAEU), a limited customs union that also includes Armenia, Belarus, Kazakhstan, and Kyrgyzstan. Moldova, Uzbekistan, and Cuba have observer status at the EAEU. The Eurasian Economic Commission (EEC) is the supranational body charged with implementing external trade policy for EAEU member states and coordinating economic integration among them. While tariff harmonization and standardized regulatory approvals across member states have eased the process of doing business within the customs union for some U.S. companies, some regulatory regimes such as those applying to medical devices and to pharmaceuticals have not been standardized and still require approvals by the individual member states. As a consequence of its membership in the EAEU, Russia's import tariff levels, trade-in-transit rules, non-tariff import measures (*e.g.*, tariff-rate quotas, import licensing, and trade remedy procedures), and customs policies (*e.g.*, customs valuation, customs fees, and country of origin determinations) are based on EAEU legal instruments. The EAEU member states are estimated to have harmonized approximately 90 percent of their tariffs governing trade with third countries.

IMPORT POLICIES

Tariffs and Taxes

Tariffs

Russia's average MFN applied tariff rate for all goods was 6.6 percent in 2022 (latest data available). Russia's average MFN applied tariff rate was 9.7 percent for agricultural products and 6.1 percent for non-agricultural products in 2022 (latest data available).

Russia has bound 100 percent of its tariff lines in the WTO, with an average WTO bound tariff rate of 7.5 percent. Russia's average WTO bound tariff rate for agricultural goods (10.7 percent) was slightly higher than its average applied rate of 9.7 percent in 2022 (latest data available). Russia's average WTO bound rate for non-agricultural products was 7.1 percent also slightly higher than its average applied rate of 6.1 percent. Russia's maximum WTO bound tariff rate was 113 percent in 2022 (latest data available). Although Russia has implemented all the tariff reductions required by its WTO commitments, some concerns remain.

In 2018, the Government of Russia adopted Decree No. 788 On Approval of Rates of Import Customs Duties In Respect of Certain Goods Whose Country of Origin Is the United States of America (amended April 26, 2022) imposing tariffs ranging from 25 percent to 40 percent on various industrial products (mainly certain types of construction machinery) imported from the United States. Russia took this action in retaliation against the U.S. President's decision to adjust duties on U.S. imports of Russian steel and aluminum articles under Section 232 of the Trade Expansion Act of 1962, as amended (19 U.S.C. § 1862). These retaliatory duties are being applied by Russia only, not by other EAEU member states. The United States had been urging Russia to work with the United States to address excess capacity in the global steel and aluminum sectors, rather than engage in unjustified retaliation designed to punish U.S. workers and companies. On August 27, 2018, the United States launched dispute settlement proceedings against Russia at the WTO and requested consultations with Russia. Following unsuccessful consultations in November 2018, a WTO dispute panel was established on December 18, 2018 and composed on January 25, 2019. On June 16, 2023, Russia requested that the panel suspend its work. Despite an objection from the United States, the panel accepted Russia's request and, effective June 23, 2023, the panel suspended its work.

Through Decree No. 1173, on July 20, 2023, Russia increased customs duties on imports of certain goods from “unfriendly” countries, including the United States. Specifically, Russia increased duties on wine (from 12.5 percent to 20 percent), purified glycerin (from 9 percent and 12 percent to 50 percent), and polyurethane (from 6.5 percent to 35 percent). These duty increases were authorized by Presidential Decree No. 973 signed in December 2022 and will stay in effect until December 31, 2025.

On August 3, 2023, Russia introduced amendments to the Federal Law On Customs Tariffs bill amending the Federal Law on customs tariffs to the State Duma (the lower chamber of Russia’s parliament) providing the government with the authority to lower export tariffs on grain, fertilizers, and raw materials to “friendly” countries. The bill was approved by the State Duma on December 12, 2023, and was pending in the upper chamber of parliament as of December 31, 2023.

Taxes

Russia applies a value-added tax (VAT) of 20 percent on goods, works, and services (with some limited exceptions). According to Article 149.2 (paragraph 21) of the Russian Tax Code, the 20 percent VAT payments on royalties paid for screening Russian movies (as defined in the Russian tax code) can be rebated, but not VAT payments on royalties for screening U.S. (or other non-Russian) films. However, following Russia’s full-scale invasion of Ukraine in February 2022, most major U.S. studios withdrew from and ceased screening movies in Russia. Similarly, Article 149 exempts from the 20 percent VAT the royalties paid on software included in the Unified Register of Russian Software (pursuant to Federal Law No. 188-FZ of June 29, 2015, and Resolution 1236 of November 16, 2015.) Because only Russian software is included in the Register, the cost of using non-Russian software can be automatically 20 percent higher than using Russian software. The United States has raised these discriminatory tax practices with the Government of Russia, but Russia has not changed its practices.

Russia’s Federal Law No. 89-FZ (as amended), imposes a recycling fee to be paid on automobiles and certain other wheeled vehicles that requires importers (since 2012) and manufacturers (since 2016) of automobiles and certain other wheeled vehicles (including self-moving agriculture and industrial vehicles). The fee is determined by the age, total mass, and engine size of the vehicle. Purportedly, the fee was imposed to offset the reduction in tariffs. The recycling fee has increased from between RUB 3,000 and RUB 110,000 (approximately \$41 and \$1,494) in 2012, depending on total mass and engine size of the vehicle, and between RUB 3,400 and RUB 1,235,000 (approximately \$36 and \$13,138) in 2023 for new passenger cars with no more than eight seats. For used passenger cars, the recycling fee increased from between RUB 5,000 and RUB 700,200 (approximately \$68 and \$9,507) in 2012 to RUB 5,200 and to RUB 1,623,800 (approximately \$55 and \$17,274) in 2023. Although the fee applies to both domestic and imported vehicles, concerns remain regarding the overall level and calculation of the fee for heavy-duty commercial vehicles.

Russia appears to apply a variable excise tax on automobiles based on their engine size. For example, in 2023, cars with engine power below 150 horsepower (hp) (e.g., a Lada, as well as some models of Fiats, Mini Coopers, and older Fords) are subject to an excise tax of RUB 55 (approximately \$0.60) per hp. For cars with engine power above 150 hp, the excise tax rate increased from RUB 531 per hp to RUB 1,584 per hp (approximately \$5.70 to \$16.90). Those rates translate to a maximum tax of approximately RUB 8,250 (approximately \$87.80) for a car with less than 150 hp, and RUB 80,181 (approximately \$852) for a car with 151 hp, and RUB 793,584 (approximately \$8,442) for a car with over 500 hp (e.g., certain models of Cadillacs, Ford Mustangs, Jaguars, Alfa Romeos or Mercedes Benz). Although the tax applies to both domestically produced and imported vehicles, it disadvantages foreign manufacturers as Russia produces a limited number of high horsepower cars. In its 2022 WTO Trade Policy Review, Russia acknowledged that it does not produce passenger cars with engine power over 300 hp.

Non-Tariff Barriers

Import Bans

Russia has maintained a ban on imports of certain food and agricultural imports from Australia, Canada, the member states of the European Union, Norway, and the United States since 2014. The list of banned food includes: certain beef, pork, poultry, fish and seafood products; fruits and nuts; vegetables; some sausages; and, most prepared foods. Russia has since amended the list of products and expanded the list of countries covered by the ban, adding Albania, Iceland, Liechtenstein, Montenegro, Ukraine, and the United Kingdom. In September 2023, Russia extended the ban until December 31, 2024 through Presidential Decree No. 693 On the Extension of Certain Special Economic Measures to Ensure the Russian Federation's Security (September 18, 2023).

Import Licensing

Even before Russia's full-scale invasion of Ukraine in February 2022, the Russian Government maintained barriers to the importation of products with cryptographic functionalities (encryption products). Although Russia has WTO commitments to allow the importation of "mass market" consumer electronics without an import license or other customs formalities (other than import duties), stakeholders report that Russia continues to require at a minimum a one-time notification or, for products with strong encryption, permission from the Russian security services in addition to an import license, which significantly increases import costs and often precludes imports altogether. In addition, pursuant to Government Resolution No. 313 (April 16, 2012), as amended, Russia requires an activity license to distribute encryption products, including many common consumer electronics, which further restricts U.S. exporters access to the Russian market. Only Russian legal entities or individual entrepreneurs may apply for a local (domestic) encryption license. Representative offices of foreign companies registered in Russia cannot apply for a local license. Prior to Russia's 2022 full-scale invasion of Ukraine, the U.S. Government had raised these concerns with the Russian Government about the import licensing regime for encryption products but Russia failed to respond to repeated outreach.

Customs Barriers and Trade Facilitation

In 2019, Russia began to implement a mandatory labeling regime (track and trace regime) in selected industry sectors that requires the application of an encrypted label to products, both imported and domestically produced, in an ever-widening list of industry sectors. The mandatory labeling regime applied initially to only certain industry sectors (*e.g.*, footwear, apparel, pharmaceuticals, and perfumery products), but now covers 16 groups of goods with the goal of making the majority of consumer goods digitally traceable by 2024. Various affected industry stakeholders have raised significant concerns about the regime, including: short implementation timelines; the risk of disclosure and misuse of sensitive commercial data collected under the regime; the lack of operational details from the Russian Government; the quantity of detailed data required for the labels; the possibility of national treatment and trading rights issues stemming from different procedures for importers to obtain these labels compared to domestic manufacturers; the requirement that the labels must be purchased from a single Russian company; the duplication with existing tracking regimes (*e.g.*, the system for tracking alcohol products); and, arbitrary misuse of the system to halt imports. Russia had shown some flexibility in response to stakeholder concerns and, in 2022, suspended some of the labeling requirements. The United States will work with stakeholders and, where possible, the Russian Government to ensure that the system does not create new trade barriers to U.S. exports, or undermine the benefits of the WTO Trade Facilitation Agreement.

U.S. stakeholders report that the Russian Government does not publish all regulations, judicial decisions, and administrative rulings of general application on customs matters. In addition, U.S. exporters report that

customs enforcement varies by region and port of entry, and that changes in regulations can be frequent and unpredictable, adding to costs and delays at the border. U.S. officials have pressed Russian officials to improve transparency in this area and ensure compliance with WTO commitments.

Import Substitution Policies

Russia's extensive import substitution policies posed a significant barrier to a wide variety of U.S. exports, even before the full-scale invasion of Ukraine in February 2022 caused a precipitous drop in trade. These policies have a long history in Russia, but have increased in prominence in the past few years and transformed into a set of policy initiatives to ensure Russia's technological sovereignty by reducing its dependence on foreign technologies. Sectors in which these policies have been developed and implemented over the last several years include: agriculture; transport vehicles; telecommunications; consumer goods; textiles; optical fiber; defense; banking; oil and gas; solar and wind energy; software; aircraft manufacturing; and, medical devices. *(For further information, see the sections on Investment Barriers, State-Owned Enterprises, and Government Procurement.)*

Initially, the Russian Government implemented these preferences primarily through government procurement, but since 2015 has increasingly extended the mandated preferences to purchases by state-owned enterprises (SOEs). For example, Russia's law governing SOE purchases expressly: (1) favors Russian-produced products; (2) grants the Russian Government the authority to establish plans and tender rules for the purchase of specific Russian goods, works, and services; (3) establishes a Government Import Substitution Commission with responsibility for determining which types of machinery and equipment must be sourced locally for large investment projects by SOEs, state corporations, or certain private businesses; (4) requires the coordination of SOEs' purchases of pharmaceutical, high technology, and innovative products with the government; and, (5) recommends that SOEs follow the more restrictive procurement rules that govern federal and municipal procurement. *(For further information, see the Government Procurement section.)*

Russia's import substitution requirements have not been limited to SOEs. Since December 2019, Russia has required the pre-installation of Russian software (e.g., search engines, Yandex browser, mapping and navigation software, anti-virus software, software that provides access to electronic government infrastructure, instant messaging and social network software, and national payment software) on certain consumer electronic products (e.g., smartphones, computers, tablets, and smart TVs) sold in Russia. (Law No. 425 On Amending Article 4 of Russian Federation Law 'On Protecting Consumer Rights' December 2, 2019.) Stakeholders contend that the law appears to be another effort by the Russian Government to disadvantage imports and increase control over technology. In August 2023, the Russian Government approved a new list of Russian software that must be pre-installed on smart TVs in 2024, adding several video streaming services. The list of programs for computers and mobile devices remained basically the same. In addition, technology companies are concerned that the law would expose devices and services to potentially unsafe, insecure, or unreliable technology. The United States raised concerns directly with the Russian Government prior to the full-scale invasion of Ukraine in 2022 and will monitor closely the implementation of this policy, which has the potential to seriously disrupt U.S. and other foreign suppliers of devices, software, and services.

Russia has expanded its localization policies beyond Russian-made goods to include Russian-origin services. *(For further information, see the Services Barriers section.)*

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

U.S. companies cite Russia's administration of technical regulations and related product-testing and certification requirements as major obstacles to U.S. exports of industrial and agricultural goods to Russia. Russia does not accept export certificates recognized by other countries, such as those issued by the Food and Drug Administration of the U.S. Department of Health and Human Services. Russia recognizes only the certificates issued by authorized agencies from one of the EAEU member countries with a representative office in Russia. Russian authorities require product testing and certification as a key element of the approval process for a variety of products; and, in many cases, only an entity registered and residing in Russia can apply for the necessary documentation for those product approvals. Consequently, opportunities for testing and certification performed by competent bodies outside Russia are limited, which is contrary to standard practice and inappropriately increases the burdens for companies exporting to Russia. Manufacturers of telecommunications equipment, oil and gas equipment, construction materials and equipment, and veterinary biologics, such as vaccines, have reported serious difficulties in obtaining product approvals within Russia. Other EAEU member states are in the process of adopting similar requirements.

Alcoholic Beverages

Stakeholders have raised concerns about legislative amendments that affect Russia's regulation of the wine market, particularly Federal Law No. 345-FZ of July 2, 2021. Stakeholders are concerned that certain definitions and provisions, such as limitations placed on wine exported to Russia in bulk and restrictions on the use of certain ingredients, could create barriers to exports from the United States and other producers of wine. Stakeholders have also raised concerns related to limitations on the right to use certain geographical indications (GIs) or appellations of origin, and the rules governing labeling (with follow-on implications for labeling approvals). In December 2022, the Geneva Act of the Lisbon Agreement on Appellations of Origin and Geographical Indications, which contains requirements that can reduce safeguards for the use of common names, came into force in Russia.

In addition, stakeholders noted that Russia requires one or multiple certificates for imported wine from the United States, even when those wines conform to both U.S. and Russian standards. Often, these certificates must be an original document issued by the U.S. Department of Treasury (Alcohol and Tobacco Tax and Trade Bureau) or an officially accredited organization located in Russia. Stakeholders also expressed concerns about the Ministry of Industry and Trade's November 2022 decision to allow imports of premium liquor brands without the trademark owners' consent under Russia's parallel imports scheme. When appropriate, the United States will work to ensure that Russia's and the EAEU's alcoholic beverages control regime is consistent with Russia's WTO commitments, and also urge Russia and the EEC to adopt international standards or guidelines for such products.

Pharmaceuticals

U.S. stakeholders continue to raise concerns about the implementation of Russia's Good Manufacturing Practices (GMP) regime for pharmaceutical products. U.S. stakeholders are concerned that Russia treats domestic and foreign manufacturers differently in the implementation of its GMP regime for medicines. For example, stakeholders have highlighted the higher rate of unwarranted denials of foreign GMP certificates, the lack of a process for paper review of corrective actions for minor deficiencies, and the disparate, legislatively-mandated treatment of GMP procedures for local and foreign sites. Moreover,

industry stakeholders report that the GMP certificates for veterinary drugs, required since September 1, 2023, present a significant barrier to imports and could potentially close the Russian market to exports of U.S. veterinary drugs.

Toys

U.S. industry is concerned about the arbitrary exclusion of certain toys from the Russian market as a result of the “psychological assessment of toys, games and play structures” required under the 1998 Federal Law No. 124-FZ On Basic Guarantees of Children’s Rights to the Russian Federation. U.S. toy industry stakeholders have also raised a concern about the EAEU’s ban on recycled content in toys, which they claim contradicts global toy safety standards and undermines the growing focus of the U.S. toy industry on sustainability.

Sanitary and Phytosanitary Barriers

Russia has banned imports of most agricultural products since August 2014. The issues discussed below continue to be of concern to the United States and still constitute market access barriers in addition to the import ban.

Food Safety Standards

Russia maintains standards on a wide array of animal products that are inconsistent with international standards set by the World Organisation for Animal Health (WOAH), the International Plant Protection Convention (IPPC), or the Codex Alimentarius Commission (Codex) without an apparent scientific justification. Findings of veterinary drug residues during Russian border inspection of U.S. meat and poultry products have resulted in trade disruptions, including the suspension of previously-approved U.S. beef, pork, and poultry facilities. For example, in October 2013, the EEC adopted a zero-tolerance policy for beta-agonists, including ractopamine, and trenbolone acetate for beef and pork products. These standards are more stringent than the Codex’s maximum residue limits for these substances in both beef and pork. Russia notified this measure to the WTO in November 2017, and to date the United States is not aware of any complete risk assessment. Although the United States has established a Never Fed Beta Agonists Program, Russia’s prohibition of these veterinary drugs, including for products that are not affected by Russia’s import bans, prevents U.S. exporters of beef and pork products from accessing the Russian market.

Plant and Animal Health

U.S. exporters of agricultural products also continue to face systemic issues in Russia. For example, since August 2008, Russian and EAEU veterinary certificates require U.S. regulatory officials to certify that exported products satisfy EAEU sanitary and veterinary requirements and meet certain chemical, microbiological, and radiological standards. These requirements are problematic because many EAEU sanitary and veterinary requirements appear to be excessively restrictive and lacking in scientific justification. Similarly, Russia requests U.S. exporters to submit certifications stating that the United States is free from various livestock diseases, even where the product in question could pose no risk of transmission. In other cases, Russia requires sanitary or phytosanitary attestations on export certificates for low-risk food or agricultural products without providing scientific evidence of the risk justifying such measures. For example, Russia requires phytosanitary attestations for shipments of certain plant-origin products destined for further processing, such as corn for popcorn, even though such processing removes any potential plant health risk. The United States is also concerned with Russia’s failure to remove certain veterinary control measures for lower-risk products. Russia maintains a ban on cultivation of genetically engineered (GE) crops and the import of GE planting seeds, as well as stringent import restrictions on

animal feed and burdensome methodological guidelines for the registration of GE products. The United States has pressed and will, as appropriate, continue to press for the removal of these types of barriers to exports of U.S. plant and animal products.

Approved Exporter and Facility Listing Requirements

Pursuant to a June 2010 EEC regulation, Russia only allows imports of most products under veterinary control (*e.g.*, meat, poultry, dairy, and seafood) from facilities on a list approved by all EAEU member states. Pursuant to a bilateral agreement signed in November 2006, Russia agreed to grant U.S. regulatory officials the authority to certify new U.S. facilities and recertify U.S. facilities that have remedied any previously reported import noncompliance. In practice, however, Russia has not consistently recognized the authority of U.S. regulatory officials to certify additional U.S. facilities, and there have been delays in responding to U.S. requests to update the list of approved U.S. facilities. Russia justifies its approach based on the EEC Customs Union Commission Decision No. 834, dated October 18, 2011, On the Regulation on the Harmonized Procedure of Joint On-Site Inspections and of Taking Samples of Goods (Products) Subject to Veterinary Control (Supervision) and the subsequent EEC Decision No. 94, dated October 9, 2014, On the Regulation on the Harmonized Procedure of Joint On-Site Inspections and of Taking Samples of Goods (Products) Subject to Veterinary Control (Supervision). The EAEU has competence for facility inspections and approvals. The United States worked with Russian and EAEU authorities to negotiate an EAEU inspection regulation that allows the EAEU to accept the certification of additional facilities provided by sanitary and phytosanitary authorities in third countries that certify new facilities. However, implementation of this regulation has lacked predictability and transparency because EAEU member states often continue to insist on conducting their own inspections prior to approving a facility, without providing any rationale.

Similarly, Russia maintains exporter approved lists. Russia has effectively banned the importation of U.S. dairy products since September 2010, when Russia's Federal Service for Veterinary and Phytosanitary Surveillance (VPSS) instructed customs officials to allow shipments only from exporters on VPSS-approved lists. The EEC has now extended this listing requirement to most agricultural products. This directive appears to be inconsistent with EAEU legislation eliminating the requirement that a foreign producer be included on an approved list in order to be eligible to export dairy products to the EAEU. The listing requirement continues to prevent U.S. exports of heat-treated dairy products despite the fact that, in March 2014, the United States and the Russia–Kazakhstan–Belarus Customs Union (CU) concluded negotiations on a U.S.–CU veterinary certificate. Despite its WTO accession commitment to eliminate listing requirements for pet food and animal feed products, Russia also continues to require approved lists of exporting establishments for pet food of animal origin. The United States has worked, where possible, with Russia and the other EAEU member states to eliminate the listing requirement for exporters, including heat-treated dairy products.

GOVERNMENT PROCUREMENT

Russia is not a Party to the WTO Agreement on Government Procurement (GPA), but has been an observer to the WTO Committee on Government Procurement since May 2013. In 2013, Russia adopted Law No. 44-FZ On the Contract System for the Procurement of Goods, Works and Services for State and Municipal Needs establishing the basis for a broad range of requirements relating to federal or municipal government procurement that it argues are not subject to the national treatment obligations of the General Agreement on Tariffs and Trade and the General Agreement on Trade in Services. Given the breadth of the Russian Government's role in the economy and the scope of the numerous import substitution policies applicable across a broad swath of the Russian economy, such measures impede trade because U.S. exports are excluded from a broad section of the Russian economy. Notwithstanding legislation simplifying the public

procurement process, Russia's restrictions on its government procurement opportunities have accelerated since 2014 when Russia established a 15 percent preference for a variety of goods (including certain food products, pharmaceuticals, steel, machinery, and medical products) produced in the EAEU for government use, and up to 30 percent for certain other products.

Since 2015, Russia has adopted increasingly autarkic measures reaffirming and expanding the ban on government procurement of a wide range of foreign-made products, including, but not limited to: furniture; vehicles; machinery and equipment; tools; appliances; paper and cardboard; and, shoes and clothing.

In addition, Russia has banned states and municipalities from purchasing foreign-made automobiles, other vehicles, and machinery, and banned procurement of a broad array of consumer goods produced outside the EAEU, unless there are no domestic or EAEU alternatives. The Industrial Policy Law, dated December 31, 2014, specifically promotes import substitution, restricting government procurement (and SOE purchases) of foreign-made products. It provides a framework for the support of certain product manufacturing, research and development (R&D) subsidies, and infrastructure projects as well as implementation of the Buy Russia Law. The Industrial Policy Law also includes provisions for financial and material support to Russian companies to boost their export potential.

In addition, measures aimed at the healthcare industry, such as Russia extending its “three’s-a-crowd” localization policy (banning government procurement of certain imported goods if more than two companies from EAEU member states submitted a bid) to government tenders for many drugs, medical devices and health-related disposable goods, have been challenging for U.S. stakeholders. If the “three’s-a-crowd” rule is not applicable, a 15 percent price preference is applied. Russia has also adopted additional restrictions on government procurement of imported medicines and medical devices. An additional challenge to U.S. pharmaceutical producers is a reimbursement system that allows only domestic companies to request annual adjustment of prices registered by the Ministry of Health.

In February 2023, the Russian Government adopted Decree No. 318 further expanding the list of goods banned from government procurement and replaced the “three’s-a-crowd” localization policy with the “two’s-a-crowd” rule previously applied to public procurement of electronic equipment.

The so-called “two’s-a-crowd” rule requires public sector customers procuring products listed in the resolution to reject bids from foreign manufacturers if there is already one (or more) bids for the supply of the same product manufactured in the EAEU. The rule was first approved in August 2021 when the Russian Government issued a resolution that significantly strengthened restrictions on public procurements for over 170 groups of electronic equipment, including more than 30 groups of medical devices manufactured by foreign companies. For the medical devices listed in this measure, this requirement will replace the similar “three’s-a-crowd” rule, described above.

These measures follow restrictions imposed by Russia that ban government procurement of over 100 imported radio electronic products and components and establish a 30 percent price preference in purchases by state-owned enterprises. In June 2022, the Ministry of Industry and Trade (MoIT) announced it had prepared a draft government decree on the introduction of the “two’s-a-crowd” rule in public procurement of essential drugs providing procurement preferences to pharmaceutical companies in EAEU member states that engage in full-cycle pharmaceutical R&D and manufacturing. In 2023, the MoIT confirmed that the decree would apply to the entire list of strategically important medicines as of September 2024.

In 2016, the Russian Government issued Decree No. 832 (last amended in May 2022) banning certain food and dairy products from non-EAEU member states for federal and municipal government procurement, (including fresh and frozen fish, fish products, canned fish, salt, beef, pork, veal, poultry, cheese, cottage cheese, rice, butter, and sugar) and established minimum purchasing requirements of domestic goods. In

April 2020, with the adoption of Resolution No. 616, the Russian Government introduced another series of bans and restrictions on the admission of foreign industrial goods for the purpose of public procurement and procurement for the needs of national defense and state security. Resolution No. 616 was last amended on September 16, 2023, expanding the list of banned foreign industrial goods in public procurement to meet the needs of national defense and state security during “special military operations” and mobilization in Ukraine. In August 2023, Russia approved amendments to the Federal Procurement Law to further simplify uncompetitive sole-source public procurement for the needs of national defense and state security during the “special military operation” (Federal Law No. 443-FZ of August 4, 2023). Eligible government entities, approved by Government Resolution No. 3514 in November 2022, are now allowed to sign with winning bidders any type of contract provided for in Russia’s Civil Code without any restrictions.

Russia has expanded the reach of its import substitution policies into the technology sector. Pursuant to amendments to Russia’s national procurement law (Law No. 44-FZ), Russia has created a registry of Russian software. Foreign-made software not on the list will no longer routinely qualify for federal and municipal government procurement, unless no similar domestically produced software is available. In July 2016, the Russian Government went a step further and issued an order approving a three-year plan to switch government agencies to Russian-origin office software. According to U.S. stakeholders, because the move to domestic software was not moving fast enough, the Russian Government in 2020 proposed measures that would expand the list of companies considered Critical Information Infrastructure (CII), and thus extending to many private companies the import substitution requirements applied to government entities. In March 2022, the Russian President signed Decree No. 166 to ban SOEs from procuring foreign software and information technology (IT) services for the CII that they operate. The Decree also bans SOEs and public authorities from using foreign IT for CII starting on January 1, 2025. In August 2023, the MoIT released a detailed action plan to ensure SOEs and public authorities meet the January 2025 deadline.

The Ministry of Digital Development, Communications, and Mass Media drafted a bill to expand the current ban on the purchase and use of foreign IT products for CII operated by public authorities and SOEs to include privately-owned CII. If the bill becomes law, the ban on the purchase and the use of foreign IT products for CII will be applied to all CII operators, regardless of government or private ownership. This measure will likely severely limit the ability of foreign-controlled entities to provide IT services to CII operators, and require such operators to migrate toward the use of domestic software and hardware only.

INTELLECTUAL PROPERTY PROTECTION

Russia remained on the Priority Watch List in the [2023 Special 301 Report](#). Challenges to intellectual property (IP) protection and enforcement in Russia include continued copyright infringement, trademark counterfeiting, and the existence of non-transparent procedures governing the operation of collective management organizations (CMOs). The United States is also closely monitoring proposals and measures undertaken by Russia to target IP rights for foreign right holders based in countries that have sanctioned Russia. Some of these measures have been implemented, including Decree 299, which permits Russian companies and individuals to forgo compensation to right holders for the use of inventions, utility models, and industrial designs under Article 1360 of the Russian Civil Code, if the right holder is a national from a list of countries designated by Russia as “unfriendly” due to factors including publicly supporting or calling for sanctions against Russia. Another new measure, Decree 322, restricts the ability of foreign right holders from those same “unfriendly” states to collect license payments for most types of IP.

Russia’s inadequate and ineffective protection of copyright, including with regard to online piracy, continues to be a significant problem, damaging the market for legitimate content in Russia and in other countries. Despite adoption of anti-piracy legislation in 2017, Russia remains home to several sites that facilitate online piracy, as identified in the [2023 Review of Notorious Markets for Counterfeiting and Piracy](#)

(Notorious Markets List). Stakeholders continue to report significant piracy of video games, music, movies, books, journal articles, and television programming. While right holders are able to obtain court-ordered injunctions against websites and smartphone applications offering infringing content, investigations and prosecutions of the owners of the large commercial websites distributing pirated material, including software, are lacking.

Trade in counterfeit goods causes significant financial losses for U.S. right holders and legitimate businesses. Russia remains a thriving market for counterfeit goods sourced from China. Despite increased seizures by the Russian Federal Customs Service, certain policies hamper IP enforcement efforts. For example, the “return to sender” policy for small consignments, which returns counterfeit goods to their producer, is problematic because it does not remove such goods from channels of commerce.

CMOs for copyright can play an important role in ensuring compensation for right holders when CMO practices are fair, efficient, transparent, and accountable. However, royalty collection by CMOs in Russia continues to lack transparency and lags behind international standards. Reports indicate that right holders are denied detailed accounting reports, making it difficult to verify how much money is being collected and distributed. Also, right holders are excluded from the selection and management of CMOs.

Finally, the United States is concerned about Russia’s implementation of its WTO commitments related to the protection against the unfair commercial use, as well as the unauthorized disclosure, of undisclosed test or other data generated to obtain marketing approval for pharmaceutical products. Stakeholders report that Russia is eroding protections for undisclosed data and lacks an effective mechanism for the early resolution of potential pharmaceutical patent disputes. Stakeholders also continue to express concerns regarding certain evidentiary standards applied by the judiciary.

SERVICES BARRIERS

Russia has extended its import substitution policies beyond the provision of goods to include the provision of services.

Audiovisual Services

In January 2022, the Russian Government announced that it would require any streaming service with over 100,000 daily users to register as a Russian company and to add 20 Russian television channels to its service, including Russian news stations, thereby forcing U.S. suppliers to become platforms for Russian state propaganda. However, affected U.S. companies suspended operations in Russia due to the full-scale invasion of Ukraine before the measure went into effect.

Financial Services

Russia continues to prohibit foreign banks from establishing branches in Russia, which means that only local subsidiaries are allowed. In June 2023, the Ministry of Finance released for public discussion a draft bill that would allow foreign banks from “friendly” countries to open branches in Russia. If the bill is approved, they will be allowed to provide banking services in Russia to corporate entities, while individual clients will only be allowed to make fund transfers without opening a bank account. Branches of foreign banks will not be allowed to open demand and term deposits. Moreover, since 2014, Russia has required that foreign-based credit card companies transmit data for all transactions within Russia through the National System of Payment Cards, undermining a key competitive advantage of foreign payments suppliers, which market their self-owned processing facilities located outside of Russia as supporting their reputation for strong consumer and privacy protections. In addition, the Central Bank of Russia (CBR)

offers a domestic credit card (Mir) and a system which allows inexpensive peer-to-peer payments for Russian retail bank customers (Faster Payment System). Providing preferential treatment for Mir payment cards, the Government of Russia has passed mandates requiring public sector employees receiving state funds and welfare benefits to migrate to Mir payment cards and making pensions accessible only through Mir bank cards. U.S. stakeholders have raised concerns about Russia's creeping financial nationalism and the potential for unfair competition in the provision of these services because the CBR is the state regulator as well as the service provider.

BARRIERS TO DIGITAL TRADE

Data Localization Requirements

In 2016, Russia began to enforce the first step of its data localization regime. By 2020, the Russia Government had implemented a regime requiring certain electronically-collected data about Russian citizens be processed and stored in Russia, imposing significant operational challenges on providers of data-intensive services, as well as on manufacturers who rely on those services. The requirements also raise concerns about state surveillance. Russia also requires certain telecommunications and Internet service providers (ISPs) to store certain communications content locally for six months and to store metadata for such content for one year or longer, depending on the type of provider (Yarovaya law), giving the Russian security services the opportunity to request those data.

Other Digital Trade Issues

Russian ISPs must install a special device on their servers to allow the Russian security services to track all credit card transactions. Russia threatens to shut off market access to ISPs that allow their customers to use virtual private networks (VPNs). In addition to the obvious concerns over state surveillance, industry stakeholders contend that the effects of these laws limit their ability to offer a variety of services in Russia and increase the cost of doing business in Russia, particularly for small and medium-sized enterprises (SMEs). Moreover, the Russian law (the Yarovaya law) may require ISPs to provide excessive access to citizens' private information, which raises privacy concerns.

In 2021, Russia implemented the so-called Landing Law which requires certain IT companies (*i.e.*, any company with a website or an application with more than 500,000 daily users) to establish a physical presence in Russia. U.S. companies, particularly SMEs, contend that this local presence requirement, coupled with difficult compliance requirements, harsh penalties, and concerns about staff safety, can constrain their ability to operate their businesses in Russia.

INVESTMENT BARRIERS

With the imposition of sanctions by the U.S. Government, numerous U.S. companies have withdrawn from the Russian market or severely limited operations. For companies with a continued presence in Russia, corruption, lack of transparency, inability to repatriate capital, and the threat of creeping expropriation remain impediments to a stable and predictable investment environment. In 2022, Russia introduced significant restrictions on cross-border transactions, such as the sale of shares, payment of dividends, and liquidation of Russian entities controlled by persons from jurisdictions deemed "unfriendly" by the Russian Government. Further obstacles to investment in Russia include: problems with enforcing the rule of law; restrictions on foreign ownership of agricultural land and land in border areas and on investment in the mining and mineral extraction sectors; inadequate dispute resolution mechanisms; weak corporate governance, including the protection of minority shareholder rights; the absence of requirements for all companies and banks to adhere to accounting standards consistent with international norms. In 2023,

Russia continued to adopt a variety of measures restricting the business affairs of foreign investors from “unfriendly” states (*e.g.*, limiting disclosure requirements in certain sectors, allowing payment of financial obligations in rubles rather than dollars, limiting certain transactions in sensitive sectors, placing Russian assets of several foreign companies which Russia claims will be under temporary control of the Federal Agency for State Property Management, and setting additional conditions for the exit of foreign companies from Russia). Finally, despite the existence of an Anticorruption Council and anticorruption legislation, with the departure of many international companies and the growing role of the state in the domestic economy, corruption is an increasing concern in Russia.

Investment Taxes

U.S. companies have raised concerns about Russian tax authorities’ scrutiny of payments that cross Russia’s borders, but remain, for tax purposes, in the legal structure of the same Russian company. This issue has arisen when a multinational company transfers an employee temporarily to the company’s Russian office from an office outside Russia. Under internationally accepted accounting standards, these normal business practices are handled as an intra-firm payment from one office to the other, or to the headquarters in the case of royalty payments. However, Russian tax inspectors have in the past disputed such expenses as economically unjustified and, consequently, impermissible under the Russian Tax Code.

SUBSIDIES

Russia agreed to no longer subsidize exports of agricultural products pursuant to the WTO 2015 Nairobi Ministerial Decision. However, U.S. stakeholders have raised concerns about the potential cost advantage to certain Russian agricultural producers resulting from the provision of subsidies for the transportation of agricultural products, including for the transportation of wheat, barley, and corn from interior regions toward export destinations. Russia has provided this subsidy since 2017, stating the measure is intended to stimulate the movement of grain exports, stabilize domestic grain prices, and support profit margins of agricultural producers. In August 2023, Russia relaxed the eligibility criteria for railroad transportation subsidies available for producers of agricultural goods and fertilizers. The United States is concerned that this measure directly or indirectly subsidizes exports of Russian agricultural products. The implementing decree No. 1104, dated September 15, 2017, specifically mentions several border crossings with Mongolia and China and authorizes the Russian Export Center (REC) to administer the subsidy. According to Russia, the REC is a state export promotion institution that provides financial and non-financial export support both to agricultural and non-agricultural value-added products.

STATE-OWNED ENTERPRISES

Russia’s numerous SOEs play a prominent role across much of the Russian economy. The Russian Academy of National Economy and Public Administration (RANEPA) estimated in May 2023 that the state’s share in the economy had grown from 47.3 percent in 2016 to 56.2 percent in 2021. While private enterprises are theoretically allowed to compete with SOEs on the same terms and conditions, in practice, the competitive playing field is distorted in favor of SOEs. These advantages result from SOEs’ lack of transparency and lack of independence, the presence of senior Russian Government officials on their boards of directors, subsidization by the government, access to preferential lending by state-owned banks, unclear responsibilities of their boards of directors, misalignment of managers’ incentives and company performance, inadequate control mechanisms on managers’ total remuneration or their use of assets transferred by the government to the SOEs, and minimal disclosure requirements.

A specific variant of SOEs, state corporations, are completely owned by the government and operate under separate legislation and in a marketplace distorted in their favor. For example, state corporation holding

structures and management arrangements (*e.g.*, senior government officials as board members) create conditions for preferential treatment and leave much scope for discretion and lobbying by company insiders, which disadvantage private enterprises. There are six state corporations: Rosatom, VEB, Fund for Communal Housing, Deposit Insurance Agency, Roskosmos, and Rostec.

In order to spur growth and boost revenue through privatizations, the Russian Government in September 2023 decided to extend its existing three-year privatization program through 2026. Russia plans by 2026 to fully privatize 23 federal state unitary enterprises and sell its stakes in 166 joint stock companies and seven limited liability companies. As of June 2023, the Russian Government still owned 278 federal state unitary enterprises, as well as stakes of various sizes in 561 SOEs. In October 2023, the Government extended the program through 2025, with plans to fully privatize 23 federal state unitary enterprises and sell its stakes in 151 joint stock companies and 9 limited liability companies by 2025. As of December 2022, the Russian Government still maintained a list of 55 SOEs with “national significance” that are either wholly or partially owned by Russia and whose privatization is permitted only with a special governmental decree, including Aeroflot, Rosneft, Rosneftegaz, Transneft, Russian Railways, and VTB. However, Russia has been slow in implementing the privatization plan. The treatment of foreign investors in privatizations conducted to date has been inconsistent, with foreign participation at times confined to minority stakes, which creates concerns about protection for minority shareholders and corporate governance.

OTHER BARRIERS

Export Policies

Notwithstanding its stated intent of reducing export duties following its accession to the WTO in 2012, Russia in 2022 began to impose various export restrictions on a wide variety of products. For example, in March 2022, Russia imposed a temporary ban on exports of over 200 types of industrial products including technological, communications and medical equipment, vehicles, agricultural machinery, and electrical equipment covering over 1,600 items, in total. In November 2022, the Russian Government extended the ban through the end of 2023. In May 2023, the list of industrial products subject to the ban was narrowed by about 200 items. In addition, notwithstanding the global food security crisis, Russia has imposed temporary export restrictions (*e.g.*, export bans, export quotas, or export duties) on sunflower seeds, soybeans, grain crops, white sugar, raw cane sugar, rice and rice cereal, rapeseed, millet, buckwheat, meslin, cereal and cereal pellets, crude flour, barley, rye, corn, onions, garlic, turnips, sunflower oil and bagasse, fish products, sulfur used to produce sulfur-containing fertilizers, sulfur containing fertilizer, nitrogen-containing fertilizer. Other temporary export restrictions include non-agricultural products such as certain types of logs, ferrous waste and scrap, stainless scrap and waste, waste and scrap of other alloy steel, and waste and scrap of tungsten. Export restrictions for many of the agricultural goods continue to be extended.

In September 2023, the Russian Government, through Resolution 1538, introduced exchange rate-linked export duty rates for the period of October 1, 2023 through December 31, 2024. The new rates apply to wide range of export commodities and goods, including oil, gas, grains, timber, machine building and scrap metal, fertilizers, nickel, aluminum, ferrous metal products, ceramics, precious metals and jewelry, paper and cardboard, wool, cotton, chemical fibers, textile material, polymers, and rubber. The scope of this measure covers about 30 percent of Russia’s exports. Export duties vary from zero percent to 7 percent. Export duties on fertilizers were increased from 7 percent to 10 percent if the exchange rate remains above RUB 80 per \$1.00.

In September 2023, Russia temporarily banned diesel and gasoline exports to stabilize fuel prices in the domestic market. The ban was relaxed at the beginning of October 2023. However, restrictions on railway

diesel exports, as well as all previously introduced restrictions on gasoline exports, remain in place. Stakeholders claim that Russia has placed higher rail freight rates on certain raw materials intended for export, contrary to its WTO commitment to eliminate discrepancies in such rates by July 1, 2013.

SINGAPORE

TRADE AGREEMENTS

The United States–Singapore Free Trade Agreement

The United States–Singapore Free Trade Agreement (FTA) entered into force on January 1, 2004. The United States and Singapore meet regularly to review the implementation and functioning of the Agreement and to address outstanding issues.

INTELLECTUAL PROPERTY PROTECTION

Despite Singapore’s overall strong record on intellectual property (IP) protection and enforcement, U.S. stakeholders continue to raise concerns regarding enforcement efforts against infringing goods transshipped through Singapore, and the use of unauthorized streaming services and third-party illicit streaming devices to access pirated content. Since November 2021, amendments to the Copyright Act impose civil and criminal liability for knowingly making, importing for sale, commercially distributing, or selling illicit streaming devices, and also for providing a service to enable such devices to access content from unauthorized sources. The United States continues to monitor the implementation of these measures.

The United States continues to urge Singapore to implement its geographical indication (GI) system in a fair and transparent manner that does not undermine market access for U.S. producers and exporters who hold trademarks or rely on the use of common names, including in connection with trade agreement negotiations and implementation.

SERVICES BARRIERS

Financial Services

When considering certain mergers or takeovers of banks, the Government of Singapore has a policy of maintaining local banks’ market share at no less than 50 percent of total resident deposits. Regarding the expansion of business within Singapore, the Monetary Authority of Singapore (MAS) will consider awarding full bank privileges to new qualifying foreign banks from countries like the United States, with which Singapore has entered into a free trade agreement, provided there are substantial benefits to Singapore.

The MAS has issued digital bank licenses to two digital full bank firms and two digital wholesale bank firms since December 2020. For digital full banks, the MAS mandates the following requirements: applicants must be controlled and headquartered in Singapore; a majority of its employees must be Singapore citizens; and foreign entities must form a joint venture with a Singapore company.

Professional Services

Legal Services

Except in the context of international arbitration, U.S. and other foreign law firms with offices in Singapore are not allowed to advise on Singaporean law by employing, or entering into partnership with, Singapore-qualified lawyers. To advise on Singaporean law, foreign firms must either form a joint venture with a Singaporean law practice (licensed as a Joint Law Venture) or obtain licensing as a Qualifying Foreign Law

Practice (QFLP). QFLP licenses are limited. Ten licenses have been issued since 2008; nine are still active as of March 2022. According to the Ministry of Law, the QFLP scheme is not currently open for application, and there are no details available regarding future applications.

OTHER BARRIERS

Medical Products

U.S. stakeholders have expressed interest in greater transparency regarding the Ministry of Health's procurement process, subsidy policies, and procedural rules regarding medical devices and pharmaceuticals, notably for approvals of biopharmaceutical innovations.

Pharmaceuticals

In August 2021, Singapore introduced a list of government-approved drugs and treatments eligible for the country's basic health insurance plan available to citizens and permanent residents. It is important for Singapore to provide stakeholders with meaningful opportunities for input when considering changes to its reimbursement policies.

SOUTH AFRICA

TRADE AGREEMENTS

The United States and South Africa signed a Trade and Investment Framework Agreement (TIFA) on June 18, 2012, amending the original 1999 agreement. The Agreement is the primary mechanism for discussions of trade and investment issues between the United States and South Africa.

IMPORT POLICIES

Tariffs

South Africa's average Most-Favored-Nation (MFN) applied tariff rate was 7.6 percent in 2022 (latest data available). South Africa's average MFN applied tariff rate was 8.7 percent for agricultural products and 7.4 percent for non-agricultural products in 2022 (latest data available). South Africa has bound 93.8 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 19.0 percent, including 39.0 percent for agricultural products and 15.6 percent for non-agricultural products in 2022 (latest data available). South Africa's maximum WTO bound tariff rate for industrial products is 50 percent, and its maximum WTO bound tariff rate for agricultural products is 597 percent.

The European Union–South African Development Community (SADC) Economic Partnership Agreement (EPA), which has been provisionally applied since October 2016 but is pending entry into force while awaiting ratification by all EU Member States, has led to greater disparities in tariff rates between EU and U.S. exports. The United States has raised concerns about the tariff disparity in bilateral discussions with South Africa, noting the unilateral tariff benefits that the United States offers South African imports under preference programs such as the African Growth and Opportunity Act (AGOA).

The South African International Trade Administration Commission (SAITAC) is reviewing the poultry tariff structure and considering proposals that include instituting a specific tariff rate rather than *ad valorem* duties and redefining tariff lines to reflect tariffs at the Harmonized System 6-digit, 7-digit, or 8-digit level. This tariff line change would fold different product categories together, and the South African Government could then select the highest tariff from among the group to represent the new product set.

The antidumping tariff-rate quota (TRQ) established by U.S. and South African poultry industry groups in 2016 for U.S. frozen bone-in chicken meat initially led to significant growth in exports. The volume of U.S. exports, however, has fallen over the past three years as a result of unjustified administrative barriers, including slow approval processes, and late announcements of antidumping TRQ windows. The volume of U.S. poultry exports has not reached the TRQ allocation since South Africa increased the in-quota tariff rate on bone-in chicken portions from 37 percent to 62 percent. In 2023, SAITAC recommended the continuation of antidumping duties on U.S. products that exceed the TRQ allocation despite the decreasing volume of U.S. exports. In 2023, U.S. export challenges were compounded by South African restrictions on poultry exports from U.S. states due to highly pathogenic avian influenza. The United States continues to work with South Africa to improve access to the South African poultry market.

Non-Tariff Barriers

Import Bans and Import Restrictions

The South African Department of Trade, Industry, and Competition prohibits the importation of certain classes and types of goods into South Africa, but in some cases an importer may get an exemption from the prohibition by applying for an import permit from SAITAC. SAITAC also requires import permits on used goods if such goods are also manufactured domestically, significantly limiting importation of used goods. Other categories of controlled imports include waste, scrap, ashes, residues, and goods subject to quality specifications and regulations published by the Government of South Africa.

Customs Barriers and Trade Facilitation

South Africa ratified the WTO Trade Facilitation Agreement (TFA) on November 30, 2017. South Africa submitted three transparency notifications related to: (1) import, export, and transit regulations; (2) the use of customs brokers; and, (3) customs contact points for the exchange of information on March 10, 2023. These notifications had been due to the WTO on February 22, 2017, according to South Africa's self-designated TFA implementation schedule.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

Certification for Electromagnetic Compatibility Goods

The South African Bureau of Standards (SABS) implements a program for the issuance of Certificates of Compliance (CoCs) for Electromagnetic Interference/Compatibility (EMI/EMC) of electrical and electronic goods, including an annual nonrefundable fee paid by manufacturers for each CoC, fees for registering factories, and fees for model name changes. The program also requires manufacturers to have EMI/EMC testing done at SABS-verified third-party labs. If testing is required from an independent lab that is not SABS verified, the manufacturer must request that the lab be verified through SABS at the expense of the lab. Ultimately, the regulation is meant to ensure that all electronic equipment entering South Africa meets the required quality-performance standards. Some stakeholders, however, have raised concerns that the five-fold increase in certification costs, the additional administrative burden, and the lack of resources in South Africa to support the new procedure will extend time to market for quickly evolving and obsolescing information and communications technology products. South Africa still accepts test results from International Laboratory Accreditation Cooperation-certified labs, but SABS also conducts a comprehensive review of the test results to ensure that the product meets South African EMC standards. The protracted review can take up to 18 months to complete, during which time the product may become obsolete.

Sanitary and Phytosanitary Barriers

Meat and Poultry

Following the conclusion of health certificate negotiations on poultry, pork, and beef in 2016, South Africa's Department of Agriculture, Land Reform and Rural Development (DALRRD) agreed to accept that U.S. Department of Agriculture (USDA) veterinarians are not authorized to certify container and seal information as required by DALRRD and that U.S. exporters must meet the requirement to include and

certify this information on a letterhead certificate that accompanies export certificates. DALRRD has not consistently accepted the agreed-upon certificate format, often requiring USDA intervention to correct any clerical errors made by exporters, which causes lengthy and costly delays. The U.S. Government has provided numerous and extensive explanations for U.S. export processes, noting that—although USDA veterinarians examine and certify consignments of USDA Food Safety and Inspection Service-regulated products intended for export—veterinarians are not present at each port to certify industry details such as container and seal information. Since 2016, DALRRD has declined granting new market access for additional meat, poultry, and egg products regulated by USDA, noting the compromise that allowed an exporter to provide container and seal information was a “one-time-exception.”

Pork

South Africa imposes multiple restrictions on the importation of pork. For example, South Africa imposes freezing requirements for imported pork and pork products that do not align with international standards. Additionally, South Africa requires certification that swine are free of pseudorabies, even though the United States eradicated pseudorabies in commercial pork herds in all 50 states in 2004. South Africa also imposes a restriction on pork cuts allowed for importation due to South Africa’s concerns related to the risk profile of specific cuts for Porcine Reproductive and Respiratory Syndrome. This restriction raises concerns of consistency with current international standards.

In January 2016, the U.S. Government and DALRRD reached agreement on the content of a USDA export health certificate for the importation of some U.S. pork and pork products into South Africa. South Africa maintains a list of U.S. eligible pork products and approves each one individually. In December 2017, DALRRD began allowing the importation of five additional pork cuts from the United States. An additional two cuts were approved on October 20, 2022. Many cuts, however, remain ineligible for import.

Poultry and Poultry Products

In October 2023, South Africa announced the lifting of restrictions on U.S. poultry and poultry product exports from 27 U.S. states that have been declared free from highly pathogenic avian influenza (HPAI). Prior to this announcement, South Africa had delayed the lifting of restrictions on U.S. states that had been declared free from HPAI, and met both World Organisation of Animal Health (WOAH) guidelines and South African sanitary and phytosanitary requirements. The United States continues to urge South Africa to follow the terms of the 2015 United States–South Africa Protocol for Poultry Meat and Day-old Chicks to ensure that safe U.S. poultry exports can resume in a timely manner after U.S. states have been declared free from HPAI. In 2023, U.S. poultry meat exports to South Africa were \$44 million. This was the lowest export value since 2016.

Meat and Poultry

South Africa imposes strict microbiological standards for imported meat and poultry products that are not based on international standards and are not enforced on domestically produced products. In 2016, South Africa signed the Agreement on Poultry Importation from the USA to South Africa, which noted specific procedures that would be followed for sampling. Noncompliant products are required to be returned to the country of origin, undergo heat treatment at a registered South African facility, or are destroyed. U.S. industry has raised concerns that South Africa does not use consistent test methods, which leads to a high level of product rejection.

GOVERNMENT PROCUREMENT

Some U.S. companies have reported challenges in competing for government tenders, noting issues with nontransparent cancellation of tenders or closed procedures for direct contract awards. On September 12, 2023, the South African Parliament's Standing Committee on Finance began hearings on proposed legislation to create a simplified national legislative framework for public procurement and outline regulatory procedures for procurement compliance.

South Africa is neither a Party to the WTO Agreement on Government Procurement nor an observer to the WTO Committee on Government Procurement.

INTELLECTUAL PROPERTY PROTECTION

The South African Government has taken some positive steps toward more effective enforcement of intellectual property (IP), including increasing raids of physical markets, appointing additional enforcement officials, improving the training provided to these officials, and increasing public awareness of IP. However, stakeholders report significant concerns.

On February 29, 2024, South Africa's Parliament passed the Copyright Amendment Bill and Performers' Protection Amendment Bill that contain some needed modernizations of the copyright law, such as new performers rights from the World Intellectual Property Organization (WIPO) Performances and Phonograms Treaty. These bills, however, also contain provisions that some stakeholders assert would weaken the adequacy and effectiveness of copyright and related rights protection in South Africa. Specific concerns include broad and ambiguous exceptions to copyright and provisions regarding technological protection measures that include overly broad exceptions and lack prohibitions on the circumvention of access controls. Stakeholders raised concerns regarding these bills during the public hearing portion of the 2024 AGOA Annual Eligibility Review process. The United States continues to monitor these bills and any subsequent implementation.

Under the SADC EPA, South Africa agreed to prohibit the use of certain terms that may be common names by recognizing them as geographical indications in its domestic market. The United States remains highly concerned about countries negotiating product-specific IP outcomes as a condition of market access from the EU and reiterates the importance of each IP right being independently evaluated on its individual merits.

SERVICES BARRIERS

On September 28, 2021, South Africa's President signed the Private Security Industry Regulation Amendment Act, which prescribes that a security business may only be registered to render security services in South Africa if it is at least 51 percent owned and controlled by South African citizens. The Act also permits the police minister to prescribe different percentages of domestic ownership and control required as a prerequisite for the registration of security businesses operating in different market segments. South Africa has full commitments under the WTO General Agreement on Trade in Services with respect to investigation and security services, including with respect to national treatment for the commercial presence of foreign suppliers. The United States continues to engage South Africa on the issue.

INVESTMENT BARRIERS

Other Investment Restrictions

In September 2022, a draft bill that would explicitly allow expropriation of property, including land, without compensation was adopted by the South African National Assembly and was still undergoing the legislative process as of December 2023.

STATE-OWNED ENTERPRISES

State-owned enterprises play a significant role in the South African economy in key sectors such as electricity, transport (air, rail, freight, and pipelines), and telecommunications. Limited competition is allowed in some sectors (*e.g.*, telecommunications and air). The limited nature of the competition in these sectors discourages foreign investment.

SWITZERLAND

TRADE AGREEMENTS

The United States–Switzerland Trade and Investment Cooperation Forum Agreement

The United States and Switzerland signed the Trade and Investment Cooperation Forum Agreement on May 25, 2006. This Agreement is the primary mechanism for discussions of trade and investment issues between the United States and Switzerland.

IMPORT POLICIES

Tariffs

Switzerland's average Most-Favored-Nation (MFN) applied tariff rate was 5.6 percent in 2022 (latest data available). Switzerland's average MFN applied tariff rate was 32.4 percent for agricultural products and 1.3 percent for non-agricultural products in 2022 (latest data available). Switzerland has bound 99.7 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 7.4 percent. The WTO bound tariff rate is 43.7 percent for agricultural products and 1.9 percent for non-agricultural goods.

In September 2021, the Swiss parliament approved amendments to the Customs Tariff Act that would abolish tariffs on all industrial imports, while leaving agricultural tariffs unchanged. The amendments entered into force on January 1, 2024. The elimination of industrial tariffs is expected to remove duties that currently apply to almost 26 percent of U.S. non-agricultural exports to Switzerland.

Agriculture

U.S. agricultural market access to the Swiss market is limited by high tariffs on certain products, preferential tariff rates for products from other trading partners, and certain government regulations.

Swiss agriculture is highly subsidized and regulated with price controls, production quotas, import restrictions, and tariffs, which all support domestic production. Imports of a broad range of agricultural products, particularly those that compete with Swiss products, are subject to seasonal import duties, quotas, and import licensing. Agricultural products not produced in Switzerland, such as tropical fruit and nuts, tend to have lower tariffs. Support to producers as a share of gross farm receipts remains high at 49 percent on average between 2020 and 2022, more than three times the Organization for Economic Cooperation and Development member state average.

Swiss trade groups and certification associations also impose some barriers on agricultural imports that compete with Swiss products. In particular, the registration fee for bovine genetics for U.S. bulls remains many times higher than the fee for domestic bulls.

Non-Tariff Barriers

Import Licensing

Switzerland maintains a complex import licensing regime, primarily to facilitate the allocation of tariff-rate quotas (TRQs). TRQ-related non-automatic licenses are required for imports of various animal, dairy, fresh fruit, and vegetable products.

SANITARY AND PHYTOSANITARY BARRIERS

Switzerland aligns many of its sanitary and phytosanitary (SPS) measures with those of the European Union (EU). As outlined in the SPS section of the EU Chapter in this National Trade Estimate Report, specific trade concerns include measures that unnecessarily restrict trade without furthering safety objectives because they are not based on science, are maintained without sufficient scientific evidence, or are applied beyond the extent necessary that negatively impact market access for U.S. agricultural products.

Agricultural Biotechnology

Switzerland's restrictive phytosanitary measures for agricultural biotechnology products have impeded access to the Swiss market. In particular, Switzerland maintains a moratorium on the planting of biotechnology crops and the marketing of products derived from animal biotechnology. In March 2022, the moratorium was extended, for the fourth time, until 2025. However, by mid-2024, the Swiss Government must present approval rules on how genetically modified organisms without foreign genetic material can be exempted from the moratorium. As of December 2023, Switzerland had approved only 1 biotechnology soybean product and 3 biotechnology corn products for food and feed use and only 11 total enzymes, vitamins, and sugars produced by or derived from modern agricultural biotechnology for food use.

INTELLECTUAL PROPERTY PROTECTION

Switzerland generally maintains high standards of intellectual property (IP) protection and enforcement and makes important contributions to promoting such protection and enforcement internationally. Although Switzerland was removed from the Special 301 Report in 2020 after many years of engagement, U.S. copyright holders continue to have concerns that Switzerland remains a host country for websites offering infringing content and the services that support them and about amendments to Switzerland's Copyright Act that came into force on April 1, 2020. These concerns include: continuing uncertainty regarding the application of the amended provisions of the Copyright Act; alleged difficulties in using IP addresses to pursue civil claims of copyright infringement; a "private use" exception that permits personal use of a single copy of a work even if derived from an unauthorized source; and a lack of sufficient "know-your-customer" protocols for data centers and Internet service providers. The United States is carefully monitoring the Swiss Government's implementation and interpretation of the new legislation as well as its effectiveness.

SERVICES BARRIERS

Audiovisual Services

A "unique distributor clause" in Switzerland's Film Act requires a single distributor to have exclusive control over all language versions of a film for all forms of distribution, including theatrical release, DVDs, and video-on-demand. In 2021, the Swiss Parliament passed a new law requiring non-domestic video-on-demand services to pay 4 percent of their revenues sourced from Switzerland into a fund to support Swiss

film production. The law also requires a 30 percent quota of European-produced content in their video-on-demand offerings, which applies as of January 1, 2024.

Insurance Services

Managers of foreign-owned insurance company branches must reside in Switzerland.

TAIWAN

TRADE AGREEMENTS

The United States and Taiwan have had in place a Trade and Investment Framework Agreement (TIFA), signed by the American Institute in Taiwan (AIT) and the Taipei Economic and Cultural Representative Office in the United States (TECRO) since 1994. This Agreement is an important mechanism for discussing a broad range of trade and investment issues between the United States and Taiwan. Meetings of the TIFA Council are typically co-led by a Deputy United States Trade Representative and Taiwan's Deputy Minister of Economic Affairs, under the auspices of AIT and TECRO. The last TIFA Council meeting was held virtually on June 29, 2021.

In addition to engagement under the TIFA, the United States and Taiwan, under the auspices of AIT and TECRO, announced the launch of the United States–Taiwan Initiative on 21st-Century Trade on June 1, 2022. The U.S.–Taiwan Initiative on 21st-Century Trade is intended to develop concrete ways to deepen the economic and trade relationship between the two economies, advance mutual trade priorities based on shared values, and promote innovation and inclusive economic growth for workers and businesses. On June 1, 2023, the two sides signed the first agreement under the U.S.-Taiwan Initiative on 21st-Century Trade. This agreement includes important commitments and outcomes in the areas of customs administration and trade facilitation, good regulatory practices, services domestic regulation, anticorruption, and small and medium-sized enterprises. Shortly after the signing of the first agreement under this trade initiative, the two sides began discussing remaining trade areas set forth in the negotiating mandate.

IMPORT POLICIES

Tariffs and Taxes

Tariffs

Taiwan's average Most-Favored-Nation (MFN) applied tariff rate was 6.5 percent in 2022 (latest data available). The average MFN applied tariff rate was 16.9 percent for agricultural products and 4.8 percent for industrial products in 2022 (latest data available). Taiwan has bound 100 percent of its tariff lines at the World Trade Organization (WTO), with an average WTO bound tariff rate of 6.8 percent.

Taiwan maintained tariff-rate quotas (TRQs) on multiple products when it became a WTO Member in January 2002, and then phased several of them out over the years. However, many TRQs on agricultural products remain in place today. Agricultural TRQs cover 16 products, including rice, and peanuts.

Taiwan has recourse to special safeguards (SSGs) for agricultural products covered by TRQs. SSGs, which are permitted under Article 5 of the WTO Agreement on Agriculture, allow Taiwan to impose additional duties when import quantities exceed SSG trigger volumes or import prices fall below SSG trigger prices. Because Taiwan previously did not import many of these products, its SSG trigger volumes are relatively low. In 2023, Taiwan had recourse to an SSG for 14 agricultural product categories, including poultry meat, certain types of offal, and milk.

Taxes

Taiwan taxes rice wine for cooking and distilled rice wine (*mijiu*) at a lower rate than that applied to alcoholic products consumed as beverages, even though *mijiu* is consumed as an alcoholic beverage. The United States and other trading partners continue to express their concerns to the Taiwan authorities that steps should be taken to ensure that imported alcoholic beverages are not taxed at a higher rate than domestically produced alcoholic beverages, including *mijiu*.

Non-Tariff Barriers

Quantitative Restrictions

In certain years, the Taiwan authorities have rejected bids from U.S. rice exporters under its country-specific quota (CSQ) regime, arguing that high U.S. prices exceeded Taiwan's ceiling price. Taiwan's ceiling price mechanism is not made public, raising concerns that prices are arbitrarily set lower than the levels bid by U.S. exporters, causing the tenders to fail. In 2022, Taiwan filled only 61 percent (39,355 metric tons) of the U.S. CSQ for rice with the remainder (25,279 metric tons) released to global tender, the biggest shortfall since 2014 given fluctuations in rice prices. In 2023, Taiwan filled 100 percent of the CSQ for U.S. rice, totaling 64,634 metric tons. Nevertheless, U.S. Government and industry concerns over rice market access persist.

Customs Barriers

Taiwan requires that genetically engineered (GE) and non-GE raw materials, such as corn and soybeans, enter under separate tariff lines. The GE products are evaluated by regulatory authorities in comparison to their non-GE counterparts and found to be as safe as their non-GE counterparts. Once approved, they are comingled with the non-GE products in the agricultural supply chain. There is no scientific or technical basis for Taiwan's separate tariff lines for GE and non-GE raw materials.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

Pork

On January 1, 2021, Taiwan implemented country of origin labeling requirements for a range of pork products, including processed pork products. The relevant measures were notified to the WTO in September 2020. Taiwan's presentation of the labeling requirements to the public as a means to ensure the food safety of U.S. pork products, while simultaneously implementing maximum residue limits (MRLs) for ractopamine in imported pork, inaccurately implied that there is a food safety concern with U.S. pork products, including pork produced with ractopamine. (*For further information, see the Sanitary and Phytosanitary Barriers section.*) The United States submitted comments through the USA WTO Technical Barriers to Trade (TBT) Enquiry Point, raising concerns with these labeling requirements. The United States has raised concerns about the labeling requirements bilaterally with Taiwan, including on the margins of the October 2020 and the February 2021 WTO Committee on Technical Barriers to Trade meetings, the June 2021 TIFA Council meeting, and the 2022 meetings of the TIFA Agriculture Working Group.

Automobiles

Taiwan adopted the United Nations Economic Commission for Europe (UNECE) 1958 Agreement automobile standards when it became a WTO Member in January 2002. In April 2008, Taiwan's Ministry of Transportation and Communications (MOTC) introduced a regulation that allows the importation of a limited number of imported vehicles that are not UNECE-compliant but do comply with U.S. Federal Motor Vehicle Safety Standards (FMVSS), which provides an equivalent level of safety. The MOTC's regulation limited the number of FMVSS-compliant vehicles on the road in Taiwan to 100 units per car model in 2021, and this number was reduced to 75 units per car model in 2023. Some vehicle manufacturers in the United States want to introduce periodically unique new U.S.-made models in order to stimulate interest in their brands. However, if the vehicles are FMVSS-compliant but not UNECE-compliant, exports of those vehicles cannot exceed the limit set by the MOTC.

Sanitary and Phytosanitary Barriers

Agricultural Biotechnology

Taiwan has banned the use of biotechnology food ingredients and processed food with biotechnology food ingredients in school meals since December 2015. The United States continues to have concerns about the scientific basis for this ban and continues to urge Taiwan to rescind it.

Beef and Beef Products

Taiwan banned imports of U.S. beef and beef products following the detection of an animal with bovine spongiform encephalopathy (BSE) in the United States in 2003. In October 2009, the United States and Taiwan reached an agreement on a protocol, signed by AIT and TECRO, to expand market access to fully re-open the Taiwan market to all U.S. beef and beef products for human consumption. However, Taiwan subsequently implemented a number of barriers to U.S. beef and beef products.

On January 1, 2021, Taiwan lifted its ban on imports of U.S. beef and beef products from cattle 30 months of age and older, which had been in place since 2010.

Taiwan has not addressed other longstanding barriers to U.S. beef products. Claiming BSE concerns, Taiwan continues to ban imports of certain U.S. beef products (*e.g.*, ground beef) even though imports of these products are permitted under the 2009 AIT-TECRO beef protocol. Taiwan imposes onerous port-of-entry inspection procedures that are not science-based on certain U.S. beef offal products. The United States continues to urge Taiwan to open its market fully to U.S. beef and beef products based on science, the World Organisation for Animal Health (WOAH) guidelines, the United States' negligible risk status for BSE, and the 2009 AIT-TECRO beef protocol.

Animal Byproducts

Taiwan continues to restrict the importation of bovine blood products for animal consumption and bulk shipments of tallow from the United States, citing concerns related to BSE. The WOAH guidelines recognize these commodities as safe-to-trade, regardless of the BSE risk status of the exporting country. The United States continues to urge Taiwan to open its market to U.S. bovine blood products for animal consumption and bulk shipments of U.S. tallow consistent with the WOAH guidelines.

Maximum Residue Limits – Beta-Agonists

Taiwan has not implemented Codex Alimentarius Commission (Codex) maximum residue limits (MRLs) for ractopamine in imported beef products other than imported beef muscle (*e.g.*, offal). On January 1, 2021, Taiwan implemented Codex MRLs for ractopamine in imported pork muscle, fat, and liver. Taiwan also implemented MRLs for ractopamine in imported pork kidney and other edible parts (*e.g.*, offal other than kidney and liver) that are more restrictive than the Codex MRLs. The United States is concerned that Taiwan's MRLs for imported pork kidney and other edible parts do not reflect consumption exposure. The United States is also concerned that Taiwan's method of testing for ractopamine residue is not aligned with methods of analysis for ractopamine recommended by Codex, and could provide inaccurate results. The United States continues to ask that Taiwan align its methods of testing for ractopamine residue with the methods recommended by Codex.

Apart from ractopamine, Taiwan has not established MRLs for other beta-agonist compounds or provided a rationale to support this policy. The United States continues to urge Taiwan to implement science-based MRLs without undue delay and to accept and approve new applications for MRLs for beta-agonists based on science and in a timely manner.

Maximum Residue Limits – Agrochemicals

The United States has raised concerns with various aspects of Taiwan's process for establishing MRLs for pesticides, such as the limited opportunities for applicants to provide additional information during the review process and the inconsistent application of crop groups to import tolerances. The United States will continue to encourage Taiwan to further improve its MRL regulatory system for pesticides.

Chipping Potatoes

On occasion, Taiwan rejects shipments of U.S. chipping potatoes due to requirements put in place in 2018 that implemented specific restrictions on sprouting for imported potatoes. Entire shipments have been rejected, even though sprouting does not pose a food safety risk, and potatoes with sprouts were previously removed as part of a normal sorting process prior to 2018. The United States, in coordination with U.S. industry and with regulators in Taiwan, is pursuing technical engagement on this matter.

INTELLECTUAL PROPERTY PROTECTION

In May 2019, Article 87.1.8 and Article 93 of Taiwan's Copyright Act were amended to combat the use of illicit streaming devices. However, right holders report that online piracy remains widespread. Additionally, right holders continue to report serious challenges with respect to the unauthorized use of textbooks and copyrighted teaching materials, particularly via on-campus digital platforms. In May 2022, Taiwan further amended the Copyright Act to allow criminal prosecution without a complaint from the right holder for online piracy over the threshold of approximately \$32,800 in damages. As of December 31, 2023, the Executive Yuan had not yet announced an implementation date for the amended Copyright Act.

Draft amendments to other articles of the Copyright Act, which were sent to the Legislative Yuan in October 2017 for review, remain pending. While the draft amendments represented progress in some areas, they also contained potentially overly-broad exceptions to copyright protection and obstacles to criminal enforcement, in addition to troubling provisions relating to licensing and the role of collective management organizations. These draft amendments were resubmitted to the Legislative Yuan by the Executive Yuan in April 2021. As of December 31, 2023, they were still being reviewed by the Legislative Yuan.

In June 2022, the Legislative Yuan approved amendments to the National Security Act to establish misappropriation of trade secrets involving the national core key technologies as a violation of national security laws, with both criminal and administrative penalties. The amendments provide that obtaining trade secrets of national core key technologies by theft, embezzlement, fraud, duress, unauthorized reproduction, or by other improper methods, or using or disclosing such trade secrets, can be punished by imprisonment for between 5 years and 12 years. The amendments also authorize the possible imposition of fines ranging between approximately \$164,000 and \$3.28 million.

Amendments to the Patent Act entered into force in July 2022. A new Article 60-1 of the Patent Act clarified the legal basis for a patent owner's patent infringement suit and a generic drug applicant's declaratory judgment of non-infringement suit under the mechanism for early resolution of potential patent disputes.

SERVICES BARRIERS

Financial Services

In August 2023, the Insurance Bureau (IB) and the Securities and Futures Bureau (SFB) issued cloud outsourcing regulations for insurance, securities, and futures companies. These regulations duplicate the approach of the Banking Bureau (BB). However, the IB and the SFB did not provide a 60-day public comment period for interested parties, including cloud service providers and financial institutions, to review and comment on a draft of the regulations. The failure to provide a 60-day comment period is in contrast to the BB's customary approach. In addition, while the SFB issued a guideline with its cloud outsourcing regulations, the IB did not release any further guidance or instructions, which has created uncertainties for cloud service providers seeking to sell into the insurance market in Taiwan.

INVESTMENT BARRIERS

In Taiwan, no foreign investment is allowed in the manufacturing of certain chemical materials and metals, television and radio programming services, electricity transmission and distribution, and postal activities. Foreign ownership in the telecommunications sector is limited to 49 percent direct ownership. For foreign ownership of telecommunications, combined direct and indirect foreign ownership is limited to 60 percent. The foreign ownership ceiling on airline companies, airport ground handling companies, forwarders, air cargo terminals, and catering companies is 49 percent, with each individual foreign investor subject to an ownership limit of 25 percent. Taiwan's Cable Radio and Television Law limits foreign direct investment in domestic cable television services to 20 percent of the operator's total issued shares. Foreign investment in satellite television broadcasting services is also restricted to no more than 50 percent.

Taiwan also maintains government investment in certain key companies. For example, the MOTC owns 35 percent in Chunghwa Telecom, the largest domestic telecommunications company, and 43 percent in Taiwan High Speed Rail Corporation, the domestic high-speed rail provider.

OTHER BARRIERS

Pharmaceuticals

In the pharmaceuticals sector, although the National Health Insurance Administration (NHIA) has tried to improve engagement with concerned stakeholders, U.S. stakeholders continue to highlight the lack of transparency and predictability with respect to the NHIA's pricing approval procedures, including during

renegotiations of managed entry agreements and under recent applications of Health Technology Reassessments. The NHIA has shortened the pricing approval timelines effective January 2024 to respond to some concerns raised by stakeholders.

Medical Devices

In Taiwan, self-pay options are available for implanted medical devices and a range of other commonly used medical devices that are not approved for NHIA reimbursement. These medical devices must be issued a self-pay code. According to U.S. stakeholders, the NHIA imposes administrative penalties on hospitals that ask patients to self-pay for devices without a self-pay code. The NHIA began assigning temporary self-pay codes in April 2014, but it also requires a review of new therapeutic procedures for which the medical device is used before a temporary self-pay code can be issued. U.S. stakeholders have raised concerns with these procedures, highlighting that increased transparency and faster issuance of temporary self-pay codes are needed to be responsive to patient demand.

THAILAND

TRADE AGREEMENTS

The United States–Thailand Trade and Investment Framework Agreement

The United States and Thailand signed a Trade and Investment Framework Agreement (TIFA) on October 23, 2002. This Agreement is the primary mechanism for bilateral discussions of trade and investment issues.

IMPORT POLICIES

Tariffs and Taxes

Tariffs

Thailand's average Most-Favored-Nation (MFN) applied tariff rate was 9.7 percent in 2022 (latest data available). Thailand's average MFN applied tariff rate was 26.6 percent for agricultural products and 7.1 percent for non-agricultural products in 2022 (latest data available). Thailand has bound 75.9 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 26.8 percent.

Wine imports are subject to a 54 percent tariff and six different taxes; taken together, the effective duty and tax burden is nearly 400 percent. Stakeholders have raised concerns about the import tariffs on wine and disparate *ad valorem* taxes that appear to favor domestic white liquor.

Import Fees

Thailand imposes food safety inspection fees in the form of import permit fees on all shipments of uncooked meat. The current fee levels were set in October 2016 at 7 baht per kilogram (approximately \$201 per metric ton (MT)) for imported uncooked meat for food or feed and at 3 baht per kilogram (approximately \$86 per MT) for imported uncooked meat for purposes other than food or feed. Under the Thai Animal Epidemics Act of 2014, the Ministry of Agriculture and Cooperatives (MOAC) Department of Livestock Development (DLD) has discretionary authority to increase these import fees up to five-fold.

Non-Tariff Barriers

Import Restrictions

Despite its 20-year Alternative Energy Development Plan (2018-2037), which aims to increase biofuels consumption, Thailand restricts the importation of biofuels intended for fuel use. Fuel ethanol imports require approval and issuance of permits by Thailand's Ministry of Energy, which bases its decision on the availability of domestic ethanol supply. Thailand has not approved an import permit for fuel ethanol since 2005.

Import Licensing

Import licenses are required for the importation of many items, including: wood; petroleum; industrial machinery; textiles; pharmaceuticals; cosmetics; and food and agricultural items, such as plants, seeds, processed meats, and salt. In some cases, imports of certain items not requiring licenses are subject to extra

fees and certificate of origin requirements. Additionally, a number of products are subject to import controls under miscellaneous laws.

Thailand imposes domestic purchase requirements on imports of several products subject to tariff-rate quotas (TRQs), including coffee, tea, potatoes, corn, soybeans, and soybean meal.

Customs Barriers and Trade Facilitation

Thailand provides incentives to customs officials who initiate investigations or enforcement actions. Thailand is one of the only major U.S. trading partners that still has such an incentive system. This system has been a cause of concern for many years among Thailand's trading partners due to the potential for corruption and the cost, uncertainty, and lack of transparency associated with the customs penalty and reward system. Despite Thailand's amendment of the Customs Act in 2017, potential conflicts of interest or excessive personal incentives remain. The amendment caps incentives at 20 percent of the sale price of seized goods or of the fine, with a maximum incentive of 5 million baht (approximately \$144,700). The amendment also limits post-audit inspections to five years from the date of import or export.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

Labeling Requirements for Information and Communications Technology Products

In July 2023, Thailand issued a regulation prescribing unique labeling requirements for personal computers and computer devices (*e.g.*, keyboards, mice, monitors, and central processing units). The measure entered into force on November 1, 2023. U.S. industry has reported that since the measure has gone into effect, costs have increased for exporters due to the additional labeling requirements. In September 2023, Thailand also issued a regulation prescribing labeling requirements for products containing lasers, such as computers, CD and DVD players, recorders, barcode scanners, photocopiers, and fax machines. The measure entered into force on January 27, 2024.

Stakeholders are concerned that Thailand's labeling requirements diverge from relevant international standards and are overly prescriptive and unnecessarily burdensome for producers, given the amount of information required and the limited space for physical labels. Furthermore, the 120-day implementation periods following publication of the final measures are insufficient time in which to adapt to the new requirements.

The United States continues to encourage the Office of the Consumer Protection Board of Thailand to consider extending the implementation period to a minimum of one year and to accept electronic labeling as a voluntary option.

Sanitary and Phytosanitary Barriers

Animal-Derived Products

Thailand's Department of Livestock Development (DLD) requires audits of production facilities in the exporting country to allow the importation of several animal-derived products, including meat, bone meal, and feather meal. Each audit approval is valid for five years. In addition, the DLD imposes five-year facility audit approvals for imported animal feed ingredients derived from or containing poultry products.

The United States has recommended that Thailand adopt a systems approach, which would recognize the U.S. inspection system as equivalent to that of Thailand's, and reduce the expense and burden of the current Thai audit requirement. The DLD conducted a fact-finding trip to the United States in late 2019, but has not yet submitted the questionnaire to the U.S. Department of Agriculture (USDA) to proceed with the audit. The USDA Animal and Plant Health Inspection Service (APHIS) resubmitted the system audit request in August 2023.

Beef and Beef Products

Thailand restricts imports of beef offal treated with beta-agonists. The DLD confirmed that fresh tongue, cheek meat, oxtail, tendon, hanging tender, inside skirt, and outside skirt are categorized as muscle cuts; and are thus not affected by this restriction. In September 2018, the DLD conducted an audit of the U.S. production system and transmitted its draft findings to the United States in March 2019. In its report, the DLD informed the USDA that U.S. beef products for export to Thailand are not to be derived from cattle treated with beta-agonists, including ractopamine, as a condition for access to the Thai market, despite a determination by the Codex Alimentarius Commission (Codex) that the use of ractopamine is safe within its established maximum residue limits (MRLs). The United States continues to press Thailand to align its import requirements with science-based international standards.

Pork

In 2012, after the Codex established MRLs for ractopamine in cattle and pig tissues, Thailand indicated it would lift its ban on imports of pork from countries that allow ractopamine use, including the United States. However, Thailand has not yet established MRLs for ractopamine in pork, which effectively prevents the importation of U.S. pork products. In 2019, Thailand and the United States agreed to review potential risk management options for Thailand to develop an MRL for ractopamine. However, due to lack of progress on the issue, effective December 30, 2020, the United States revoked approximately one-sixth of Thailand's duty-free trade preferences under the U.S. Generalized System of Preferences (GSP) program.

Poultry

Since 2014, Thailand has, at various times, and most recently in February 2022, imposed a ban on U.S. live poultry and poultry meat imports due to the sporadic presence of highly pathogenic avian influenza in the United States. The ban applies to all such U.S. products, notwithstanding World Organisation for Animal Health (WOAH) guidelines that recommend importing countries regionalize their bans, rather than apply them on a country-wide basis. In addition, Thailand has banned U.S. turkey meat imports since late 2014. Thailand sent officials to conduct a production-system audit of U.S. turkey in July 2019 and determined in November 2020 that the United States failed the systems approach audit. The United States continues to negotiate with the DLD to regain market access for uncooked U.S. turkey.

New Processed Meat Products

The DLD's regulatory authority was extended in 2018 to include "processed foods made or derived from animal carcass," including: sausage; salami; ham; bacon; smoked meat products; pickled meat products; cured meat products; honey and related products; and, salty/processed eggs and egg yolks. Other than a single product approved in early 2022, the DLD has not approved any new processed meat products. The DLD claims that a new import protocol has been under development since 2018, and that market access requests could be submitted either through government-to-government channels, or by individual stakeholders. As of December 2023, the DLD had not yet published or notified import requirements and procedures that allow individual U.S. suppliers to access the establishment-by-establishment approval process.

INTELLECTUAL PROPERTY PROTECTION

Thailand remained on the Watch List in the [2023 Special 301 Report](#). Thailand continues to make progress on intellectual property (IP) protection and enforcement. For example, Thailand acceded to the World Intellectual Property Organization (WIPO) Copyright Treaty in 2022. In September 2022, Thailand established the Thai Customs IPR Recordation System, a new online database that allows right holders to file confidential information that would allow Thai customs officers to verify the authenticity of copyrighted or trademarked goods being imported, being exported, or in transit. Right holders continue to use Thailand's 2021 memorandum of understanding with electronic commerce platforms to report online listings of counterfeit products.

While Thailand is making progress in these areas, concerns remain. Counterfeit and pirated goods are still readily available, particularly online. The [2023 Review of Notorious Markets for Counterfeiting and Piracy](#) (Notorious Markets List) included the MBK Mall as a physical market with a large number of counterfeit goods in Bangkok. Other U.S. concerns include: online piracy by devices and applications that allow users to stream and download unauthorized content; a process established by the 2022 Copyright Act amendments that may lead to overly broad exceptions to technological protection measures; unauthorized collective management organizations; the continued use of unlicensed software in the private sector; the backlog in pending pharmaceutical patent applications; lengthy civil IP enforcement proceedings; and, low civil damages. The United States will continue to monitor these issues.

The United States continues to encourage Thailand to provide an effective system for protecting against the unfair commercial use, as well as unauthorized disclosure, of undisclosed test or other data generated to obtain marketing approval for pharmaceutical and agricultural chemical products. In addition, the United States continues to urge Thailand to engage in a meaningful and transparent manner with all relevant stakeholders before adopting new IP laws, regulations, or guidelines.

SERVICES BARRIERS

Audiovisual Services

The 2008 Motion Picture and Video Act authorizes Thailand's Film Board to establish ratios and quotas limiting the importation of foreign films. The Film Board had not exercised this authority, however, as of December 31, 2023. Foreign investment in terrestrial broadcast networks is limited to 25 percent of registered capital and voting rights.

Financial Services

Thailand limits the number of licenses for foreign bank branches and subsidiaries, and only sporadically accepts applications for new foreign banking operations. Thailand has not held a round of applications for new licenses for traditional banks since 2013, when Thailand granted new subsidiary licenses to two foreign banks.

Since 2013, Thailand has required in-country processing of all domestic retail electronic payment transactions for debit cards issued in Thailand. As a result, foreign electronic payment service suppliers are precluded from supplying these services across borders and must establish a local presence and build processing facilities in Thailand. When a card is accepted on more than one network, at least one of those networks must be a domestic debit card network. Under the 2016 Thai Bank Chip Card Standard, the Bank of Thailand requires financial institutions that issue debit cards to issue cards with local-standard chips.

Foreign ownership in insurance companies is initially limited to less than 25 percent of outstanding voting shares. Foreign directors may hold no more than 25 percent of the initial board seats. The Thai Government allows a company to increase the foreign equity in the company up to 49 percent and up to half the seats on the board be held by foreign directors, if the company meets conditions relating to improving efficiency and competitiveness. In addition, the Ministry of Finance, with the recommendation of the Office of Insurance Commission, may permit a company to have foreign ownership exceeding 49 percent, or foreign directors comprising more than one-half of the board, or both, under certain circumstances, such as for the purpose of strengthening the overall stability of the insurance sector.

BARRIERS TO DIGITAL TRADE

Internet Services

According to U.S. stakeholders, including human rights organizations, Thailand's Computer Crime Act raises particular concerns for online services that host non-IP-protected, user-generated content. The concern is that it provides the government with authority to regulate online content that is so expansive it could restrict legitimate activities. The Act establishes a liability shield for online service providers with respect to non-IP-protected, user-generated content if they comply with requirements to remove certain content within specified timeframes. However, the mandated timeframes vary across content types and are as short as 24 hours for some types of content. Without strict compliance, service providers may be subject to penalties and treated as if they had created the offending content themselves.

INVESTMENT BARRIERS

The Foreign Business Act (FBA) lays out the framework governing foreign investment in Thailand. Under the FBA, non-Thai nationals and majority foreign-owned entities are prohibited from holding more than 50 percent ownership in many sectors; but U.S. investors registered under the United States–Thailand Treaty of Amity and Economic Relations (AER) are generally exempt. Nevertheless, the privileges under the AER do not exempt U.S. investments from the prohibitions on majority foreign ownership in the following areas: telecommunications; transportation; fiduciary functions; banking involving depository functions; exploitation of land or other natural resources; and, the practice of certain professions reserved for Thai nationals. The United States has encouraged Thailand to extend the exemptions available to U.S. investors registered under the AER to these sectors, or to amend the FBA to remove barriers to foreign ownership in these sectors. In particular, stakeholders report interest in investing in Thailand's telecommunications sector, but the Telecommunications Business Act prohibits majority foreign-owned entities from receiving the necessary operating licenses.

LABOR

In April 2020, the United States partially suspended Thailand's tariff benefits under the GSP program due to Thailand's failure to take steps to afford workers in Thailand internationally-recognized worker rights, particularly with regard to freedom of association. Approximately one-third of Thailand's GSP-eligible trade, for which the United States is a relatively important market for Thailand, were excluded from duty-free treatment. As of December 31, 2023, partial suspension of duty-free treatment under GSP remained in effect.

TUNISIA

TRADE AGREEMENTS

The United States–Tunisia Trade and Investment Framework Agreement

The United States and Tunisia signed a Trade and Investment Framework Agreement (TIFA) on October 2, 2002. This Agreement is the primary mechanism for discussions of trade and investment issues between the United States and Tunisia. The most recent meeting of the United States–Tunisia Trade and Investment Council, established under the TIFA, was held in May 2021.

IMPORT POLICIES

Tariffs

Tunisia's average Most-Favored-Nation (MFN) applied tariff rate was 19.5 in 2022 (latest data available). Tunisia's average MFN applied tariff rate was 30.3 percent for agricultural products and 17.8 percent for non-agricultural products in 2022 (latest data available). Tunisia has bound 58.0 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 57.9 percent.

Goods imported into Tunisia can be subject to tariff rates as high as 200 percent. Agricultural goods are subject to tariffs ranging from zero percent to 50 percent, with most agricultural imports within the 36 percent to 50 percent range. All imported goods subject to tariffs are assessed a customs administrative fee amounting to 3.0 percent of the total duties paid on the imported good.

The 2022 Budget Law instituted 20 percent to 50 percent tariff increases on consumer products that have locally-manufactured equivalents. The law also included higher tariffs on some goods with no local equivalent such as bananas (from zero percent to 50 percent), mobile phones (from zero percent to 20 percent), coffee (from 36 percent to 50 percent), and cosmetic products and perfumes (from 30 percent to 43 percent). Tariffs increased to 50 percent on imported apparel and bedding, shoes, and food products such as cheese, honey, chocolate, candies, juices, beer, and wine. Tariffs also increased to 43 percent on construction materials and products with local equivalents such as marble, gypsum, paint, wood, aluminum, ceramics, glassware, and tools.

The 2023 Budget Law, passed on December 22, 2022, eliminated tariffs on milk powder and butter.

The 2024 Budget Law, passed on December 27, 2023, imposed tariffs on selected dairy products, including cheeses and fresh cream; reduced tariffs on nuts; and, increased tariffs on nut flour.

Non-Tariff Barriers

Import Licensing

Approximately 3 percent of imported goods, including agricultural products, automobiles, and textiles, require an import license issued by the Tunisian Ministry of Trade and Export Development. Tunisia also imposes certain quotas, especially for imported consumer goods that compete with local products. Importers of these goods must request an allotment from the Tunisian Government to receive an import license. The licenses are typically valid for 12 months after issuance by the Ministry of Trade and Export

Development. Several agricultural products are also subject to burdensome technical import requirements established in a Book of Specifications.

Tunisia maintains a control system on imports of consumer goods, under which the importer must provide several documents in order to acquire an import license. The required documents include an invoice from the exporting factory, a certificate from an official authority in the exporter's country attesting to the factory's legal status, proof of product trademark, and documents affirming the product's safety and quality. The list of controlled products includes fragrances, cosmetics, underwear, shoes, household appliances, vegetables and fruits, spices, flour, chocolate, and non-alcoholic drinks. Imports of raw materials; semi-finished products; and, equipment and spare parts for industries, services, and handicrafts are exempted.

Agricultural Subsidies and Domestic Support

Since 2016, Tunisia has not responded to questions raised by the United States in the WTO Committee on Agriculture in connection with its agricultural domestic support and export subsidy outlays.

Customs Barriers and Trade Facilitation

Customs processing remains cumbersome and, for the most part, reliant on paper documents, despite some steps to digitize certain procedures. Inconsistent application of customs processes within the Tunisian Customs Administration can be a significant obstacle for importers. Although Tunisia expanded its simplified customs clearance process for authorized operators to 152 companies in 2023, risk management and other targets are primarily conducted manually by reviewing large volumes of entry documents in paper form.

Tunisia notified the latest update to its customs valuation legislation to the WTO in May 2011 but has not yet responded to the WTO Checklist of Issues describing how the Customs Valuation Agreement is being implemented.

Tunisia ratified the WTO Trade Facilitation Agreement (TFA) in July 2020. Tunisia submitted two transparency notifications related to: (1) import, export, and transit regulations; and (2) customs contact points for the exchange of information on March 9, 2023. Those notifications had been due to the WTO on February 22, 2017, according to Tunisia's self-designated TFA implementation schedule.

INTELLECTUAL PROPERTY PROTECTION

Tunisia has made some progress with respect to intellectual property (IP) protection and enforcement. However, the presence of and trade in counterfeit and pirated goods, including illicit Internet Protocol Television content, remain a concern. Stakeholders have expressed concerns about the lack of an effective system for protecting against the unfair commercial use, as well as unauthorized disclosure of undisclosed test or other data generated to obtain marketing approval for pharmaceutical products. The United States will continue to engage with Tunisia to improve IP protection and enforcement in the region.

BARRIERS TO DIGITAL TRADE

The Tunisian dinar is convertible for a limited number of current account transactions. This limits Tunisians' ability to purchase goods and services online or receive payments from foreign digital firms. Individual users of "Digital Technology Charge Cards" (the government-approved method for certain firms and entities to make purchases of foreign goods and services online) are limited to the equivalent of 1,000 dinars (approximately \$320) in annual purchases, while companies are limited to 10,000 dinars

(approximately \$3,200) and startups are limited to 100,000 dinars (approximately \$32,000). These relatively low thresholds are fixed in dinars so the actual value of the allotments has been impacted by currency fluctuations.

INVESTMENT BARRIERS

Entering Tunisia's domestic market, particularly the services sector, remains difficult for foreign investors. Foreign ownership is limited to 49 percent in most nonindustrial sectors, and the process of investing is particularly challenging in areas that are not government priorities (*i.e.*, where there are no public tenders). Under Tunisia's investment code, high-value joint ventures with a foreign investor must be approved by the Tunisian Government, which assesses the potential benefit of the investment to the Tunisian economy. U.S. investors in Tunisia frequently raise concerns about delays, lack of transparency regarding rules and fees, unfair competition from state-owned enterprises, and other bureaucratic complications in the process of registering a business. One hundred percent foreign ownership of businesses in the agricultural sector is allowed, although foreign investors do not directly own agricultural land.

OTHER BARRIERS

Foreign Exchange

Tunisian law prohibits the use of foreign currency from export of foreign currency from Tunisia for import payments until the importer's bank receives documents confirming the shipment of merchandise from the country of origin. These requirements remain a source of confusion and difficulty for some U.S. companies.

Centralized Control of Imported Pharmaceuticals

The Tunisian Central Pharmacy maintains a monopoly on pharmaceutical imports. Some U.S. companies complain that they encounter reimbursement and payment delays of up to one year.

TÜRKİYE

TRADE AGREEMENTS

The United States–Türkiye Trade and Investment Framework Agreement

The United States and Türkiye signed a Trade and Investment Framework Agreement on September 29, 1999. This Agreement is the primary mechanism for discussions of trade and investment issues between the United States and Türkiye.

IMPORT POLICIES

Tariffs and Taxes

Tariffs

Türkiye's average Most-Favored-Nation (MFN) applied tariff rate was 16.8 percent in 2022, up from 10.0 percent in 2019. Türkiye's average MFN applied tariff rate was 41.6 percent for agricultural products and 13.0 percent for non-agricultural products in 2022. Türkiye has bound 50.5 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 28.9 percent in 2022. Türkiye has taken advantage of substantial differences between its applied and WTO bound tariff rates to increase tariffs significantly across multiple sectors.

In accordance with its customs union agreement with the European Union (EU), Türkiye exempts from tariffs non-agricultural products imported from the EU and applies the EU common external tariff to non-agricultural products imported from third-countries, including those from the United States. Türkiye also exempts from tariffs non-agricultural products imported from the European Free Trade Association (EFTA) and other trading partners with which it has a free trade agreement and also exempts non-agricultural products from countries with which the EU maintains a free trade agreement.

Despite Türkiye's use of the EU common external tariff, in 2020, the Turkish Government announced additional temporary tariffs of between 2 percent and 50 percent for more than 4,000 products. Türkiye removed approximately 500 of these 4,000 additional tariffs in February 2022, in response to specific requests from importers. In 2023, Türkiye removed tariffs on 47 products, introduced new tariffs on an additional 38 products, and increased tariffs for 40 products. None of the additional tariffs exceed Türkiye's WTO bound tariff rates. These additional tariffs are not applied to imports originating in the EU, the EFTA, countries with which the EU maintains free trade agreements, or other countries that have preferential trade agreements with Türkiye.

On May 1, 2023, Türkiye increased tariffs on certain flat steel products, ostensibly to protect Turkish steel producers and encourage local production following Türkiye's 2023 earthquakes, which disrupted domestic steel production. The tariff on unalloyed hot-rolled sheet increased to 15 percent, and the tariff on alloyed hot-rolled sheet increased to 13 percent. The tariff on plate products increased from 9 percent, 10 percent, and 15 percent, respectively, to between 15 percent to 20 percent. The tariff on unalloyed cold-rolled sheet increased to 17 percent.

In June 2018, Türkiye imposed additional duties on multiple U.S. exports in retaliation for the United States' March 2018 decision to impose tariffs on imports of Turkish steel and aluminum articles under Section 232 of the Trade Expansion Act of 1962, as amended. The retaliatory duties were levied on 22

goods of U.S. origin, including an additional 60 percent tariff on passenger cars and parts, a 70 percent tariff on distilled spirits, a 30 percent tariff on skin care and make-up materials, a 25 percent tariff on rice, and a 10 percent tariff on wood products and tree nuts. In December 2023, a WTO panel ruling, recognizing that the U.S. Section 232 actions on steel and aluminum are security measures, found that Türkiye violated WTO rules by adopting retaliatory tariffs disguised as safeguard measures.

Türkiye continues to maintain high tariff rates on many imported food and agricultural products. The average tariff on fresh fruit imports is 39.3 percent, with a maximum WTO bound duty of 146.0 percent. Tariffs on imported chicken and chicken products are 65 percent and 121 percent, respectively. Effective June 1, 2023, Türkiye raised the tariff on imported sunflower seeds and sunflower oil from zero percent to 27 percent and 36 percent, respectively. Türkiye's Trade Ministry also instituted a reference price for imports of sunflower seed (\$700 per metric ton) and crude sunflower oil (\$1,350 per metric ton) to protect local sunflower growers during the harvest season.

In November 2023, tariffs for walnuts and almonds from all origins were increased to 15 percent. This tariff is in addition to the 10 percent retaliatory tariff on U.S.-originated walnuts and almonds. The "Additional Financial Liability" (AFL), an additional tax paid by the importer to import shipments, also increased for multiple products on November 1, 2023. The AFL for in-shell walnuts increased to \$416 per metric ton (MT); for shelled walnuts the AFL increased to \$1,099 per MT; for in-shell almonds the AFL increased to \$580 per MT; and the AFL for shelled almonds increased to \$942 per MT. Türkiye has insisted that the AFL is not a separate charge, but rather part of the MFN applied tariff rate. The United States continues to engage on this issue to understand the administration of the tariff for applicable agricultural products. U.S. stakeholders remain concerned about the complex structure of the AFL, its lack of transparency and predictability, and the general level of duty imposed by Türkiye.

In May 2023, the Turkish Government implemented a 130 percent tariff on grains aimed at protecting the local agricultural industry. The tariff on chickpeas and lentils increased to 19.3 percent in July 2023, and the tariff on milled rice increased to 45 percent in September 2023. These tariffs on staple commodities have helped maintain the high domestic cost of food products and persistently high food inflation in Türkiye.

Taxes

Türkiye maintains an excise duty known as a Special Consumption Tax (OTV) that is levied at one stage of the consumption process of luxury products, certain beverages, petroleum products, natural gas, automobiles and other vehicles, as outlined in four lists annexed to Law No. 4760. On May 27, 2022, Türkiye increased the OTV tax on "List 3" items, including alcoholic beverages, fruit juices, and soft drinks, in line with the domestic producer price index (PPI) inflation rate determined by the Turkish Statistical Institute. U.S. stakeholders note that an OTV tax is added to the value-added tax (VAT) and tariffs on imported alcohol, and accounts for approximately 65 percent of the price of beer and distilled spirits in Türkiye. In 2020 the Turkish Tobacco and Alcohol Market Regulatory Authority published a rule requiring importers to pay three months excise taxes in advance of sale to obtain the necessary tax stamp strips (these stamps are applied to bottles by hand), whereas domestic producers need only pay the excise tax within 30 days after sale. U.S. companies have noted a significant increase in the number of counterfeit products on the Turkish market in the last year due to the rapidly increasing cost of alcohol in Türkiye and the additional tariffs on U.S. brands.

Türkiye imposed new OTV rates on electric vehicles (EVs) on March 2, 2023. As with the OTV rates for internal combustion vehicles, the tax rate is determined through a combination of the vehicle's engine size and sale price. EVs with engine power below 160 kilowatts (kW) face a 10 percent OTV rate if their sale price is less than 1,250,000 Turkish lira (TL) (approximately \$40,340), and 40 percent if their sale price

exceeds 1,250,000 TL. EVs with engine power above 160 kW face a 50 percent OTV rate if their sale price is below 1,350,000 TL (approximately \$43,570) and a 60 percent OTV rate if their sales price exceeds 1,350,000 TL (approximately \$43,560). Türkiye's domestically produced TOGG is one of the few EVs that would qualify for the lowest tax threshold.

Non-Tariff Barriers

Agricultural Subsidies and Domestic Support

Although Türkiye has large agricultural support programs in place, which include price supports and input subsidies, Türkiye is significantly overdue on submitting its required WTO notifications regarding agricultural domestic support and export subsidies. Türkiye's most recent domestic support notifications were submitted in 2020, covering the years 2014 to 2016, and raised concerns that Türkiye had exceeded its WTO commitments regarding trade-distorting domestic support in those years. Türkiye's most recent export subsidy notifications were submitted in 2019, covering the calendar years 2010 to 2013. Türkiye has yet to notify changes in export subsidy measures pursuant to the 2015 Nairobi Ministerial Decision on Export Competition (Nairobi Decision). The United States and several other WTO Members regularly raise concerns at the WTO about the accuracy, completeness, and timeliness of Türkiye's domestic support notifications, as well as the amount of Türkiye's domestic support.

U.S. exporters have expressed concerns about Türkiye's subsidies, inward processing program for wheat, and Türkiye's reimbursement of freight costs for certain exports. They report that they do not believe a monitoring system exists to ensure that the quality and characteristics of imported wheat are the same as the domestic wheat used in exported flour and wheat products. Such monitoring is an important component of an inward processing scheme as described by the WTO Agreement on Subsidies and Countervailing Measures.

Import Restrictions

Since 2015, Türkiye has banned the importation of nearly all refurbished parts, which affects products in several sectors, including computer equipment and medical devices. Türkiye also requires that construction equipment, tractors, and agricultural equipment be imported during the year in which individual units are manufactured, effectively limiting the volume of U.S. exports of such equipment to Türkiye, given the long lead times associated with these types of orders.

Import Licensing

Türkiye requires import licenses for some agricultural products and for various products that need after-sales service, such as photocopiers, advanced data processing equipment, and diesel generators. U.S. firms complain that a lack of transparency in Türkiye's import licensing system results in costly delays and demurrage charges.

Customs Barriers and Trade Facilitation

Turkish documentation requirements for many imports are onerous, inconsistent, and non-transparent, often resulting in delayed shipments at Turkish ports. U.S. exporters of certain industrial goods and food products such as rice, dried beans, pulses, sunflower seeds, wheat, and walnuts, have reported concerns regarding decisions by Turkish customs authorities on the valuation of selected products. Further, the Ministry of Trade periodically requires tracking and monitoring of certain imports, which includes an onerous registration process that must be completed annually, with limited guidance for exporters throughout the registration process. In March 2020, the Ministry of Trade expanded its mandatory foreign exporter

registration process to a list of 31 agricultural commodities including almonds, walnuts, peanuts, peanut butter, tea, garlic, bananas, fresh peppers, flaxseed, rapeseed, and sunflower seed products.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

Food and Feed Products – Traceability Requirements

Türkiye’s 2010 Biosafety Law mandates traceability procedures for movement of animal feed products produced using agricultural biotechnology, including a requirement that each supply-chain entity maintains traceability records for 20 years. Those that have not kept such records have been prosecuted by Turkish authorities for both criminal and civil violations.

Pharmaceuticals – Good Manufacturing Practices Certification

Türkiye’s amended Regulation on the Pricing of Medicinal Products for Human Use, which took effect in March 2010, requires foreign pharmaceutical producers to secure a Good Manufacturing Practices (GMP) certificate based on a manufacturing plant inspection by Turkish Ministry of Health (MOH) officials before their products will be authorized for sale in Türkiye. The amended measure requires that Turkish authorities themselves perform the inspections, rather than the previous practice of allowing inspections by authorities from the exporting country, such as the U.S. Food and Drug Administration of the U.S. Department of Health and Human Services or the European Medicines Agency, has led to severe delays in obtaining GMP certifications for many pharmaceutical products. An MOH inspection backlog has prolonged the already lengthy processes for granting final approvals for pharmaceutical products to be sold on the Turkish market.

Since 2016, following repeated U.S. requests to Türkiye that it accelerate approvals, the MOH has authorized parallel (rather than sequential) submissions of GMP inspection and marketing approval applications for MOH-designated “Priority One” (*i.e.*, highly innovative and/or lifesaving) pharmaceutical products imported from U.S. and EU firms. While a positive step, as of December 2023, the MOH had not uniformly applied this approach to all pharmaceutical product applications. As a result, U.S. stakeholders report that GMP inspection-related delays have effectively closed the Turkish market to certain new drugs.

Sanitary and Phytosanitary Barriers

Food Safety Standards

Türkiye’s national food safety laws are not necessarily based on or aligned with international standards and science-based decision-making. The Ministry of Agriculture and Forestry (MAF) plans to adopt a pesticide reduction schedule outlined in the EU strategies.

The importation of live animals, certain animal-sourced products, and certain plant materials requires a Control Certificate that grants permission for import of the product, obtained from the MAF only after the importer submits an application and provides documents related to the product. The issuance of this certificate is not automatic and has presented challenges for U.S. exports of live cattle, meat products, hides and animal genetics upon arrival at Turkish ports.

Plant Health

Türkiye rejects imports of U.S. unmilled rice (rough or paddy) if white tip nematodes are detected. Türkiye considers the white tip nematode to be a quarantine pest, even though it is widespread in Türkiye. Due to the risk of nematode detection upon arrival and Türkiye's rejection of any available post-entry mitigation, southern U.S. rice exporters have stopped shipping to Türkiye. The United States continues to engage Türkiye on this phytosanitary issue at a technical level and points out that the pathogen is widespread in Türkiye.

Animal Health

Despite guidelines from the World Organisation for Animal Health (WOAH) that countries should limit any trade restrictions on animals and animal products that pose a risk of spreading disease to other animals within a defined region, Türkiye does not accept regionalization at the county level for imports of live poultry or poultry products from the United States, though it implements regionalization within its own territory and for its own poultry exports. Türkiye has banned the import of poultry and poultry meat from an entire U.S. state if high pathogenic avian influenza (HPAI) occurs in a single area of that state, as well as, but also the transit of poultry from HPAI-affected U.S. states, up to six months after regions have been declared disease free. As Türkiye had been an important transit point for U.S. poultry shipped to the broader Middle East region, this policy has inhibited U.S. exports of animals and animal products. The United States has raised this issue extensively with Türkiye. However, Türkiye refuses to alter their interpretation of regionalization.

Türkiye requires certificates for dairy product imports to be signed by a veterinarian. In 2018, U.S. and Turkish officials agreed that Türkiye would accept certificates for a limited number of dairy products signed by inspectors from the U.S. Department of Agriculture Agricultural Marketing Service. However, U.S. exports of other dairy products not covered by these certificates are not allowed by Türkiye, despite commercial demand.

Agricultural Biotechnology

Although Türkiye notified the 2010 Biosafety Law to the WTO Committee on Sanitary and Phytosanitary Measures prior to its enactment, the Turkish Government has failed to notify any subsequent revisions to the law, its implementing regulations or its various regulatory controls. U.S. agricultural biotechnology stakeholders have expressed reluctance to seek regulatory approvals in Türkiye for individual products due to onerous liability requirements imposed by the Biosafety Law, unclear assessment procedures required to receive approval, and concerns regarding the protection of applicants' confidential information.

The agricultural biotechnology oversight authority within the Turkish Government rests with the MAF, which assesses agricultural biotechnology products through both a Scientific Risk Assessment Committee and a Socio-Economic Assessment Committee under the Ministry's Agricultural Research and Policies Directorate General. The Ministry has approved no agricultural biotechnology products for human consumption and rejected several applications for animal feed use without providing scientific justification. As of December 2023, only 36 products produced using agricultural biotechnology can be imported into Türkiye for animal feed use (15 soybean products and 21 corn products). Türkiye has maintained the total number of approved products at 36, without providing justification for that limit. Nine additional applications are outstanding, five of which have been pending since 2015, despite the law's official 270-day review timeline. Several Turkish agricultural associations that previously submitted applications for the approval of these products have declined to sponsor their renewals, citing the challenging and non-science-based review system.

Türkiye's delays in completing science-based reviews are especially burdensome considering its impractical low-level presence policy (LLP). The current zero-tolerance threshold is difficult to meet for food and feed imports. In general, if a shipment tests positive for any amount of unapproved agricultural biotechnology product or ingredient, the cargo is rejected and cannot be used for feed or food. However, there are two exceptions to this prohibition: 1) unapproved products pending biotechnology approval in Türkiye for feed use are allowed to be present in shipments up to a 0.1 percent threshold, and 2) shipments containing up to 0.9 percent presence of approved (but not declared) agricultural biotechnology products intended for feed use. Discriminatory testing requirements for U.S. food and feed imports can lead to entire shipments being rejected when trace amounts of unrelated products such as genetically-engineered soy or corn are found.

GOVERNMENT PROCUREMENT

Turkish Government contracting officials are authorized to issue tender documents that restrict foreign companies' participation and that provide price advantages of up to 15 percent (particularly for high technology products) to domestic bidders. Although the Turkish procurement law requires government contracting agencies to consider best value pricing, the lowest-cost bids are selected in most tenders. In a scenario involving the procurement of highly technical goods or services, this may prevent consideration of bids from firms with the highest capacity and best abilities, including U.S. firms, (*i.e.*, those that provide a greater number of services, lower life cycle costs, and higher quality products).

Other features of the Turkish procurement system severely limit the ability of U.S. companies to participate in government tenders. Turkish procurement law mandates the use of model contracts, which make it difficult for U.S. companies to formulate proposals that are fully responsive to procuring agencies' requirements. In addition, foreign companies, including those with Turkish subsidiaries, have reported difficulties complying with onerous documentation requirements imposed by contracting agencies. Türkiye frequently issues regulations that exempt urgent projects and procurements from requirements of the Turkish Public Tender Law, allowing entities to conduct tenders or negotiations on an invitational basis. While these exempted tenders technically are open to foreign and domestic firms, in practice few of these have been awarded to foreign firms unless they were offering goods or services that were urgently needed and not available in Türkiye.

In the energy generation sector, the Ministry of Energy and Natural Resources requires producers to source most of their equipment from manufacturers located in Türkiye in order to obtain a license to generate solar or wind electricity above five megawatts (MW). Power generation operations producing less than five MW of electricity for consumption within the organized industrial zone are exempt from this requirement.

Türkiye's Industrial Cooperation Program gives civilian ministries the authority to impose commercial offset requirements in procurement contracts. A foreign company awarded a government procurement contract may be required to produce a share of the locally produced products or services with a local partner, or it must transfer technology in order to provide the products or services. The Turkish government has imposed offsets in the transportation, telecommunications, pharmaceuticals, aerospace, and energy sectors, among others. Turkish military procurement policy generally mandates the inclusion of various "commercial offset" requirements in contracts. These specifications typically encourage domestic sourcing commitments by bidding firms, including by requiring foreign investors to partner with local companies and transfer technology.

Since July 2019, the Turkish Government has prohibited public institutions and organizations from using cloud-computing services.

Türkiye is not a Party to the WTO Agreement on Government Procurement, but has been an observer to the WTO Committee on Government Procurement since June 1996.

INTELLECTUAL PROPERTY PROTECTION

Türkiye remained on the Watch List in the [2023 Special 301 Report](#) due to deficiencies in its intellectual property (IP) regime that represent barriers to U.S. exports and investment.

U.S. industry sources report significant problems involving the export from and trans-shipment through Türkiye of counterfeit goods, as well as software piracy, piracy of printed works, and online piracy. These sources report that the enforcement system, including judges, prosecutors, and police, fails to adequately address IP-related crime. IP enforcement additionally suffers from a lack of prioritization among government bodies to combat IP crimes. The Tahtakale market in Istanbul is listed in the [2023 Review of Notorious Markets for Counterfeiting and Piracy](#) (Notorious Markets List) as a major transit hub for counterfeit goods coming from China into European and Middle Eastern markets.

Türkiye's 2016 Industrial Property Law consolidated in a single law the provisions for protecting trademarks, designs, utility models, patents and geographical indications, and improved the legal framework for technology commercialization and transfer. The United States encourages Türkiye to fully implement its obligations under the World Intellectual Property Organization (WIPO) Performances and Phonograms Treaty (WPPT) and WIPO Copyright Treaty (WCT), collectively known as the WIPO Internet Treaties, and develop effective mechanisms to address online piracy.

U.S. pharmaceutical companies continue to raise concerns that Türkiye does not adequately protect against the unfair commercial use as well as unauthorized disclosure of test or other data submitted to obtain marketing approval for pharmaceutical products. They have also reported concerns about the timing of resolving pharmaceutical patent disputes.

SERVICES BARRIERS

Professional Services

Turkish citizenship is required to practice as an accountant, a certified public accountant, or a lawyer representing clients in Turkish courts.

Audiovisual Services

Türkiye's 2019 Regulation on the Transmission of Radio, Television, and On-Demand Services on the Internet requires providers of Internet streaming services to establish a commercial presence in Türkiye and obtain a broadcasting license. The law also imposes substantial requirements for providers of streaming services to censor content and provide the government with data about their subscribers on request.

Financial Services

Türkiye's Law on Payments and Security Settlement Systems, Payment Services, and Electronic Money Institutions (E-Payment Law) requires information systems used by financial firms for keeping documents and records to be physically located within Türkiye. Many U.S. firms, which utilize a globally distributed network architecture, view these requirements as unworkable. The implementation of the E-Payment Law has led one prominent U.S. firm to suspend its operations in Türkiye.

BARRIERS TO DIGITAL TRADE

Internet Services

The 2022 Law Amending Press Law and Certain Laws criminalizes publishing what the Turkish Government considers disinformation on social media and raises potential privacy concerns and risks for third-party social media companies. The law covers information and communication technology firms, with fines that could reach up to 3 percent of global revenue and throttling of bandwidth by up to 95 percent. As of December 2023, implementing regulations were still being drafted.

The Law on the Regulation of Broadcasts via the Internet and Prevention of Crimes Committed through Such Broadcasts gives the Ministry of Transport and Infrastructure Information and Communication Technologies Authority (BTK) the responsibility to enforce bans on Internet content deemed offensive by the Turkish courts. BTK has used its authority to block access to various Internet-based service suppliers, including U.S. suppliers. Most noticeably, Türkiye restricted access to a social media service provider in the days following the February 2023 earthquakes and pursued expanded limitations on the use and operation of social media services. As of July 2020, Law No. 5651 also requires social media platforms with more than one million daily visits from users in Türkiye to appoint a representative physically located within Türkiye and to rapidly respond to content removal requests. Social media platforms are also required to store user data in Türkiye. BTK issued a new decision in April 2023 updating these requirements, including affirming the requirements for local presence and the storage of user data in Türkiye. Penalties for noncompliance include escalating fines, blocking of advertisement, and restricting bandwidth.

Digital Services Taxation

Since 2020, Türkiye has implemented a digital services tax of 7.5 percent that applies to companies offering Internet-based services in Türkiye without having a physical presence there. The implementing legislation covers revenue from various digital services and grants the President the power to adjust the tax rate (up to 15 percent) and the revenue level at which the tax is applicable.

The United States and Türkiye are among the 134 jurisdictions to have joined the 2021 OECD/G20 Inclusive Framework on Base Erosion and Profit Shifting [Statement on a Two-Pillar Solution to Address the Tax Challenges Arising from the Digitalization of the Economy](#) in reaching a political agreement on a two-pillar solution to address tax challenges arising from the digitalization of the world economy. As part of Pillar 1, all parties would remove existing digital services taxes and other relevant similar measures, and would coordinate the withdrawal of these taxes. The United States and Türkiye issued a [joint statement](#) in November 2021 on a transitional approach to existing Unilateral Measures while implementing Pillar 1 of the Two-Pillar Solution. According to the joint statement, digital services taxation (DST) liability that accrues during the transitional period prior to implementation of Pillar 1 will be creditable in defined circumstances against future income taxes due under Pillar 1. In return, the United States terminated a Section 301 trade action on Turkish goods and committed not to take further trade actions against Türkiye for its existing DST until the date the Pillar 1 multilateral convention comes into force or December 31, 2023. The arrangement set out in the November joint statement was extended to June 30, 2024. In coordination with the U.S. Department of Treasury, USTR continues to monitor implementation of the political agreement and the transitional approach as provided in the joint statement.

OTHER BARRIERS

Export Restrictions and Prohibitions

Türkiye bans exports of sunflower seed oil. Türkiye never notified this export ban to the WTO, despite requests from the United States and other WTO Members to do so.

Türkiye imposed a ban on olive oil exports, initially for three months starting on August 1, 2023, and extended the decision indefinitely on October 18, 2023. The Turkish Ministry of Trade introduced the measure to prevent a price increase in the domestic market as a drought in Europe had caused olive oil production in Mediterranean countries to decrease by 20 percent in the 2022/2023 season. Türkiye's production increased by 62 percent in the 2022/2023 season, but greater demand from Europe drove up prices domestically.

Restrictions on Reimbursement and Official Exchange Rate for Government Purchases

Since 2017, the Turkish Government has instituted a reimbursement regime for pharmaceutical products that substantially decreased reimbursements. U.S. pharmaceutical companies have raised concerns that they are unable to market next-generation drugs in Türkiye due to the government's maintenance of an artificially low official exchange rate for reimbursement for pharmaceutical products.

The Turkish Government maintains two lists totaling approximately 200 pharmaceuticals for which government reimbursement is denied unless the products are manufactured in Türkiye. Since government reimbursement covers most pharmaceutical products sold in Türkiye, U.S. firms have raised concerns that denying reimbursement has undermined their ability to market their products in Türkiye because they are not manufactured locally. The Turkish Government has previewed plans to “delist” three tranches of products, but has not specified a timeline nor taken any action to implement these further measures.

Delayed Reimbursement for Medical Devices and Pharmaceuticals

The lack of prompt payments by Turkish hospitals (ostensibly due to budgetary restraints) remains a concern for U.S. pharmaceutical and medical device companies.

The Turkish Government has tasked the State Procurement Institute (DMO) with the authority to open tenders to procure pharmaceuticals, as well as medical and laboratory disposables for public hospitals. According to U.S. stakeholders, DMO has honored its commitment to make payments within 90 days, and delayed payments are no longer an issue with public hospitals. However, some stakeholders have reported that, as of December 2023, university hospitals that make direct purchases from medical device manufacturers still had payments outstanding for over 12 months.

UKRAINE

NOTE: *This chapter of the National Trade Estimate Report inventories primarily the significant trade and investment barriers in Ukraine before Russia’s full-scale invasion of Ukraine in February 2022. The U.S. Government recognizes that the ability of the Government of Ukraine and the U.S. Government to engage on or address these barriers remains limited and unpredictable.*

TRADE AGREEMENTS

The United States–Ukraine Trade and Investment Cooperation Agreement

The United States and Ukraine signed a Trade and Investment Cooperation Agreement (TICA) on April 1, 2008. This Agreement is the primary mechanism for discussions of trade and investment issues between the United States and Ukraine.

IMPORT POLICIES

Tariffs and Taxes

Tariffs

Ukraine’s average Most-Favored-Nation (MFN) applied tariff rate was 4.4 percent in 2022 (latest data available). Ukraine’s average MFN applied tariff rate was 9.1 percent for agricultural products and 3.7 percent for non-agricultural products in 2022 (latest data available). Ukraine has bound 100 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 5.8 percent.

Taxes

The standard value-added tax (VAT) rate in Ukraine is 20 percent, which applies to all transactions subject to VAT except specific transactions subject to a 14 percent VAT rate (applies to import and supply of certain agriculture products including soybeans, corn, and sunflower seeds), a 7.0 percent VAT rate (applies to supply and import of qualifying medicines and specific medical goods), and a zero percent VAT rate (applies to export and re-export of goods). Ukraine employs an automated VAT refund system, but the efficacy of that system has been inconsistent, and U.S. companies continue to report that the State Tax Service delays or rejects VAT refunds. In addition, the State Tax Service continues to request original documents confirming business transactions within very short deadlines. Companies also report requests for documentation that go beyond what is required by law. The United States has raised concerns about such delays and requests.

Non-Tariff Barriers

Customs Barriers and Trade Facilitation

While Ukraine’s MFN applied tariff rates are relatively low, U.S. businesses have raised concerns that Ukraine’s State Customs Service (SCS) assigns higher and seemingly inconsistent customs values to imports than are reflected in the transaction price as provided in the import documentation. Such practices may raise concerns under WTO rules and appear contrary to the Ukrainian law that requires the SCS to rely primarily on the transaction price in determining customs value. Furthermore, it appears that the SCS uses its internal valuation database as a mechanism to establish the minimum values of the goods, rather than

for risk analysis purposes only. Specifically, even a slight decrease in the invoice value (as compared to historical prices), or the mere fact that the declared value is lower than the “risk indicators” (which are not publicly available), may result in an increased declared value of the goods. U.S. businesses also report that the SCS has been sending goods for laboratory tests or additional risk audits more frequently, delaying shipments and raising costs. The United States has frequently raised concerns about these practices with the SCS.

Other Market Access Barriers

Importers of U.S. products have complained about inspection officials at ports of entry taking larger numbers of samples than needed for laboratory testing due to a faulty and arbitrary definition of “uniform allotment” (*i.e.*, batches identified for sampling). Sampling and testing, particularly of expensive products, such as caviar, fish, or chilled meat, and the associated testing fees, poses a significant burden on importers. In 2018, Ukraine adopted legislation establishing the main principles for a governmental food and feed control system, including rules governing sampling at the border. Nevertheless, stakeholders claim that testing continues to be excessive. The United States has asked that Ukraine ensure these regulations are consistent with Ukraine’s WTO obligations.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY MEASURES

Technical Barriers to Trade

Conformity Assessment Procedures – European Union Technical Regulations and Regimes

As part of its Association Agreement with the European Union (EU), including the provisions to establish a Deep and Comprehensive Free Trade Area since being granted candidate status for EU membership in June 2022 and opening EU accession negotiations in December 2023, Ukraine is moving to approximate EU technical regulations and the EU’s regulatory regime (including the EU’s conformity assessment procedures). Some U.S. industry stakeholders have expressed concerns that this process may lead Ukraine to adopt measures that raise technical barriers to trade. U.S. trade could be negatively affected if Ukraine follows EU practice by refusing to accept any standards as a basis for technical regulations except unique EU regional standards. The United States continues to press Ukraine to ensure that, as it approximates its legislation to that of the EU, it does so in a manner that is consistent with its WTO obligations. Further, the U.S. Government has urged Ukraine to make full use of the WTO notification procedure to ensure that new regulations and conformity assessment practices are transparent and comply with Ukraine’s international obligations. Separately, Ukraine has launched a pilot program to create an electronic platform to publicize draft regulatory measures, accept public comments, and provide its responses to those comments.

Sanitary and Phytosanitary Barriers

Import Certification

To enforce import requirements for food products of animal origin, Ukraine maintains requirements for 72 generic veterinary certificates for the relevant products. The certificates capture product-specific requirements that do not appear to be science-based and require the exporting country’s regulators to certify that exports are in compliance with “Ukrainian regulatory provisions” rather than in compliance with the attestations contained within the certificate itself. While the Government of Ukraine accepts previously-negotiated U.S.–Ukrainian export certificates for products of animal origin, these certificates can no longer

be amended, new certificates cannot be negotiated, and generic certificates cannot be modified. The United States continues to work with Ukraine to ensure that market access for U.S. agricultural exports is not disrupted as Ukraine continues to implement its import regulations.

Approved Exporters List

Under Article 61 of the Law On State Control over Enforcement of Regulations on Food and Feed Safety, Animal Byproducts, Animal Health and Wellbeing, U.S. establishments (*e.g.*, facilities, farms, genetics centers) can export animal-based products (including live animals, reproductive materials, composite products, animal feed, and seafood) to Ukraine only if they are on Ukraine's Approved Exporters List. Only those facilities that exported to Ukraine historically (between 2013 and 2018) or are approved to export to the EU are included on the list. Ukraine has cited the need to harmonize its legislation with that of the EU, as well as its preference to maintain its trading relationship with historical exporters, as the rationale. However, Ukraine's procedure for adding "historical exporters" is lengthy and problematic, requiring establishments to collect and confirm data on historical exports between 2013 and 2018. In order to add a new-to-market establishment to Ukraine's list, that establishment must undergo an audit. Although basic principles of foreign individual audits are published, specific rules and requirements for the procedure are unclear, and the process itself is cost-prohibitive for small and medium-sized producers. As a result, some U.S. establishments will be unable to export to Ukraine until they complete an expensive and time-consuming EU approval process, or the United States undergoes a country-wide food safety systems audit. The United States has engaged Ukraine on this topic in various meetings and continues to work with Ukraine to resolve this issue.

Food Safety Standards

Ukraine has adopted food safety requirements that mimic EU standards as it deepens its economic relationship with the EU. These measures were notified to the WTO between 2018 and 2023. U.S. exporters (primarily exporters of products of animal origin) are concerned that Ukraine's adoption of EU standards as its national standards, particularly those that are not in line with international standards or based on a risk assessment, could make it significantly more difficult to export certain products to Ukraine. Many of these Ukrainian requirements are related to agrochemicals, veterinary drugs, and hygiene requirements, among others. The United States is working with Ukraine to introduce science-based international practices into Ukraine's rule-making process. In addition, the United States has encouraged Ukraine to make full use of the WTO sanitary and phytosanitary (SPS) notification procedure to ensure that Ukraine's process for adopting new SPS measures is transparent and complies with Ukraine's international obligations.

U.S. industry has raised concerns with the Government of Ukraine about Ukraine's biotechnology regime, largely due to the fact that Ukraine's regulatory system for biotechnology products is still in development. Ukraine has not yet implemented a holistic regulatory regime for registration of biotechnology products either for cultivation or trade of food and feed. Without a fully developed regulatory system, U.S. biotechnology and biotechnology-derived products that could benefit Ukrainian farmers, such as U.S. seeds and genetics, cannot be imported into Ukraine. By law, cultivation of biotechnology products is limited to only registered agricultural biotechnology products. As of December 2023, Ukraine's official registry of biotechnology products did not contain any entries. As a result, no biotechnology product can be legally cultivated in Ukraine or imported into Ukraine from the United States or any other third country. Ukraine committed to moving towards regulating its biotechnology sector in line with EU norms by adopting in August 2023 the Law of Ukraine #3339-IX On State Regulation of Genetic Engineering Activities and State Control of the Circulation of Genetically Modified Organisms and Genetically Modified Products to Ensure Food Safety (GE Law). The law will enter into force in September 2026. The law contains provisions noting that cultivation of genetically engineered (GE) rapeseed and GE sugar will be postponed

until after five years of the GE Law's entry into force, while totally banning GE corn. The steps related to GE product registration and implementation of GE trade are unclear at this stage, and new specific regulations and guidelines will need to be developed.

The United States continues to work with the Government of Ukraine to facilitate the development and implementation of an effective, science and risk-based regulatory framework for products of biotechnology, and to help meet Ukraine's economic and sustainability goals since biotechnology crops can help farmers adapt to climate change, increase yields on existing farmland, and strengthen global food security.

GOVERNMENT PROCUREMENT

On July 14, 2022, amendments to Ukraine's law on public procurement entered into force, establishing local content requirements in public procurement of urban transport, utility equipment, railway transport, aerospace products, and energy engineering products by giving preference to domestic producers in government tenders. Following consultations with the U.S. Government, and consistent with Ukraine's WTO commitments, the law exempts from the preference provisions those procurements subject to the WTO Agreement on Government Procurement (GPA). U.S. stakeholders remain concerned that the opaque mechanism for determining compliance with the preference provisions could increase the risk of corruption in the procurement process.

Ukraine is a Party to the WTO Agreement on Government Procurement.

INTELLECTUAL PROPERTY PROTECTION

Due to Russia's full-scale invasion of Ukraine in February 2022, the 2022 and 2023 Special 301 reviews of Ukraine were suspended. During 2021, the United States had engaged with Ukraine on concerns regarding Ukraine's intellectual property (IP) regime, including in the areas of: (1) the administration of the system for collective management organizations that are responsible for collecting and distributing copyright royalties to right holders; (2) the use of unlicensed software by government agencies; and (3) the implementation of effective means to combat widespread online copyright infringement. The United States continues to monitor Ukraine's IP regime and welcomes opportunities to engage with Ukraine on the protection and enforcement of IP.

INVESTMENT BARRIERS

While Ukraine generally affords foreign investors the same treatment as domestic investors, foreign investors are prohibited from owning agricultural land, producing bioethanol, engaging in certain publishing activities, and investing in certain energy sector assets, such as gas transmission systems, electricity grids, and various plants and factories.

OTHER BARRIERS

Bribery and Corruption

The United States will continue to work with Ukraine to establish strong anticorruption institutions, drive law enforcement reform, and create a business environment that is transparent and firmly grounded in the rule of law. Although Ukraine's judiciary has in the past been regarded as one of the country's least trusted institutions, Ukraine in 2023 undertook important steps to reform its judiciary, including the reestablishment of key judicial institutions for vetting, evaluating, and disciplining judges.

UNITED KINGDOM

TRADE AGREEMENTS

Following a June 2016 referendum, the United Kingdom (UK) formally left the European Union (EU) on January 31, 2020 (“Brexit”). To avoid any break in existing legal coverage and mechanisms, the UK Government enacted the European Union (Withdrawal) Act 2018 to incorporate EU laws and regulations into domestic UK law, replacing references to EU entities and laws and regulations with corresponding UK references. As a result, beginning January 1, 2021, the UK and EU had virtually identical legal and regulatory structures, although the UK is now generally free to change its laws and regulations independent of the EU.

The UK and EU negotiated a new trade agreement, the United Kingdom–European Union Trade and Cooperation Agreement (TCA), which, as of January 1, 2021, continues tariff-free and quota-free access to each other’s markets without binding each other’s regulatory regimes. Under the TCA, if domestic regulatory systems diverge in ways that significantly affect trade, either side may seek to rebalance the agreement by modifying market access commitments.

On December 31, 2020, the United States and the UK completed the transition of five existing United States–European Union agreements to new United States–United Kingdom agreements. These five agreements covered areas of bilateral trade in wine, distilled spirits, marine equipment, telecommunication equipment, electromagnetic capability, pharmaceutical products (good manufacturing practices), and covered insurance and reinsurance. Additional information about the agreements can be found on the Office of the United States Trade Representative’s [website](#). The United States and the UK have also ensured the transition of mechanisms supporting trade in organic products and recognition of veterinary health certificates.

IMPORT POLICIES

Tariffs

United Kingdom Global Tariff

The UK’s average Most-Favored-Nation (MFN) applied tariff rate was 3.8 percent in 2022 (latest data available). The UK’s average MFN applied tariff rate was 9.4 percent for agricultural products and 2.9 percent for non-agricultural products in 2022 (latest data available). The UK has bound 100 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 5.1 percent.

The UK has duties on approximately 5,000 tariff lines, including on certain agricultural products, ceramics, chemicals, bioethanol, and vehicles. Tariffs on some products such as bananas, raw cane sugar, and apparel, which tend not to be import sensitive for the UK, have been maintained to provide for preferential access for imports from certain developing countries into the UK compared to the MFN rate. The UK has some high tariffs that affect U.S. exports, such as rates of up to 25.0 percent for some fish and seafood products, 10.0 percent for trucks, 10.0 percent for passenger vehicles, and up to 6.5 percent for certain mineral or chemical fertilizers.

Tariff-Rate Quotas

Under the UK Global Tariff, some products are covered by a tariff-rate quota (TRQ). TRQs apply to a variety of agricultural products that the United States exports in significant quantities, including beef, pork, cereals, and rice.

Non-Tariff Barriers

Northern Ireland-Specific Border Controls

Northern Ireland is subject to separate arrangements under the Windsor Framework – formerly known as the Protocol on Ireland/Northern Ireland (the Protocol) – that forms part of the agreement between the UK and the EU that addresses the UK’s withdrawal from the EU. On February 27, 2023, the UK and the EU jointly announced the Windsor Framework to address certain issues regarding the Protocol. The introduction of new trade easements for goods moving from Great Britain to Northern Ireland under the Windsor Framework began on October 1, 2023, and will continue to be implemented in phases through 2025. When fully implemented, the Windsor Framework will apply UK regulations regarding food safety, value-added tax and excise rates, and medical licensing for goods and services remaining within Northern Ireland.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

Upon withdrawal from the EU, the UK transposed existing EU technical regulations into UK law in 2021, thus creating close initial alignment between UK and EU technical regulations and requirements. Several specific trade concerns outlined in the technical barriers to trade (TBT) section of the EU Chapter in this National Trade Estimate Report therefore remain with respect to the UK. Additional divergences between the two regimes will likely continue because changes to some EU regulations have not been, or will not be, automatically reflected in the UK regulatory regime and vice versa.

Sanitary and Phytosanitary Barriers

Upon withdrawal from the EU, the UK transposed existing EU sanitary and phytosanitary (SPS) measures into UK law in 2021, thus creating close initial alignment between UK and EU SPS measures. Some trade concerns outlined in the SPS section of the EU Chapter in this National Trade Estimate Report therefore remain with respect to the UK. The United States is concerned that these measures may unnecessarily restrict trade without furthering safety objectives, because they appear to be applied beyond the extent necessary to protect human, animal, or plant life or health, not based on science, or maintained without sufficient scientific evidence. Specifically, the UK remains closely aligned to EU policy on pesticide approvals, regulation, and maximum residue limits (MRLs). However, there have been divergences between the two regimes as changes to some EU SPS measures have not been automatically reflected in the UK SPS measures (with the exception of Northern Ireland) and vice versa.

Agricultural Biotechnology

U.S. exports of processed foods and beverages to the UK have been constrained in part by local legislation pertaining to genetically modified (GM) food products. Due to long-standing negative perceptions in the UK of agricultural biotechnology, UK supermarkets and food manufacturers formulate their grocery

products to exclude GM ingredients. The UK retained EU legislation post-Brexit, and there has been no attempt to amend the legislation to allow GM products into the UK market, with the exception of specific agricultural biotechnology products for animal feed that require approval. The UK now has the autonomy to establish its own regulatory and policy approach for agricultural biotechnology products, including crops and animals. The UK is working to transition away from the retained EU policy approach for agricultural biotechnology products, beginning with genome-edited products, with the intention of subsequently addressing GM products.

In March 2023, the Genetic Technology (Precision Breeding) Act received Royal Assent, confirming it as an Act of Parliament. The Act intends to simplify the process by which precision breeding technologies (*i.e.*, targeted genetic changes to produce beneficial traits that can also occur through traditional breeding and natural processes) can be authorized and brought to market more easily. This approach paves the way for the modernization of the UK's full suite of agricultural biotechnology regulations. The next stage in the implementation of the new legislative framework began in November 2023 with a consultation on proposals for a new framework for the regulation of precision-bred organisms used for food and animal feed.

Agricultural Chemicals, Pesticide Regulations

In May 2021, UK officials indicated that the UK would follow a risk-based approach to reviewing and approving agricultural chemicals and pesticides, when they established their post-Brexit regulatory policies. In November 2022, the UK noted it will continue to follow the EU's hazard-based approach to MRLs while it develops its own regulatory processes. In August 2023, the UK notified to the WTO Committee on Sanitary and Phytosanitary Measures a proposed measure to reduce the MRL for chlorpropham for fresh and frozen potatoes. In this case, rather than relying on risk assessments that were completed while the UK was a member of the EU, the UK's approach appears even more restrictive than the EU's.

U.S. agricultural exporters are increasingly concerned that the UK might retain the EU's approach to regulating agricultural chemicals and pesticides, which often results in restrictions that do not appear to be science-based and that could result in reductions of MRLs important to U.S. growers, creating excessive barriers to trade and disrupting U.S. crop, food, and agriculture exports to the UK.

GOVERNMENT PROCUREMENT

The UK is a Party to the WTO Agreement on Government Procurement.

UK Space Agency

Participation in European Space Agency (ESA) procurements, to which the UK contributes funding, is generally only open to economic operators in ESA Member States. U.S. companies are generally prohibited from competing on ESA contracts. A significant amount of money is allocated by the UK to ESA. For example, the UK Space Agency allocated £553 million (approximately \$681 million) to ESA in its 2022–2023 budget, which is approximately 85 percent of the UK Space Agency's total budget.

INTELLECTUAL PROPERTY PROTECTION

The UK generally maintains high levels of intellectual property (IP) protection and enforcement. However, U.S. stakeholders have expressed concern that the UK music copyright collective fails to remunerate U.S. artists for radio broadcasts and public performances of their music in the UK. The United States will continue to monitor developments with the UK's IP system.

Geographical Indications

The UK geographical indications (GI) program limits the use of the geographical names for food, drink, and agricultural products (including beer, cider, and perry), spirit drinks, wine, and aromatized wine. The UK schemes use the following designations: Protected Designation of Origin (PDO); Protected Geographical Indication (PGI); and Traditional Speciality Guaranteed (TSG).

The UK schemes are open to producers from the UK and other countries. All existing products that were registered under the EU GI schemes as of December 31, 2020, remain covered under the UK GI schemes, including both UK and EU GIs.

The United States is monitoring the impact of the UK's schemes for the protection of GIs on prior trademark rights and on market access for U.S. goods that rely on the use of common names.

SERVICES BARRIERS

Professional Qualifications

Permission to act as a chartered accountant requires the applicant to have professional experience in the UK, thus limiting experienced U.S. certified public accountants (CPAs) from obtaining authorization to practice in the UK. Efforts are being made to address this through professional bilateral arrangements.

BARRIERS TO DIGITAL TRADE

Digital Services Taxation

The United States and the UK are among the 137 member jurisdictions to have joined the October 8, 2021 OECD/G20 Inclusive Framework on Base Erosion and Profit Shifting [Statement on a Two-Pillar Solution to Address the Tax Challenges Arising from the Digitalization of the Economy](#), which called for all Parties to commit not to introduce digital services taxes (DSTs) in the future. On October 21, 2021, the United States, Austria, France, Italy, Spain, and the UK issued a [joint statement](#) “on a transitional approach to existing Unilateral Measures while implementing Pillar 1.” According to the statement, DST liability that accrues to Austria, France, Italy, Spain, or the UK during a transitional period prior to implementation of Pillar 1 will be creditable in defined circumstances against future corporate income tax liability due under Pillar 1. In return, the United States terminated the existing Section 301 trade actions on goods with respect to each country and committed not to take further trade actions against each country with respect to existing DSTs, provided that the country follows through on the agreement described in the joint statement, until the earlier of the date the Pillar 1 multilateral convention comes into force or December 31, 2023. The arrangement set out in the October 21 joint statement was extended to June 30, 2024, according to a [joint statement](#) issued on February 15, 2024. In coordination with the U.S. Department of Treasury, USTR continues to monitor implementation of the political agreement and the transitional approach as provided in the joint statement.

SUBSIDIES

Government Support for Airbus

In October 2019, after 15 years of litigation, the WTO authorized the United States to take \$7.5 billion in countermeasures in the dispute against the EU, France, Germany, Spain, and the UK regarding their illegal subsidies for the Airbus consortium.

On June 17, 2021, the United States and the UK announced a cooperative framework to address the large civil aircraft disputes and agreed to future cooperation to overcome any disagreements in the sector. Over many years, the UK, together with France, Germany, and Spain, provided subsidies to Airbus-affiliated companies to aid in the development, production, and marketing of Airbus's large civil aircraft. As part of the cooperative framework, the United States and UK will not impose countermeasures in the form of tariffs for five years and will work together to address nonmarket practices in the aircraft sector. The United States and the UK established a working group to address these issues on an ongoing basis.

URUGUAY

TRADE AGREEMENTS

The United States and Uruguay signed a Trade and Investment Framework Agreement on January 25, 2007. This Agreement is the primary mechanism for discussions of trade and investment issues between the United States and Uruguay.

IMPORT POLICIES

Tariffs

Uruguay's average Most-Favored-Nation (MFN) applied tariff rate was 10.1 percent in 2022 (latest data available). Uruguay's average MFN applied tariff rate was 10.0 percent for agricultural products and 10.1 percent for non-agricultural products in 2022 (latest data available). Uruguay has bound 100 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 31.5 percent.

Uruguay is a founding member of the Southern Common Market (MERCOSUR), formed in 1991, which also includes Argentina, Brazil, and Paraguay. MERCOSUR's Common External Tariff (CET) ranges from zero percent to 35.0 percent *ad valorem* and averages 11.7 percent. In July 2022, MERCOSUR countries agreed to a 10 percent reduction of the CET for over 80 percent of product lines. The decision reduced the block's average CET to 10.3 percent. Any good imported into Uruguay (not including free trade zones) is subject to the payment of the CET to Uruguay's customs authority. If the product is then re-exported to another MERCOSUR country, the CET must be paid again to the second country. MERCOSUR approved a Common Customs Code (CCC) in 2010 and launched a plan to eliminate the double application of the CET within MERCOSUR in 2021. However, only Argentina has ratified the CCC, and it has not taken effect.

Non-Tariff Barriers

Customs Barriers and Trade Facilitation

Uruguay charges a consular fee on imports, currently at 5 percent *ad valorem*, up from 2 percent in 2018. The imposition of consular fees disadvantages U.S. exports to Uruguay by increasing costs and imposing additional formalities that are unrelated to the services provided by the customs authority.

U.S. poultry exporters have reported serious challenges in receiving necessary import documentation from Uruguay, effectively closing the market to U.S. poultry exports for most of 2023.

INTELLECTUAL PROPERTY PROTECTION

The United States urges Uruguay to ensure transparency and due process in the protection of geographical indications (GIs) and to ensure that the grant of GI protection does not deprive interested parties of the ability to use common names, particularly as Uruguay proceeds with the European Union–MERCOSUR Trade Agreement.

VIETNAM

TRADE AGREEMENTS

The United States–Vietnam Trade and Investment Framework Agreement

The United States and Vietnam signed a Trade and Investment Framework Agreement in June 2007. This Agreement is the primary mechanism for discussions of trade and investment issues between the United States and Vietnam.

IMPORT POLICIES

Tariffs and Taxes

Tariffs

Vietnam's average Most-Favored-Nation (MFN) applied tariff rate was 9.6 percent in 2022 (latest data available). Vietnam's average MFN applied tariff rate was 17.1 percent for agricultural products and 8.4 percent for non-agricultural products in 2022 (latest data available). Vietnam has bound 100 percent of its tariff lines in the World Trade Organization (WTO), with an average WTO bound tariff rate of 11.7 percent. Vietnam also maintains import tariff-rate quota regimes for salt, eggs, and sugar.

Although the majority of U.S. exports to Vietnam face tariffs of 15 percent or less, consumer-oriented food and agricultural products continue to face higher rates. In recent years, Vietnam has increased MFN applied tariff rates on a number of products, including: sweeteners (such as fructose and glucose); shelled walnuts; ketchup and other tomato sauces; inkjet printers; soda ash; and, stainless steel bars and rods. Most of the products for which tariffs have increased are also produced by companies in Vietnam.

In May 2023, Vietnam enacted Decree 26/2023/ND-CP, which updated detailed tariff rates for each Harmonized System code, effective July 15, 2023. The primary change from the decree was a reduction in ethanol tariffs from 15 percent to 10 percent. Despite this decrease, the tariff on ethanol continues to be significantly higher than Vietnam's tariffs on other substitutable fuel additives, which are either zero percent or 3 percent.

Taxes

In 2016, Vietnam's Law 106/2016/QH13 increased the special consumption taxable base for imported alcoholic beverages from the import price to the sales price received by the importer, thereby significantly increasing the tax burden on importers relative to domestic producers.

Non-Tariff Barriers

Import Bans and Restrictions

Vietnam prohibits the commercial importation of some products, including: certain children's toys; second-hand consumer goods; used parts for vehicles; used internal combustion engines of less than 30 horsepower; certain encryption devices and encryption software; refurbished medical devices; and certain cultural products.

Vietnam maintains import prohibitions on certain used information technology (IT) products. Decision 18/2016/QĐ-TTg eases import prohibitions on some used IT products, if these products meet various technical regulations and standards. The products covered under the decision include used IT goods that are: (1) imported in conjunction with the relocation of means of production of a single organization; (2) imported for the control, operation, and inspection of activities in one or all parts of a system or production line; (3) imported for software production, business outsourcing, or data processing for foreign partners; or, (4) reimported after overseas repairs under warranty. The decision also covers refurbished goods and components no longer in production that are imported to replace or repair those being used domestically.

Product Registration Requirements – Imported Pharmaceuticals

Decree No. 54/2017/ND-CPD, which came into effect in July 2017, permits foreign pharmaceutical companies to establish importing entities. The international business and pharmaceutical communities welcomed this step but continue to have concerns about warehousing, distribution, and licensing requirements.

Circular 08/2022/TT-BYT, effective on October 20, 2022, regulates drug registration and Certificate of Pharmaceutical Product (CPP) content requirements and harmonizes with international practice, specifically following the World Health Organization's CPP template. Under Circular 8, the Vietnam Ministry of Health (MOH) no longer has a blanket requirement to verify CPP authenticity. Instead, a risk-based approach is applied and that verification can be done via different channels and in parallel with the market authorization (MA) review process. The Circular also simplified several administrative procedures following international practices. Some challenges remain as, in practice, the MOH requires foreign competent authorities and Vietnam's diplomatic missions to authenticate or consular legalize electronic CPPs. Companies can amend the dossier for product registration up to three times the maximum; otherwise, the dossier is rejected. This is in order to meet the MOH's objective of ensuring the dossier quality. However, submissions of quality application dossiers will require regulator-industry consultations to ensure Circular 8 regulatory requirements are understood.

In response to the ongoing backlog of drug registration renewals and applications, the Vietnam National Assembly issued Resolution 80/2023/QH15 in January 2023. This measure allows MAs of drugs and drug raw materials that are expiring between January 1, 2023, and December 31, 2024, and MAs that have been previously extended, to continue until December 31, 2024, if those drugs and drug raw materials meet certain requirements. The MOH is responsible for reviewing and publicizing the list of MAs that meet the requirements in a public and transparent manner. The United States will continue to monitor the implementation of the drug registration process in Vietnam.

Medical Devices

In March 2023, Vietnam issued Decree 07/2023/ND-CP (Decree 07), amending and supplementing Decree No. 98/2021/ND-CP. Decree 07 allows all existing import licenses to be automatically extended to December 31, 2024, and regulates outstanding lodged dossiers for import licenses to be reviewed and approved under the legal framework of this new decree. The United States will continue monitoring developments related to the implementation of the new decree.

Ethanol

Vietnam currently only allows blends of 5 percent ethanol in one of its three grades of gasoline. Vietnam's Ministry of Industry and Trade (MOIT) is the lead ministry on ethanol policy. The United States continues to seek the expansion of ethanol blending to all grades of gasoline sold in Vietnam, the reduction of tariffs on ethanol to at least match tariff rates on other fuel additives currently used in Vietnam, as well as the

eventual migration to a 10 percent ethanol blend (E10). The MOIT had previously sought to expand to E10 in all grades of gasoline, but this has not occurred.

TECHNICAL BARRIERS TO TRADE / SANITARY AND PHYTOSANITARY BARRIERS

Technical Barriers to Trade

Labeling

Decree 111/2021/ND-CP, which revised Decree 43/2017/ND-CP on Goods Labeling and became effective on February 15, 2022, requires imported goods to have a label added by merchants. The updated decree requires significantly more information to appear on all labels and imposes a range of additional specific requirements that vary depending on the product category. Importers have reported challenges to entering imported goods due to uncertainty and inconsistency in product classifications, which make it difficult for importers to comply with labeling requirements.

Sanitary and Phytosanitary Barriers

Approvals for the Importation or Commercialization of Genetically Engineered Products

In 2023, after several years of inactivity, Vietnam resumed its acceptance of new applications of genetically engineered (GE) products for cultivation. As of December 31, 2023, Vietnam had approved 10 GE corn hybrids for cultivation; made progress on an application for a GE corn product (MIR162) that is resistant to Fall Army Worm; and was actively reviewing seven new applications of biotechnology corn, soybean, canola, and cotton. Vietnam remains a major importer of biotechnology products and a key market for cultivation approvals as part of the commercialization process. The United States will continue to engage with Vietnam on the approval of pending applications.

Imports under the Food Safety Law

In February 2018, as part of enforcement of its Food Safety Law, Vietnam adopted Decree 15/2018/ND-CP (Decree 15), which provides guidance on self-declaration, labeling, import inspection, and registration for export to Vietnam of food products of plant and animal origin. Although Decree 15 simplified self-declaration for importation of food products, some aspects of the decree created uncertainty, with different line ministries, and even departments within the Ministry of Agriculture and Rural Development (MARD), appearing to have contradictory interpretations. For example, the MARD and the MOH have provided contradictory interpretations regarding Vietnam's definition of "processed products," which are exempt from the facility registration process under Decree 15. Despite requests by the United States and other trading partners, Vietnam refused to notify Decree 15 to the WTO.

In March 2021, Vietnam issued a draft decree that would revise Decree 15. The new draft decree covers foods and agricultural products and would create a two-step registration for import inspection by merging the self-declaration (for food safety) and conformity announcement (for quality inspection) into the registration for import inspection. Vietnam notified the draft decree to the WTO in July 2021. As of December 31, 2023, the draft decree remains under review by the Government of Vietnam and has not been finalized.

In 2023, the MOH was assigned to collaborate with the MARD and the MOIT on the review of the Food Safety Law's implementation. According to Decision 426/DQ-TTg, the Food Safety Law's review will be

conducted from 2023 to 2025, after which line ministries will draft proposals to amend and supplement the law. The MOH was also assigned to review the implementation of Decree 15 in coordination with MARD and MOIT. The United States will continue to monitor Vietnam's review of its Food Safety Law and Decree 15 to avoid any potential disruptive effects on U.S. agricultural exports.

Ban on Offal Products

Despite the MARD lifting Vietnam's ban on the importation of so-called "white offal," such as poultry gizzards and beef and pork stomach and intestines, Vietnam has not approved new U.S. facilities to export these products since September 2013. The United States continues to raise concerns about Vietnam's lack of a science-based justification for not approving new U.S. facilities seeking to export offals. Plans for Vietnam to conduct onsite audits of U.S. facilities were indefinitely postponed purportedly due to the outbreak of African Swine Fever in Vietnam. The United States will continue to discuss this issue with Vietnam.

GOVERNMENT PROCUREMENT

Vietnam's 2013 Law on Procurement provides the basic framework for government procurement and generally promotes the purchase of domestic goods or services in government procurement when they are available. U.S. exporters do not receive any guaranteed access to the Vietnamese Government procurement market.

Vietnam is not a Party to the WTO Agreement on Government Procurement, but has been an observer to the WTO Committee on Government Procurement since December 2012.

INTELLECTUAL PROPERTY PROTECTION

Vietnam remained on the Watch List in the 2023 Special 301 Report. Despite positive developments, such as reported improvements on border enforcement in some parts of the country and the amended Law on Intellectual Property, which took effect in January 2023, the United States remains concerned about intellectual property (IP) protection and enforcement in Vietnam, including in the digital environment.

Capacity and resource constraints, corruption, and poor coordination among enforcement agencies continue to pose challenges to effective IP enforcement. Piracy and sales of counterfeit goods online and in physical markets continue to be a concern. Two physical markets in Vietnam—Saigon Square Shopping Mall in Ho Chi Minh City, and Tan Thanh Market and the sub-market Viet Trung Trade Center, both in Lang Son Province—are included in the [2023 Review of Notorious Markets for Counterfeiting and Piracy \(Notorious Markets List\)](#). There are almost no criminal investigations or prosecutions, even though Vietnam has criminal laws imposing substantial fines and years of incarceration for copyright and trademark infringement. Vietnam continues to rely heavily on administrative actions and penalties to enforce IP, but these have failed to deter counterfeiting and piracy. In addition, the United States has concerns about the lack of clarity in Vietnam's system for protecting against the unfair commercial use and unauthorized disclosure of undisclosed test or other data generated to obtain marketing approval for pharmaceutical products.

The United States continues to discuss these issues with Vietnam. The United States also continues to monitor the implementation of IP provisions pursuant to Vietnam's commitments under trade agreements with third parties.

SERVICES BARRIERS

Audiovisual Services

Decree 71/2022 (Decree 71), amending Decree 06/2016 on the Management, Provision and Use of Radio and Television Services, was enacted on October 1, 2022. Decree 71 expands the scope of regulation of Decree 06 from traditional broadcasting services to Internet-enabled subscription video services. Decree 71 imposes new licensing requirements, with forced local presence or forced joint venture, on online, over-the-top (OTT) radio and television services, the definition of which includes films. The Authority of Broadcasting and Electronic Information (ABEI) has requested certain U.S. platforms, in the absence of a local office or a submitted licensing plan, to leave the market. The Law on Cinema and its implementing decree allow foreign OTT suppliers to offer films without having to obtain a license or establish locally. However, under pressure from the ABEI, the Ministry of Culture, Sports, and Tourism is developing a system to classify online content with a specific focus on “sensitive categories” that would require operating licenses.

Financial Services

Foreign investors may establish 100 percent foreign-owned bank subsidiaries and may take ownership interests in domestic “joint stock” banks (*i.e.*, commercial banks with any percentage of private ownership) or “joint venture” banks (*i.e.*, banks set up by joint venture agreement, typically between domestic and foreign partners). Total equity held by foreign institutional and individual investors in domestic joint stock banks is limited to 30 percent, while total equity held by a foreign strategic investor (defined as a foreign credit institution meeting certain criteria related to capacity to help develop the Vietnamese banking partner) is limited to 20 percent. Foreign equity in joint venture banks is limited to 50 percent. Over the last two years, foreign banks have raised concerns about provisions in the Law on Credit Institutions, which limits the lending of foreign bank branches in Vietnam based on their local charter capital, rather than the global capital of the parent bank. The State Bank of Vietnam has also proposed amendments that would lower the limits for ownership by individual and institutional shareholders in banks.

Electronic Payment Services

In 2016, two Vietnamese payment processing networks were consolidated into a *de facto* monopoly, the National Payments Corporation of Vietnam (NAPAS), which is partially owned by the State Bank of Vietnam. Since January 2021, Circular 28 requires that domestic retail electronic payment transactions be processed through NAPAS when a payment card, including an internationally-branded payment card, is presented at the merchant point of sale. This requirement does not apply to online transactions.

Telecommunications Services

Vietnam permits foreign participation in the telecommunications sector, with varying equity limitations depending on the sub-sector. According to the Law on Telecommunications (Telecom Law) 41/2009/QH12, for domestic companies that provide basic telecommunication services with infrastructure, foreign ownership is generally capped at 49 percent; for companies that supply telecommunications services without infrastructure, foreign ownership is capped at 65 percent. Vietnam allows foreign ownership of up to 70 percent for virtual private network (VPN) services suppliers. Facilities-based operators are required to be state-controlled firms, meaning that the state, through the relevant line ministry, must hold 51 percent or more of equity. The revised Telecom Law was passed by Vietnam’s National Assembly on November 24, 2023. The final draft submitted to the National Assembly’s approval session seems to address some

U.S. concerns but may still raise uncertainty around the scope of the law. The United States will continue to monitor the issue.

BARRIERS TO DIGITAL TRADE

Law on Cybersecurity

Vietnam's Law on Cybersecurity (No. 24/2018/QH14) took effect in June 2018, and Decree 53/2022/ND-CP on Implementing the Law on Cybersecurity (Cybersecurity Decree) became effective on October 1, 2022. This law and regulation create uncertainty around the scope of specific requirements for businesses as they apply broadly to domestic and foreign enterprises that provide services on telecommunications networks or the Internet, or that provide other value-added services in cyberspace in Vietnam. The Cybersecurity Law requires foreign service suppliers to establish a branch or representative office in Vietnam. The Ministry of Public Security is also drafting a Decree on Administrative Penalties for Violations of Cybersecurity Laws that will impose fines and administrative penalties (including "technical measures," such as bandwidth limits and blocking of sites) for violations of regulations concerning cybersecurity, personal data protection, information security, and network protection. Stakeholders have expressed concern with a lack of certainty with respect to compliance with Vietnamese laws and regulations. The latest draft of this decree was shared with stakeholders in May with a deadline for public comment by June 20, 2023.

Internet Services

Internet-Based Content Services

Vietnam continues to allow access to the Internet only through a limited number of Internet service providers, all of which are state-controlled companies to some extent. Vietnam restricts or blocks access to certain websites that it deems politically or culturally inappropriate. Decree 72/2013/ND-CP (Decree 72) on the management, provision, and use of Internet services and online information prohibits the use of Internet services to, among other things, oppose the government. In March 2018, Vietnam issued Decree 27/2018/ND-CP (Decree 27) to amend and supplement Decree 72. Decree 27 consolidates existing content, server localization, and data retention requirements for social networks and information websites.

In July 2023, the Authority of Broadcasting and Electronic Information, at the Ministry of Information and Communications (MIC), released a draft measure to replace Decree 72 (and Decree 27) that would impose problematic requirements on a wide range of suppliers of Internet services and content providers. The draft decree contains content censorship measures and data localization requirements that are likely to overlap with the Cybersecurity Decree and the Personal Data Privacy Decree. It also contains a burdensome registration and licensing regime for the electronic gaming and social media industries and would broaden the scope of regulation to include data center and cloud services.

Personal Data Protection Regulation

Vietnam's Personal Data Protection Decree (Decree 13/2023/ND-CP) was promulgated on April 17, 2023 and went into effect on July 1, 2023. This measure does not provide clear scope of which industries or businesses will be subject to it. Personal data controllers must maintain a log or diary of the cross-border data transfer processes.

Electronic Transactions

Vietnam's Law on Electronic Transactions was passed by the National Assembly on June 22, 2023, as Law No. 20/2023/QH15. The language of the law remains ambiguous concerning compliance obligations for "digital platforms" and registration requirements for cross-border electronic signature and electronic transaction services providers. The MIC is in the process of drafting decrees and circulars to implement the law.

INVESTMENT BARRIERS

Vietnam maintains statutory restrictions on foreign ownership in certain enumerated sectors, such as joint partnerships and projects in banking, network infrastructure services, non-infrastructure telecommunications services, transportation, and energy. Decree 31/2021/ND-CP, promulgated in 2021, lists 25 business sectors in which foreigners are prohibited from investing. It also lists 59 other business sectors subject to market access conditions, which includes: banks and non-bank credit institutions; aviation; land and sea transportation; film production and distribution; and, logistics. The market access conditions may include: foreign ownership caps; joint venture and local partnership requirements; and, other conditions on investments involving foreign investors imposed by the relevant ministry. Certain foreign investments also require the Prime Minister's approval, including: projects involving airports and certain seaports; casinos; oil and gas exploration, production, and refining; telecommunications and network infrastructure; forestry; publishing; and other projects requiring approval from more than one Vietnamese province.

ENVIRONMENT

In October 2020, the U.S. Trade Representative initiated a Section 301 investigation into Vietnam's acts, policies, and practices related to the import and use of illegal timber, and in particular, to examine reports that Vietnam's wood processing industry relies upon imported timber that may have been illegally harvested or traded. On October 1, 2021, the United States and Vietnam signed an agreement (Timber Agreement) that addresses U.S. concerns in the investigation. The agreement secures commitments that will help keep illegally harvested or traded timber out of the supply chain, and protect the environment and natural resources.

The United States held working group meetings with Vietnam in 2022 and 2023 and will continue to monitor Vietnam's implementation of its commitments under the Timber Agreement.

OTHER BARRIERS

U.S. stakeholders continue to have concerns about the lack of transparency and accountability in the Government of Vietnam's regulatory process due to different line ministries' overlapping mandates and other governance issues in Vietnam. The United States will continue to work with Vietnam to support reform efforts and to promote greater transparency.

Export Taxes

Vietnam imposes export taxes (ranging from 5 percent to 40 percent) on goods indicated in Decree 125/2017/ND-CP, which are primarily goods produced from minerals and natural resources in which the cost of energy, minerals, and natural resources is more than 51 percent of the value of the product. These goods include: plants and botanical parts; ore; coal; crude oil; chemicals; skins; wood; charcoal; gems; silver and gold; jewelry; and, metals and metal products. Decree 57/2020/ND-CP, revising and

supplementing Decree 125, increased export tax rates for copper tubes and pipes (Harmonized System heading 7411) from zero percent to five percent.

APPENDIX I

APPENDIX I

Report on Progress in Reducing Trade-Related Barriers to the Export of Greenhouse Gas Intensity Reducing Technologies

This Appendix provides an update on progress the Administration has made in reducing trade-related barriers to the export of greenhouse gas intensity reducing technologies (GHGIRTs), as called for by the Energy Policy Act of 2005. In October 2006, pursuant to section 1611 of the Act,¹ the Office of the United States Trade Representative (USTR) prepared a report that identified trade barriers that U.S. exporters of GHGIRTs face in the top 25 greenhouse gas (GHG) emitting developing countries and described the steps the United States is taking to reduce these and other barriers to trade. The Act also calls for USTR to report annually on progress made with respect to removing the barriers identified in the initial report. USTR submitted the first [annual progress report](#) in October 2007. USTR will continue to submit further annual progress reports as part of the NTE Report.

As described in the initial 2006 GHGIRT report,² barriers to the exports of GHGIRTs are generally similar to those identified in the NTE Report with respect to other exports to the 25 developing countries, for example: lack of regulatory transparency and sound legal infrastructure; state-controlled oil and energy sectors, that are often slower to invest in new technologies; cumbersome and unpredictable customs procedures; corruption; import licensing schemes; investment restrictions, including requirements to partner with domestic firms; lack of adequate and effective intellectual property rights protections; and, in some countries, high applied tariff rates. Progress in removing such barriers is noted in the appropriate country chapters of this NTE Report. USTR's Special 301 Report, pursuant to section 182 of the Trade Act of 1974, identifies those countries that deny adequate and effective protection for intellectual property rights or deny fair and equitable market access for persons that rely on intellectual property protection. The [2023 Special 301 Report](#) was published in April 2023.

The global market in environmental goods and services, including GHGIRTs, is estimated to be over \$1.1 trillion annually, and the United States exported \$275 billion of environmental goods in 2023.³

¹ Section 1611 of the Act amends the Global Environmental Protection Assistance Act of 1989 (Public Law 101-240) to add new Sections 731-39. Section 732(a)(2)(A) directs the Department of State to identify the top 25 GHG emitting developing countries for the purpose of promoting climate change technology. Section 734 calls on the United States Trade Representative “(as appropriate and consistent with applicable bilateral, regional, and mutual trade agreements) [to] (1) identify trade-relations barriers maintained by foreign countries to the export of greenhouse gas intensity reducing technologies and practices from the United States to the developing countries identified in the report submitted under section 732(a)(2)(A); and (2) negotiate with foreign countries for the removal of those barriers.”

² The Department of State's 2006 “Report to Congress on Developing Country Emissions of Greenhouse Gases and Climate Change Technology Deployment” identified the following 25 countries: Algeria; Argentina; Azerbaijan; Bangladesh; Brazil; Chile; China; Colombia; Egypt; India; Indonesia; Iraq; Kazakhstan; Libya; Malaysia; Mexico; Nigeria; Pakistan; Philippines; South Africa; Thailand; Turkmenistan; Uzbekistan; Venezuela; and Vietnam.

³ Based on 2023 U.S. Bureau of Census data and includes U.S. exports and re-exports. Re-exports are defined as exports of foreign goods without significant modification.

APPENDIX II

UNITED STATES TRADE REPRESENTATIVE

EXECUTIVE OFFICE OF THE PRESIDENT

WASHINGTON, D.C. 20508

USTR.GOV

PRONÓSTICOS DE LAS IMPORTACIONES PROVENIENTES DE CHINA, TAIWÁN Y SINGAPUR, Y EL CONSOLIDADO DEL RESTOS DEL MUNDO¹

Julián David Rosero Navarrete²

Consultor y Analista Cuantitativo

1. INTRODUCCIÓN

Actualmente, existe la necesidad de nuevamente solicitar las medidas antidumping para la importación de vajillas de loza y porcelana provenientes de China (subpartidas arancelarias No. 6912.00.00.00 y No. 6911.10.00.00). Esta medida ha sido implementada desde 2004, pero se ha solicitado e implementado nuevamente en 2017, lo que ha traído como consecuencia una contracción significativa en dichas importaciones: en porcelana, pasó de poco más de 3 millones de kilos trimestrales en 2005 a alrededor de 300 mil kilos en 2023; por su parte, en loza, de un promedio aproximado de 1.5 millones de kilos trimestrales entre 2012 y 2015, pasó a cerca de un millón de kilos en 2023.

Al observar este cambio en el volumen de importaciones, el interés de la industria de vajillas de loza y porcelana es la renovación de los derechos antidumping con el fin de contraer o al menos mantener el volumen que se ha observado en los últimos años. Para esto, resulta necesario mostrarle de manera objetiva y

rigurosa los efectos de las medidas antidumping a la autoridad correspondiente.

Por tanto, en el siguiente reporte se desarrolla un ejercicio prospectivo con el cual no sólo se haga el pronóstico teniendo en cuenta las actuales condiciones del mercado, sino en el que también se construya con técnicas estadísticas escenarios contrafactuales que simulen un universo sin medida para las importaciones proveniente de China, Taiwán y Singapur, y el agregado del resto del mundo. Esto con el fin de tener insumos para un análisis comparativo que evidencie el efecto que las medidas antidumping tuvieron sobre las importaciones de vajillas de loza y porcelana.

En consecuencia, el presente reporte está compuesto por 4 secciones, incluyendo esta introducción. En la segunda sección se reseña la metodología utilizada, tanto para los pronósticos como para los escenarios contrafactuales, y finaliza con algunos hechos estilizados. En la tercera sección se exponen los resultados de los modelos estimados, los estadísticos de prueba que se utilizaron para su validación estadística y los pronósticos obtenidos. Por último, el

¹ Ejercicio prospectivo realizado para contar con un referente cuantitativo del posible efecto de las medidas antidumping sobre las importaciones de vajillas, tanto de porcelana y loza, proveniente de China, Taiwán y Singapur, y el consolidado del resto del mundo. Este ejercicio es solicitado y realizado para la firma Araujo Ibarra Consultores Internacionales SAS.

² Economista y Magíster en Economía de la Universidad de Los Andes. Magíster en Econometría de la Universidad Torcuato Di Tella. Consultor independiente en análisis cuantitativo y econometría aplicada.

documento finaliza con las respectivas conclusiones del ejercicio.

2. METODOLOGÍA

En primer lugar, se puede concordar que las series de importaciones de vajillas de loza y de porcelana provenientes de China, Taiwán-Singapur y el agregado del resto del mundo (y_t), son susceptibles de seguir procesos autorregresivos o de media móvil, haciendo posible identificar y estimar las series con modelos univariados de series de tiempo. Por tanto, dichas series pueden seguir la siguiente forma funcional:

$$y_t = \alpha_0 + \alpha_1 t + \Phi'Y + \Theta'E + \xi_t$$

En donde α_0 es una constante o intercepto (condiciones iniciales), $\alpha_1 t$ es un componente asociado a la tendencia, $\Phi'Y$ son los componentes autorregresivos con su respectivo vector de coeficientes asociados a cada rezago, $\Theta'E$ son los componentes de media móvil asociados a su vector de coeficientes y ξ_t es una perturbación estocástica.

Para determinar si la serie tiene componentes autorregresivos, de media móvil y la forma funcional para la estimación, se utiliza la metodología Box y Jenkins (1970), la cual ofrece una ruta que permite la identificación, estimación, validación y obtención de pronósticos utilizando modelos de series de tiempo univariadas.

El procedimiento se desarrolla bajo las siguientes fases (Box y Jenkins, 1970; Hamilton, 1994; Rosales *et al.*, 2008):

1. *La transformación e identificación del proceso:* se debe constatar que el volumen de las importaciones siguen un proceso $I(0)$ o estacionario. Si no es así, se deben transformar, ya sea con logaritmos o diferencias entre sus rezagos. De otra parte, se debe observar qué procesos explican las series: autorregresivos, de media móvil o una combinación de los dos. También se debe identificar si resulta necesario controlar los efectos asociados a la estacionalidad, datos atípicos, cambios estructurales, etc.
2. *La estimación del modelo:* se suele utilizar la técnica de Mínimos Cuadrados Ordinarios para estimar los coeficientes asociados a los procesos que sigue las series (vector Φ y/o vector Θ , sea el caso). También se pueden usar técnica de máxima verosimilitud.
3. *La validación estadística:* se debe constatar si los coeficientes estimados de los modelos son significativos, individual y globalmente, junto con estabilidad en aquellos asociados a los procesos autorregresivos. Esto es que los coeficientes asociados a este proceso (si los tienen) sigan $|\phi_1 + \phi_2 + \dots + \phi_m| < 1$ y los asociados al SARIMA (si los tienen) también sean también inferiores a la unidad. De la misma manera, se debe tener evidencia estadística que la perturbación estocástica del modelo sigue un proceso ruido blanco y que tiene una periodicidad estable. Esto se hace con una serie de pruebas estadísticas que se describirán más adelante.

Una vez obtenido las formas funcionales, sus estimaciones y haber realizado el proceso de validación estadística, se procede a obtener las predicciones y pronósticos. En este caso se emplean técnicas dinámicas para la obtención de

estos resultados a partir del último dato registrado, ya que se requieren pronósticos para la ventana 2024 – 2026.

Adicional a esto, en el ejercicio se estiman varios modelos para cada serie los cuales se comparan según la bondad de ajuste y la precisión de sus predicciones. Para determinar el modelo de mayor precisión y ajuste, se utilizan los criterios de información Akaike y Schwarz, seleccionando aquel que presente menor magnitud en estas medidas.

2.1. ESCENARIO CONTRAFACTUAL

Como se explicó en la sección anterior, la idea de establecer escenarios contrafactuales para las importaciones de China, Taiwán y Singapur y el agregado del resto del mundo es contar con un referente para el análisis comparativo con el cual se pueda observar el efecto de las medidas antidumping implementadas. Como actualmente no existen datos observados de estas importaciones que ofrezcan información sobre la dinámica y tendencia previa a la implementación de dichas medidas, se requiere de una simulación utilizando métodos estadísticos para mantener el rigor técnico del ejercicio.

Para establecer la ventana de análisis que necesita la construcción de estas simulaciones, se utilizan como valores observados aquellos que se asimilen o que teóricamente tengan una dinámica parecida a lo que se observaba previo a la implementación de las medidas antidumping. Una vez establecido un periodo con estas características, se estima el respectivo modelo y se hace el pronóstico a partir de ahí, para así simular la existencia de un universo en donde no se han implementado tales medidas.

Estos pronósticos también se estiman utilizando la metodología Box y Jenkins (1970), pero concordando que la ventana de pronóstico no es de 2024 a 2026 como con las series observadas, sino desde el periodo que discrecionalmente se haya acordado. En el Anexo No. 1 y en la subsección 3.1 del presente documento se exponen los periodos elegidos.

2.2. DATOS

Para realizar el ejercicio se utilizaron las series de volumen de importación en kilos correspondiente a las subpartidas arancelarias No. 6912.00.00.00 y No. 6911.10.00.00, provenientes de China, Taiwán y Singapur, y el agregado del resto del mundo.

En el caso de las importaciones de vajillas de porcelana provenientes de China, Taiwán y Singapur, y el agregado del resto del mundo, se utilizaron datos trimestrales para poder capturar la dinámica natural de la serie, contar con un acervo de datos suficientes para estimar un modelo con estimadores robustos y además, controlar la estacionalidad, eliminar la censura de datos y mitigar la varianza que se presenta en la información de frecuencia mensual.

En la Gráfica No. 1 se observa las tres series de importaciones de porcelana, desde 2005 hasta el segundo trimestre de 2024, siendo esta la ventana temporal general para hacer las estimaciones. En la gráfica se puede apreciar cómo las importaciones provenientes de China se contraen sustancialmente desde 2005, pasando de más de 3 millones de kilos trimestrales, a alrededor de 300.000 18 años después. También se presenta una dinámica particular en las importaciones de Taiwán y Singapur entre 2014 y finalizando 2022, en donde conforme cae las

importaciones provenientes de China, las de estos dos países incrementan.

Gráfica No. 1

*Importaciones Trimestrales Vajillas Porcelana
(Volumen: kilos netos)*

Fuente: Datos DIAN.

De otra parte, en la Gráfica No. 2a se expone la serie de importaciones de vajillas de loza proveniente de dos de los tres orígenes aquí estudiados: China y el agregado de Taiwán y Singapur. En primer lugar, es necesario comentar que la frecuencia usada para estas series fue trimestral, ya que en la serie mensual se presentaba censura en los datos, una extrema volatilidad y la presencia de valores atípicos asunto que dificultaría las estimaciones por mínimos cuadrados ordinarios.

A diferencia de lo que se observa para las importaciones de porcelana, se presentó un incremento en las importaciones de China iniciando la década pasada que perduró hasta 2019. De ahí en adelante, el nivel de importaciones y su dinámica se contrae. De otra parte, se observa que las importaciones provenientes de Taiwán y Singapur aumentan considerablemente a partir de la contracción de

las que provienen de China. No obstante, estas caen estrepitosamente a lo largo de 2021, situándose en niveles inferiores a 2019.

Gráfica No. 2a

*Importaciones Trimestrales Vajillas Loza
China y Taiwán y Singapur
(Volumen: kilos netos)*

Fuente: Datos DIAN.

Con respecto a las importaciones de loza del agregado del resto del mundo, se decidió utilizar las series en frecuencia mensual, ya que no sólo no presentaba censura en los datos, sino que se buscó contar con la mayor cantidad de información posible para captar con precisión su dinámica. Así pues, la Gráfica No. 2b muestra las importaciones de este último origen. Se observa que, a mediados de la década pasada, las importaciones mensuales moderaron su tendencia y dinámica, disminuyendo considerablemente su magnitud. Sin embargo, finalizando 2020, el nivel de importaciones aumenta considerablemente, para volver a caer durante 2023.

3. RESULTADOS

Ahora bien, una vez reseñado la metodología y descrito los datos que se van a utilizar en el ejercicio, se procede a mostrar las estimaciones y pronósticos. Siguiendo la ruta aquí planteada resulta necesario mostrar, en primer lugar, tanto el proceso como los resultados de la identificación, lo cual establece cuáles son las formas funcionales y los componentes que tienen las series de importaciones una vez realizadas las estimaciones.

En segundo lugar, en esta sección se presenta los modelos estimados y su validación: la magnitud y dirección de los coeficientes, si hay estabilidad en los componentes autorregresivos, y si la perturbación estocástica es ruido blanco, se distribuye como una normal, etc. Por último, se presenta los pronósticos y el estado contrafactual para observar si se presenta una diferencia evidente entre un escenario simulado sin medida en comparación a lo observado.

3.1. IDENTIFICACIÓN

Para comenzar, se debe contar con series de tiempo estacionarias, es decir, que se distribuyan como una $I(0)$, con media y varianza constante, aspectos que requieren los modelos univariados para ser estimados (Montenegro, 2001; Hamilton, 1994; entre otros). Así pues, se utiliza la prueba de Dickey-Fuller, cuya hipótesis nula es que la serie se distribuye como una $I(1)$, integrada y no estacionaria.

En la Tabla No. 1, se presenta evidencia estadística para determinar que las series utilizadas en la estimación del ejercicio son estacionarias, ya que en todos los casos se rechaza la hipótesis nula de raíz unitaria $I(1)$ al 1% de significancia.

Tabla No. 1

Test Dickey-Fuller - Series Observadas

Ho: La serie es integrada de orden 1				
Series Porcelana	Transformación	Dickey-Fuller	Dickey-Fuller Aumentado	
			Con Tendencia	Rezagos (*)

(*) Último Rezago incluido en donde se rechaza la hipótesis nula (así sea al 10%)

Fuente: Datos DIAN. Cálculos propios.

De otra parte, con respecto a los escenarios contrafactuales, en la Tabla No. 2 se exponen los resultados de la prueba de *Dickey – Fuller* para evaluar la hipótesis nula de raíz unitaria en las ventanas temporales que se utilizaron para simular los escenarios contrafactuales. Como se explicó en la sección de metodología, los escenarios contrafactuales se construyen a partir de segmentos de la serie cuya dinámica y tendencia se asemeja teóricamente a un mundo sin medidas antidumping. Por tanto, resulta

necesario utilizar series estacionarias y por ello, se debe evaluar si se rechaza la hipótesis nula de raíz unitaria. Como se observa en la tabla, en 5 de los 6 casos se rechaza dicha hipótesis nula, contando así con series estacionarias para los contrafactuales.

Tabla No. 2
Test Dickey-Fuller - Contrafactuales

Ho: La serie es integrada de orden 1

Fuente: Datos DIAN. Cálculos propios.

Ahora bien, otro momento de la identificación es determinar si las series cuentan con procesos autorregresivos y/o de media móvil para estimar los modelos. Para esto, se estiman las funciones de autocorrelación y autocorrelación parcial, tanto para las series observadas como para los segmentos de serie utilizados para simular los escenarios contrafactuales (ver Anexo No. 1).

Por tanto, después de observar estos resultados y utilizando los criterios de información para identificar cuáles modelos tienen mejor ajuste, se obtuvieron las siguientes formas funcionales para los modelos estimados con series observadas:

Tabla No. 3
Formas Funcionales de las Series Observadas

IMPORTACIONES PORCELANA	
China	
$Y_t = \varphi_1 Y_{t-1} + \varphi_2 Y_{t-2} + \varphi_3 Y_{t-3} + \varepsilon_t + \theta_2 \varepsilon_{t-2}$	
Taiwán y Singapur	
$(1 - \varphi_1 L - \varphi_2 L^2)(1 - \Phi_1 L^4 - \Phi_2 L^{2(4)})Y_t = (1 + \theta_1 L)\varepsilon_t$	
Resto de Países	
$Y_t = \alpha_0 + \varphi_1 Y_{t-1} + \varphi_3 Y_{t-3} + \varepsilon_t$	
IMPORTACIONES LOZA	
China	
$Y_t = \alpha_0 + \varphi_1 Y_{t-1} + \varphi_3 Y_{t-3} + \varphi_3 Y_{t-4} + \varepsilon_t$	
Taiwán y Singapur	
$(1 - \varphi_2 L^2 - \varphi_3 L^3)(1 + \Theta_1 L^4)Y_t - A'C = \varepsilon_t$	
Resto de Países	
$(1 - \varphi_1 L)(1 - \Phi_1 L^4)Y_t - A'C - \delta D_t = (1 + \theta_1 L)\varepsilon_t$	

Fuente: Elaboración propia

Como se comentó, en casi todos los casos se utilizaron series trimestrales que abordan la ventana temporal completa: del primer trimestre de 2005 al segundo trimestre de 2024. En el único modelo que no se usó información trimestral, fue el de la serie de importaciones de vajillas de loza provenientes del resto del mundo. En ese caso, se usaron series mensuales.

Comenzando por las **vajillas de porcelana**, la serie de importaciones de **China** se transformó en primeras diferencias y se estimó un modelo **ARIMA (3,1,2)**, con tres componentes autorregresivos y uno de media móvil. Por su parte, en el caso de **Taiwán y Singapur**, por la presencia de eventos estacionales a lo largo de la serie, se decidió incluirle al modelo univariado un componente que controle tal estacionalidad y

también se le hizo una transformación utilizando primeras diferencias. A los dos componentes autorregresivos y al de media móvil se le agregó un efecto estacional en los componentes autorregresivos, de la forma **SARIMA (2,1,1) (2,0,0)₄**.

Por último, la forma funcional estimada para las que provienen del agregado del **resto del mundo** fue una relativamente parsimoniosa, en la que se contemplan **dos componentes autorregresivos, de orden 1 y de orden 3**. La transformación que se aplicó en la serie fue con logaritmo natural para controlar la variabilidad en la serie.

En cuanto a las importaciones de vajillas de loza, la serie de **China** se transformó con logaritmo natural y se utilizó una forma funcional relativamente parsimoniosa con tres componentes autorregresivos **AR (1,3,4)** y su respectiva constante. Frente a la serie de importaciones provenientes de **Taiwán y Singapur**, se transformó con primeras diferencias, se estimó un modelo autorregresivo con dos rezagos de orden 2 y 3, y se incluyó un efecto estacional en el componente autorregresivo de orden 1, de la forma **SARIMA (2/3,1,0)(1,0,0)₄**. Adicionalmente, se incluyeron **tres controles** para mitigar el efecto de datos atípicos presentes en la serie.

Para culminar, en el caso de las importaciones de vajillas mensuales de loza del agregado del **resto del mundo**, se transformó la serie utilizando logaritmo natural y se construyó un modelo con varios componentes: en primer lugar, se incluyeron procesos autorregresivos y de media móvil de orden 1, junto con efecto estacional en el proceso autorregresivo, de la forma **SARIMA (1,0,1) (1,0,0)₁₂**. En segundo

lugar, se le incluyó una **dicotómica de cambio estructural** en la cual se buscó controlar el efecto del periodo de pandemia, acontecido a partir de marzo de 2020. Como se observa en la Gráfica No. 1, la Gráfica No. 2a y la Gráfica No. 2b, solo en la serie de importaciones de loza proveniente del agregado del resto del mundo se observa ese cambio justo en el periodo de pandemia. También se incluyó un **vector de controles** con los cuales se mitigó el efecto de valores atípicos en la serie.

Utilizando los resultados de las funciones de autocorrelación parcial y autocorrelación del Anexo No. 1, se hizo el mismo ejercicio para identificar las formas funcionales para estimar los escenarios contrafactuales. Los resultados de este proceso de identificación se encuentran en la siguiente tabla:

Tabla No. 4
Formas Funcionales de las Simulaciones

CONTRAFACTUALES PORCELANA	
China	
$(1 - \varphi_3 L^3)Y_t = (1 + \theta_3 L^3)(1 + \Phi_1 L^4)\varepsilon_t$	
Taiwán y Singapur	
$Y_t = \varphi_4 Y_{t-4} + \varepsilon_t$	
Resto de Países	
$(1 - \varphi_1 L)(1 - \Phi_1 L^4)Y_t = (1 + \theta_1 L)\varepsilon_t$	
CONTRAFACTUALES LOZA	
China	
$(1 - \varphi_1 L)Y_t = (1 + \Theta_1 L^4)\varepsilon_t$	
Taiwán y Singapur	
$Y_t = \varphi_1 Y_{t-1} + \varphi_3 Y_{t-3} + \varepsilon_t + \theta_2 \varepsilon_{t-2}$	
Resto de Países	
$Y_t = \alpha_0 + \varphi_2 Y_{t-2} + \varphi_3 Y_{t-3} + \varepsilon_t + \theta_1 \varepsilon_{t-1}$	

Fuente: Elaboración propia

Es importante tener en cuenta que, para los escenarios contrafactuales, las formas funcionales se construyeron utilizando un segmento de la serie de importaciones el cual se observó un comportamiento semejante al que teóricamente debería corresponder al de un universo sin medidas antidumping.

Por ejemplo, para el escenario contrafactual de **porcelana para China**, se tomó el segmento temporal **2005T1 – 2019T2**, cuyo supuesto recaía en que las importaciones son sustancialmente superiores al mundo con medida. En este caso se contempló un proceso autorregresivo de orden 3 y una media móvil de también orden 3, controlando el efecto estacional en las medias móviles, de la forma **SARIMA (3,0,3)(0,0,1)₄**. La serie no tuvo ninguna transformación y se utilizó en niveles ya que, como se observa en la Tabla No. 2, se obtuvo evidencia estadística de su estacionariedad.

Con respecto al contrafactual de las importaciones de **porcelana provenientes de Taiwán y Singapur**, se utilizó el segmento temporal **2013T1 – 2022T4**, ya que presenta las mayores magnitudes de la serie pero en una tendencia constante, lo cual daría el espacio para que las importaciones de china crecieran sin medidas antidumping. El modelo utilizado fue relativamente parsimonioso compuesto por **un proceso autorregresivo de orden 4**. No se hace ninguna transformación a la serie y en el segmento utilizado, la Tabla No. 2 expone evidencia estadística de su estacionariedad.

Con respecto al contrafactual para las importaciones de **porcelana provenientes del resto de países**, se utilizó el segmento **2013T1 – 2019T4** con el cual se busca proyectar unas importaciones con una magnitud moderada,

constantes y sin mayor variabilidad. La forma funcional identificada para este segmento fue un proceso autorregresivo con media móvil de orden 1, controlando el efecto estacional en el proceso autorregresivo, de la forma **SARIMA (1,0,1)(1,0,0)₄**. No se le hizo transformación a la serie, ya que en este segmento hubo evidencia estadística de su estacionariedad.

Pasando a las formas funcionales que simularon los **contrafactuales de loza**, para el caso de **China** se utilizó el segmento **2013T1 – 2019T1** en el cual se observa las mayores magnitudes de la serie con una tendencia creciente. Esto arrojaría unos pronósticos en la misma línea simulando un escenario sin medida que no contendría a las importaciones chinas. La forma funcional identificada es un proceso autorregresivo de orden 1 controlando el efecto estacional en media móvil de orden 1, de la forma **SARIMA (1,0,0)(0,0,1)₄**. Tampoco se emplearon transformaciones y en la Tabla No. 2 se observa evidencia que la serie en niveles es estacionaria.

En cuanto a la simulación del escenario contractual de las importaciones provenientes de **Taiwán y Singapur**, se utilizó el segmento **2015T1 – 2019T1**, en donde se observa una magnitud sustancialmente inferior que el final de la serie, cuyo pronóstico fuera decreciente y que diera pie al incremento sustancial de las importaciones chinas en un universo sin medidas antidumping. La forma funcional identificada fueron dos procesos autorregresivos de orden 1 y orden 3, y un proceso de media móvil de orden 2 de la forma **ARMA (3,2)**. No se aplicó ninguna transformación a la serie y de su forma en niveles, no se obtuvo evidencia estadística de su estacionariedad. No obstante, al solo tratarse de un escenario simulado, se decidió relajar la

condición de estacionalidad en la serie para darle prelación a un pronóstico que recreara el universo sin medida bajo el supuesto planteado con el fin de observar el incremento de las importaciones chinas.

Para culminar, se encuentra la simulación del escenario contrafactual, pero para las importaciones de vajillas de loza provenientes del **resto del mundo**. En este caso se utilizaron series mensuales de **toda la ventana temporal** y se hizo una transformación a logaritmos naturales, asunto que ofreció evidencia estadística de su estacionariedad. El supuesto es mantener una senda natural de leve crecimiento que acompañe el incremento de las importaciones chinas. La forma funcional identificada fue relativamente parsimoniosa, con dos procesos autorregresivos de orden 2 y 3, y un proceso de media móvil de orden 1, de la forma **ARMA (3,1)**.

3.2. MODELOS Y VALIDACIÓN

Una vez identificadas las formas funcionales para los procesos generadores de datos, se procedió a hacer las estimaciones.

Adicionalmente, se observaron los resultados en materia de significancia individual y global, estabilidad y se aplicaron las pruebas necesarias para la validación de los modelos, tanto para las series observadas, como para los que simularon los escenarios contrafactuales.

3.2.1. MODELOS PARA LAS SERIES DE IMPORTACIONES OBSERVADAS

Los resultados de los modelos para las series de importaciones observadas de vajillas de porcelana, con los que se estiman los pronósticos 2024 – 2026, se encuentran en la siguiente tabla:

Tabla No. 5
Estimaciones Modelos Series Observadas
Vajillas de Porcelana

(***) Significativo al 1%; (**) Significativo al 5%; (*) Significativo al 10%
Nota: Para todos los Tests el número asociado es el p-valor

Fuente: Datos DIAN. Cálculos Propios

Comenzando para el modelo de la serie de importaciones proveniente de **China**, se puede observar que los coeficientes asociados a los cuatro procesos del modelo son significativos. Se observa que el modelo presenta inestabilidad, ya que $|\phi_1 + \phi_2 + \phi_3|$ supera la unidad. Esto hace que los pronósticos necesariamente tiendan a contraerse fuertemente dado la dirección que presentan los signos de los coeficientes. Frente a la significancia global, se observa que el modelo también significativo ya que su p-valor asociado es inferior a 0.05.

Con respecto a la perturbación estocástica, se observa que existe evidencia estadística para

determinar que es ruido blanco, ya que no se rechaza al 10% de significancia la hipótesis nula de ruido blanco en la prueba de Portmanteau (no autocorrelación de los errores, varianza y media constante). Lo mismo ocurre con la hipótesis nula de la prueba de Barlett la cual establece que la perturbación es ruido blanco, homocedasticidad, entre otras propiedades de un proceso de esta naturaleza. En el Anexo No. 2, se encuentra el periodograma en el que se ve que el proceso es estable conforme al aumento de frecuencias. Por último, se observa el contraste Jarque Bera, en donde la hipótesis nula de normalidad no se rechaza al 1% de significancia.

Por su lado, en el modelo de la serie de importaciones proveniente de **Taiwán y Singapur**, se puede observar que todos los procesos, incluyendo los que controlan los efectos estacionales, son significativos, tres de ellos al 1% y dos al 5%. En cuanto a la estabilidad del modelo, se observa que $|\phi_1 + \phi_2|$ es inferior a la unidad al igual que los coeficientes asociados a los procesos estacionales, por lo que se concluye que el modelo sigue el criterio de estabilidad. De otra parte, el modelo es significativo globalmente, toda vez que el p-valor asociado al Test de Wald es inferior a 0.05.

Continuando con la validación estadística del modelo, se observa que existe evidencia para determinar que la perturbación estocástica es ruido blanco, ya que no se rechaza esta hipótesis nula en la prueba de Portmanteau y la hipótesis nula de la prueba de Barlett. El periodograma del Anexo No. 2 para la serie observada, muestra que el proceso es estable ya que no se sale de las bandas de confianza y sigue una senda constante. Finalmente, se obtuvo evidencia estadística para no rechazar la hipótesis nula de normalidad al 1% de significancia.

Los procesos autorregresivos del modelo estimado para las importaciones del **resto de países** resultaron estables, ya que $|\phi_1 + \phi_3|$ es inferior a la unidad. Tanto la constante como los coeficientes asociados resultaron significativos estadísticamente, incluso al 1% de significancia. Con respecto a lo global, también se rechaza la hipótesis nula de no significancia al 1%.

Frente a la perturbación estocástica, se obtuvo evidencia estadística para no rechazar las hipótesis nulas de la prueba de Portmanteau y la prueba de Barlett, con lo que se puede concluir que la perturbación es ruido blanco: media y varianza constante, idénticamente distribuido, homocedástico y no autocorrelacionado. Lo mismo ocurre con la prueba de Jarque Bera, ya que tampoco se rechaza la hipótesis nula de normalidad. En los tres casos, las hipótesis nulas no se rechazan al 10% de significancia.

Para darle fin a esta primera tanda de modelos, al observar el periodograma para series observadas del Anexo No. 2, se puede constatar que el proceso es estable y se mantiene dentro de las bandas de confianza conforme aumentan las frecuencias. Algo importante de destacar es de los tres modelos presentados, este es el que menor magnitud presenta en los criterios de información, aduciendo con esto que es el que mejor ajuste y precisión tiene.

Pasando a las estimaciones de los modelos de importaciones de **vajillas de loza**, con los que se estiman los pronósticos 2024 – 2026, los resultados se encuentran en la siguiente tabla:

Tabla No. 6
Estimaciones Modelos Series Observadas
Vajillas de Loza

<i>Importaciones China</i>		<i>Importaciones Taiwán y Singapur</i>		<i>Importaciones Resto del Mundo</i>

(***) Significativo al 1%; (**) Significativo al 5%; (*) Significativo al 10%

Nota: Para todos los Tests el número asociado es el *p-valor*

Fuente: Datos DIAN. Cálculos Propios

En primer lugar, se puede apreciar que los coeficientes asociados a los tres procesos del modelo y la constante estimada para **China** son significativos y además estables, ya que $|\phi_1 + \phi_3 + \phi_4|$ es inferior a la unidad. En cuanto a la significancia global, se observa que el modelo es también significativo ya que su p-valor asociado es inferior a 0.05.

Con respecto a la perturbación estocástica, se observa que hay evidencia para concluir que es ruido blanco, ya que no se rechaza la hipótesis nula en la prueba de Portmanteau y la prueba de Barlett al 10% de significancia. Por su parte, examinando el Anexo No. 2, el periodograma para la serie observada ofrece evidencia que el proceso es estable conforme al aumento de frecuencias. Frente a la hipótesis nula de normalidad, el p-valor asociado al estadístico de prueba del contraste Jarque Bera es 0,34, lo cual es superior a 0.1, concluyendo que no hay evidencia estadística para rechazarla. Finalmente, es importante mirar la magnitud de los criterios de información, la cual es sustancialmente pequeña en comparación a los

otros modelos. Esto es evidencia que el modelo para China tiene buen ajuste y precisión.

Frente al modelo de las importaciones proveniente de **Taiwán y Singapur**, se puede observar que todos los procesos, incluyendo los que controlan los efectos estacionales, son significativos incluso al 1%. En cuanto a la estabilidad del modelo, se observa que $|\phi_2 + \phi_3|$ y el coeficiente asociado al efecto estacional es inferior a la unidad, argumentando con esto con el modelo es estable. Por su lado, el modelo es significativo globalmente, toda vez que el p-valor asociado al Test de Wald es inferior a 0.05.

De otra parte, existe evidencia para determinar que la perturbación estocástica es ruido blanco, ya que no se rechaza esta hipótesis nula en la prueba de Portmanteau y en la Prueba de Barlett. El periodograma del Anexo No. 2 para la serie observada, muestra que el proceso es estable ya que no se sale de las bandas de confianza. Para culminar, se obtuvo evidencia estadística para no rechazar la hipótesis nula de normalidad al 1% de significancia.

Para culminar con las estimaciones de los modelos con las series observadas, en el caso del modelo estimado para el agregado del **resto de países**, los coeficientes asociados a los componentes autorregresivos son inferiores a la unidad, aduciendo con esto que estos procesos son estables. De otra parte, la constante y los coeficientes asociados al componente autorregresivo y al control estacional de orden 1 resultaron significativos al 1%, al igual que la significancia global. No obstante, el control al efecto estacional de orden 2 resultó no significativo.

Frente a la validación estadística, se obtuvo evidencia que la perturbación es ruido blanco, ya que no se rechaza la hipótesis nula de la prueba de Portmanteau y de la prueba de Barlett al 10% de significancia. Examinando el periodograma para las series observadas del Anexo No. 2, se observa que con el aumento de frecuencias se conserva una tendencia estable que no sale de las bandas de confianza. Por último, la perturbación estocástica se distribuye como una normal ya que no se rechaza la hipótesis nula de normalidad al 5% de significancia.

3.2.2. ESCENARIOS CONTRAFACTUALES

Terminando con la revisión de las estimaciones de los modelos univariados realizados con las series observadas, resulta necesario inspeccionar los resultados de los modelos que simulan los escenarios contrafactuales, aquellos que arrojan pronósticos que recrean artificialmente un universo sin medidas antidumping. En la siguiente tabla se exponen los resultados para vajillas de porcelana:

Tabla No. 7
Estimaciones Escenarios Contrafactuales
Vajillas de Porcelana

Contrafactual China		Contrafactual Taiwán y Singapur		Contrafactual Resto del Mundo

(***) Significativo al 1%; (**) Significativo al 5%; (*) Significativo al 10%

Nota: Para todos los Tests el número asociado es el p-valor

Fuente: Datos DIAN. Cálculos Propios

Como se puede apreciar en la tabla anterior, los tres modelos son válidos estadísticamente, ya que en los tres casos no hay evidencia estadística para rechazar la hipótesis que la distribución es ruido blanco y para rechazar la hipótesis de normalidad. Frente a los periodogramas, en el Anexo No. 2 se observa que los realizados para los contrafactuales de **China** y el agregado del **resto de países** siguen una tendencia estable dentro de los intervalos de confianza.

No obstante, para el caso del modelo que simula el escenario contrafactual en las importaciones de vajillas de porcelana para **Taiwán y Singapur**, la hipótesis nula de la prueba de Barlett no se rechaza al 1%, lo cual es el poder estadístico más bajo en comparación a los otros modelos que no rechazan al 5%. De hecho, si se observa el periodograma para las series contrafactuales del Anexo No. 2, el correspondiente a las importaciones de estos orígenes es el único en el que se observa inestabilidad. No obstante, el modelo se utilizó porque lo que se busca es darle prelación a que su pronóstico simule una realidad con base en un supuesto teórico.

Observando especificidades por modelo, se puede apreciar que aquel que simula el escenario contrafactual para **China**, el coeficiente asociado al proceso autorregresivo AR (3) es inferior a la unidad, aduciendo con esto que este proceso presenta estabilidad. De otra parte, los coeficientes asociados a los tres procesos son significativos individualmente (dos al 1% y uno al 5%) y los coeficientes en su conjunto, son significativos globalmente al 1%.

Para el caso del modelo que simula el escenario contrafactual de las importaciones provenientes de **Taiwán y Singapur**, se puede

apreciar que el coeficiente asociado al proceso autorregresivo es inferior a la unidad, por lo que se concluye con esto sobre su estabilidad. También el modelo es significativo individual y globalmente al 1% de significancia.

Por último, el modelo estimado para las importaciones del **resto de países** se observa que los coeficientes asociados a dos de los tres procesos son estadísticamente significativos: el del proceso autorregresivo al 10% y el que controla el efecto estacional al 1%. Adicionalmente, estos dos coeficientes son inferiores a la unidad, por lo que se concluye que los procesos presentan estabilidad. Finalmente, los coeficientes en su conjunto son significativos globalmente al 1% de significancia.

Ahora bien, con respecto a los modelos que simulan escenarios contrafactuales para las importaciones de **vajillas de loza**, los resultados se presentan en la siguiente tabla:

Tabla No. 8
Estimaciones Escenarios Contrafactuales
Vajillas de Loza

<i>Contrafactual China</i>		<i>Contrafactual Taiwán y Singapur</i>		<i>Contrafactual Resto del Mundo</i>

(***) Significativo al 1%; (**) Significativo al 5%; (*) Significativo al 10%

Nota: Para todos los Tests el número asociado es el *p-valor*

Fuente: Datos DIAN. Cálculos Propios

Detallando la información anterior, los modelos de simulación contrafactual para **China** y el agregado del **resto de países**, son válidos estadísticamente, ya que en los tres casos no hay evidencia estadística para rechazar la hipótesis que la perturbación estocástica es ruido blanco y para rechazar la hipótesis de normalidad. En el caso de China, la hipótesis de normalidad no se rechaza al 10% de significancia, mientras que para el caso del agregado del resto de países no se rechaza al 1%, siendo esto un poder estadístico relativamente bajo, pero que alcanza a configurarse como evidencia para concluir sobre la normalidad en la perturbación estocástica. Examinando los periodogramas del Anexo No. 2 para las series de los modelos contrafactuales, en estos dos casos se presenta un proceso estable y dentro de los intervalos de confianza

En cuanto al modelo de la simulación contractual para las importaciones de **Taiwán y Singapur**, se observa que hay evidencia estadística para no rechazar la hipótesis nula que las perturbaciones estocásticas son ruido blanco. Adicionalmente, su respectivo periodograma muestra que el proceso tiene una tendencia estable y dentro de los intervalos de confianza. Sin embargo, se observa que se rechaza la hipótesis nula de normalidad. Ahora, como se trata de una simulación, se le dio prelación a que el pronóstico arrojado coincida con lo dinámica y tendencia que teóricamente debería tener la serie en un universo sin medida antidumping, razón por la cual se empleó este modelo para el ejercicio.

Entrando en detalle, se puede apreciar que en el modelo estimado para **China**, el coeficiente asociado al proceso autorregresivo de orden 1 es inferior a la unidad, por lo que se evidencia que el proceso presenta estabilidad. De otra parte, los

coeficientes son significativos al 1% en al AR y a 5% en el MA. También, los modelos son significativos globalmente.

Por su lado, en el modelo estimado para **Taiwán y Singapur**, también se observa que $|ϕ_1 + ϕ_3| < 1$, sugiriendo con esto que se presenta estabilidad en los procesos autorregresivos. Adicionalmente, tanto el coeficiente asociado al AR como el coeficiente asociado al MA son significativos estadísticamente al 1% y al 5%, respectivamente. El modelo también es globalmente significativo.

Para finalizar con la revisión de los resultados obtenidos tras las estimaciones, se puede apreciar que los coeficientes asociados a los procesos autorregresivos del modelo estimado para el agregado del **resto de países** también presentan estabilidad ya que $|ϕ_2 + ϕ_3| < 1$. Los cuatro coeficientes estimados (incluyendo la constante) son significativos estadísticamente al 1%, de la misma manera que la significancia estadística global del modelo.

3.3. PRONÓSTICOS DE LAS SERIES OBSERVADAS Y LOS ESCENARIOS CONTRAFACTUALES

Después de exponer con claridad la metodología, haber ofrecido una descripción suficiente de las formas funcionales identificadas para la estimación y haber examinado los resultados de las estimaciones, se procede a exponer los pronósticos obtenidos de cada uno de los modelos detallados en la Secciones 3.1. y estimados en la Sección 3.2. En este caso, el orden de exposición es: primero los pronósticos de las series observadas, las cuales muestran en prospectiva el estado actual de las importaciones con medidas antidumping y, luego, las

simulaciones de los escenarios contrafactuales para hacer el respectivo contraste.

Así que, en la Tabla No. 9 se encuentra los pronósticos semestrales del segundo semestre de 2024 hasta 2026 de las series de importaciones observadas de **vajillas de porcelana**. Se puede apreciar que los pronósticos de China y Taiwán y Singapur tienden a contraerse conforme al paso del tiempo. En el caso de China, pasa de 703 mil kilos netos el segundo semestre de 2024 a 665 el segundo semestre de 2026. En el caso de Taiwán y Singapur, pasa de 770 mil kilos netos a 338 mil.

Tabla No. 9 <i>Pronósticos Series Observadas 2024 - 2026</i> <i>Importación Vajillas Porcelana</i>			
PRONÓSTICOS 2024 - 2026			
(Kilos Netos)			
Periodo	China	Taiwán - Singapur	Demás Países
2024S2	703.007	770.120	293.808,0
2025S1	696.079	812.316	292.123,0
2025S2	673.935	470.236	286.281,0
2026S1	703.260	764.850	275.563,0
2026S2	665.275	338.715	271.884,0

Fuente: Cálculos Propios.

Por su parte, el resto de presentan una tendencia decreciente pero moderada en comparación a los otros dos orígenes: de 293 mil kilos pasa a 271 mil kilos.

Contrastando con las simulaciones de los escenarios contrafactuales de las importaciones que se presentan en la Tabla No. 10, en un universo sin medidas antidumping las importaciones chinas superarían el millón de kilos, incrementando paulatinamente y contemplando una estacionalidad en donde los segundos semestres presentan un volumen mayor que los primeros. Por su lado, las importaciones de Taiwán y Singapur tendrían a contraerse más que en el escenario observado con medida, ya

que no habría el incentivo de eludir por cambio de origen y, por tanto, las vajillas de porcelana se importaría mayoritariamente de China.

Tabla No. 10
Escenarios Contrafactuales 2024 - 2026
Importación Vajillas Porcelana

PRONÓSTICOS 2024 - 2026			
(Kilos Netos)			
Periodo	China	Taiwán - Singapur	Demás Países
2024S2	1.353.196	487.691	210.857
2025S1	1.013.921	499.844	184.116
2025S2	1.431.327	408.270	211.824
2026S1	1.058.005	418.444	184.516
2026S2	1.515.117	341.783	212.079

Fuente: Cálculos Propios.

El agregado del resto de países se mantendría relativamente constante con un efecto estacionales, en donde los segundos semestres tendrían a presentarse un mayor volumen de importación que los primeros.

En cuanto a los pronósticos de las importaciones de vajillas de loza, en la Tabla No. 11 se observa el ejercicio para las series observadas:

Tabla No. 11
Pronósticos Series Observadas 2024 - 2026
Importación Vajillas Loza

PRONÓSTICOS 2024 - 2026			
(Kilos Netos)			
Periodo	China	Taiwán - Singapur	Demás Países
2024S2	2.334.363	38.629	106.566
2025S1	2.358.764	29.918	154.733
2025S2	2.265.800	28.983	97.280
2026S1	2.210.133	33.111	154.013
2026S2	2.168.234	30.339	116.378

Fuente: Cálculos Propios.

A diferencia de lo que se presenta en vajillas de porcelana, las importaciones de loza provenientes de China son sustancialmente

mayores a los otros orígenes, ya que el pronóstico arroja más de 2 millones de kilos, frente a la importación de alrededor de 30.000 de Taiwán y Singapur, y a la importación en el rango de 100 mil a 160 mil proveniente del resto de países.

No obstante, se aprecia una tendencia decreciente en las importaciones de China y de Taiwán y Singapur. En el caso del resto de países, las importaciones tienen cierta variabilidad, pero se mantienen entre 106 mil y 154 mil, según la estacionalidad del caso.

En aras de hacer el contraste con los escenarios contrafactuales, la siguiente tabla expone los pronósticos contemplando un universo sin medidas antidumping. Como se puede observar, en esta simulación sin medida China no sólo acapararía la totalidad de las importaciones, sino que, en total, se doblarían las importaciones de vajillas de loza en comparación a los pronósticos de las series observadas con medidas antidumping. La importación de Taiwán y Singapur sería ínfima, dado que no habría en lo absoluto eludir dicha medida con el cambio de origen.

Tabla No. 10
Escenarios Contrafactuales 2024 - 2026
Importación Vajillas Loza

PRONÓSTICOS 2024 - 2026			
(Kilos Netos)			
Periodo	China	Taiwán - Singapur	Demás Países
2024S2	4.754.964	174	165.663
2025S1	4.216.233	77	158.490
2025S2	4.977.055	34	156.680
2026S1	4.438.324	15	156.252
2026S2	5.199.146	7	156.151

Fuente: Cálculos Propios.

Con respecto al resto de países, el volumen de importaciones sería constante y sin la estacionalidad presentada en el escenario

observado. De hecho, el volumen anual sería superior en un escenario sin medida que en lo que se ha observado con la implementación de las medidas antidumping contra China.

4. CONCLUSIONES

En el presente reporte se hizo el ejercicio de estimación de modelos univariados de series de tiempo, tanto para obtener pronósticos de series observadas como para hacer una simulación de escenarios contrafactuales en los cuales se recree un universo sin medidas antidumping. Esto con el fin de tener un referente objetivo y cuantitativo con el que se puede hacer un análisis comparado de los efectos que han tenido tales medidas.

Para las series de importaciones independientemente del origen, fue posible construir y estimar formas funcionales con procesos autorregresivos y de medial móvil, sea el caso, que además tuviesen en cuenta en algunas ocasiones el posible efecto que tiene la estacionalidad en las estimaciones. De hecho, al observar los resultados, no sólo se obtuvieron coeficientes significativos y pronósticos acordes con la realidad observada y las concepciones teóricas en la materia, sino que además fueran modelos válidos estadísticamente. Fueron aislados los casos en donde se le dio prelación al pronóstico y que este coincidiera con la dinámica y tendencia que teóricamente se esperaría, sobre algunos aspectos de validación.

Contrastando los pronósticos tanto del escenario observado con medidas antidumping como de los escenarios contrafactuales, se pudo determinar que efectivamente hay evidencia del fuerte efecto que tuvo dichas medidas sobre las importaciones de vajillas de porcelana y vajillas de loza. Fue evidente que el volumen de las

importaciones provenientes de China sería sustancialmente superior en universo acorde a los escenarios contrafactuales y, además, que afectaría el nivel de importaciones de otros orígenes.

Así pues, este ejercicio resulta ser un referente cuantitativo y técnico válido estadísticamente para argumentarle a la respectiva autoridad, la necesidad de ampliar las mencionadas medidas para mantener las importaciones de estos perfiles en los niveles hasta ahora observados y pronosticados hasta 2026.

PREMISAS PROYECCIÓN MERCADO Y PRECIOS ESCENARIO CON MEDIDAS

MERCADO VAJILLAS DE LOZA

Ventas Nacionales

- **II SEM 2024:**

Se tomó como base la proyección del Plan de Ventas y Operaciones (PVO) de septiembre de 2024, el cual, incluye información real de ventas de 2022 hasta agosto del 2024 y proyectados de septiembre a diciembre de 2024.

En el primer semestre del 2024 se evidenció una contracción del mercado del 18% con respecto al mismo periodo del 2023, pasando de un volumen de ventas de **CONFIDENCIAL** kg a **CONFIDENCIAL** kg.

Para el segundo semestre del 2024 se tienen en cuenta el volumen de ventas reales de julio y agosto. Para las proyecciones de septiembre a diciembre se realiza un ejercicio interno de acuerdo con la información que recolecta el área comercial de acuerdo con las ventas e inventarios de sus clientes. Además, esta proyección incluyó elementos como los calendarios comerciales, es decir, Ofertas de navidad, Blackfriday, Regalos corporativos de fin de año, entre otros.

Teniendo en cuenta lo anterior, se estima una recuperación para el segundo semestre del 10.5% respecto al segundo semestre del 2023 debido a una mejor dinámica del canal B2B, Moderno y Digital. Pasando entonces de un volumen de ventas en el segundo semestre del 2023 de **CONFIDENCIAL** kg a **CONFIDENCIAL** kg para el segundo semestre del 2024.

- **I SEM – II SEM 2025:**

Para las proyecciones del volumen se realizó un análisis a nivel de Canal de Distribución. Por cual, a continuación, se presenta una caracterización de cada uno:

- *Canal Detallista:* En este canal se encuentran los intermediarios minoristas, estos a su vez se encargan de comercializar el producto a consumidor final. Son empresas pequeñas que compran a fabricantes.
- *Canal Digital:* Es el medio de distribución en el que se le vende al consumidor final por medio de una plataforma en línea, ya sea e-commerce propios o market places.

- *Canal Directo:* Es el canal en el cual se vende directamente del fabricante al consumidor final, sin intermediarios. El consumidor final puede ser una persona natural o jurídica.
- *Canal Institucional:* Es el canal encargado de transacciones entre compañías con el fin de potencializar un producto o premiar ciertas acciones de sus clientes. Se caracteriza por tener un comportamiento estacional ya que busca impulsar la venta.
- *Canal Mayorista:* Se caracteriza por su papel de intermediario en la cadena de suministro, actuando como puente entre fabricantes y minoristas o, en algunos casos, directamente con otros negocios. Su naturaleza es la compra de producto en grandes volúmenes.
- *Canal Moderno:* Es un canal enfocado a formatos de venta y distribución asociados con el comercio detallista organizado como grandes superficies y Retail en general. Es el canal en el que la marca cuenta con una mayor visibilidad debido a la gran afluencia del público y su nicho de mercado más valorizado.

Para cada canal se distribuyó la cifra del 2024, dando como resultado el siguiente volumen:

Canal	2024
Detallista	
Digital	
Directos	
Institucional	
Mayorista	
Moderno	
Total general	

Tabla 1. Volumen 2024 por Canal - Loza

Para los canales Detallista, Directos, Mayorista y Moderno se aplicó el porcentaje de crecimiento estimado del PIB de la Industria (1,6%) proyectado por Fedesarrollo en su Informe de Prospectiva Económica (Ver Anexo 15) sobre las ventas registradas en el año 2024. Lo anterior, teniendo en cuenta que las vajillas de Loza se pueden considerar como una manufactura que es fabricada para el consumo de los hogares.

Para el canal Institucional se realizó un análisis de su tendencia de venta histórica, las cuales muestran un comportamiento estacional en el que cada dos años de caída se observa un repunte el tercer año, así como se muestra en la gráfica en piezas:

Ilustración 1. Ventas en Millones de Piezas Canal Institucional.

Por lo tanto, se estima que en esta canal para el 2025 se presente un repunte de los niveles del 2018, es decir, un 22% vs el año anterior, por lo que la venta pasaría de **CONFIDENCIAL** kg a **CONFIDENCIAL** kg.

En el caso del Canal Digital, el Informe de Cierre del 2023 publicado por la Cámara Colombiana de Comercio Electrónico (CCCE) indica que el crecimiento proyectado del comercio electrónico total del 2024 vs el 2023 es del 18%¹. Para el 2025 se espera que, aunque se tengan proyecciones como las de Statista en la que se estima que el crecimiento del e-commerce en Colombia será del 26%², hay otras proyecciones como las de AmericaRetail & Malls en las que prevé que el comercio electrónico en Colombia continúe creciendo, pero en un ritmo más moderado³, por lo que se toma la decisión de proyectar el 2025 con un crecimiento igual al del 2024, es decir del 18%. Por lo tanto, las ventas de este canal pasarían de **CONFIDENCIAL** kg a **CONFIDENCIAL** kg.

Teniendo en cuenta las consideraciones anteriores, se proyecta el 2025 así:

Canal	2024 KG	2025 KG	% Crec
Detallista			1,6%
Digital			18,0%
Directos			1,6%
Institucional	CONFIDENCIAL		22,0%
Mayorista			1,6%
Moderno			1,6%
Total general			5,1%

Tabla 2. Volumen 2024 y 2025 proyectado - Loza

Teniendo el total de las ventas proyectadas para 2025 y para obtener el volumen por semestre, se aplicó un porcentaje estimado de acuerdo con el comportamiento

¹ Cámara Colombiana de Comercio Electrónico (2023). Informe de cierre del Comportamiento del Comercio Electrónico en Colombia 2023, P 34. Tomado de: <https://ccce.org.co/wp-content/uploads/2017/06/INFORME-DE-CIERRE-2023-VERSION-PUBLICA.pdf>

² Arreaza, J. M. (2021, December 21). El ECommerce en Colombia crecerá 26% hacia 2025 (Statista). Marketing4eCommerce Colombia. <https://marketing4ecommerce.co/el-ecommerce-en-colombia-crecera-26-hacia-2025-statista/>

³ Palacios, K. (2024, July 5). Análisis del avance y proyección del comercio electrónico hasta 2026. AmericaRetail & Malls. <https://america-retail.com/secciones/omnicanalidad/analisis-del-avance-y-proyeccion-del-comercio-electronico-hasta-2026/>

registrado en las ventas del 2023, dónde la distribución de las ventas total fue de 52,5% en el ISEM y de 47,5% en el IISEM.

• **ISEM – IISEM 2026:**

Para este periodo se realiza un ejercicio a nivel de canal de distribución partiendo de la base del 2025:

Canal	2025
Detallista	-
Digital	-
Directos	-
Institucional	-
Mayorista	-
Moderno	-
Total general	-----

Tabla 3. Volumen 2025 por Canal – Loza

Para los canales Detallista, Directos, Mayorista y Moderno se aplicó el porcentaje de crecimiento estimado del PIB de la Industria (2%) proyectado por Fedesarrollo en su Informe de Prospectiva Económica (Ver Anexo 15), sobre las ventas registradas en el año 2025.

Para el canal Institucional, a pesar de que el análisis de ventas históricas indicaría que este año no se tendría un crecimiento importante con respecto al año anterior, se plantean estrategias comerciales y de mercadeo que permitan tener un crecimiento sostenido en el canal. Por lo que se estima nuevamente un crecimiento del 22%. Por lo tanto, las ventas de este canal pasarían de **CONFIDENCIAL** kg a **CONFIDENCIAL** kg.

En el Canal Digital se proyecta continuar con un crecimiento del 18%. Lo anterior debido a que, a pesar de que estimaciones de Payments & Commerce Market Intelligence (PCMI) estima que el comercio electrónico en Colombia crecerá para el 2026 un 27%⁴, hay otras proyecciones como las de AmericaRetail & Malls en las que prevé que el comercio electrónico en Colombia continúe creciendo, pero en un ritmo más moderado⁵, por lo que se toma la decisión de proyectar el 2026 con la misma estimación del 2025. Por lo tanto, las ventas de este canal pasarían de **CONFIDENCIAL** kg a **CONFIDENCIAL** kg.

Teniendo en cuenta las consideraciones anteriores, se proyecta el 2026 así:

⁴ Datos del mercado del comercio electrónico en Colombia. (2024). Payments and Commerce Market Intelligence - Global Payments Market Research and Insights. <https://paymentscmi.com/insights/datos-mercado-comercio-electronico-colombia/>

⁵ Palacios, K. (2024, July 5). Análisis del avance y proyección del comercio electrónico hasta 2026. AmericaRetail & Malls. <https://america-retail.com/secciones/omnicanalidad/analisis-del-avance-y-proyeccion-del-comercio-electronico-hasta-2026/>

Canal	2025 KG	2026 KG	% Crec
Detallista			2,0%
Digital			18,0%
Directos			2,0%
Institucional	CONFIDENCIAL		22,0%
Mayorista			2,0%
Moderno			2,0%
Total general			6,0%

Tabla 4. Volumen 2025 y 2026 proyectado - Loza

Teniendo el total de las ventas proyectadas para 2026 y para obtener el volumen por semestre, se aplicó un porcentaje estimado de acuerdo con el comportamiento registrado en las ventas del 2023, dónde la distribución de las ventas total fue de 52,5% en el ISEM y de 47,5% en el IISEM.

Importaciones de China

- II SEM 2024:**
 Para este periodo se realizó una proyección a partir de modelos univariados de series de tiempo utilizando la metodología Box y Jenkins (Ver Anexo 13 Pronósticos de Las Importaciones Provenientes de China, Taiwán y Singapur, y el Consolidado del Resto del Mundo).
- ISEM – IISEM 2025 y 2026:**
 Para este periodo se realizó una proyección a partir de modelos univariados de series de tiempo utilizando la metodología Box y Jenkins (Ver Anexo 13 Pronósticos de Las Importaciones Provenientes de China, Taiwán y Singapur, y el Consolidado del Resto del Mundo).

Importaciones de Taiwán y Singapur

- II SEM 2024:**
 Para este periodo se realizó una proyección a partir de modelos univariados de series de tiempo utilizando la metodología Box y Jenkins (Ver Anexo 13 Pronósticos de Las Importaciones Provenientes de China, Taiwán y Singapur, y el Consolidado del Resto del Mundo).
 .
- ISEM – IISEM 2025 y 2026:**
 Para este periodo se realizó una proyección a partir de modelos univariados de series de tiempo utilizando la metodología Box y Jenkins (Ver Anexo 13 Pronósticos de Las Importaciones Provenientes de China, Taiwán y Singapur, y el Consolidado del Resto del Mundo).

Importaciones Demás Orígenes

- **II SEM 2024:**

Para este periodo se realizó una proyección a partir de modelos univariados de series de tiempo utilizando la metodología Box y Jenkins (Ver Anexo 13 Pronósticos de Las Importaciones Provenientes de China, Taiwán y Singapur, y el Consolidado del Resto del Mundo).

.

- **ISEM – IISEM 2025 y 2026:**

Para este periodo se realizó una proyección a partir de modelos univariados de series de tiempo utilizando la metodología Box y Jenkins (Ver Anexo 13 Pronósticos de Las Importaciones Provenientes de China, Taiwán y Singapur, y el Consolidado del Resto del Mundo).

Consumo Nacional Aparente

- Para todos los periodos estimados, el CNA es la sumatoria de las proyecciones de las ventas del productor nacional, más las proyecciones de las importaciones totales (China, Taiwán & Singapur y los demás orígenes).

PRECIO VAJILLAS DE LOZA

Productor Nacional

- **II SEM 2024:**

Ya que los incrementos de precios en Locería Colombiana se hacen típicamente una vez al año (al inicio del año), para este semestre se estimó que los precios serían iguales a los precios del ISEM24, teniendo en cuenta que ya eran datos reales y sobre los que no se proyectaba ningún cambio.

- **ISEM y IISEM 2025:**

Considerando que en este escenario seguirían vigentes las Medidas AD, se tomó como premisa que los precios del 2025 simplemente reflejarían un incremento de acuerdo

con la inflación proyectada por el Banco de la República para ese mismo año. Se aplicó entonces un IPC del 5,8%⁶ sobre los precios proyectados del 2024.

- **ISEM y IISEM 2026:**

Considerando que en este escenario seguirían vigentes las Medidas AD, se tomó como premisa que los precios del 2026 simplemente reflejarían un incremento de acuerdo con la inflación proyectada por el Banco de la República para ese mismo año. Se aplicó entonces un IPC del 4% sobre los precios proyectados del 2025.

Importaciones

Para todos los orígenes de importación (China, Taiwán & Singapur y demás orígenes) se estimó el precio así:

- **IISEM 2024:**

Para este semestre se estimó el mismo precio registrado para el ISEM24, ya que no se proyectaron incrementos.

- **ISEM y IISEM 2025:**

Para los dos semestres del 2025 se aplicó el IPC mundial proyectado por el Fondo Monetario Internacional – FMI del 4%⁷, sobre los precios del año 2024.

- **ISEM y IISEM 2026:**

Para los dos semestres del 2026 se aplicó IPC mundial proyectado por el Fondo Monetario Internacional – FMI del 3,6%, sobre los precios del año 2025.

MERCADO VAJILLAS DE PORCELANA

Para el caso de la porcelana, los productos van dirigidos principalmente al sector del entretenimiento, puntualmente al segmento HORECA. Compuesto por Hoteles, Restaurantes y Casinos.

Ventas Nacionales

- **IISEM 2024:**

⁶ Fuente: Supuestos Macroeconómicos Corporativo Corona.

⁷ World Economic Outlook Database, April 2024. (2024, April 16). IMF. <https://www.imf.org/en/Publications/WEO/weo-database/2024/April>

Se tomó como base la proyección del Plan de Ventas y Operaciones (PVO) de septiembre de 2024, el cual, incluye información real de ventas de 2022 hasta agosto del 2024 y proyectados de septiembre a diciembre de 2024.

En el primer semestre del 2024 se evidenció una contracción del mercado del 21,2% con respecto al mismo periodo del 2023, pasando de un volumen de ventas de **CONFIDENCIAL** kg a **CONFIDENCIAL** kg.

Para el segundo semestre del 2024 se tienen en cuenta el volumen de ventas reales de julio y agosto. Para las proyecciones de septiembre a diciembre se realiza un ejercicio interno de acuerdo con la información que recolecta el área comercial de acuerdo con las ventas e inventarios de sus clientes. Además, esta proyección incluyó elementos como los calendarios comerciales.

Teniendo en cuenta lo anterior, se estima un menor decrecimiento para el segundo semestre del 2024, siendo este de 0,4% respecto al mismo periodo del 2023, debido a una mejor dinámica del canal Detallista. Pasando entonces de un volumen de ventas en el segundo semestre del 2023 de **CONFIDENCIAL** kg a **CONFIDENCIAL** kg para el segundo semestre del 2024.

- **ISEM – IISEM 2025:**

Para las proyecciones del volumen se realizó un análisis a nivel de Canal de Distribución. Por cual, a continuación, se presenta una caracterización de cada uno:

- *Canal Detallista:* En este canal se encuentran los intermediarios minoristas, estos a su vez se encargan de comercializar el producto a consumidor final. Son empresas pequeñas que compran a fabricantes.
- *Canal Digital:* Es el medio de distribución en el que se le vende al consumidor final por medio de una plataforma en línea, ya sea e-commerce propios o market places.
- *Canal Directo:* Es el canal en el cual se vende directamente del fabricante al consumidor final, sin intermediarios. El consumidor final puede ser una persona natural o jurídica.
- *Canal Institucional:* Es el canal encargado de transacciones entre compañías con el fin de potencializar un producto o premiar ciertas acciones de sus clientes. Se caracteriza por tener un comportamiento estacional ya que busca impulsar la venta.
- *Canal Mayorista:* Se caracteriza por su papel de intermediario en la cadena de suministro, actuando como puente entre fabricantes y minoristas o, en algunos casos, directamente con otros negocios. Su naturaleza es la compra de producto en grandes volúmenes.
- *Canal Moderno:* Es un canal enfocado a formatos de venta y distribución asociados con el comercio detallista organizado como grandes superficies y Retail en general. Es el canal en el que la marca cuenta con una mayor

visibilidad debido a la gran afluencia del público y su nicho de mercado más valorizado.

Para la estimación de las ventas de este periodo se realiza un análisis de las ventas históricas en piezas:

Ilustración 2. Ventas en Millones de Piezas Porcelana

Se presenta una caída en el 2020 por efectos de la pandemia, y a partir de este año, se observa una recuperación hasta el 2022, sin embargo, a pesar de que en el 2023 y 2024 se evidencia una caída del mercado, se plantean estrategias comerciales y de mercadeo que permitan tener un crecimiento que permitan volver a los niveles de 2022 y 2023. Además, teniendo en cuenta que la porcelana va dirigida al segmento HORECA (Hoteles, Restaurantes y Casinos) se consideran las perspectivas positivas con respecto al crecimiento del sector del entretenimiento para el 2025 de acuerdo con informes de AmericaRetail & Malls ⁸y la Revista P&M⁹. Dando como resultado un crecimiento del 14% para el 2025 frente al año inmediatamente anterior para los canales Detallista, Directos, Mayorista y Moderno. Por lo tanto, el total de ventas para estos canales pasarían de **CONFIDENCIAL** kg en 2024 a **CONFIDENCIAL** kg en 2025.

Para el canal Institucional, no se realizan apuestas ya que este canal se caracteriza por la comercialización en su mayoría de producto de Loza.

En el caso del Canal Digital, el Informe de Cierre del 2023 publicado por la Cámara Colombiana de Comercio Electrónico (CCCE) indica que el crecimiento proyectado del comercio electrónico total del 2024 vs el 2023 es del 18%¹⁰. Para el 2025 se espera que, aunque se tengan proyecciones como las de Statista en la que se estima que el

⁸ Palacios, K. (2024, September 6). El auge del sector del entretenimiento en Colombia. AmericaRetail & Malls. <https://america-retail.com/secciones/innovacion/el-auge-del-sector-del-entretenimiento-en-colombia/>

¹⁰ Cámara Colombiana de Comercio Electrónico (2023). Informe de cierre del Comportamiento del Comercio Electrónico en Colombia 2023, P 34. Tomado de: <https://ccce.org.co/wp-content/uploads/2017/06/INFORME-DE-CIERRE-2023-VERSION-PUBLICA.pdf>

crecimiento del e-commerce en Colombia será del 26%¹¹, hay otras proyecciones como las de AmericaRetail & Malls en las que prevé que el comercio electrónico en Colombia continúe creciendo, pero en un ritmo más moderado¹², por lo que se toma la decisión de proyectar el 2025 con un crecimiento igual al del 2024, es decir del 18%. Por lo tanto, las ventas de este canal pasarían de **CONFIDENCIAL** kg a **CONFIDENCIAL** kg.

Teniendo en cuenta las consideraciones anteriores, se proyecta el 2025 así:

Canal	2024 KG	2025 KG	% Crec
Detallista			14,0%
Digital			18,0%
Directos			14,0%
Institucional	CONFIDENCIAL		0,0%
Mayorista			14,0%
Moderno			14,0%
Total general			14,0%

Tabla 5. Volumen 2025 y 2026 proyectado - Porcelana

Teniendo el total de las ventas proyectadas para 2025 y para obtener el volumen por semestre, se aplicó un porcentaje estimado de acuerdo con el comportamiento registrado en las ventas del 2023, dónde la distribución de las ventas total fue de 48,8% en el ISEM y de 51,2% en el IISEM.

• **ISEM – IISEM 2026:**

Para este periodo se realiza un ejercicio a nivel de canal de distribución partiendo de la base del 2025:

Canal	2025
Detallista	
Digital	
Directos	
Institucional	
Mayorista	
Moderno	
Total general	

Tabla 6. Volumen 2025 por Canal – Porcelana

Para los canales Detallista, Directos, Mayorista y Moderno se aplicó el porcentaje de crecimiento estimado del PIB de la Industria (2%) proyectado por Fedesarrollo en su

¹¹ Arreaza, J. M. (2021, December 21). El ECommerce en Colombia crecerá 26% hacia 2025 (Statista). Marketing4eCommerce Colombia. <https://marketing4ecommerce.co/el-ecommerce-en-colombia-crecera-26-hacia-2025-statista/>

¹² Palacios, K. (2024, July 5). Análisis del avance y proyección del comercio electrónico hasta 2026. AmericaRetail & Malls. <https://america-retail.com/secciones/omnicanalidad/analisis-del-avance-y-proyeccion-del-comercio-electronico-hasta-2026/>

Informe de Prospectiva Económica (Ver Anexo 15), sobre las ventas registradas en el año 2025.

Para el canal Institucional, no se realizan apuestas ya que este canal se caracteriza por la comercialización en su mayoría de producto de Loza.

En el Canal Digital se proyecta continuar con un crecimiento del 18%. Lo anterior debido a que, a pesar de que estimaciones de Payments & Commerce Market Intelligence (PCMI) estima que el comercio electrónico en Colombia crecerá para el 2026 un 27%¹³, hay otras proyecciones como las de AmericaRetail & Malls en las que prevé que el comercio electrónico en Colombia continúe creciendo, pero en un ritmo más moderado¹⁴, por lo que se toma la decisión de proyectar el 2026 con la misma estimación del 2025. Por lo tanto, las ventas de este canal pasarían de **CONFIDENCIAL** kg a **CONFIDENCIAL** kg.

Teniendo en cuenta las consideraciones anteriores, se proyecta el 2026 así:

Canal	2025 KG	2026 KG	% Crec
Detallista			2,0%
Digital			18,0%
Directos			2,0%
Institucional	CONFIDENCIAL		0,0%
Mayorista			2,0%
Moderno			2,0%
Total general			2,2%

Tabla 7. Volumen 2025 y 2026 proyectado - Porcelana

Teniendo el total de las ventas proyectadas para 2026 y para obtener el volumen por semestre, se aplicó un porcentaje estimado de acuerdo con el comportamiento registrado en las ventas del 2023, dónde la distribución de las ventas total fue de 48,8% en el ISEM y de 51,2% en el IISEM.

Importaciones de China

- **II SEM 2024:**
Para este periodo se realizó una proyección a partir de modelos univariados de series de tiempo utilizando la metodología Box y Jenkins. Ver Reporte de Pronósticos Vajillas de Porcelana y Loza (Ver Anexo 15).

¹³Datos del mercado del comercio electrónico en Colombia. (2024). Payments and Commerce Market Intelligence - Global Payments Market Research and Insights. <https://paymentscmi.com/insights/datos-mercado-comercio-electronico-colombia/>

- **ISEM – IISEM 2025 y 2026:**

Para este periodo se realizó una proyección a partir de modelos univariados de series de tiempo utilizando la metodología Box y Jenkins (Ver Anexo 13 Pronósticos de Las Importaciones Provenientes de China, Taiwán y Singapur, y el Consolidado del Resto del Mundo).

Importaciones de Taiwán y Singapur

- **II SEM 2024:**

Para este periodo se realizó una proyección a partir de modelos univariados de series de tiempo utilizando la metodología Box y Jenkins (Ver Anexo 13 Pronósticos de Las Importaciones Provenientes de China, Taiwán y Singapur, y el Consolidado del Resto del Mundo).

- **ISEM – IISEM 2025 y 2026:**

Para este periodo se realizó una proyección a partir de modelos univariados de series de tiempo utilizando la metodología Box y Jenkins (Ver Anexo 13 Pronósticos de Las Importaciones Provenientes de China, Taiwán y Singapur, y el Consolidado del Resto del Mundo).

Importaciones Demás Orígenes

- **II SEM 2024:**

Para este periodo se realizó una proyección a partir de modelos univariados de series de tiempo utilizando la metodología Box y Jenkins (Ver Anexo 13 Pronósticos de Las Importaciones Provenientes de China, Taiwán y Singapur, y el Consolidado del Resto del Mundo).

.

- **ISEM – IISEM 2025 y 2026:**

Para este periodo se realizó una proyección a partir de modelos univariados de series de tiempo utilizando la metodología Box y Jenkins (Ver Anexo 13 Pronósticos de Las Importaciones Provenientes de China, Taiwán y Singapur, y el Consolidado del Resto del Mundo).

.

Consumo Nacional Aparente

- Para todos los periodos estimados, el CNA es la sumatoria de las proyecciones de las ventas del productor nacional, más las proyecciones de las importaciones totales (China, Taiwán & Singapur y los demás orígenes).

PRECIO VAJILLAS DE PORCELANA

Productor Nacional

- **II SEM 2024:**
Ya que los incrementos de precios en Locería Colombiana se hacen típicamente una vez al año (al inicio del año), para este semestre se estimó que los precios serían iguales a los precios del ISEM24, teniendo en cuenta que ya eran datos reales y sobre los que no se proyectaba ningún cambio.
- **ISEM y IISEM 2025:**
Considerando que en este escenario seguirían vigentes las Medidas AD, se tomó como premisa que los precios del 2025 simplemente reflejarían un incremento de acuerdo con la inflación proyectada por el Banco de la República para ese mismo año. Se aplicó entonces un IPC del 5,8¹⁵% sobre los precios proyectados del 2024.
- **ISEM y IISEM 2026:**
Considerando que en este escenario seguirían vigentes las Medidas AD, se tomó como premisa que los precios del 2026 simplemente reflejarían un incremento de acuerdo con la inflación proyectada por el Banco de la República para ese mismo año. Se aplicó entonces un IPC del 4% sobre los precios proyectados del 2025.

Importaciones

Para todos los orígenes de importación (China, Taiwán & Singapur y demás orígenes) se estimó el precio así:

- **IISEM 2024:**
Para este semestre se estimó el mismo precio registrado para el ISEM24, ya que no se proyectaron incrementos.
- **ISEM y IISEM 2025:**
Para los dos semestres del 2025 se aplicó el IPC mundial proyectado por el Fondo Monetario Internacional – FMI del 4%¹⁶, sobre los precios del año 2024.
- **ISEM y IISEM 2026:**
Para los dos semestres del 2026 se aplicó IPC mundial proyectado por el Fondo Monetario Internacional – FMI del 3,6%, sobre los precios del año 2025.

¹⁶ World Economic Outlook Database, April 2024. (2024, April 16). IMF. <https://www.imf.org/en/Publications/WEO/weo-database/2024/April>

PREMISAS PROYECCIÓN MERCADO Y PRECIOS ESCENARIO SIN MEDIDAS

Partimos del supuesto de que el CNA será el mismo en el escenario con y sin medida, y lo que cambiará será la participación de sus componentes (productor nacional, importaciones de China, importaciones de Taiwán & Singapur y las importaciones de los demás orígenes).

MERCADO VAJILLAS DE LOZA

Ventas Nacionales

- II SEM 2024:**
Para el segundo semestre del 2024 las medidas siguen vigentes, por lo cual, las ventas del productor nacional serán iguales a las calculadas en el escenario con medidas. Es decir que, para el IISEM24 se proyecta de acuerdo con el plan de ventas de Locería Colombiana de septiembre de 2024.
- ISEM – IISEM 2025 y 2026:**
Las ventas del productor nacional se estimaron a partir de la diferencia entre el CNA proyectado y las importaciones totales proyectadas.

Año	Semestre	Volumen
2025	ISEM	—
2025	IISEM	—
2026	ISEM	—
2026	IISEM	—

Tabla 1. Volumen por semestre - Loza

Adicionalmente, estas estimaciones están justificadas a partir de un ejercicio interno realizado por el peticionario en el que tuvo en cuenta la combinación de dos criterios: el precio proyectado de las importaciones investigadas y el comportamiento del segmento comercial al que van dirigidos este tipo de productos, tal y como se verá más adelante.

Para el caso de la loza, los productos van dirigidos principalmente al segmento Hogar, que está compuesto por tres sub-segmentos: Funcional, Informado y Decorativo.

Importaciones de China

- **II SEM 2024:**
Para este periodo se realizó una proyección a partir de modelos univariados de series de tiempo utilizando la metodología Box y Jenkins (Ver Anexo 13 Pronósticos de Las Importaciones Provenientes de China, Taiwán y Singapur, y el Consolidado del Resto del Mundo).
- **ISEM – IISEM 2025 y 2026:**
Para este periodo se realizó una proyección a partir de modelos univariados de series de tiempo utilizando la metodología Box y Jenkins (Ver Anexo 13 Pronósticos de Las Importaciones Provenientes de China, Taiwán y Singapur, y el Consolidado del Resto del Mundo).

Importaciones de Taiwán y Singapur

- **II SEM 2024:**
Para este periodo se realizó una proyección a partir de modelos univariados de series de tiempo utilizando la metodología Box y Jenkins (Ver Anexo 13 Pronósticos de Las Importaciones Provenientes de China, Taiwán y Singapur, y el Consolidado del Resto del Mundo).
- **ISEM – IISEM 2025 y 2026:**
Para este periodo se realizó una proyección a partir de modelos univariados de series de tiempo utilizando la metodología Box y Jenkins (Ver Anexo 13 Pronósticos de Las Importaciones Provenientes de China, Taiwán y Singapur, y el Consolidado del Resto del Mundo).

Importaciones Demás Orígenes

- **II SEM 2024:**
Para este periodo se realizó una proyección a partir de modelos univariados de series de tiempo utilizando la metodología Box y Jenkins (Ver Anexo 13 Pronósticos de Las Importaciones Provenientes de China, Taiwán y Singapur, y el Consolidado del Resto del Mundo).
- **ISEM – IISEM 2025 y 2026:**
Para este periodo se realizó una proyección a partir de modelos univariados de series de tiempo utilizando la metodología Box y Jenkins (Ver Anexo 13 Pronósticos de Las Importaciones Provenientes de China, Taiwán y Singapur, y el Consolidado del Resto del Mundo).

Consumo Nacional Aparente

- Se tiene como premisa que el CNA es el mismo al calculado en el escenario con medidas para todos los semestres proyectados (Del IISEM24 al IISEM26) ya que el tamaño del mercado no cambia. Lo que variará será el porcentaje de participación de cada uno de sus componentes (Productor Nacional, Importaciones China, Importaciones Taiwán & Singapur y los demás orígenes).

PRECIO VAJILLAS DE LOZA

Productor Nacional

- **II SEM 2024:**
Ya que los incrementos de precios en Locería Colombiana se hacen típicamente una vez al año (al inicio del año), para este semestre se estimó que los precios serían iguales a los precios del ISEM24, teniendo en cuenta que ya eran datos reales y sobre los que no se proyectaba ningún cambio.

Para el caso de la loza, los productos van dirigidos principalmente al segmento Hogar, que está compuesto por tres sub-segmentos: Funcional, Informado y Decorativo.

- *Funcional:* Es un consumidor que se caracteriza por priorizar el precio en su decisión de compra.
- *Informado:* Es un consumidor que se caracteriza por buscar un equilibrio entre precio y diseño. Están atentos a las ofertas y se informan previamente a cerca del producto que quieren adquirir.
- *Decorativo:* Es un consumidor que se caracteriza por estar influenciado por el diseño y las formas, buscan moda y tendencias y les gusta decorar su hogar.

El cálculo del precio se entiende como un precio promedio ponderado entre dos variables: el volumen de ventas y el precio de cada uno de los sub-segmentos. Por lo tanto, la combinación entre el mix de ventas y el precio de cada sub-segmento, determina al final el precio promedio ponderado del peticionario en cada semestre proyectado.

- **ISEM 2025:**

Efectos Variable Precio

En un escenario en el que no se prorroguen las medidas AD y en el que las importaciones de China ingresen nuevamente a precios de dumping, el Productor Nacional se verá obligado a replantear sus precios en cada sub-segmento:

- Sub-segmento Funcional. Es el más sensible al precio, el Productor Nacional estima que deberá reducir su precio sólo hasta un nivel en que obtenga un margen mínimo de acuerdo con su estructura de costos y gastos. Por lo tanto, sólo podrá bajar sus precios un 10%. Esta disminución se aplica sobre la base de los precios del 2024 (\$**CONFIDENCIAL**/kg). Posteriormente, se aplica la variación del IPC proyectado para el 2025 (5,8%¹) arrojando una proyección del precio para este segmento de \$ **CONFIDENCIAL** kg.
- Sub-segmento Informado. El Productor Nacional estima que deberá reducir su precio sólo hasta un nivel en que obtenga un margen mínimo de acuerdo con su estructura de costos y gastos. Por lo tanto, sólo podrá bajar sus precios un 16%. Esta disminución se aplica sobre la base de los precios del 2024 (\$**CONFIDENCIAL**/kg). Posteriormente, se aplica la variación del IPC proyectado para el 2025 (5,8%²) arrojando una proyección del precio para este segmento de \$ **CONFIDENCIAL** /kg.
- Sub-segmento Decorativo. El Productor Nacional estima que para este primer semestre los exportadores/importadores de China habrán iniciado una lectura de las tendencias del mercado colombiano, por lo que se estima que el Productor Nacional deberá disminuir en un 5,5% su precio con el objetivo de no tener una mayor pérdida. Esta disminución se aplica sobre la base de los precios del 2024 (\$**CONFIDENCIAL** /kg). Posteriormente, se aplica la variación del IPC proyectado para el 2025 (5,8%) arrojando una proyección del precio para este segmento de \$ **CONFIDENCIAL** /kg.

Efectos Variable Volumen

Se parte de la base del Volumen de Ventas Nacionales proyectadas para este periodo: **CONFIDENCIAL** kg.

Teniendo en cuenta que el precio del Productor Nacional depende de la composición de su mix de ventas y del precio de cada uno de los sub-segmentos explicados previamente, se procedió a distribuir ese volumen por sub-segmento de acuerdo con los siguientes criterios:

- En el primer semestre del 2025, el sub-segmento Decorativo se verá afectado en diferentes proporciones. El 80% de las ventas del Sub-segmento crecerá con respecto al PIB Industrial (1,6%) proyectado por Fedesarrollo (Ver Anexo 15) tomando como base las ventas del primer semestre del 2024 (**CONFIDENCIAL** kg). Mientras que el 20% restante de las ventas del Sub-Segmento disminuirá un 45% con respecto al mismo periodo del año anterior, así:

¹ Fuente: Supuestos Macroeconómicos Corporativo Corona.

² Fuente: Supuestos Macroeconómicos Corporativo Corona.

Sub-segmento	ISEM24	Porcentaje Afectado	Volumen por Porcentaje	Comentario	ISEM25
DECORATIVO	CONFIDENCIAL				
Total general			808.784		746.460

Tabla 2. Proyección Sub-segmento Decorativo ISEM25.

- Para el volumen restante **CONFIDENCIAL** kg (**CONFIDENCIAL** kg – **CONFIDENCIAL** kg = **CONFIDENCIAL** kg), se hace una distribución entre los sub-segmentos funcional e informado de acuerdo con la proporción que tenían en el primer semestre de 2023:

Sub-Segmento	Venta KG ISEM 2023	% KG ISEM 2023	Venta KG ISEM 2025	% KG ISEM 2025
FUNCIONAL	CONFIDENCIAL			
INFORMADO				
Total general				

Tabla 3. Proyección Sub-segmentos Funcional e Informado ISEM25.

- Considerando los efectos sobre el precio y el volumen para cada uno de los Sub-segmentos, se calculó entonces el precio promedio ponderado:

Sub-Segmento	Venta KG ISEM 2025	Precio ISEM 2025	Venta ISEM 2025 \$
FUNCIONAL	CONFIDENCIAL		
INFORMADO			
DECORATIVO			
Total general			

Tabla 4. Resumen KG, Precio y Valor ISEM25 Loza

$$\begin{aligned} \text{Precio Ponderado} &= \frac{\text{Venta \$}}{\text{Venta KG}} = \frac{\text{CONFIDENCIAL}}{\text{CONFIDENCIAL}} \\ &= \$\text{CONFIDENCIAL/kg} \end{aligned}$$

- Por lo tanto, el precio para el ISEM25 es de **\$CONFIDENCIAL** /kg.

• IISEM 2025:

Efectos Variable Precio

- Sub-segmento Funcional. Se mantiene la premisa del ISEM25: \$ **CONFIDENCIAL** /kg.
- Sub-segmento Informado. Se mantiene la premisa del ISEM25: \$ **CONFIDENCIAL** /kg.
- Sub-segmento Decorativo. Se estima que para este momento los exportadores/importadores de China ya habrán hecho una lectura más completa de las tendencias del mercado colombiano. Por lo tanto, se proyecta

que para que el Productor Nacional deberá disminuir su precio. Para este semestre se estimó una reducción del 10%. Esta disminución se aplica sobre la base de los precios del ISEM25 (\$**CONFIDENCIAL** /kg) arrojando una proyección del precio para este segmento de \$ **CONFIDENCIAL** /kg.

Efectos Variable Volumen

Se parte de la base del Volumen de Ventas Nacionales proyectadas para este periodo: **CONFIDENCIAL** kg

Teniendo en cuenta que el precio del Productor Nacional depende de la composición de su mix de ventas y del precio de cada uno de los sub-segmentos explicados previamente, se procedió a distribuir ese volumen por sub-segmento de acuerdo con los siguientes criterios:

- En el Sub-segmento Decorativo se verá afectado en diferentes proporciones. El 80% de las ventas del Sub-segmento crecerá con respecto al PIB Industrial (1,6%) proyectado por Fedesarrollo (Ver Anexo 15) tomando como base las ventas del segundo semestre del 2024 (**CONFIDENCIAL** kg). Mientras que el 20% restante de las ventas del Sub-Segmento disminuirá un 59% con respecto al mismo periodo del año anterior, así:

Sub-segmento	IISEM24	Porcentaje Afectado	Volumen por Porcentaje	Comentario	IISEM25
DECORATIVO	CONFIDENCIAL				
Total general					

Tabla 5. Proyección Sub-segmento Decorativo IISEM25.

- Para el volumen restante **CONFIDENCIAL** kg (**CONFIDENCIAL** – **CONFIDENCIAL** kg = **CONFIDENCIAL** kg), se hace una distribución entre los sub-segmentos funcional e informado de acuerdo con la proporción que tenían en el segundo semestre de 2023:

Sub-Segmento	Venta KG		% KG	
	IISEM 2023	IISEM 2023	IISEM 2025	IISEM 2025
FUNCIONAL	CONFIDENCIAL			
INFORMADO				
Total general				

Tabla 6. Proyección Sub-segmentos Funcional e Informado IISEM25.

- Considerando los efectos sobre el precio y el volumen para cada uno de los Sub-segmentos, se calculó entonces el precio promedio ponderado:

Sub-Segmento	Venta KG IISEM 2025	Precio IISEM 2025	Venta IISEM 2025 \$
FUNCIONAL	CONFIDENCIAL	CONFIDENCIAL	CONFIDENCIAL
INFORMADO

Tabla 7. Resumen KG, Precio y Valor IISEM25 Loza

$$\text{Precio Ponderado} = \frac{\text{Venta \$}}{\text{Venta KG}} = \frac{\text{CONFIDENCIAL}}{\text{CONFIDENCIAL}} = \$\text{CONFIDENCIAL/kg}$$

- Por lo tanto, el precio para el IISEM25 es de \$ **CONFIDENCIAL** /kg.

• ISEM 2026:

Efectos Variable Precio

- Sub-segmento Funcional. Se proyecta el precio tomando como base el precio registrado en el año 2025 (\$**CONFIDENCIAL** /kg) y aplicando la variación del IPC proyectado para el 2026 (4,0%)³, por lo tanto, el precio para este Sub-segmento es de \$ **CONFIDENCIAL** /kg.
- Sub-segmento Informado. Se proyecta el precio tomando como base el precio registrado en el año 2025 (\$**CONFIDENCIAL** /kg) y aplicando la variación del IPC proyectado para el 2026 (4,0%), por lo tanto, el precio para este Sub-segmento es de \$ **CONFIDENCIAL** /kg.
- Sub-segmento Decorativo. Se estima que para este momento los exportadores/importadores de China ya habrán hecho una lectura completa de las tendencias del mercado colombiano. Por lo tanto, se proyecta que para que el Productor Nacional vea una afectación menor a la del 2025 en el volumen del Sub-segmento deberá continuar disminuyendo su precio. Para este semestre se estimó una reducción del 5%. Esta disminución se aplica sobre la base de los precios del IISEM25 (\$**CONFIDENCIAL** /kg). Posteriormente, se aplica la variación del IPC proyectado para el 2026 (4,0%) arrojando una proyección del precio para este segmento de \$ **CONFIDENCIAL** /kg.

Efectos Variable Volumen

Se parte de la base del Volumen de Ventas Nacionales proyectadas para este periodo:
CONFIDENCIAL kg

³ Fuente: Supuestos Macroeconómicos Corporativo Corona.

Teniendo en cuenta que el precio del Productor Nacional depende de la composición de su mix de ventas y del precio de cada uno de los sub-segmentos explicados previamente, se procedió a distribuir ese volumen por sub-segmento de acuerdo con los siguientes criterios:

- En el Sub-segmento Decorativo se verá afectado en diferentes proporciones. El 80% de las ventas del Sub-segmento crecerá con respecto al PIB Industrial (2%) proyectado por Fedesarrollo (Ver Anexo 15) tomando como base las ventas del primer semestre del 2025 (**CONFIDENCIAL** kg). Mientras que el 20% restante de las ventas del Sub-Segmento disminuirá un 4% con respecto al mismo periodo del año anterior, así:

		DECORATIVO		Si	Si	Si	Si

Tabla 14. Resumen Efectos Volumen y Precio - Loza

Importaciones de China

- IISEM 2024:**
Como en este semestre aún estarán vigentes las medidas de AD se estimó el mismo precio que en el escenario con medidas, es decir, el precio registrado para el IISEM24.
- ISEM y IISEM 2025:**
En ausencia de derechos AD se estima un precio equivalente al precio promedio registrado para este origen entre los años 2001-2004, momento en el cual aún no se

tenían medidas vigentes que corrigieran la práctica del dumping de China. El precio promedio obtenido para el periodo 2001-2004 fue de USD 0,68/Kg.

- **ISEM y IISEM 2026:**

Para los dos semestres del 2026 se aplicó el IPC mundial proyectado por el Fondo Monetario Internacional – FMI del 3,6%⁴ sobre los precios proyectados para el año 2025.

Importaciones de Taiwán, Singapur y Demás Orígenes

Como estos orígenes de importación no se ven afectados por la medida de AD, se estimó el precio así:

- **IISEM 2024:**

Para este semestre se estimó el mismo precio registrado para el ISEM24, ya que no se proyecta un segundo incremento por año.

- **ISEM y IISEM 2025:**

Para los dos semestres del 2025 se aplicó IPC mundial proyectado por el Fondo Monetario Internacional – FMI del 4% sobre los precios del año 2024.

- **ISEM y IISEM 2026:**

Para los dos semestres del 2026 se aplicó el IPC mundial proyectado por el Fondo Monetario Internacional – FMI del 3,6% sobre los precios proyectados para el año 2025.

MERCADO VAJILLAS DE PORCELANA

Ventas Nacionales

- **IISEM 2024:**

Para el segundo semestre del 2024 las medidas siguen vigentes, por lo cual, las ventas del productor nacional serán iguales a las calculadas en el escenario con medidas. Es decir que, para el IISEM24 se proyecta de acuerdo con el plan de ventas de Locería Colombiana de septiembre de 2024.

- **ISEM y IISEM 2025 y 2026:**

Las ventas del productor nacional se estimaron a partir de la diferencia entre el CNA proyectado y las importaciones totales proyectadas.

⁴ World Economic Outlook Database, April 2024. (2024, April 16). IMF. <https://www.imf.org/en/Publications/WEO/weo-database/2024/April>

Año	Semestre	Volumen
2025	I SEM	
2025	II SEM	
2026	I SEM	
2026	II SEM	

Tabla 15. Volumen por semestre - Porcelana

Adicionalmente, estas estimaciones están justificadas a partir de un ejercicio interno realizado por el peticionario en el que tuvo en cuenta la combinación de dos criterios: el precio proyectado de las importaciones investigadas y el comportamiento del segmento comercial al que van dirigidos este tipo de productos, tal y como se verá más adelante.

Para el caso de la Porcelana, los productos van dirigidos principalmente al segmento HORECA (Hoteles, Restaurantes y Casinos), que está compuesto por tres sub-segmentos: Precio, Servicio y Tendencia.

Importaciones de China

- II SEM 2024:**
 Para este periodo se realizó una proyección a partir de modelos univariados de series de tiempo utilizando la metodología Box y Jenkins (Ver Anexo 13 Pronósticos de Las Importaciones Provenientes de China, Taiwán y Singapur, y el Consolidado del Resto del Mundo).
- ISEM – II SEM 2025 y 2026:**
 Para este periodo se realizó una proyección a partir de modelos univariados de series de tiempo utilizando la metodología Box y Jenkins (Ver Anexo 13 Pronósticos de Las Importaciones Provenientes de China, Taiwán y Singapur, y el Consolidado del Resto del Mundo).

Importaciones de Taiwán y Singapur

- II SEM 2024:**
 Para este periodo se realizó una proyección a partir de modelos univariados de series de tiempo utilizando la metodología Box y Jenkins (Ver Anexo 13 Pronósticos de Las Importaciones Provenientes de China, Taiwán y Singapur, y el Consolidado del Resto del Mundo).
- ISEM – II SEM 2025 y 2026:**
 Para este periodo se realizó una proyección a partir de modelos univariados de series de tiempo utilizando la metodología Box y Jenkins (Ver Anexo 13 Pronósticos de Las

Importaciones Provenientes de China, Taiwán y Singapur, y el Consolidado del Resto del Mundo).

Importaciones Demás Orígenes

- **II SEM 2024:**

Para este periodo se realizó una proyección a partir de modelos univariados de series de tiempo utilizando la metodología Box y Jenkins (Ver Anexo 13 Pronósticos de Las Importaciones Provenientes de China, Taiwán y Singapur, y el Consolidado del Resto del Mundo).

- **ISEM – IISEM 2025 y 2026:**

Para este periodo se realizó una proyección a partir de modelos univariados de series de tiempo utilizando la metodología Box y Jenkins (Ver Anexo 13 Pronósticos de Las Importaciones Provenientes de China, Taiwán y Singapur, y el Consolidado del Resto del Mundo).

Consumo Nacional Aparente

- Se tiene como premisa que el CNA es el mismo al calculado en el escenario con medidas para todos los semestres proyectados (Del IISEM24 al IISEM26) ya que el tamaño del mercado no cambia. Lo que variará será el porcentaje de participación de cada uno de sus componentes (Productor Nacional, Importaciones China, Importaciones Taiwán & Singapur y los demás orígenes).

PRECIO VAJILLAS DE PORCELANA

Productor Nacional

- **II SEM 2024:**

Ya que los incrementos de precios en Locería Colombiana se hacen típicamente una vez al año (al inicio del año), para este semestre se estimó que los precios serían iguales a los precios del ISEM24, teniendo en cuenta que ya eran datos reales y sobre los que no se proyectaba ningún cambio.

Para el caso de la porcelana, los productos van dirigidos principalmente al segmento HORECA (Hoteles, Restaurantes y Casinos), que está compuesto por tres sub-segmentos: Precio, Servicio, Tendencia.

- *Precio:* Es un consumidor que se caracteriza por priorizar el precio en su decisión de compra.

- *Servicio*: Es un consumidor que se caracteriza por buscar un equilibrio entre costo y beneficio. Valorán la capacidad de reposición del menaje y la continuidad del portafolio ofrecido en el tiempo.
- *Tendencia*: Es un consumidor muy especializado, valora la exclusividad y la innovación de las vajillas y/o piezas que utilizará en su menaje.

El cálculo del precio se entiende como un precio promedio ponderado entre dos variables: el volumen de ventas y el precio de cada uno de los sub-segmentos. Por lo tanto, la combinación entre el mix de ventas y el precio de cada sub-segmento, determina al final el precio promedio ponderado del peticionario en cada semestre proyectado.

- **ISEM 2025:**

Efectos Variable Precio

En un escenario en el que no se prorroguen las medidas AD y en el que las importaciones de China ingresen nuevamente a precios de dumping, el Productor Nacional se verá obligado a replantear sus precios en cada sub-segmento:

- Sub-segmento Precio. Es el más sensible al precio, el Productor Nacional estima que deberá reducir su precio sólo hasta un nivel en que obtenga un margen mínimo de acuerdo con su estructura de costos y gastos. Por lo tanto, sólo podrá bajar sus precios un 20,5%. Esta disminución se aplica sobre la base de los precios del 2024 (\$**CONFIDENCIAL** /kg). Posteriormente, se aplica la variación del IPC proyectado para el 2025 (5,8%⁵) arrojando una proyección del precio para este segmento de \$ **CONFIDENCIAL** /kg.
- Sub-segmento Servicio. El Productor Nacional estima que deberá reducir su precio sólo hasta un nivel en que obtenga un margen mínimo de acuerdo con su estructura de costos y gastos. Por lo tanto, sólo podrá bajar sus precios un 16%. Esta disminución se aplica sobre la base de los precios del 2024 (\$**CONFIDENCIAL** /kg). Posteriormente, se aplica la variación del IPC proyectado para el 2025 (5,8%) arrojando una proyección del precio para este segmento de \$ **CONFIDENCIAL** /kg.
- Sub-segmento Tendencia. El Productor Nacional estima que para este primer semestre los exportadores/importadores de China habrán iniciado una lectura de las tendencias del mercado colombiano, sin embargo, prefiere ser conservador en cuanto al desempeño del segmento con el fin de que la reducción de precios dañe el mercado existente, por lo que proyecta que no tendrá que afectar su precio en este periodo, pero partiendo del precio base del

⁵ Fuente: Supuestos Macroeconómicos Corporativo Corona.

2024 (\$**CONFIDENCIAL** /kg). Posteriormente, se aplica la variación del IPC proyectado para el 2025 (5,8%) arrojando una proyección del precio para este segmento de \$ **CONFIDENCIAL** /kg

Efectos Variable Volumen

Se parte de la base del Volumen de Ventas Nacionales proyectadas para este periodo: **CONFIDENCIAL** kg.

Teniendo en cuenta que el precio del Productor Nacional depende de la composición de su mix de ventas y del precio de cada uno de los sub-segmentos explicados previamente, se procedió a distribuir ese volumen por sub-segmento de acuerdo con los siguientes criterios:

- En el primer semestre del 2025, el sub-segmento Tendencia se verá afectado en diferentes proporciones. El 80% de las ventas del Sub-segmento crecerá con respecto al PIB Industrial (1,6%) proyectado por Fedesarrollo (Ver Anexo 15) tomando como base las ventas del primer semestre del 2024 (**CONFIDENCIAL** kg). Mientras que el 20% restante de las ventas del Sub-Segmento disminuirá un 36% con respecto al mismo periodo del año anterior, así:

Sub-segmento	ISEM24	Porcentaje Afectado	Volumen por Porcentaje	Comentario	ISEM25
TENDENCIA	CONFIDENCIAL				
Total general					

Tabla 16. Proyección Sub-segmento Tendencia ISEM25.

- Para el volumen restante **CONFIDENCIAL** kg (**CONFIDENCIAL** kg – **CONFIDENCIAL** kg = **CONFIDENCIAL** kg), se hace una distribución entre los sub-segmentos precio y servicio de acuerdo con la proporción que tenían en el primer semestre de 2023:

Sub-Segmento	Venta KG ISEM 2023	% KG ISEM 2023	Venta KG ISEM 2025	% KG ISEM 2025
PRECIO	CONFIDENCIAL			
SERVICIO				
Total general				

Tabla 17. Proyección Sub-segmentos Precio y Servicio ISEM25.

- Considerando los efectos sobre el precio y el volumen para cada uno de los Sub-segmentos, se calculó entonces el precio promedio ponderado:

Sub-Segmento	Venta KG ISEM 2025	Precio ISEM 2025	Venta ISEM 2025 \$
PRECIO	CONFIDENCIAL		
SERVICIO			
TENDENCIA			
Total general			

Tabla 18. Resumen KG, Precio y Valor ISEM25 Porcelana

$$\text{Precio Ponderado} = \frac{\text{Venta \$}}{\text{Venta KG}} = \frac{\text{CONFIDENCIAL}}{\text{CONFIDENCIAL}} = \$\text{CONFIDENCIAL/kg}$$

- Por lo tanto, el precio para el ISEM25 es de \$ **CONFIDENCIAL** /kg.

- **IISEM 2025:**

Efectos Variable Precio

- Sub-segmento Precio. Se mantiene la premisa del ISEM25: \$ **CONFIDENCIAL** /kg.
- Sub-segmento Servicio. Se mantiene la premisa del ISEM25: \$ **CONFIDENCIAL** /kg.
- Sub-segmento Tendencia. Se estima que para este momento los exportadores/importadores de China ya habrán hecho una lectura de las tendencias del mercado colombiano. Por lo tanto, se proyecta que para que el Productor Nacional no vea una afectación mucho mayor que la del semestre anterior en el volumen del Sub-segmento deberá disminuir su precio. Para este semestre se estimó una reducción del 5%. Esta disminución se aplica sobre la base de los precios del ISEM25 (\$**CONFIDENCIAL** kg) arrojando una proyección del precio para este segmento de \$ **CONFIDENCIAL** kg.

Efectos Variable Volumen

Se parte de la base del Volumen de Ventas Nacionales proyectadas para este periodo: **CONFIDENCIAL** kg

Teniendo en cuenta que el precio del Productor Nacional depende de la composición de su mix de ventas y del precio de cada uno de los sub-segmentos explicados previamente, se procedió a distribuir ese volumen por sub-segmento de acuerdo con los siguientes criterios:

- El Sub-segmento Tendencia se verá afectado en diferentes proporciones. El 80% de las ventas del Sub-segmento crecerá con respecto al PIB Industrial (1,6%) proyectado por Fedesarrollo (Ver Anexo 15) tomando como base las ventas del segundo semestre del 2024 (**CONFIDENCIAL** kg). Mientras que el 20% restante de las ventas del Sub-Segmento disminuirá un 50% con respecto al mismo periodo del año anterior, así:

Sub-segmento	IISEM24	Porcentaje Afectado	Volumen por Porcentaje	Comentario	IISEM25
TENDENCIA	CONFIDENCIAL				
Total general					

Tabla 19. Proyección Sub-segmento Tendencia IISEM25.

- Para el volumen restante **CONFIDENCIAL** kg (**CONFIDENCIAL** kg – **CONFIDENCIAL** kg = **CONFIDENCIAL** kg), se hace una distribución entre los sub-segmentos precio y servicio de acuerdo con la proporción que tenían en el segundo semestre de 2023:

Sub-Segmento	Venta KG IISEM 2023	% KG IISEM 2023	Venta KG IISEM 2025	% KG IISEM 2025
PRECIO	CONFIDENCIAL			
SERVICIO				
Total general				

Tabla 20. Proyección Sub-segmentos Precio y Servicio IISEM25.

- Considerando los efectos sobre el precio y el volumen para cada uno de los Sub-segmentos, se calculó entonces el precio promedio ponderado:

Sub-Segmento	Venta KG IISEM 2025	Precio IISEM 2025	Venta IISEM 2025 \$
PRECIO	CONFIDENCIAL		
SERVICIO			
TENDENCIA			
Total general			

Tabla 21. Resumen KG, Precio y Valor IISEM25 Porcelana

$$\text{Precio Ponderado} = \frac{\text{Venta \$}}{\text{Venta KG}} = \frac{\text{CONFIDENCIAL}}{\text{CONFIDENCIAL}} = \$\text{CONFIDENCIAL/kg}$$

- Por lo tanto, el precio para el IISEM25 es de \$ **CONFIDENCIAL** /kg.

• ISEM 2026:

Efectos Variable Precio

- Sub-segmento Precio. Se proyecta el precio tomando como base el precio registrado en el año 2025 (\$**CONFIDENCIAL** /kg) y aplicando la variación del IPC proyectado para el 2026 (4,0%)⁶, por lo tanto, el precio para este Sub-segmento es de \$ **CONFIDENCIAL** /kg.

⁶ Fuente: Supuestos Macroeconómicos Corporativo Corona.

- Sub-segmento Servicio. Se proyecta el precio tomando como base el precio registrado en el año 2025 (\$**CONFIDENCIAL** /kg) y aplicando la variación del IPC proyectado para el 2026 (4,0%), por lo tanto, el precio para este Sub-segmento es de \$ **CONFIDENCIAL** /kg.
- Sub-segmento Tendencia. Se estima que para este momento los exportadores/importadores de China ya habrán hecho una lectura completa de las tendencias del mercado colombiano. Por lo tanto, se proyecta que para que el Productor Nacional vea una afectación menor a la del año anterior en el volumen del Sub-segmento deberá disminuir su precio. Para este semestre se estimó una reducción del 7%. Esta disminución se aplica sobre la base de los precios del IISEM25 (\$**CONFIDENCIAL** /kg). Posteriormente, se aplica la variación del IPC proyectado para el 2026 (4,0%) arrojando una proyección del precio para este segmento de \$ **CONFIDENCIAL** /kg

Efectos Variable Volumen

Se parte de la base del Volumen de Ventas Nacionales proyectadas para este periodo: **CONFIDENCIAL** kg

Teniendo en cuenta que el precio del Productor Nacional depende de la composición de su mix de ventas y del precio de cada uno de los sub-segmentos explicados previamente, se procedió a distribuir ese volumen por sub-segmento de acuerdo con los siguientes criterios:

- El Sub-segmento Tendencia se verá afectado en diferentes proporciones. El 80% de las ventas del Sub-segmento crecerá con respecto al PIB Industrial (2%) proyectado por Fedesarrollo (Ver Anexo 15) tomando como base las ventas del primer semestre del 2025 (**CONFIDENCIAL** kg). Mientras que el 20% restante de las ventas del Sub-Segmento disminuirá un 33% con respecto al mismo periodo del año anterior, así:

Sub-segmento	ISEM25	Porcentaje Afectado	Volumen por Porcentaje	Comentario	ISEM26
TENDENCIA	CONFIDENCIAL				
Total general					

Tabla 22. Proyección Sub-segmento Tendencia ISEM26.

- Para el volumen restante **CONFIDENCIAL** kg (**CONFIDENCIAL** kg – **CONFIDENCIAL** kg = **CONFIDENCIAL** kg), se hace una distribución entre los sub-segmentos funcional e informado de acuerdo con la proporción que tenían en el primer semestre de 2023:

Sub-Segmento	Venta KG ISEM 2023	% KG ISEM 2023	Venta KG ISEM 2026	% KG ISEM 2026
PRECIO				
SERVICIO				
Total general				

Tabla 23. Proyección Sub-segmentos Servicio y Tendencia ISEM26.

- Considerando los efectos sobre el precio y el volumen para cada uno de los Sub-segmentos, se calculó entonces el precio promedio ponderado:

Sub-Segmento	Venta KG ISEM 2026	Precio ISEM 2026	Venta ISEM 2026 \$
PRECIO			
SERVICIO			
TENDENCIA			
Total general			

Tabla 24. Resumen KG, Precio y Valor IISEM25 Porcelana

$$\text{Precio Ponderado} = \frac{\text{Venta \$}}{\text{Venta KG}} = \frac{\text{CONFIDENCIAL}}{\text{CONFIDENCIAL}} = \$\text{CONFIDENCIAL/kg}$$

- Por lo tanto, el precio para el ISEM26 es de \$38.083/kg.

• IISEM 2026:

Efectos Variable Precio

- Sub-segmento Precio. Se mantiene la premisa del ISEM26: \$ **CONFIDENCIAL** /kg.
- Sub-segmento Servicio. Se mantiene la premisa del ISEM26: \$ **CONFIDENCIAL** /kg.
- Sub-segmento Tendencia. Se mantiene la premisa del ISEM26: \$ **CONFIDENCIAL** /kg.

Efectos Variable Volumen

Se parte de la base del Volumen de Ventas Nacionales proyectadas para este periodo: **CONFIDENCIAL** kg

Teniendo en cuenta que el precio del Productor Nacional depende de la composición de su mix de ventas y del precio de cada uno de los sub-segmentos explicados

previamente, se procedió a distribuir ese volumen por sub-segmento de acuerdo con los siguientes criterios:

- En el Sub-segmento Tendencia se verá afectado en diferentes proporciones. El 80% de las ventas del Sub-segmento crecerá con respecto al PIB Industrial (2%) proyectado por Fedesarrollo (Ver Anexo 15) tomando como base las ventas del segundo semestre del 2025 (**CONFIDENCIAL** kg). Mientras que el 20% restante de las ventas del Sub-Segmento disminuirá un 33% con respecto al mismo periodo del año anterior, así:
